Surface disturbance affects fewer acres under Alternative B, and thus has less direct impact on the Nez Perce NHT and Other Historic Trails compared to Alternative A. As with Alternative A, actions that may physically impact the trails, particularly the Nez Perce NHT, would be limited through enforcement of a National Trail Management Corridor. Under this alternative, the National Trail Management Corridor would extend to areas in view within 5 miles of the Nez Perce NHT and Other Historic Trails, except within existing utility corridors. Additional protections come from an NSO restriction within 3 miles and a CSU stipulation in view within 5 miles of the Nez Perce NHT and Other Historic Trails. The same distances apply to mineral materials disposal.

As with the other alternatives, normal compliance with NHPA Section 106 before approving an action moderates the amount of actual disturbance. In addition, the BLM and the SHPO consult to develop and implement a treatment plan to mitigate adverse impacts to contributing trail segments.

Restrictions on surface-disturbing activities for the protection of other resources (e.g., soil, water, biological resources, and special designations) are greater under Alternative B than Alternative A, providing more protection for trail resources.

Resource Uses

Impacts related to lands and realty actions on BLM-administered surface land are anticipated to be similar to those for Alternative A; however the intensity varies by alternative. Compliance with the NHPA would still be required. More acreage may be acquired under Alternative B than under Alternative A, with the result that there would be more survey and identification of potentially NRHP-eligible trail segments under Alternative B.

Management of renewable energy projects and linear developments (e.g., ROWs, corridors, and travel and trails management), would result in similar, but of a reduced magnitude impacts, than under Alternative A. Alternative B provides a wider National Trail Management Corridor than Alternative A, and limits ROW authorizations within 5 miles for the Nez Perce NHT and Other Historic Trails (except within existing utility corridors). As with the other alternatives, renewable energy presents a special situation. Even the wider National Trail Management Corridor required under Alternative B may need to be expanded as the trails' viewsheds are considered on a case-by-case basis, depending on the terrain. In all cases, adverse impacts must be mitigated in compliance with NHPA Section 106.

Travel management and recreation would result in similar direct and indirect, and adverse and beneficial impacts as Alternative A; however, Alternative B provides for more recreational options and more anticipated disturbance than Alternative A. Improved access also may indirectly lead to impacts; however, limiting motorized vehicle use to designated roads and trails in view within 5 miles of the Nez Perce NHT or Other Historic Trails would limit the potential for activities that may degrade the surface of the trail or impact the trail viewshed to a greater extent than Alternative A.

Special Designations

Alternative B designates more special designation areas and includes greater restrictions on surface-disturbing activity within these areas than Alternative A. These additional restrictions would result in the greatest beneficial impact to NHTs and Other Historic Trails. However, Alternative B also designates more back country byways than Alternative A and develops more interpretative facilities than the other alternatives, which may increase adverse impacts through increased access, but may also have

National Historic Trails and Other Historic Trails

beneficial impacts by promoting knowledge and appreciation of trail resources. Alternative B would therefore result in greater adverse and beneficial impacts than Alternative A.

Resources

The impact of fire and fuels management would be primarily adverse under Alternative B, but would have less impact compared to Alternative A due to its smaller projected acreage of related disturbance.

Alternative B provides more protection for cultural and visual resources than Alternative A, resulting in greater beneficial impacts to NHTs and Other Historic Trails. For example, Alternative B manages more of the Planning Area as VRM Class I and II, which would close or limit motorized vehicle use to designated roads and trails. Similar to Alternative A, the Nez Perce NHT and surrounding public lands are generally managed as VRM Class II, which would help to retain the integrity of areas outside of the National Trail Management Corridor that contribute to the associated settings and scenic values for which the NHT was designated.

Proactive Management

Proactive management actions under Alternative B emphasize resource protection in the vicinity of the Nez Perce NHT and Other Historic Trails through a 3-mile NSO and 5-mile CSU buffer, and viewshed buffers. In addition, this alternative allows wider buffers on a case-by-case basis for certain types of development, such as wind-energy developments. As mentioned above, use of motorized vehicles also is limited to designated roads and trails in view within 5 miles of trails. Because trails often comprise multiple traces, the Nez Perce National Trail Management Corridor extends from the outer edges of the overall trace. This National Trail Management Corridor is larger under Alternative B than Alternative A. Alternative B removes canals from the same type of consideration as trails, recognizing that the significance criteria for this resource type are different from those of other linear features, such as trails.

Alternative C

Surface Disturbance

Alternative C is projected to result in the greatest acreage of surface disturbance and, consequently, the greatest potential to the Nez Perce NHT and Other Historic Trails. As with the other alternatives, compliance with BLM management practices and the NHPA would limit adverse impacts through development of treatment plans and limitations on development within the Nez Perce National Trail Management Corridors.

Because management under Alternative C places a greater emphasis on resource use, there would be fewer restrictions on surface-disturbing activities for the protection of other resources (e.g., soil, water, biological resources, and special designations). Therefore, although there would be some additional protection for trail resources, it would be less than under alternatives A, B, or D.

Resource Uses

The Nez Perce NHT and Other Historic Trails would be affected by lands and realty management similar to Alternative A. As under the other alternatives, the survey required for NHPA Section 106 compliance in the case of either disposal or acquisition would result in a beneficial impact to cultural resources because of data that furthers understanding of trail resources in the Planning Area.

Under Alternative C, the management of renewable energy projects and linear developments (e.g., ROWs, corridors, and recreational trails management) would have greater impacts on the Nez Perce NHT and Other Historic Trails than actions under alternatives A, B, or D. Under this alternative, an NSO

restriction is applied, similar to Alternative A, but a 1-mile CSU stipulation is also added to protect the Nez Perce NHT. The areas around the Nez Perce NHT are closed to mineral materials disposal within ¼ mile or in view within 1 mile, and motorized travel is limited to designated roads and trails in view within ¼ mile. Similar restrictions are applied to Other Historic Trails, except within existing utility corridors where the trail lacks integrity or the viewshed has been compromised. Some beneficial impacts would result from the inventory and identification of previously unrecorded segments. In all cases, adverse impacts must be mitigated in compliance with NHPA Section 106.

Improved access, due to fewer limitations on motorized vehicle use, has the greatest potential to result in indirect adverse impacts under this alternative. Similarly, recreational development is greatest under this alternative, potentially leading to the greatest adverse impacts. However, installation of educational kiosks, diversion of traffic away from the historic trail to alternative routes, and general improved education would have a beneficial impact.

Special Designations

Beneficial impacts from special designations would be lowest under Alternative C. Having fewer special designations and, fewer restrictions within those areas would reduce the benefits to NHTs and Other Historic Trails. Back country byways, which may indirectly affect historic trails resources through increased access and interpretive opportunities, are managed similar to Alternative A.

Resources

As under the other alternatives, impacts from fire and fuels management would be primarily adverse. A greater emphasis on commodity production would increase the potential for adverse impacts. Alternative C would cause the most disturbance related to fire and fuels management compared to alternatives A, B, and D.

Under Alternative C, cultural and visual resources management would continue to result in both direct and indirect beneficial impacts to the Nez Perce NHT and Other Historic Trails, although the impacts would be less than under alternatives B and D. For example, motorized vehicle use is not limited by VRM class under Alternative C, whereas Alternative B restricts motorized vehicle use in these areas. Alternative C manages the Nez Perce NHT and surrounding public lands primarily as VRM Class III, which would allow activities within the viewshed, but outside of the National Trail Management Corridor, to adversely affect the associated settings and scenic values for which the NHT was designated to a greater extent than Alternative A.

Proactive Management

Proactive management actions under Alternative C would result in beneficial impacts to the Nez Perce NHT and Other Historic Trails. Under existing management, a NSO restriction is added within ¼ mile of the Nez Perce NHT and Other Historic Trails, Alternative C adds a CSU restriction within 1 mile of the Nez Perce NHT and Other Historic Trails. Exceptions occur where the trail's integrity or setting has been compromised. Areas within ¼ mile or in view within 1 mile also are closed to mineral materials disposal, and motorized vehicle use is limited to designated roads and trails, which would reduce access and associated impacts. Limiting motorized vehicle use to designated roads and trails within a ¼-mile of the Nez Perce NHT or Other Historic Trails would limit the potential for activities that may degrade the surface of the trail or impact the trail viewshed to a greater extent than Alternative A, which does not include specific restrictions on motorized vehicle use for purposes of protecting these trails.

As with the other alternatives, because NHT and Other Historic Trails often comprise multiple traces, the National Trail Management Corridor extends from the outer edges of the overall trace. The size of the

National Trail Management Corridors and associated restrictions under Alternative C are less than those required under alternatives B and D, but more than under Alternative A.

Alternative D

Surface Disturbance

The amount of surface disturbance projected under Alternative D is similar to Alternative A, falling between the amount of disturbance projected under alternatives B and C. As with Alternative A, actions that would directly affect these trails, particularly the Nez Perce NHT, would be limited due to management that restricts certain resource uses within the National Trail Management Corridor and areas within view of Other Historic Trails. In contrast to the other alternatives, Alternative D does not contain management specific to mineral leasing (e.g., NSO or CSU restrictions) or mineral materials disposal, instead controlling these uses through a more generalized management approach to mitigate their impacts. Under this alternative, the BLM avoids surface-disturbing activities and protects the foreground of the trails up to 3 miles or the visual horizon whichever is closer (the setting consideration zones) where setting is an important aspect of the integrity of the trail, and uses BMPs to avoid, minimize and/or compensate adverse impacts.

As with the other alternatives, required compliance with NHPA Section 106 before approving an action would reduce disturbance or adverse impacts to these trails. Additionally, the BLM and the SHPO consult to develop and implement a treatment plan to mitigate adverse impacts to contributing trail segments.

Restrictions on surface-disturbing activities for the protection of other resources (e.g., soil, water, biological resources, and special designations) under Alternative D would result in impacts similar to Alternative A.

Resource Uses

The types of impacts from lands and realty management are anticipated to be similar to those described under Alternative A, though the intensity of these impacts would be less than under alternatives A or C, and more than under Alternative B. In all cases, compliance with the NHPA is still required.

The management of renewable energy projects and linear developments (e.g., ROWs, corridors, and travel and trails management) would result in fewer adverse impacts than Alternative A. Alternative D provides protection via a wider National Trail Management Corridor than either alternatives A or C, but less than Alternative B. For Other Historic Trails, motorized vehicle use is constrained or guided by other resource management actions and does not have trails-specific requirements, in contrast to alternatives B and C. As with the other alternatives, renewable energy presents a special situation, whereby the trails' viewsheds are considered on a case-by-case basis, depending on the terrain. In all cases, adverse impacts must be mitigated in compliance with NHPA Section 106.

For other resource uses, including recreation and livestock grazing, impacts from management under Alternative D would be similar to those under Alternative A.

Special Designations

Alternative D designates more special designation areas and includes greater restrictions on surface-disturbing activity within these areas, resulting in a greater beneficial impact than alternatives A and C. In all cases, improved access also may indirectly lead to impacts. Although Alternative D has fewer back country byways than Alternative B, it has more than alternatives A and C, and may increase access to, and interpretive opportunities related to, historic trails in the vicinity of the byways.

Resources

The impact of fire and fuels management would be similar to that under Alternative A. Alternative D protects cultural and visual resources somewhat less than Alternative B, but more than either alternatives A or C, resulting in beneficial impacts to NHTs and Other Historic Trails. Alternative D manages the Nez Perce NHT and surrounding public lands as VRM Classes II and III, which would help to retain the integrity of areas outside of the National Trail Management Corridor that contribute to the associated settings and scenic values for which the NHT was designated. These beneficial impacts would be similar to, but somewhat less than Alternative A due to the larger area managed as VRM Class III under Alternative D.

Proactive Management

Proactive management actions under Alternative D emphasize avoidance of surface-disturbing activities and protection of the foreground of the Nez Perce NHT and Other Historic Trails. For the Nez Perce NHT, Alternative D requires the avoidance of surface-disturbing activity up to 3 miles or the visual horizon whichever is closer (the setting consideration zones) where setting is an important aspect of the integrity for the trail. BMPs are to be used to avoid, minimize and/or compensate adverse effects for the Nez Perce NHT and all Historic Trail segments. Motorized vehicle use is limited to existing roads and trails within 5 miles of the Nez Perce NHT, which would result in similar impacts as described for Alternative B. For Other Historic Trails, the foreground is to be protected up to 2 miles, and motorized vehicle use is constrained or guided by other resource management actions. In addition, consideration of wider buffers may be necessary on a case-by-case basis for certain types of development, such as wind-energy developments. Because trails often comprise multiple traces, the National Trail Management Corridor extends from the outer edges of the overall trace. This National Trail Management Corridor is larger under Alternative D than alternatives A and C, but smaller than Alternative B.

Alternative E

Surface Disturbance

Alternative E applies the same management corridor as Alternative B (refer to Map 91), and adverse and beneficial impacts to the Nez Perce NHT and Other Historic Trails from surface-disturbing activities would be similar to Alternative B. However, under Alternative E, additional restrictions on surface-disturbing activities along 31 miles of the Nez Perce NHT and Other Historic Trails would apply in areas overlapping the Greater Sage-Grouse Key Habitat Areas ACEC. These restrictions would include withdrawal from locatable mineral entry, closures to mineral materials disposal, ROW and renewable energy exclusion, and additional restrictions on allowable density and area of disturbance which would result in greater protection for these trails. Alternative E has the lowest amount of acres affected by surface disturbances, and thus has the least potential for direct impact on the Nez Perce NHT and Other Historic Trails of any of the alternatives.

In areas outside of the Greater Sage-Grouse Key Habitat Areas ACEC, restrictions on surface-disturbing activities for the protection of other resources (e.g., soil, water, biological resources, and special designations) and consultation and compliance requirements under NHPA Section 106 are the same as under Alternative B, and impacts would be the same as Alternative B.

Resource Uses

The management of resource uses under Alternative E, except for certain resource uses in the proposed Greater Sage-Grouse Key Habitat Areas ACEC, is the same as Alternative B; impacts to trail resources outside the ACEC would be the same as Alternative B, while impacts inside the ACEC would be less adverse. Lands in the Greater Sage-Grouse Key Habitat Areas ACEC are managed for potential acquisition, so more acreage may be acquired under Alternative E than any other alternatives, with resulting surveys that may identify other potential NRHP-eligible trail segments. All lands within the proposed Greater Sage-Grouse Key Habitat Areas ACEC are managed as excluded from ROW and renewable energy uses, which may reduce the magnitude of impacts from new developments on trail resources in the area compared to the other alternatives. Under Alternative E, the Greater Sage-Grouse Key Habitat Areas ACEC is closed to all types of mineral development, which may decrease the potential for adverse impacts from these types of activities.

Overall, additional protective management along certain trail segments in the Greater Sage-Grouse Key Habitat Areas ACEC would reduce adverse impacts to the Nez Perce NHT and Other Historic Trails; along all other portions, impacts from resources uses would be the same as Alternative B. As with all the alternatives, compliance with the NHPA would be required for all actions under Alternative E.

Special Designations

Alternative E designates more special designation areas and includes greater restrictions on surface-disturbing activity within these areas any other alternative. In addition to all the special designations made under Alternative B, Alternative E also designates the Greater Sage-Grouse Key Habitat Areas ACEC (1,232,583 acres). The addition of this ACEC would provide additional protection for the Nez Perce NHT and Other Historic Trails through greater restrictions on surface-disturbing activities. These additional restrictions would result in the greatest beneficial impact to the NHT and Other Historic Trails of any alternative from special designations management.

Resources

Fire and fuels management under Alternative E, except for areas in the proposed Greater Sage-Grouse Key Habitat Areas ACEC, is the same as Alternative B; impacts to trail resources outside the ACEC would be the same as Alternative B. Additional restrictions in the Greater Sage-Grouse Key Habitat Areas ACEC would limit access for fire management activities compared to the other alternatives, which may reduce adverse impacts from fire suppression, stabilization, and rehabilitation compared to the other alternatives.

VRM and cultural resource management under Alternative E is the same as Alternative B, and impacts to trail resources would be the same as Alternative B.

Proactive Management

Management of the Nez Perce NHT and Other Historic Trails under Alternative E is the same as Alternative B, and beneficial impacts to these trail resources would be the same as Alternative B.

Alternative F

Surface Disturbance

Alternative F applies the same management corridor as Alternative D (refer to Map 92), and adverse and beneficial impacts to the Nez Perce NHT and Other Historic Trails from surface-disturbing activities would be similar to those discussed under Alternative D. However, under Alternative F, the BLM would

apply additional restrictions on surface-disturbing activities along 24 miles of the Nez Perce NHT and Other Historic Trails located in the Greater Sage-Grouse PHMAs ACEC. These restrictions would include restrictions on leasable mineral development and more stringent allowable density and area of disturbance considerations, which may result in greater protection for these trails. Total projected surface disturbance under Alternative F is similar to alternatives A and D, less than Alternative C, and greater than alternatives B and E.

In areas outside of the Greater Sage-Grouse PHMAs ACEC, restrictions on surface-disturbing activities for the protection of other resources (e.g., soil, water, biological resources, and special designations) and consultation and compliance requirements under NHPA Section 106 are the same as Alternative D, and impacts would be the same as Alternative D.

Resource Uses

The management of resource uses under Alternative F, except for certain resource uses in the proposed Greater Sage-Grouse PHMAs ACEC, is similar to management under Alternative D; impacts to trail resources outside the ACEC would be the same as Alternative D while impacts inside the ACEC may be less adverse. Lands in the Greater Sage-Grouse PHMAs ACEC would limit motorized vehicle use to designated roads and trails, potentially limiting access in the area to a greater extent than alternatives A, C, and D, but less so than alternatives B and E. Within the ACEC, NSO restrictions within 0.6 mile of occupied greater sage-grouse leks may also benefit trail resources where they overlap with these leasable mineral surface restrictions.

Overall, additional protective management along certain trail segments in the Greater Sage-Grouse PHMAs ACEC may result a slight reduction in adverse impacts for the Nez Perce NHT and Other Historic Trails; along all other portions, impacts from resources uses would be the same as described under Alternative D. As with all the alternatives, compliance with the NHPA would be required for all actions under Alternative E.

Special Designations

Alternative F designates more special designation areas than alternatives A, C, and D, and includes greater restrictions on surface-disturbing activities within these areas, resulting in greater beneficial impacts than under those alternatives. Alternative F includes the same back country byways as Alternative D, and impacts would be the same as Alternative D.

Resources

Fire and fuels management under Alternative F, except for areas in the proposed Greater Sage-Grouse PHMAs ACEC, is the same as Alternative D; impacts to trail resources outside the ACEC would be the same as Alternative D. Additional restrictions in the Greater Sage-Grouse PHMAs ACEC would limit the ability to use prescribed fire and implement fuels reduction in certain habitats, potentially resulting in fewer adverse impacts from fire and fuels management than alternatives A and D.

VRM and cultural resource management under Alternative F is the same as Alternative D, and impacts to trail resources would be the same as Alternative D.

Proactive Management

Management of the Nez Perce NHT and Other Historic Trails under Alternative F is the same as Alternative D, and beneficial impacts to these trail resources would be the same as Alternative D.

4.7.5 Wild and Scenic Rivers

There are 20 waterways and associated waterway corridors (comprising 27,317 acres) in the Planning Area that have been identified as eligible for inclusion in the NWSRS due to their ORVs and free-flowing conditions (Map 94). Chapter 3 and Appendix F describe the process used to identify WSR eligible waterways (WSR eligible waterway segments) and lists the ORVs, tentative classifications (wild, scenic, or recreational), and suitability determinations for each. The WSR review contained in Appendix F was conducted separately from the RMP planning process to expedite the review process, resulting in a stand-alone WSR review report. Following the review and response to any public comments that address WSR recommendations presented in this document, the BLM will release the Record of Decision that contain the agency's WSR findings.

This section describes proposed management actions for WSR eligible waterway segments likely to result in impacts to other resources, resource uses, and special designations. This section also describes the effects of management actions on the ORVs and other WSR-related qualities identified in these areas (i.e., their free-flowing condition, water quality, and other values which determined their tentative classifications).

Adverse impacts from management of WSR eligible waterways result from actions that restrict resource uses or the management of resources; beneficial impacts are those that enhance other resource uses or the management of resources. Adverse impacts to WSR eligible waterways are those that diminish free-flowing conditions, ORVs, and characteristics that justified their tentative classifications; beneficial impacts are those that preserve and enhance these qualities. ORVs include scenic, recreational, geologic, fish, wildlife, cultural, historic, and other similar values (e.g., ecologic/biologic diversity, paleontological, or botanic values). Adverse impacts to ORVs generally result from surface-disturbing activities (such as mineral development, ROW and road construction, and vegetation treatment and timber harvesting) or other activities that can affect vegetation or damage resources, such as concentrated livestock grazing and off-road motorized vehicle use.

Direct impacts result from management actions prescribed to WSR eligible waterway segments that restrict other resource uses or activities. Direct impacts also result from resource uses or activities (or restrictions thereof) within WSR eligible waterway corridors that affect their tentative classifications. Indirect impacts include management actions prescribed to overlapping special designations (e.g., WSAs) that may contribute to the preservation of free-flowing conditions, ORVs, and characteristics that justified their tentative classifications.

4.7.5.1 Methods and Assumptions

Methods and assumptions used in this impact analysis include the following:

- Alternative A assumes the BLM continues the current interim management for the 20 eligible waterways.
- Alternatives B and E assume that all 20 eligible waterways are recommended to Congress, and subsequently accepted, as suitable for inclusion in the NWSRS.
- Alternatives C, D, and F assume that the BLM recommends none of the eligible waterways to Congress as suitable for inclusion in the NWSRS.
- Interim Management of WSRs may not be consistent with other resource values.
- Designating rivers as WSRs may attract more visitors to the area, and therefore, increase resource use.

4.7.5.2 Summary of Impacts by Alternative

Alternatives A, B, and E apply interim management to the 20 eligible waterway segments and associated waterway corridors to preserve their free-flowing conditions, ORVs, and characteristics that justified their tentative classifications; Alternatives B and E also recommend all of these waterways to Congress as suitable for inclusion in the NWSRS. In contrast, under alternatives C, D, and F, the BLM does not recommend any of these eligible waterways to Congress as suitable for inclusion in the NWSRS and therefore does not apply interim management to preserve their ORVs and free-flowing conditions. The preservation of any ORVs or other WSR-related qualities identified in the waterway segments would be least effective under alternatives C, D, and F due to the greater intensity of resource uses allowed under these alternatives. Alternatives E, B, and A, respectively, are the most protective of WSR eligible waterway segments and would result in the greatest beneficial impacts to the free-flowing conditions, ORVs, and characteristics that justified their tentative classifications by restricting or limiting resource uses that could degrade these qualities. Due to the extent and intensity of the restrictions under alternatives B and E, the beneficial impacts to the WSR-related qualities and the adverse impacts to other activities and resource uses would be greatest under these alternatives. Alternatives C, D, and F, respectively, include the least restrictive management of several resource uses and would have the fewest adverse impacts on mineral development, livestock grazing, and timber harvesting.

4.7.5.3 Detailed Analysis of Alternatives

Waterway segments are only recommended for inclusion in the NWSRS or managed to preserve ORVs and the free-flowing conditions under alternatives A, B, and E. Under alternatives C, D, and F, no waterways in the Planning Area are recommended for inclusion in the NWSRS or managed for the purpose of protecting any WSR-related qualities or characteristics.

Table 4-35 summarizes acreages and allocations associated with resources and resource uses along the waterway segments managed under alternatives A, B, and E. For purposes of comparison, this table also lists the acreages and allocations of these same waterway segments under alternatives C, D, and F; no special management actions are specifically applied to protect the ORVs and other WSR-related qualities under these alternatives.

Table 4-35. Acres of Management in Wild and Scenic River Eligible and/or Suitable Segments by Alternative

	Mineral Development Restrictions (acres)			Rights-of-Way (acres)			Visual Resource Management (acres)				Travel Management (acres)				
	Mineral Materials Closure	Closed to Mineral Leasing	Withdrawn from Mineral Entry	Exclusion	Avoidance	Open	Class I	Class II	Class III	Class IV	Closed	Limited to Designated	Limited to Existing	Open	Seasonal Restrictions
Alternative A	21,780	17,261	17,849	11,004	15,625	657	5,389	18,227	1,498	2,176	12,523	10,793	2,089	0	1,898
Alternative B	25,815	26,303	23,719	22,284	5,022	11	18,582	8,559	0	176	22,638	2,276	3	0	2,389
Alternative C	8,809	7,869	6,390	0	16,159	11,158	5,389	17,579	1,691	2,656	5,675	13,548	5,773	0	2,309

Source: BLM 2013a

Impacts Common to All Alternatives

There is no “common-to-all management” specific to WSR eligible and/or suitable waterway segments. However, any management that results in restrictions on resource use, development, or surface-disturbing activities near to WSR segments may result in beneficial impacts by reducing the potential for impacts on ORVs or the free-flowing conditions or other characteristics of these waterways. Alternatively, management that decreases restrictions in areas near these waterway segments may result in adverse impacts by diminishing ORVs and other characteristics of the waterways.

Alternative A

Under Alternative A, the BLM has identified 20 WSR eligible waterway segments (see Chapter 3) and applies interim management to protect their free-flowing conditions and ORVs. Under interim management, the qualities that preliminarily qualified the waterway segments as eligible for inclusion in the NWSRS are protected, and the undeveloped nature of the waterways is preserved.

Surface Disturbance

Under Alternative A, surface-disturbing and disruptive activities are allowed on a case-by-case basis along nine WSR eligible waterways and portions of the Clarks Fork of the Yellowstone River and White Creek, while such activities are prohibited along the other eligible waterways. Prohibitions against surface disturbance would result in adverse impacts to mineral development, range improvement projects, watershed improvement projects, recreation development, and other types of actions that benefit these resources and resource uses, while case-by-case reviews may result in additional expense and delays for these types of actions. Prohibitions on and, to a lesser degree, case-by-case reviews of surface-disturbing activities would generally result in beneficial impacts to the ORVs and other WSR-related qualities along the eligible waterway segments because activities that degrade these qualities are not allowed.

Under this alternative, the BLM performs a case-by-case review of all proposed actions along all WSR eligible waterways and applies protective management, subject to existing rights, as appropriate. Case-by-case reviews may result in additional expense and delay for some projects, but requiring reviews of all these actions may result in additional mitigation or design considerations that protect the ORVs and other WSR-related qualities of the waterways.

Resource Uses

Management for eligible WSR segments under Alternative A is designed to preserve their ORVs and other WSR-related qualities, but also imposes restrictions that would adversely affect other resources and resource uses. Restrictions on mineral entry, leasing, and disposal under this alternative would result in adverse impacts to mineral resources. Under Alternative A, nine WSR eligible waterways are withdrawn (or partially withdrawn in the cases of Porcupine, Dry Medicine Lodge, and White creeks) from appropriation under the mining laws and closed to mineral leasing. Along seven WSR eligible water segments, including portions on the Paint Rock Creek Unit and Clarks Fork of the Yellowstone River, this alternative applies an NSO restriction and a seasonal NSO restriction (in the WFO only) on mineral leasing. Alternative A also limits geophysical exploration along 11 WSR eligible waterway segments, including portions of White Creek and Clarks Fork of the Yellowstone River, to foot access and allows geophysical exploration via existing roads and trails along three other segments. Management under this alternative closes 12 WSR eligible waterway segments, including portions of White Creek and Clarks Fork of the Yellowstone River, to recreational dredging for minerals and mineral materials

disposal. Closing the majority of the WSR eligible waterway corridors to mineral entry, leasing, and disposal and applying additional restrictions on exploration and surface occupancy in the remaining areas would result in adverse impacts to mineral resources (see Table 4-35). Restrictions on mineral exploration and development in these areas would reduce adverse impacts to vegetation, wildlife, cultural, and scenic quality-related ORVs.

Closing 13 eligible and waterways, including portions of White Creek and Clarks Fork of the Yellowstone River, to timber sale or harvesting would result in adverse impacts to forest products and beneficial impacts to these WSR eligible waterways ORVs. Adverse impacts to the use of forest products would result from these restrictions on forest management practices and the extraction of forest products. Closure to timber sale or harvesting would result in beneficial impacts to the protection of ORVs if these closures prevent surface-disturbing activities, habitat loss, damage to cultural resources, degradation of scenic quality, or other ORVs along these waterway segments.

Under Alternative A, the BLM manages four WSR eligible waterways, (including a portion of White Creek), as ROW exclusion areas, nine as ROW avoidance areas (including portions on the Paint Rock Creek Unit and Clarks Fork of the Yellowstone River), and the remainder as open to ROW authorizations subject to case-by-case approval. Management that restricts the ability to grant ROW authorizations would result in adverse impacts to ROW authorizations. Impacts from restrictions on ROW authorizations would be more in ROW exclusion areas.

Closure of eligible and suitable waterway segments to disposal actions would result in an adverse impact to lands and realty by prohibiting land disposals along the waterway corridors identified in Chapter 3. Prohibiting disposals in these areas may result in beneficial impacts to WSR eligible and suitable waterway segments by preventing the disposal of land that could subsequently be used in a manner that diminishes ORVs.

Under Alternative A, five WSR eligible waterway corridors are closed to motorized vehicle use and the use of motorized or mechanized vehicle ground equipment to suppress fires (including a portion of White Creek); nine are limited to designated roads and trails (including a portion of Clarks Fork of the Yellowstone River); and the remainder are limited to existing roads and trails. Travel management that restricts motorized vehicle use, particularly through closures or limiting travel to designated routes, would result in adverse impacts to access and recreational motorized travel by eliminating some potential routes.

Alternative A includes management for WSR eligible waterway corridors to prevent an increase in actual grazing use, which may result in adverse impacts to livestock grazing and beneficial impacts to waterway ORVs. Adverse impacts to livestock grazing may result if additional forage becomes available in the WSR eligible waterway corridors and it cannot be allocated to grazing permittees. Beneficial impacts from limiting the amount of grazing use to current levels may include a smaller risk of damage to the ORVs that are vulnerable to invasive species (i.e., scenic, wildlife, and other vegetation-related values) and, in situations where livestock grazing could become concentrated if additional use is allowed, less soil compaction and degradation of riparian/wetland areas.

Special Designations

WSR eligible waterways, where they intersect specially designated areas with additional and more restrictive management, such as WSAs, would be afforded additional protection. In the case of WSAs, Class I VRM objectives and non-impairment standards as directed by BLM Manual 6330, *Management of Wilderness Study Areas* (BLM 2012a) would benefit the ORVs and the free-flowing condition of the waterways and other resources within these corridors, including wildlife, vegetation, soils, watershed, and recreational settings and experiences. However, these additional management prescriptions may

preclude other resource management actions that may benefit those resources, for example, watershed development projects and wildlife development projects such as fish barriers.

Resources

Prohibitions on water impoundments, major diversions, or hydroelectric power facilities on all WSR eligible waterways under Alternative A would result in adverse impacts to water development projects and beneficial impacts to the protection of the free-flowing condition of the waterways.

Managing the corridors along two WSR eligible waterway segments as VRM Class IV and 12 segments (including portions on the Paint Rock Creek Unit, White Creek, and Clarks Fork of the Yellowstone River) as VRM Class II would result in adverse impacts to resource uses and development, but would benefit certain ORVs (see Table 4-35). Along WSR eligible waterway segments where there is no WSR-specific VRM objectives, visual resources are managed consistent with the underlying VRM classification in consideration of the need to avoid damaging the identified ORVs. Managing visual resources as VRM Class II would restrict the development and use of other resources because the allowable visual contrast would be limited and additional design consideration or mitigation may be required for certain activities. Management under stricter VRM Classes (i.e., Classes I and II) would be beneficial to the protection of scenic, recreational, and other ORVs that may be affected by surface-disturbing and other related activities. WSR eligible waterways are managed as VRM Class I where they intersect WSAs.

Alternative B

Under Alternative B, the BLM recommends to Congress that all 20 waterway segments identified as WSR eligible in Alternative A are suitable for inclusion in the NWSRS (see Chapter 3). To support this recommendation, the BLM applies specific management prescriptions to protect and enhance their free-flowing conditions, ORVs, and other wild, scenic, or recreational characteristics.

Surface Disturbance

Under Alternative B, surface-disturbing and disruptive activities are prohibited along all the WSR suitable segments and impacts would be similar to, but more extensive than, those under Alternative A. Closing lands along the Middle Fork of the Powder River, Paint Rock Creek Unit, and Dry Medicine Lodge Creek and other additional waterways under this alternative would provide only minimal added protection, because the case-by-case authorization of surface-disturbing activities under Alternative A would be used to protect the free-flowing condition and ORVs associated with these waterways.

Where appropriate, Alternative B applies protective management based on case-by-case reviews of discretionary actions proposed in the waterway corridors. Generally, the BLM would not approve such actions if they could result in adverse impacts to a WSR suitable waterways' free-flowing condition and ORVs.

Resource Uses

Impacts to and from mineral development and timber harvesting under Alternative B would be similar to Alternative A, except that the extent would be greater because more areas are closed to these activities (Table 4-35). All WSR suitable waterway segments would be withdrawn from appropriations under the mining laws and closed to mineral leasing. Unlike Alternative A, Alternative B also would close all segments to geophysical exploration. The management of mineral materials disposal would be the same as under Alternative A, though restrictions to protect other resources would mean more area along suitable waterways would be closed to disposals than under Alternative A. Alternative B also closes all WSR suitable waterway corridors to timber sale or harvesting. Management of minerals and

forest products under this alternative would be more effective at protecting and enhancing the ORVs than Alternative A, and would be more effective at preserving the tentative classification of these waterways, especially along Wild and Scenic waterways where watersheds and shorelines are to be maintained in a primitive or largely undeveloped state, respectively.

The BLM manages all WSR suitable waterway corridors as ROW exclusion areas and closes the majority to motorized vehicle use (see Table 4-35). Impacts of ROW management would be similar to those described for Alternative A, although to a greater extent because managing the WSR suitable waterways as ROW exclusion would prohibit ROW authorizations, even if effects on ORVs could be mitigated. Adverse impacts from travel and transportation management designations in along WSR suitable waterways under Alternative B would result in impacts similar to Alternative A, but to a greater extent because of increased restrictions that close or limit travel to designated roads and trails across a larger area. Similar to the beneficial impacts conveyed through more restrictive management of mineral use and forest products, the management of ROWs and CTTM under this alternative would be more effective at maintaining and enhancing the ORVs and tentative classifications of the waterways than management under Alternative A.

Under Alternative B, all WSR suitable waterway corridors would be closed to livestock grazing, and adverse impacts to this resource use would be greater than under Alternative A. Closing these areas to livestock grazing would remove AUMs associated with available forage and would result in reduced flexibility and increased operating costs for livestock grazing permittees in affected allotments. Although no conflicts between livestock grazing and the waterway segment ORVs have been identified, a closure may protect against future visual intrusions and impacts to vegetation and soils (e.g., invasive species infestations or damage to riparian/wetland vegetation) that could degrade certain ORVs.

Special Designations

WSR suitable waterways that intersect special designation areas with more restrictive management of resource uses would be afforded additional protection. WSAs, which are managed as VRM Class I to maintain their scenic qualities, would indirectly beneficially affect other resources, such as recreational settings and experiences and wildlife resources and associated habitat on WSR suitable waterways.

Resources

Management of water impoundments, major diversions, or hydroelectric power facilities would be the same as under Alternative A.

Under Alternative B, one WSR suitable waterway segment is managed as VRM Class IV, and the remainder are managed as VRM Class I (11 waterways) or Class II (8 waterways) (see Table 4-35). This management would be more restrictive than management under Alternative A and would effectively limit the types of visual intrusions along the WSR suitable waterways to only very minor activities that would not attract the attention of viewers. This more restrictive management would allow more effective maintenance of these waterways, tentative classifications and would provide additional protection and enhancement of scenic, recreational, and other ORVs that may be affected by surface-disturbing and other related activities compared to Alternative A. Where WSR suitable waterways intersect WSAs, other resource enhancement projects, such as the construction of fish barriers, may be precluded.

Alternative C

Under Alternative C, none of the waterway segments determined to be WSR eligible under Alternative A would be recommend to Congress as suitable, and the impacts to resources and resource uses under alternatives A and B would not occur. These waterway segments are released to other uses and no special management actions are specifically applied to protect the ORVs. Alternative C allows activities that may alter the ORVs identified under Alternative A, depending on restrictions from other program areas.

The BLM manages the sale and harvest of forest products consistent with other management objectives. This alternative implements the greatest amount of silviculture treatments to actively manage the forests and woodlands and would be less restrictive to the harvest of forest products than the other alternatives. These activities would increase the potential for adverse impacts to the ORVs and other WSR-related values of these waterways.

Alternative C generally includes the fewest restrictions on mineral exploration and development of any alternative and would result in the fewest impacts on minerals development of any alternative, and the largest adverse impacts to the ORVs and other WSR-related values (see Table 4-35).

Under Alternative C, management of ROW authorizations, VRM, and travel is similar but slightly less restrictive than under Alternative A (see Table 4-35) and impacts would generally be similar to those described for that alternative. Alternative C manages a greater area as open or avoidance areas for ROW than Alternative A. Alternative C ROW management would result in fewer adverse impacts to the location of ROWs, but greater adverse impacts to ORVs from more ROWs and fewer requirements for mitigation of these adverse impacts. In addition, disposal actions along the corridors would be consistent with other resource objectives, which would increase the risk of compromising the identified ORVs by disposing those lands within the corridors. Alternative C closes more acreage to motorized vehicle use than Alternative A and permits motorized vehicle use across a slightly smaller area on existing and designated roads and trails, which may result in a smaller potential for adverse impacts to the preservation of ORVs and other WSR-related qualities from motorized public access. Alternative C would not encourage new recreation opportunities on these waterways to the same degree as alternatives A and B.

Alternative C generally places the fewest restrictions on livestock grazing management and livestock forage production and utilization, and would be least restrictive to livestock grazing management in the waterway segments than the other alternatives. This would minimize the realization of beneficial impacts described for Alternative B.

Some of these waterway segments will remain protected under the management prescriptions of other resource programs such as ACECs and WSAs. However, these prescriptions may be eliminated if Congress decides to release the WSAs within these areas to multiple uses or the BLM does not carry forward these ACECs in future RMP revisions, at which time the waterway segments would lose any protective management prescriptions associated with these designations. Lack of these prescriptions would adversely affect the identified ORVs within the segments, as well as other resources such as wildlife, fisheries, scenic quality, and recreational resources that benefit from these management prescriptions.

Alternative D

The BLM used the RMP revision process as the suitability analysis to determine what eligible waterway corridors would be recommended for NWSRS inclusion. The comments BLM received regarding WSR suitability strongly opposed any designation of WSRs on BLM-administered public lands. As a result, none of the waterway segments are recommended for inclusion into the NWSRS under Alternative D. As under Alternative C, no special management actions are applied to protect the ORVs. Alternative D allows activities that may alter the ORVs identified under Alternative A, depending on restrictions from other program areas.

Mineral exploration and development under Alternative D is similar to management under Alternative C, and would result in similar types of impacts to the identified ORVs and other WSR-related values (see Table 4-35).

The BLM manages the sale and harvest of forest products consistent with other management objectives, and the impacts of this alternative on the identified ORVs would be similar to those described for Alternative C. Both the adverse and beneficial impacts from this management would occur to a lesser extent under Alternative D, because fewer acres would be available and timber harvests and treatments are managed for resource protection and enhancement, in addition to enhancing resource uses.

Under Alternative D, management of ROW authorizations, VRM, and travel is similar to Alternative A (see Table 4-35) and impacts would generally be similar to those identified under that alternative. Alternative D limits motorized vehicles to designated roads and trails on a similar acreage as Alternative A, and manages more area as closed to motorized use than alternatives A and C, but substantially less than Alternative B. In addition, Alternative D manages more acreage as ROW avoidance areas than Alternative C, which may reduce adverse impacts to the ORVs and other WSR-related qualities compared to that alternative by giving the BLM more ability to control ROW siting, apply additional mitigation, and close routes that are causing environmental damage. Impacts from disposal actions would be the same as Alternative C. New recreation opportunities would be encouraged similarly to Alternative C.

Alternative D places restrictions on livestock grazing management and livestock forage production and utilization similar to those under Alternative A. However, under Alternative D, these waterways would not be managed to prevent an increase in actual grazing use and the adverse impacts to livestock grazing and beneficial impacts to the ORVs would not occur.

Similar to Alternative C, some of these waterway segments ORVs would be protected under the management prescriptions of other resource programs, such as ACECs and WSAs. The protections from these special designations would be greater under this alternative however, as Alternative D includes a greater number of ACECs than alternatives A or C, but fewer than Alternative B. As described under Alternative C, these protective management prescriptions would not remain in effective if the WSAs or ACEC overlapping the waterway segment were released.

Alternative E

Impacts to ORVs and other WSR-related qualities s under Alternative E would be the same as those described under Alternative B; therefore, the impacts analysis for Wild and Scenic Rivers under Alternative B is representative of the impacts anticipated under Alternative E.

Alternative F

Impacts to ORVs and other WSR-related qualities under Alternative F would be the same as those described under Alternative D; therefore, the impacts analysis for Wild and Scenic Rivers under Alternative D is representative of the impacts anticipated under Alternative F.

4.7.6 Wilderness Study Areas

WSAs are managed under BLM Manual 6330, *Management of Wilderness Study Areas*, which recently replaced the *Interim Management Policy and Guidelines for Lands Under Wilderness Review* (BLM 2012a). Management actions and resource uses in WSAs are subject to the nonimpairment standard under Manual 6330, ensuring that WSAs are not adversely affected by impairing their suitability for preservation as wilderness. There are no proposed actions contrary to managing the areas to protect their wilderness characteristics. Therefore, managing WSAs according to Manual 6330 preserves the wilderness character of the areas. The areas' naturalness, opportunities for solitude and primitive, unconfined recreation, and any special features that further qualify them for consideration as wilderness, would be preserved. At the same time, activities that would adversely affect the wilderness character of the areas would be prohibited.

Adverse impacts to WSAs are those that reduce wilderness characteristics in the area and reduce the potential for designation as wilderness. Beneficial impacts to WSAs are those that maintain or enhance wilderness characteristics or decrease evidence of human presence in these areas. Direct impacts result from management actions that may affect naturalness, opportunities for solitude, and opportunities for primitive, unconfined recreation within the boundaries of WSAs. Indirect impacts include management actions outside WSA boundaries that may affect wilderness characteristics.

4.7.6.1 Methods and Assumptions

Methods and assumptions used in the impact analysis include the following:

- All WSAs in the Planning Area will continue to be managed under the BLM Manual 6330, *Management of Wilderness Study Areas*, until such time as Congress either designates all or portions of the WSAs as wilderness or releases the WSAs, or portions of the WSAs, from any further consideration for wilderness and the lands revert back to general land use management.
- Wilderness management is subject to valid existing rights and the grandfather clause under all of the alternatives.
- The WSA designation is beneficial to the protection of air and watersheds, soil and water quality, ecological stability, plant and animal gene pools, archeological and historical sites, habitats for wildlife, and livestock grazing.

4.7.6.2 Summary of Impacts by Alternative

WSAs exist under all alternatives and are managed according to Manual 6330 (BLM 2012a), which restricts discretionary activities in WSAs to ensure that their suitability for Wilderness designation is not impaired. Overall, beneficial impacts to WSAs would be the greatest under alternatives B and E, followed by alternatives F, D, A, and C. Although there are limited discretionary actions the BLM can take that would affect WSAs, management under alternatives B and E would result in the greatest beneficial impacts to WSAs by emphasizing resource protection and limiting the potential for activities in and adjacent to WSAs that may adversely affect wilderness characteristics. Alternative C places the

fewest restrictions on activities that may diminish wilderness characteristics, and includes the fewest other resource protection measures that would benefit WSAs. Motorized vehicle use, which may be incompatible with the concept of primitive recreation and may affect perceptions of solitude, is least restricted in WSAs under Alternative C, followed by alternatives A, D, F, B, and E, respectively. Alternatives B, C, D, E, and F identify land-tenure adjustments that may result in beneficial impacts to WSAs by increasing the potential for and expediting the disposal of inholdings or the acquisition of areas with high wilderness characteristics values that increase the manageability of WSAs. Additionally, alternatives B, D, E, and F include provisions for the acquisition of inholdings within WSA boundaries that would result in beneficial impacts through the elimination of incompatible uses.

4.7.6.3 Detailed Analysis of Alternatives

Impacts Common to All Alternatives

Manual 6330 (BLM 2012a) allows for little flexibility in the management of a WSA, because no discretionary actions that adversely affect WSAs are allowed (mandated by the nonimpairment standard). Manual 6330 (BLM 2012a) prohibits surface-disturbing and most other disruptive activities and sets management guidelines aimed at the preservation of wilderness characteristics. However, Manual 6330 (BLM 2012a) respects valid existing rights and includes a grandfather clause that allows several resource uses and management actions not subject to the nonimpairment standard. Resource uses and management actions that may meet this definition, and potentially adversely affect WSAs, include mineral development; ROW maintenance and development and new temporary ROWs where there is no reasonable, less impairing, alternative access available; or valid existing rights where the BLM has determined that application of the nonimpairment standard would unreasonably interfere with the exercise of those rights.

Valid existing mining claims not subject to the nonimpairment standard may adversely affect wilderness characteristics, primarily through surface disturbance and facilities development. WSAs are closed to mineral leasing and mineral materials disposal under all alternatives, protecting wilderness values from adverse impacts from new mineral leasing. Existing ROW maintenance requiring vehicle use and new ROW authorizations necessary to develop valid existing rights may adversely affect wilderness characteristics in WSAs through surface disturbance and facilities development.

Invasive species are anticipated to spread under all alternatives and may adversely affect the naturalness of WSAs. Invasive species control is permitted in WSAs according to Manual 6330 (BLM 2012a). Vegetation treatments to control the spread of invasive species may result in short-term adverse impacts to wilderness characteristics due to mechanical clearing, prescribed fire, or other treatments that disturb the naturalness of WSAs. However, invasive species control would result in long-term beneficial impacts by maintaining natural vegetative communities and helping to meet vegetation management objectives.

Other special designations in WSAs, such as ACECs and WSRs, may be beneficial to wilderness characteristics in WSAs if their management increases resource restrictions or actions that protect or increase wilderness characteristics in the WSA. The Spanish Point Karst ACEC, designated under all alternatives, would provide additional protection for cave and karst resources in the Trapper Creek and Medicine Lodge WSAs.

WSAs are managed as VRM Class I areas under all of the alternatives, which is beneficial to the maintenance of wilderness characteristics because VRM Class I areas are managed to preserve the

existing character of the landscape. However, activities that alter the visual landscape are allowed in areas adjacent to WSAs if they conform to the VRM for the area.

While the types of impacts to WSAs under each alternative are similar, the magnitude of these impacts would vary based on specific management and allocations under each alternative.

Alternative A

Restrictions on motorized vehicle use in WSAs would provide beneficial impacts to the preservation of wilderness characteristics. Motorized vehicle use may be incompatible with the concept of primitive recreation, and may affect perceptions of solitude by increasing noise levels and visitor contacts or by degrading the natural character of the landscape in areas where unauthorized pioneered routes have proliferated. Under Alternative A, motorized vehicle use is limited to existing primitive routes in the Cedar Mountain and Honeycombs WSAs, and limited to designated primitive routes in the Trapper Creek, Medicine Lodge, Alkali Creek, and McCullough Peaks WSAs (in those areas outside the Spanish Point Karst ACEC, which is closed to motorized vehicle use). The Owl Creek, Sheep Mountain, Red Butte, and Bobcat Draw Badlands WSAs are closed to motorized vehicle use under Alternative A to manage for maintaining their wilderness characteristics.

The proposed expansion of the Bobcat Draw Badlands WSA would result in beneficial impacts by restricting uses incompatible with the preservation of wilderness characteristics on an additional 1,290 acres. No other land acquisitions or disposal actions are proposed for WSAs under this alternative.

All WSR eligible waterway segments are managed to protect their free-flowing condition, ORVs, and tentative classifications. Segments of Medicine Lodge Creek and Trapper Creek lie within similarly named WSAs. Under Alternative A, these special designations include additional resource protection measures that prohibit surface-disturbing activities such as range improvements, exclude ROWs, and close these segments to motorized vehicle use. These protective measures would result in beneficial impacts to WSAs by further protecting wilderness characteristics.

Alternative B

Alternative B is more restrictive for motorized and mechanized vehicle travel and would be more beneficial to the preservation of wilderness characteristics such as opportunities for solitude and primitive recreation, compared to Alternative A. Management under this alternative maintains the closures under Alternative A and expands them to include all areas in the WSAs and mechanized vehicle travel. Closing the WSAs to motorized and mechanized use would result in adverse impacts to CTTM and motorized access within the WSAs. Users who once were able to access desired areas within the WSAs will either be displaced to alternative areas where they may not realize their desired settings and experiences, or access areas using alternative methods, such as horses.

Lands and realty management under Alternative B would provide the BLM flexibility to acquire WSA inholdings and may, therefore, have the greatest beneficial impact on eliminating any incompatible uses (e.g., extensive surface disturbances with strong visual contrast) occurring on these non BLM-administered parcels. The identification of land-tenure adjustments may result in beneficial impacts to WSAs by increasing the potential for and expediting the disposal of inholdings or the acquisition of areas with high wilderness characteristics values that increase the manageability of WSAs.

Under Alternative B, managing approximately 476,349 acres of lands with wilderness characteristics specifically to preserve their wilderness characteristics would decrease incompatible land uses adjacent to some WSAs, resulting in beneficial impacts to the wilderness characteristics in WSAs. Because many

Wilderness Study Areas

of the lands with wilderness characteristics are adjacent to or surround the WSAs, adverse impacts to wilderness characteristics from adjacent land uses (e.g., intensive oil and gas development) would be limited along the boundaries of the WSAs.

Impacts to WSAs from WSRs would be similar to Alternative A, except that the Dry Medicine Lodge Creek WSR, a portion of which is in the Medicine Lodge WSA, includes additional management actions for resource protection under this alternative that would further protect the wilderness characteristics of the WSA.

Alternative C

Alternative C is the least restrictive for motorized vehicle use in WSAs and would be the least beneficial to the preservation of wilderness characteristics. Under Alternative C, motorized vehicle use is limited to designated primitive routes in all WSAs. Management of the Cedar Mountain and Honeycombs WSAs under Alternative C would provide greater protection of the areas' wilderness characteristics than management under Alternative A. The less restrictive designations in the remaining WSAs, especially Owl Creek, Sheep Mountain, Red Butte, and Bobcat Draw Badlands – closed to motorized vehicle use under Alternative A but limited to designated trails under Alternative C – would provide the least benefit to the preservation of wilderness characteristics of any alternative.

Under Alternative C, the BLM does not pursue the acquisition of inholdings, lands, or interests in lands within WSA boundaries, which would result in adverse impacts to WSAs by decreasing lands transactions that consolidate lands in WSAs and increase the ability to meet management objectives that help maintain or improve wilderness characteristics. Reducing the potential for land transactions in WSAs also would result in adverse impacts by reducing the flexibility to mitigate the effects of incompatible adjacent uses through land-tenure adjustments.

Under Alternative C, management of WSR eligible waterway segments would not benefit wilderness characteristics in the WSAs, because the BLM does not manage waterways to maintain their ORVs.

Alternative D

Alternative D is generally more restrictive of travel in WSAs than alternatives A or C, but less than Alternative B. Alternative D limits motorized vehicle use to designated roads and trails in the Cedar Mountain, Honeycombs, Trapper Creek, Medicine Lodge, and Alkali Creek WSAs (as under Alternative C), carries forward the McCullough Peaks Travel Management Plan (as under Alternative A), and closes the Owl Creek, Sheep Mountain, Red Butte, and Bobcat Draw Badlands to motorized vehicle use (as under Alternative A). Beneficial impacts to wilderness characteristics from travel management in these areas would be similar to those identified under alternatives A and B.

As under Alternative B, the BLM would have flexibility under Alternative D to acquire WSA inholdings or interests in lands within WSA boundaries, which could result in beneficial impacts by eliminating uses incompatible with the preservation of wilderness characteristics occurring on these non BLM-administered parcels. Alternative D also includes land-tenure adjustments that would increase the potential for and expedite the disposal of inholdings or the acquisition of areas with high wilderness characteristics values that increase the manageability of WSAs. Under Alternative D, the BLM does not manage WSR eligible waterway segments to maintain their ORVs or wilderness characteristics, so no beneficial impacts would be conveyed to WSAs where these areas overlap or adjoin other special designations.

Alternative E

Impacts to WSAs under Alternative E would be the same as those described under Alternative B; therefore, the impacts analysis for WSAs under Alternative B is representative of the impacts anticipated under Alternative E.

Alternative F

Impacts to WSAs under Alternative F would be the same as those described under Alternative D; therefore, the impacts analysis for WSAs under Alternative D is representative of the impacts anticipated under Alternative F.

4.8 Socioeconomic Resources

4.8.1 Social Conditions

This section addresses the potential for the alternatives to have impacts on social conditions in the Planning Area, including direct, indirect, short-term, and long-term impacts. Laws, regulations, policies, and guidance considered in the analysis of social conditions are identified in Appendix B.

Potential impacts to social conditions include changes in population, such as fluctuations caused by economic boom and bust cycles; changes in the demand for housing and community services along with community fiscal conditions, which can affect the ability of state, regional, and local governments to supply community services such as education; and changes in community character, culture, and social trends.

The BLM does not directly manage social conditions in the Planning Area. However, BLM management actions have the potential to indirectly affect social conditions. For example, a decision to prohibit future oil and gas exploration or leasing on BLM-administered mineral estate may adversely affect job opportunities in the Planning Area, which may lead to a reduction in populations in parts of the Planning Area as residents move away to find job opportunities elsewhere (or as fewer people move to the Planning Area for jobs).

4.8.1.1 Methods and Assumptions

The Impact Analysis for Planning model (IMPLAN) was used to estimate socioeconomic impacts resulting from BLM management actions under the alternatives. IMPLAN is a regional economic model that provides a mathematical accounting of the flow of money, goods, and services through a region's economy. The model provides estimates of how a specific economic activity translates into jobs and income for the region. It includes the "ripple effect" (or "multiplier effect") of changes in sectors that may not be directly affected by management actions, but are linked to industries that are directly affected. In IMPLAN, these ripple effects are termed indirect impacts (for changes in industries that sell inputs to the industries that are directly affected) and induced impacts (for changes in household spending as household income increases or decreases due to the changes in production).

For example, an increase in oil and gas production implies more money would be spent on the maintenance of existing oil and gas equipment and/or new oil and gas equipment; this, in turn, implies more money would be spent in sectors that provide inputs to oil and gas support services or equipment sectors. These production and consumption or "input-output" relationships allow IMPLAN to estimate the indirect and induced impacts based on changes in production that may result from an alternative. Appendix Q provides technical assumptions and additional information about the IMPLAN model.

Impacts to social conditions associated with each of the alternatives were compared to existing conditions and trends in the Planning Area to establish a context for the impacts. Social impacts were classified broadly into three categories: impacts on population; impacts on housing and community services; and impacts on custom, culture, and social trends.

Assumptions used in this impact analysis include the following:

- Economic conditions, especially jobs, labor earnings, and economic output, will continue to drive population growth or decline in the Planning Area.
- Any population change that may reasonably be associated with the alternatives will likely be due to changes in employment opportunities.
- Federal, state, and local taxes will continue to be collected on minerals produced in the Planning Area.
- The pace and timing of economic development in the Planning Area will continue to depend on many factors beyond the management actions of the BLM. Because the pace of development in the Planning Area is driven largely by external forces such as worldwide economic trends and technological change, it is difficult to predict. Therefore, the economic impact analysis—which influences the social impact analysis because of the link between employment opportunities and population—assumes a relatively constant rate of development. Actual social and economic impacts may differ if the rate of development changes.

4.8.1.2 Summary of Impacts by Alternative

Social conditions are fundamentally influenced by economic conditions. Employment and income improve or detract from social conditions and quality of life; communities in the Planning Area have developed cultures associated with economic activities such as natural resource extraction, ranching, and recreation. Given the large portions of public land within the counties of the Planning Area, BLM management decisions have the potential to influence the community character and identity, even if the economic impact as measured by this analysis is minimal.

For the purposes of the analysis below, some impacts of the management alternatives on economic activities (e.g., restrictions to ROWs, travel management or seasonal restrictions) are not included in the quantitative estimates of impacts and derived discussions, but are recognized qualitatively when appropriate. Table 4-36 provides a summary of impacts on social conditions as discussed in this section for the alternatives. Although the table attempts to summarize impacts and characterize them as low, medium, or high, it does not classify these impacts as beneficial or adverse. Social impacts seen as beneficial to some people and groups may be seen as adverse to others. For instance, increased emphasis on resource conservation in alternatives B and E would result in a change from the current uses, which may be seen as a beneficial impact by wilderness advocates, but an adverse impact by oil and gas development and livestock grazing interests. In Table 4-36, high impacts are those that would result in substantial changes to an existing condition in a way that would affect a large number of people and/or endure for a long period of time; no high impacts were identified during this analysis. Low impacts are those that would affect a limited number of people and for a limited period of time. Impacts on population, housing, and community services would lie within typical annual fluctuations for the Planning Area. Impacts on quality of life and culture would not be expected to be noticeable by most people. Medium impacts are intermediate and fall between high and low impacts.

Under all alternatives, the social condition is expected to change. However, the greatest impact on social conditions under alternatives B and E would be from reduced oil and gas development and livestock grazing and increased emphasis on resource conservation and primitive recreational opportunities. Alternative E imposes additional constraints on disturbance in greater sage-grouse Key Habitat Areas when compared to Alternative B; however, based on the economic analysis in the Economic Conditions section, these additional constraints are expected to have little additional adverse impacts on employment and earnings. Under Alternative C, the greatest impact on social conditions

Social Conditions

would result from decreased restrictions on oil and gas development compared to the other alternatives, which would bring more job opportunities, greater demand for community services, and greater tax revenues to local governments—allowing them to expand community services to meet the needs of a slightly higher population.

Alternatives D and F balance management emphasis between resource conservation and resource use, but are generally closer in line with resource use and development. Alternative F imposes additional constraints on disturbance in greater sage-grouse PHMAs when compared to Alternative D. Based on analysis in the Economic Conditions section, these additional constraints would restrict further economic activity in the oil and gas sector when compared to Alternative D. Impacts of Alternative F on population and public services associated with impacts on economic activity would be essentially the same as in Alternative D, but impacts on quality of life and local culture are expected to be greater than Alternative D.

Overall, alternatives E and B favor resource conservation over traditional industries such as livestock grazing, and the values associated with these industries when compared to alternatives F and D. Alternatives E and B may also enhance opportunities to engage in primitive forms of recreation in comparison to the other alternatives, while restricting motorized use of recreational sites, due to seasonal closures of greater sage-grouse Key Habitat Areas.

Table 4-36. Overall Impacts on Social Conditions by Alternative

Impact	Alternative A	Alternative B	Alternative C	Alternative D	Alternative E	Alternative F
Impact on Population	Low Impact	Medium Impact (potential reductions focused in oil/gas service areas, which generally correspond to population centers)	Low Impact	Low Impact	Medium Impact (potential reductions focused in oil/gas service areas, which generally correspond to population centers)	Low Impact
Impact on Housing and Community Services	Low Impact	Medium Impact (due to potential population reductions)	Low Impact	Low Impact	Medium Impact (due to potential population reductions)	Low Impact
Consistency with Adopted County Land Use Plans	No Impact	Potential conflict with Hot Springs County Land Use Plan	No Impact	No Impact	Potential conflict with Hot Springs County Land Use Plan	No Impact
Impacts on Quality of Life and Local Culture	Low Impact	Medium Impact (change from recent trends would constitute greater emphasis on resource conservation at the expense of traditional industries such as livestock grazing)	Medium Impact (change from recent trends would constitute greater emphasis on resource development)	Low Impact	Medium Impact (change from recent trends would constitute greater emphasis on resource conservation at the expense of traditional industries such as livestock grazing)	Low to medium (due to restrictions and requirements for livestock grazing operators in Priority Habitat Management Areas)

Source: Based on the analysis of impacts to social conditions, as described in the text.

4.8.1.3 Detailed Analysis of Alternatives

The analysis of impacts on social conditions focuses on the effects of BLM-authorized actions. It is important to note that many other events outside of the BLM's control may alter economic and social trends. For instance, oil and gas prices may change as a result of an expansion or contraction of world or national economic activity, and this, in turn, may affect the pace of development or the quantity of development. Similarly, state and local laws regulating the subdivision of land may alter land ownership and development patterns, which may in turn affect open space and physical landscapes. Minimal or no changes to social conditions resulting from BLM actions does not imply that no change could occur, as other forces may drive changes in economic and social trends.

Impacts Common to All Alternatives

Humans and associated social and economic conditions are an integral part of ecosystem and community function in the Planning Area. Lifestyles, attitudes, beliefs, values, social structure, culture, and population characteristics affect and are affected by management actions made by the BLM in the Planning Area. In addition, both the Planning Area lands and BLM management of these lands have emotional meanings for many people. Varying viewpoints on economic development and conservation of natural resources are expected to cause controversy related to management of BLM-administered land and federal mineral estate.

Any population change that could reasonably be associated with the alternatives may be due to changes in employment opportunities. Employment opportunities related to activities on BLM-administered land and mineral estate include jobs in exploration, development, and production of minerals, including oil and gas, coal, locatable and salable minerals; jobs in livestock production; and jobs in various recreation activities. The economic analysis provides quantitative estimates of employment in the Planning Area from oil and gas exploration and development, grazing, and recreation activities on BLM-administered lands and mineral estate. These quantitative estimates are used to analyze impacts from management on population.

The social and economic values associated with BLM-administered lands include market values and nonmarket values. Market values are those related to goods and services that are typically bought and sold in markets. For example, commodities such as oil and gas, bentonite, crops, livestock products, and services such as outfitter trips and fishing guides are traded in markets. The production and sale of these goods and services result in jobs and income and the value of these goods to society can be readily expressed in monetary terms. Nonmarket values relate to things that people value, but are not generally bought or sold in markets. For example, many people may value the ability to see a mountain range from a certain vista point without human-caused impacts to visibility in the air. Some people value open vistas that lack structures, fences, wind turbines, or other signs of human development. Some people may place a high value on their ability to hunt or fish on public lands, and the satisfaction they derive from this ability may exceed the equivalent monetary cost of purchasing the same amount of food from the grocery store. Other people may value the knowledge that their offspring will enjoy clean air, open vistas, and the ability to fish and hunt. The common feature of these values is that they are generally not bought and sold like tangible goods and services, and for that reason are difficult to assign a monetary value. Other examples of nonmarket values include the satisfaction people derive from resources such as clean water, biological resources (e.g., wildlife), cultural resources, or even the satisfaction they derive from the knowledge that the BLM uses a particular fire management or invasive species control regime.

Some of the value associated with open space and other features is captured in markets. For example, the price of a house that overlooks a pristine mountain range may be higher than the price of a house that is identical in almost every respect but overlooks a cement factory. However, the ability to see an open landscape while driving along a highway is not likely to be captured in the market.

A related concept is that some changes in management may affect both market and nonmarket values. For instance, industrial development that substantially alters visual characteristics of the landscape may, over time, result in a lower number of tourists visiting the area and spending money in local hotels, restaurants, and shops. This decline in tourism would result in adverse impacts on employment and income. Such industrial development could also reduce the satisfaction of local residents who value open space resulting in adverse impacts on nonmarket values. On the other hand, the new industrial development would also generate jobs and income, and the net effect—if all values were to be expressed in the same metric (dollars)—could be beneficial or adverse.

Although economists have developed approaches to assign a monetary value to things that are not traded in markets, the approaches for doing so are often complex, controversial (due to the subjective nature of assigning a dollar value to something that is neither bought nor sold), and require considerable resources and time to analyze and interpret properly. For example, stated preference methods (e.g., surveys) are a common approach for placing a monetary value on clean air and open views. A survey may present people with images of a mountain vista with different degrees of haze superimposed and ask people to express how much they are willing to pay for the ability to see the vista with lower levels of haze for a certain number of days per year. However, research has shown that the survey design, sample size, and outreach methods can have a dramatic influence on the results. Due to the complexity and cost of implementing nonmarket valuation methods, quantifying these values was beyond the scope of this RMP revision. However, the BLM recognizes that changes in nonmarket values are likely correlated with level of resource protection and development under each alternative. The development of oil and gas resources and other minerals, as well as development of ROWs, renewable energy facilities, and other structures, may result in adverse impacts to nonmarket values under all alternatives. Furthermore, alternatives emphasizing resource development over conservation may result in greater impacts to nonmarket values.

Because of the close relationship between nonmarket economic values and how individuals in the Planning Area perceive their own quality of life, impacts on nonmarket values are discussed qualitatively in the section on Quality of Life and Local Culture.

With mounting economic pressures on the livestock sector, some ranch owners have raised money for retirement or other purposes by subdividing portions of their land into “ranchettes” and selling them to individuals. The sale of these ranchettes provides financial liquidity to ranchers who frequently have most of their assets in land but generally results in increased construction of fences, houses, and sometimes other structures (e.g., barns), resulting in changes to the visual landscape. Under all alternatives, this trend is likely to continue because it is fundamentally related to (1) the nature of the ranching business (principally, the fact that most ranchers’ assets are in land and the fact that profit margins are generally low and can turn negative in drought or other adverse conditions) and (2) state laws that govern property subdivision, under which county zoning laws cannot regulate subdivisions of 35 acres and larger. However, alternatives that adversely affect the profitability of ranching could serve to increase this trend. Because the subdivision of ranch land affects local culture and quality of life, impacts on this trend are discussed in the section on Quality of Life and Local Culture.

The economic and social analysis incorporates variations in pace of development over time. However, under all alternatives, the pace of development may differ from the rate assumed in the analysis. The BLM has limited control over the pace of development of leases because the agency only authorizes

economic activities such as oil and gas drilling and does not conduct these activities. An abrupt shift in the pace of development may result in short-term impacts (beneficial or adverse) on demand for housing and community services and on the supply of tax revenues from residences or businesses to support community services, due to short-term changes in job opportunities and the resulting change in immigration or emigration trends. Any such impacts may be more for smaller communities, which are less likely to be able to absorb a sudden increase in population or to continue to support existing infrastructure if the population were to suddenly decrease.

The BLM did consider an alternative that would regulate the rate of oil and gas development in the Planning Area, but determined that the holders of federal oil and gas leases have the right to develop those leases. In addition, the BLM determined that setting reduced or limited rates of development is more appropriately analyzed in site-specific NEPA documents. The BLM therefore eliminated this alternative from detailed analysis. For more information, see the *Alternatives Considered but Not Carried Forward for Detailed Analysis* section in Chapter 2.

Under all alternatives, the BLM continues to consider socioeconomic impacts of site-specific actions and incorporates socioeconomic issues into analyses of environmental, social, and economic impacts, such as the analyses required by NEPA for site-specific actions.

Alternative A

Impacts on Population

As noted under *Impacts Common to All Alternatives*, changes in employment opportunities may result in changes to population and demographics. Under Alternative A, activities on BLM-administered land and mineral estate related to oil and gas, livestock grazing, and recreation would support an average of 1,520 full-time and part-time jobs per year (Table 4-37) which represents approximately 3.8 percent of total employment in the Planning Area using 2011 employment statistics. It is important to note that this does not constitute an increase of 1,520 jobs per year over current employment, it more closely represents an estimate of the contribution of certain activities on BLM-administered lands and mineral estate to overall employment in the Planning Area.

Table 4-37. Comparison of Projected BLM-Related Earnings and Employment to 2011 Total Employment in the Four County Planning Area

Measure	Alternative A	Alternative B	Alternative C	Alternative D	Alternative E	Alternative F
Forecasted annual earnings due to activities on BLM-administered surface ¹ (\$ millions)	\$86.7	\$38.5	\$94.1	\$83.9	\$38.3	\$83.8
Total labor earnings in 2011 (\$ millions)	\$2,269	\$2,269	\$2,269	\$2,269	\$2,269	\$2,269
Forecasted annual earnings as a percentage of 2011 earnings	3.8%	1.7%	4.1%	3.7%	1.7%	3.7%
Forecasted annual employment due to activities on BLM-administered surface ¹	1,520	763	1,631	1,478	761	1,477
Total employment in 2011	37,066	37,066	37,066	37,066	37,066	37,066
Forecasted annual employment as a percentage of 2011 employment	4.1%	2.1%	4.4%	4.0%	2.1%	4.0%

Source: Forecasted annual earnings and employment are calculated based on the IMPLAN model, as described in the text. Earnings and employment for 2011 are from the Bureau of Economic Analysis (BEA 2013). Earnings are in millions of year 2011 dollars.

¹Estimate of annual earnings and employment includes direct, indirect, and induced economic activity (the “multiplier effect”).

BLM Bureau of Land Management
 IMPLAN Impact Analysis for Planning model

Approximately 77 percent of the job opportunities from activities analyzed using the IMPLAN model would be related to oil and gas development and production (1,177 jobs). Livestock grazing would contribute approximately 12 percent of the job opportunities (185 jobs) and recreation would contribute approximately 10 percent (158 jobs). These jobs would be dispersed geographically across the Planning Area because all three sectors operate across the Planning Area. Section 3.8 *Socioeconomic Resources* in Chapter 3 describes the geographic distribution of economic activities that occur on BLM-administered lands.

Job opportunities (and resulting increases or shifts in population) may concentrate in population centers such as Cody, Powell, and Worland. Management under Alternative A may not result in noticeable impacts to the current distribution of job opportunities in the Planning Area for a variety of reasons. Alternative A maintains current management where the contribution of economic activity on BLM-administered lands accounts for a relatively small proportion of jobs in the Planning Area (3.8 percent, according to the IMPLAN analysis of oil and gas, livestock grazing, and recreation for Alternative A). Also, the IMPLAN analysis considers jobs in all sectors, including those industries directly affected by BLM actions (e.g., oil and gas production) as well as those affected indirectly (e.g., retail jobs created by expenditures of workers in various industries). As a result, Alternative A would not alter the overall trend of BLM-authorized activities and associated population changes in the Planning Area.

Impacts on Housing and Community Services

Changes in population have the potential to change the demand for housing and community services such as roads, schools, and police and fire protection. As described in Chapter 3, county-wide vacancy rates in 2000 (the latest year for which data are available at this resolution) were 15.5 percent in Big Horn County, 17.2 percent in Hot Springs County, 13.1 percent in Park County, and 10.3 percent in Washakie County. These percentages represent approximately 800, 400, 1,600, and 400 vacant units in Big Horn, Hot Springs, Park, and Washakie counties, respectively. Vacancy rates for rental properties in the Planning Area have declined since 2001-2002. However, because Alternative A would not result in a change in direction of current BLM management, a change in either the total demand for housing and community services or its geographic distribution is not expected.

If development occurs slower or faster than the relatively steady pace assumed in the analysis, there may be short-term impacts on demand for housing and community services and on the supply of tax revenues from residences or businesses to support community services. It may be more difficult for smaller communities to absorb sudden changes of this nature. If national and international energy prices, operator business strategies, or other factors lead to a rapid pace of development there may be sudden short-term increases in demand for community services as a result of new jobs and increased population. However, local and state tax revenues collected from energy production could help to mitigate short-term increases in demand for services, since tax revenues help to pay for community services.

Consistency with Adopted County Land Use Plans

BLM land use plans must be consistent with state and local land use plans to the maximum extent consistent with federal law, including FLPMA. The BLM takes practical steps to resolve any identified conflicts between federal and local plans. Section 3.8.1 *Social Conditions* in Chapter 3 summarizes adopted land use plans for each of the counties. Alternative A would maintain existing policies for BLM land management and would not result in any inconsistencies or conflicts with existing county land use plans.

Impacts on Quality of Life and Local Culture

Historically, the communities in the Planning Area developed around a combination of resource-based industries, ranching, trade and commerce, and providing supplies and services to tourists. Quality of life for the people who live in the Planning Area depends on continued economic opportunities as well as features of the natural landscape. Alternative A continues current BLM management. Historically, these policies have contributed, along with other government policies and the actions of private firms and residents, to economic viability and resilience in the Planning Area. Despite these policies and actions, several communities in the Planning Area have experienced and continue to experience declines in population and increases in median age. The BLM believes that a balanced management approach continues to be best for improving the capability of communities to respond to technological, demographic, and economic change. Alternative A would allow other forces (beyond BLM-authorized actions) to drive changes to the economic, physical, and social conditions in the Planning Area.

Although there are groups with particular interests in the management of certain resources and resource uses (e.g., wilderness advocates, oil and gas interests, and ranchers), overall the residents of the Planning Area tend to support both conservation of natural resources and the economic viability of resource-based industries. For this reason, residents generally support multiple-use of BLM lands, including the development of mineral and energy resources, livestock grazing authorizations, continued access to BLM-administered lands for recreation, and conservation of wildlife and native vegetation.

Under this alternative, continued development of oil and gas wells, ROWs, and other human-made structures on the landscape would continue to result in decreases in nonmarket values associated with open space and the environment. Because Alternative A essentially represents continuation of current management, these decreases may be similar to historic trends. Under this alternative, subdivision of ranch land and related development and sale of “ranchette” parcels would continue, generally consistent with historic trends. The development of these “ranchette” parcels increases institutional challenges, such as those related to provision of community services and management of invasive plant species. In addition, the development of “ranchettes” may adversely affect the value of land as wildlife habitat by increasing the number of fences and other barriers to wildlife movement.

Alternative B

Impacts on Population

Under Alternative B, activities on BLM-administered land and mineral estate related to oil and gas, livestock grazing, and recreation would support an average of 763 full-time and part-time jobs per year, which represents approximately 2.1 percent of total employment in the Planning Area as of 2011 (Table 4-37). Compared to Alternative A, this represents a decrease of 757 jobs (approximate 50 percent decrease), or approximately 1.7 percent of employment using 2011 employment statistics. Most of these job losses are related to restrictions on development of oil and gas resources (705 jobs), with the remainder related to reduced livestock grazing (52 jobs). Due to restrictions on oil and gas development under Alternative B, more oil and gas wells may be drilled on nearby state or fee surface land, partially compensating for the projected employment decrease in that sector.

A decrease in employment opportunities may result in a decrease in population in the Planning Area as people may leave the area to seek employment elsewhere. The expected magnitude of any such decrease would be similar to the magnitude of employment loss but would be lower since some people (e.g., retired people) survive on unearned income and do not depend directly on employment for economic well-being. In other words, if 1.7 percent of employed people and their families leave the Planning Area, the population would decrease by less than 1.7 percent because some residents of the Planning Area are retired or otherwise non-working families.

Approximately 62 percent of the job opportunities from activities analyzed using the IMPLAN model would be related to oil and gas development and production under Alternative B (472 jobs). Livestock grazing would contribute approximately 17 percent of the job opportunities (133 jobs), and recreation would contribute approximately 21 percent (158 jobs). (Note that due to rounding, these sector breakouts do not necessarily add up to the total reported above.) These jobs would be dispersed geographically across the Planning Area as described under Alternative A. The average annual number of jobs supported by recreation activities would be the same across all alternatives; however, average annual jobs and income supported by oil and gas would decrease by approximately 60 percent compared to Alternative A, and jobs and income supported by livestock grazing would decrease by approximately 28 percent compared to Alternative A.

Job opportunities and job losses (and resulting shifts in population) in Alternative B may concentrate in population centers. Because the majority of job losses in Alternative B would be related to decreased oil and gas development, the greatest population changes would occur in areas that service oil and gas fields (e.g., Cody). Oil and gas fields occur throughout the basin, and overall the distribution of any job losses would also likely occur throughout the basin. Jobs and income lost in the livestock grazing industry would also affect workers throughout the Planning Area. The adverse effects on grazing operations from the loss of access to federal allotments could also result in substantial adverse financial

effects for some individual ranching operations, depending on how specific operations use the federal allotments and how important a role BLM-administered lands play in financing and production. The IMPLAN model does not account for “cascade” type effects such as the potential for individual operations to fail. Failing operations could have subsequent indirect impacts on social and economic conditions in communities. For example, a loss of individual grazing operations could result in reduced income for retail businesses that supplied the lost operations (e.g., feed and supply stores). Financial threats to grazing operations could increase land sales to residential developers and the spread of “ranchettes.” Note, however, that the failure of individual operators does not necessarily mean that the operation will cease to exist or will immediately be developed into residential or ranchette parcels. Historically, many ranching and grazing operations have changed hands while being maintained in ranching and grazing. In some of these cases, the new owners have been less dependent on livestock grazing for financial security, so the emphasis of the operation may change but the operation does not cease to exist in its entirety. In other cases, subdivisions have sprung up, creating new challenges. This topic is discussed with further detail in the section on quality of life and local culture, below.

Impacts on Housing and Community Services

Alternative B may result in decreased population compared to Alternative A, which may result in decreased demand for housing and community services. Alternative B would also result in a reduced tax base for providing community services, as described in Section 4.8.2 *Economic Conditions*. The exact geographic distribution of these changes is not possible to predict because tax losses in specific jurisdictions would be driven by undetermined well locations; however, the restrictions on oil and gas development in Alternative B affect broad areas of land throughout the Planning Area, so the reductions in tax revenues would likely affect all communities that currently produce oil and/or gas.

Consistency with Adopted County Land Use Plans

As described under Alternative A, the BLM takes practical steps to resolve any identified conflicts between federal and local plans. Under Alternative B, increased restrictions on oil and gas development could be perceived as a conflict with the Hot Springs County Land Use Plan, which expresses concern about growing federal and state regulation on public lands that may slow or hinder economic development. Alternative B would not conflict with the adopted land use plans of Big Horn, Park, or Washakie counties.

Impacts on Quality of Life and Local Culture

As described under Alternative A, quality of life for the people who live in the Planning Area depends on continued economic opportunities as well as features of the natural landscape. Alternative B would reduce economic opportunities, but would also result in decreased air pollution and other adverse environmental impacts associated with development (e.g., oil and gas) compared to Alternative A.

As noted under Alternative A, residents generally support multiple-use of BLM lands, including the development of mineral and energy resources, livestock grazing authorizations, continued access of BLM lands for recreation, and conservation of wildlife and native vegetation. Alternative B would continue the BLM’s current practice of allowing multiple-uses, but would prioritize resource conservation over resource uses such as oil and gas development. This may be inconsistent with the culture advocated by some interest groups (e.g., oil and gas interests, livestock ranchers) and may promote the culture advocated by others (e.g., wilderness advocates).

Under this alternative, continued development of oil and gas wells, ROWs, and other human-made structures on the landscape would continue to result in adverse impacts to nonmarket values associated with open space and the environment. However, because this alternative emphasizes resource

Social Conditions

conservation, the magnitude of these decreases would be less than historic trends and less than under Alternative A.

From a distributional perspective, the withdrawal of livestock grazing areas in Alternative B would result in a substantial impact on a substantial number of allotments, and potentially on a substantial number of livestock operators. BLM currently allows grazing on 673 allotments in the Planning Area. Livestock grazing withdrawals on these allotments would result in the loss of at least half the AUMs on 44 percent of the allotments, the loss of at least three-quarters of the AUMs on 25 percent of allotments, and the loss of nine-tenths or more of the AUMs on 15 percent of the allotments in the Planning Area. Furthermore, the losses in Alternative B would affect allotments in all size categories, and allotments spread over the entire Planning Area. Some ranchers may be able to continue operating, albeit at a reduced level, by using more state and private land. However, many ranchers may be forced to cut back their operations, sell their ranch to another operator (consolidate operations), or find alternative ways to make a living. This would certainly result in substantial impacts on individual ranchers, and depending on potential “cascade” effects, could also result in accelerated subdivision of ranch land, sales of ranch land to residential developers, development of “ranchette” parcels, and the resulting conversion of ranch land to residential areas. However, as noted above, the failure of individual operators does not necessarily mean that the operation will cease to exist or will immediately be developed into residential or ranchette parcels.

Alternative C

Impacts on Population

Under Alternative C, activities on BLM-administered land and mineral estate related to oil and gas, livestock grazing, and recreation would support an average of 1,631 full-time and part-time jobs per year (Table 4-37), which represents approximately 4.4 percent of total employment in the Planning Area using 2011 employment statistics. Compared to Alternative A, which essentially represents the continuation of current trends, Alternative C would result in an increase of 111 jobs (approximate 7 percent increase), or approximately 0.3 percent of employment using 2011 employment statistics. These job increases would be associated with increased development of oil and gas resources.

An increase in employment opportunities may result in an increase in population in the Planning Area as people are drawn to the new jobs. The expected magnitude of any such increase would be similar to the magnitude of employment gained, as new employees move to the area with their families.

As shown in Section 4.8.2 *Economic Conditions*, approximately 79 percent of the job opportunities from activities analyzed using the IMPLAN model would be related to oil and gas development and production (1,289 jobs). Livestock grazing would contribute approximately 11 percent of the job opportunities (184 jobs), and recreation would contribute approximately 10 percent (158). These jobs would be dispersed geographically across the Planning Area as described under Alternative A. The average annual number of jobs supported by recreation activities and livestock grazing would be the same as Alternative A; however, average annual jobs supported by oil and gas would increase by approximately 10 percent compared to Alternative A.

Overall, Alternative C would result in more job opportunities and may result in increased population compared to the other alternatives. Although Alternative C would result in increased job opportunities and population compared to the other alternatives, it would still not considerably alter the relative distribution of job opportunities or substantially affect population increase or movement in the region due to the factors described under Alternative A.

Impacts on Housing and Community Services

Alternative C may result in increased population leading to higher demand for housing and community services compared to alternatives A, B, and D. Alternative C would result in a greater tax base for providing these services, as described in Section 4.8.2 *Economic Conditions*. The geographic distribution of these changes is not possible to predict because higher tax revenues in specific jurisdictions would be driven by undetermined well locations. Oil and gas occurs throughout the basin, and the RFD does not predict specific well locations.

An increase in population sometimes results in population growth that overwhelms the ability of town or county governments to provide services. This is not expected to occur as a result of the BLM's actions under Alternative C, for several reasons. First, the estimated increase would be spread over a relatively large area (four counties) and would likely "ramp up" over a relatively long time period. Second, based on county land use plans and information from city planning departments, rising population (at least on this scale) would not lead to the inability to provide infrastructure or community services. Several planning documents refer to the issue or problem of declining population, especially working-age population, and recommend increasing the use of public lands for development of oil and gas and other industries that can provide jobs. This implies that the supply of infrastructure and services exceeds the demand. This conclusion is also consistent with the descriptions of the infrastructure in counties' planning documents (e.g., the Big Horn County Land Use Plan, which describes the service capacity for each of the towns in Big Horn County for water, wastewater, and other services and, in virtually all cases, concludes there is plenty of available capacity). The primary concerns regarding the availability of community services relate to the way in which new land is developed (spatial density or boom/bust cycles), rather than the total quantity of new development. Alternative C would not affect the spatial density of development, nor would it make boom/bust cycles more likely or substantially more severe. As a result, Alternative C would not likely have substantial effects on the ability of local governments to provide services.

Consistency with Adopted County Land Use Plans

Similar to the other alternatives, the BLM takes practical steps to resolve any identified conflicts between federal and local plans. The increased pace of oil and gas development under Alternative C may be perceived as creating a conflict with the Big Horn County Land Use Plan, as this plan identifies a need to diversify the region's economy, pointing to the idea that it relies relatively heavily on mining and public sector activities. However, the county has other policy instruments to encourage economic diversification and the BLM's actions under Alternative C would not likely limit the county's ability to use these other instruments. As a result, there would not likely be a conflict with the Big Horn County Land Use Plan. Alternative C would not conflict with the adopted land use plans of Hot Springs, Park, or Washakie counties.

Impacts on Quality of Life and Local Culture

Alternative C would increase economic opportunities in the Planning Area more than alternatives A, B, and D, which may result in beneficial impacts on quality of life. However, Alternative C may also result in adverse impacts to air quality, wildlife, and other resources that improve quality of life related to natural characteristics.

Alternative C would prioritize the use of resources such as oil and gas development over the conservation of resource such as air quality and wildlife. This management approach would be consistent with the culture advocated by some interest groups (e.g., oil and gas interests) and would be inconsistent with the culture advocated by others (e.g., wilderness advocates).

Social Conditions

Under this alternative, continued development of oil and gas wells, ROWs, and other human-made structures on the landscape would continue to result in decreases in nonmarket values associated with open space and the environment. However, because this alternative emphasizes resource use and development, the magnitude of these decreases would be greater than historic trends and greater than under the other alternatives. Under this alternative, subdivision of ranch land and related development and sale of “ranchette” parcels would continue and would result in impacts similar to Alternative A. This continuation would generally be in line with historic trends, because Alternative C would have relatively little impact on the economics of ranching.

Alternative D

Impacts on Population

Under Alternative D, activities on BLM-administered land and mineral estate related to oil and gas, livestock grazing, and recreation would support an average of 1,478 full-time and part-time jobs per year (Table 4-37), which represents approximately 4.0 percent of total employment in the Planning Area using 2011 employment statistics. Compared to Alternative A, which essentially represents the continuation of current trends, Alternative D would result in a decrease of 42 jobs (approximately 3 percent decrease), or approximately 0.1 percent of year 2011 employment. Most of these job decreases would be associated with decreased development of oil and gas resources.

As shown in Section 4.8.2 *Economic Conditions*, approximately 77 percent of the job opportunities from activities analyzed using the IMPLAN model would be related to oil and gas development and production (1,135 jobs). Livestock grazing would contribute approximately 13 percent of the job opportunities (185 jobs), and recreation would contribute approximately 11 percent (158). (Note that due to rounding, these sector-level figures do not necessarily match the total reported above.) These jobs would be dispersed geographically across the Planning Area, as described under Alternative A. The average annual number of jobs supported by recreation activities and livestock grazing would be identical to that under Alternative A; however, average annual jobs supported by oil and gas would decrease by approximately 4 percent compared to Alternative A.

Overall, Alternative D would result in a slight decrease in job opportunities and, therefore, may result in a slight decrease in population compared to Alternative A. Alternative D would result in more job opportunities than Alternative B, but less than Alternative C. Because the change in population and employment would be very small, spread over time, and spread throughout the Planning Area, Alternative D would not considerably alter the relative distribution of job opportunities or substantially affect population increase or movement.

Impacts on Housing and Community Services

Alternative D may result in a small decrease in population compared to Alternative A, which may result in a small decrease in demand for housing and community services. Alternative D would also result in a slightly reduced tax base from oil and gas production (about 6 percent) for providing community services, as described in Section 4.8.2 *Economic Conditions*. Geographically, the change in job opportunities—and related impacts on housing and community services—would be spread across the Planning Area and would be spread over time.

Consistency with Adopted County Land Use Plans

Similar to the other alternatives, the BLM takes practical steps to resolve any identified conflicts between federal and local plans. Alternative D continues the BLM’s historical policy of balanced resource conservation and development, which encourages diversified economic activities by providing opportunities for developers to extract resources (e.g., oil and gas extraction) as well as develop industries that are sustainable in the very long term (e.g., renewable energy). Alternative D does not conflict with the adopted land use plans of Big Horn, Hot Springs, Park, or Washakie counties.

Impacts on Quality of Life and Local Culture

Alternative D would provide economic opportunities in the Planning Area very similar to, although slightly less than, Alternative A. Alternative D would also result in some beneficial impacts to air quality, wildlife, and other resources that improve quality of life related to natural characteristics. The balanced management approach under Alternative D could increase the quality of life in the long term and increase the economic viability and sustainability of communities.

Alternative D would balance the use of resources such as oil and gas reserves with the conservation of resources such as air quality, open space, and wildlife habitat. Alternative D balances the culture advocated by some interest groups (e.g., oil and gas interests) with those of others (e.g., wilderness advocates). Alternative D provides for resource development and associated job opportunities while managing for nonmarket values associated with open space and natural characteristics.

Under this alternative, subdivision of ranch land and related development and sale of “ranchette” parcels would continue and would result in impacts similar to Alternative A. This continuation would generally be in line with historic trends, because Alternative D would have relatively little impact on the economics of ranching.

Alternative E

Impacts on Population

Under Alternative E, activities on BLM-administered land and mineral estate related to oil and gas, livestock grazing, and recreation would support an average of 761 full-time and part-time jobs per year, which represents approximately 2.1 percent of total employment in the Planning Area counties as of 2011 (Table 4-37). Although Alternative E places additional restrictions on energy development in greater sage-grouse Key Habitat Areas in comparison to Alternative B, it is not expected to result in a perceptible change in the number of jobs supported by oil and gas, livestock grazing, and recreation in comparison to that alternative (for additional details, please see *Leasable Minerals – Oil and Gas, Recreation, and Livestock Grazing Management*). Therefore, impacts on population would be the same as those described under Alternative B, which would include a decrease of 759 jobs (approximate 50 percent decrease) compared to Alternative A. Using 2011 employment statistics, these job losses represent approximately 2 percent of total employment in the Planning Area counties.

A decrease in employment opportunities may result in a decrease in population in the Planning Area as people may leave the area to seek employment elsewhere. As with the other alternatives, the expected magnitude of any such decrease would be similar to the magnitude of employment loss but would be lower since some people (e.g., retired people) survive on unearned income and do not depend directly on employment for economic well-being.

Approximately 62 percent of the job opportunities from activities analyzed using the IMPLAN model would be related to oil and gas development and production under Alternative E (470 jobs). Livestock

Social Conditions

grazing would contribute approximately 18 percent of the job opportunities (133 jobs), and recreation would contribute approximately 21 percent (158 jobs). These jobs may be dispersed across the Planning Area; however, those cities with a higher concentration of oil and gas support activities businesses, as well as housing centers for oil and gas workers, could experience greater impacts.

Impacts on Housing and Community Services

Anticipated population and tax revenue decreases under Alternative E are similar to Alternative B and greater than under the other alternatives; resulting impacts on housing and community services would be the same as described under Alternative B. This population decrease may result in reduced demand for housing and community services compared to existing conditions. Alternative E would result in a reduced tax base for providing community services similar to that described under Alternative B (see *Economic Conditions* for additional information). The exact geographic distribution of these changes is not possible to predict because tax losses in specific jurisdictions would be driven by undetermined well locations; however, the restrictions on oil and gas development under Alternative E affect broad areas of land throughout the Planning Area, so the reductions in tax revenues would likely affect all communities that currently produce oil and/or gas.

Consistency with Adopted County Land Use Plans

BLM takes practical steps to resolve any identified conflicts between federal and local plans. The Hot Springs County Land Use Plan expresses concern about growing federal and state regulation on public lands that may slow or hinder economic development. Similar to Alternative B, but to a greater extent due to additional conservation measures for greater sage-grouse, restrictions on oil and gas development under Alternative E could be perceived as a conflict with the Hot Springs County Land Use Plan. Alternative E would not conflict with the adopted land use plans of Big Horn, Park, or Washakie counties. These plans simultaneously advocate both the economic use of lands and open spaces and the preservation of wildlife habitat.

Impacts on Quality of Life and Local Culture

In general, quality of life impacts would be the same as those described under Alternative B. Quality of life for the people who live in the Planning Area is closely interconnected with continued economic opportunities as well as features of the natural landscape. Alternative E would reduce economic opportunities from oil and gas development and livestock grazing, but would also result in decreased air pollution and other adverse environmental impacts associated with development compared to the other alternatives.

Residents generally support multiple-use of BLM-administered lands, including the development of mineral and energy resources, livestock grazing authorizations, continued access to BLM-administered lands for recreation, and conservation of wildlife and native vegetation. Alternative E would continue BLM's current practice of allowing multiple-uses, but would prioritize resource conservation over resource uses such as oil and gas development and livestock grazing. This resource conservation focus would be especially evident in areas like the Greater Sage-Grouse Key Habitat Areas ACEC, where many resource use activities would be restricted or prohibited. This may be inconsistent with the culture advocated by some interest groups (e.g., oil and gas interests, livestock ranchers) and may promote the culture advocated by others (e.g., wilderness advocates).

Under Alternative E, the continued development of oil and gas wells, ROWs, and other human-made structures on the landscape would continue to result in adverse impacts to nonmarket values associated with open space and the environment. However, because this alternative emphasizes resource

conservation, the magnitude of these decreases would be less than under the other alternatives and less than overall historic trends.

The withdrawal of a large portion of the Planning Area from livestock grazing under Alternative E would result in the same adverse impacts on allotments and livestock operators as described under Alternative B, including potential reductions in operations and ranch consolidations and/or sales.

As under Alternative B, residents of the Planning Area would be affected by restrictions to recreational opportunities beyond what is reflected in *Economic Conditions*. This is because the economic impacts of recreational activities only capture changes to non-resident recreation that would affect expenditures made in the Planning Area. In addition to affects from non-resident expenditures, seasonal travel restrictions in greater sage-grouse Key Habitat Areas and other wildlife habitats under Alternative E would limit motorized vehicle use in those areas for all recreationists on BLM-administered land, and in effect favor primitive recreational uses; these effects would be the same as under Alternative B.

Alternative F

Impacts on Population

Under Alternative F, activities on BLM-administered land and mineral estate related to oil and gas, livestock grazing, and recreation would support an average of 1,477 full-time and part-time jobs per year (Table 4-39), which represents approximately 4.0 percent of total employment in the Planning Area counties using 2011 employment statistics. Compared to Alternative A, which essentially represents the continuation of current trends, Alternative F would result in a decrease of 43 jobs (approximate 3 percent decrease), or approximately 0.1 percent of year 2011 employment. These job decreases would be associated with decreased development of oil and gas resources.

As shown in *Economic Conditions*, approximately 77 percent of the job opportunities from activities analyzed using the IMPLAN model would be related to oil and gas development and production (1,134 jobs). Livestock grazing would contribute approximately 13 percent of the job opportunities (185 jobs), and recreation would contribute approximately 11 percent (158). (Note that due to rounding, these sector-level figures do not necessarily match the total reported in Table 4-40.) These jobs would be dispersed geographically across the Planning Area, as described under Alternative A. In comparison to Alternative A, the average annual number of jobs supported by recreation activities and livestock grazing would be nearly the same, while the number of jobs supported by oil and gas would decrease by approximately 4 percent.

Alternative F would result in a slight decrease in job opportunities compared to Alternative A, potentially causing a slight decrease in population. Because the change in population and employment would be very small, spread over time, and spread throughout the Planning Area, Alternative F would not considerably alter the relative distribution of job opportunities or substantially affect population increase or movement. However, it should be noted that the ability to draw definitive conclusions for the relationship between job opportunities and population among the alternatives may be limited, to a degree, by the input-output nature of the IMPLAN model.

Impacts on Housing and Community Services

Alternative F may result in a small decrease in population compared to Alternative A, which may in turn decrease the demand for housing and community services. Alternative F would also result in a slightly reduced tax base from oil and gas production compared to Alternative A. Geographically, the change in job opportunities—and related impacts on housing and community services—would be spread across the Planning Area and would be spread over time.

Consistency with Adopted County Land Use Plans

Similar to the other alternatives, the BLM would take practical steps to resolve any identified conflicts between federal and local plans. Similar to Alternative D, Alternative F would continue BLM's historical policy of balanced resource conservation and development, but with slightly greater emphasis on resource conservation in greater sage-grouse PHMAs. In general, Alternative F encourages diversified economic activities by providing opportunities for developers to extract resources (e.g., oil and gas extraction), as well as develop industries that are sustainable in the very long term (e.g., renewable energy). Alternative F would not conflict with the adopted land use plans of Big Horn, Hot Springs, Park, or Washakie counties. These plans simultaneously advocate both the economic use of lands and open spaces, as well as the preservation of wildlife habitat.

Impacts on Quality of Life and Local Culture

Economic opportunities in the Planning Area under Alternative F would be slightly less than under Alternative A. Alternative F would also result in greater beneficial effects to air quality, wildlife, and other resources that improve quality of life related to natural characteristics than under alternatives A or C.

Alternative F employs a balanced management approach and would continue BLM's current practice of allowing multiple-uses of public lands, as opposed to a single species management. However, under Alternative F, additional measures related to the conservation of resources (particularly in greater sage-grouse PHMAs) would place additional emphasis on wildlife habitat concerns over economic development compared to management under alternatives A or D.

Under this alternative, subdivision of ranch land and related development and sale of "ranchette" parcels would continue and would result in impacts similar to those of alternatives A and D, although some uncertainty exists on the effects of this alternative on ranchers, due to the added restrictions when compared to Alternative D. This continuation would generally be in line with historic trends.

4.8.2 Economic Conditions

This section addresses the potential for the alternatives to result in impacts on economic conditions in the Planning Area, including direct, indirect, short-term, and long-term impacts. Laws, executive orders, regulations, policies, and guidance considered in the analysis of economic conditions are identified in Appendix B.

Potential impacts include changes in regional economic output, employment, and earnings, and in tax revenues for the local, state, and federal governments. The economic modeling analysis assumes direct and indirect impacts occur simultaneously even though in reality these impacts may take time to work their way through the economic sectors in the analysis area. For example, an action to permit gas exploration and production may result in the direct infusion of money into several economic sectors and indirect infusions into related sectors, such as retail, accommodation, and food services and education and other social services. In economic modeling, these impacts would be assumed to occur instantaneously. Continued direct infusion of money into the Planning Area's economy created by the decision to lease oil and gas would be analyzed over the life of the project, which in this case is likely to represent a multi-year period of production. As a result, the analysis of impacts to economic conditions is designed to account for the economic activity produced by planning decisions over time. The impacts are estimated on an annual basis through 2028 based on the estimated annual direct impact of the alternatives.

4.8.2.1 Methods and Assumptions

The analysis in this section is based on the IMPLAN model as described at the beginning of the Socioeconomic Resources section. IMPLAN focuses on employment and labor earnings and does not explicitly address non-labor income such as transfer payments (e.g., Social Security), investment earnings, or rent. As a result, the focus of this analysis is limited to the segment of the economy that is based on work-related income. The effects of non-labor income should be considered when interpreting the results of the IMPLAN model as substantial portions of income in some locations in the Planning Area come from non-labor income (e.g., Park County where nearly 40 percent of personal income is from non-labor income).

Assumptions used in this analysis include the following:

- Employment, earnings, and output are indicators of economic and population change.
- BLM-influenced activities alter economic conditions. Economic benefits to the Planning Area accrue from BLM-influenced activities, such as oil and natural gas development, livestock grazing, and recreation. Economic benefits to the Planning Area also accrue from wildlife grazing, to the extent that wildlife grazing contributes to the availability of and demand for recreational activities. Conversely, the possibility of economic losses to the Planning Area due to BLM-influenced activities is recognized and evaluated.
- Indirect and induced benefits due to minerals, livestock grazing, and recreation can reasonably be estimated by the IMPLAN model. (The IMPLAN production coefficients were modified to reflect the interaction of producing sectors in the Planning Area.)
- Recreation-related expenditures by residents occur in the region, but do not represent new money coming into the Planning Area; therefore, the analysis of economic impacts from recreation considers only recreation expenditures of nonresidents in the four-county Planning Area. In other words, there is a multiplier effect associated with nonresident recreation-related spending because it results in an input of new money into the Planning Area. By comparison, it is assumed that recreation-related expenditures of people who live within the Planning Area would generally be spent within the area (although not necessarily on the same activities), given the set of possible management actions represented by the range of alternatives analyzed.
- The analysis of direct and indirect impacts associated with oil and gas activity considers only activities on BLM-administered surface and federal mineral estate. The cumulative analysis considers activities on state and fee land and mineral estate.
- For livestock grazing, the analysis reflects a “worst-case” assumption that all acres impacted by surface-disturbing actions (from all the sources listed in Appendix T) are lands currently permitted for grazing; thus, the number of acres available for grazing in 2027 is the number of acres available under each alternative, minus acres that are affected in the long term by surface-disturbing actions (and withdrawals). In addition, the analysis of grazing reflects the assumption that surface-disturbing actions occur at a constant rate over time.
- For livestock grazing, the analysis of baseline AUMs available and reductions in AUMs is adjusted for the ratio of authorized use to active use, which is calculated based on the long-term average of authorized and active (use) AUMs for the Planning Area from 1988 to 2012. This long-term average is 64 percent. Appendix Q contains additional details regarding this adjustment.

The pace and timing of economic development in the Planning Area depends on many factors beyond BLM management. These include national and international energy demand, supply, and prices; operator business strategies; production conditions within the Planning Area; and demand and supply

for agricultural products. Because the future pace of development in the Planning Area is unknown, this analysis assumes a relatively constant rate of development. Therefore, actual impacts may differ if the rate of development changes substantially (e.g., there may be boom and bust type short-term impacts that would differ from long-term impacts).

The IMPLAN production coefficients were modified to reflect the interaction of producing sectors in the Planning Area. As a result, the calibrated model does a better job of generating multipliers and the subsequent impacts that reflect the interaction between and among the sectors in the Planning Area, compared to a model using unadjusted national coefficients. Specifically, worker productivity in oil and gas production is higher in Wyoming and more of the hay used for livestock feed is produced within the region, compared with national averages. Key variables used in the IMPLAN model were filled in using data specific to Wyoming, including employment estimates, labor earnings, and total industry output.

Appendix Q describes the economic analysis method in more detail, along with detailed assumptions and factors for the analysis.

4.8.2.2 Summary of Impacts by Alternative

Based on the data from the IMPLAN model, as well as qualitative analysis from other sectors, output, employment, and tax revenues resulting from activities on BLM-administered land and mineral estate would be highest under Alternative C and lowest under Alternative E. Alternative A would result in the second-highest level of economic activity, and Alternative D the third-highest.

The most important drivers of economic activity influenced by BLM management, respectively, are oil and gas activity and livestock grazing. Oil and gas production would be highest under Alternative C, followed by alternatives A, D, and F; the lowest oil and gas production would occur under alternatives B and E. It is also worth pointing out that the Oil and Gas Management Areas proposed under alternatives C, D, and F would facilitate oil and gas development by, among other things, exempting these areas from seasonal development and other restrictions. This would help operators to smooth their exploration, development and production cycles, which would help smooth seasonal employment cycles during the year. In alternatives B and E, where Oil and Gas Management Areas would not apply, seasonal restrictions could contribute to a seasonal “boom and bust” cycle with some production, development or maintenance workers being subject to seasonal access restrictions.

Livestock grazing closures and curtailed activity, if they occur, would result in disruptions and impacts to the economic contribution of livestock grazing in the local economy as well as the social fabric of the communities in which they operate. Some jobs and associated earnings would be lost. This is documented in the tables in this section. Note that if a ranch closes due to the loss of part of its federal allotment, but its other private assets (e.g., capital and land) are absorbed by another ranching operation, that transfer of use from one owner to another would not generally be expected to have adverse effects on overall regional employment. However, the loss of the federal grazing land would have adverse effects, and it is those impacts that are measured by the analysis.

Economic activity from livestock grazing would be similar under alternatives A, C, D, and F, but substantially lower under alternatives B and E. Additional restrictions and requirements for livestock grazing in PHMAs under Alternative F could result in adverse effects to economic activity compared to alternatives A and D; however, at present it is not possible to quantify the changes in livestock grazing economic activity that would result from these restrictions. Earnings, output, and employment from recreation would be similar across all the alternatives.

Economic activity from other sectors not modeled using IMPLAN, including renewable energy, locatable minerals, and salable minerals, would be greatest under alternatives A, C, D, and F, and lowest under alternatives B and E. However, at present it is not possible to quantify effects from renewable energy, locatable minerals, and salable minerals.

Alternative C would result in the highest earnings and employment, followed by alternatives A, D, F, B, and E. Table 4-37 includes additional information on projected earnings and employment related to activities on BLM-administered areas to the levels in 2011. Alternative A would result in approximately \$87 million in earnings and 1,520 jobs annually from BLM-administered land and resources. Alternatives B and E would generate about \$38 million in earnings and 763 jobs; Alternative C would generate approximately \$94 million in earnings and 1,631 jobs; Alternative D would generate about \$84 million in earnings and 1,478 jobs; and Alternative F would result in \$84 million in earnings and 1,477 jobs annually from BLM-administered land and resources.

It is useful to compare the differences in earnings and employment across alternatives, not only in absolute terms, but also to the size of the regional economy. The earnings associated with Alternative A represent approximately 3.8 percent of the total earnings in the Planning Area counties compared to 2011 earnings (Table 4-37). Earnings associated with BLM-administered lands under alternatives B, C, D, E, and F constitute 1.7, 4.1, 3.7, 1.7, and 3.7 percent of year 2011 earnings, respectively. The average employment associated with activities on BLM-administered land under alternatives A, B, C, D, E, and F represents about 4.1, 2.1, 4.4, 4.0, 2.1, and 4.0 percent of employment for counties in the Planning Area in year 2011, respectively (Table 4-37). This provides a useful perspective on the relative importance of BLM-administered lands in the overall regional economy and also shows that the difference between alternatives—relative to the regional economy—is small. For example, the difference in employment projected between alternatives A and B would be just 2.0 percentage points of employment in year 2011 (4.1 minus 2.1), which would certainly be noticeable (it would be as if the unemployment rate increased by 2.0 percentage points), but would not likely lead to wholesale changes in regional economic activity. The difference in annual employment between alternatives A and F would barely be noticeable in regional statistics, with a 0.1 percentage point change, which is not likely noticeable for most residents or workers. Other national, state, and regional policies and trends, such as the value of the dollar, federal fiscal and monetary policy, and global oil prices, would have a substantially larger impact on economic activity in the Planning Area.

The data presented in Table 4-37, as well as the other tables in this section showing the results of the economic model analysis, reflect direct and indirect impacts on economic conditions. For example, the earnings and employment information in this section include oil and gas, livestock grazing, and recreation sectors as well as all other sectors that are connected such as retail, food service, hotels and other accommodation services, and social services such as education and health care. These jobs may be dispersed across the Planning Area; however, those cities with a higher concentration of oil and gas support activities businesses, as well as housing centers for oil and gas workers, could experience greater impacts.

4.8.2.3 Detailed Analysis of Alternatives

Impacts Common to All Alternatives

The focus of the following analysis is on the resource activities most likely to be affected by land management decisions, including oil and gas, livestock grazing, and recreation. Management of resource programs or constraints (as described in the alternatives) that affect oil and gas, livestock

grazing, and recreation (e.g., surface-disturbing activities that affect the amount of land available for grazing) are included in the analysis. Also included are restrictions on ROWs and corridors, since the BLM's RFD for oil and gas, which provides estimated numbers of oil and gas wells and production, incorporates the restrictions on ROWs and corridors. Restrictions on new ROWs would tend to be a negligible factor in the decision to develop additional oil and gas wells in fields that are already producing, but may be an important factor in a decision to develop a new field.

Economic impacts related to other resources, such as locatable and salable minerals and renewable energy, are addressed outside the framework of the IMPLAN model. Impacts to economic conditions related to renewable energy management actions are described below for each alternative. For locatable and salable minerals, the BLM expects to meet market demand and respond to applications so that the production of these minerals would not vary across the alternatives being considered. Thus, the sections below on impacts under each alternative do not include earnings, jobs, or output related to locatable or salable minerals, such as bentonite. This does not mean production of these minerals or other activities not modeled in IMPLAN are unimportant (e.g., see Section 3.8.2 *Economic Conditions* in Chapter 3 for information on current employment and payroll from bentonite mining and processing). For more information on minerals, refer to Section 4.2.1 *Locatable Minerals* and Section 4.2.7 *Salable Minerals*.

Under all alternatives, the BLM generally expects to meet market demand and respond to applications for locatable minerals and mineral materials and does not anticipate that the production of these minerals would vary across the alternatives being considered. The different alternatives include varying restrictions on mineral entry and mineral materials disposal; however, restrictions may have a minor impact on overall economic conditions compared to current conditions.

Changes in economic activity have impacts on federal, state, and local tax revenues. While all sectors of the economy contribute to tax revenues, the analysis of tax revenue impacts focuses on oil and gas production because almost all of the measurable variation in economic activity among alternatives is related to oil and gas.

The focus of this analysis is on regional earnings and output, employment, and tax revenue, with the region defined as the four-counties in the Planning Area. The IMPLAN model is run at a regional (multi-county) scale, with the mathematical relationships that describe linkages between sectors aggregated to the four-county level. Because of this mathematical aggregation, it is not possible to identify total economic impacts for an individual community. For additional information on the structure of the IMPLAN model and specific assumptions made for the economic modeling analysis, refer to Appendix Q, *Economic Impact Analysis Methodology*.

Alternative A

Impacts on Regional Earnings and Output

Based on the IMPLAN model, regional earnings under Alternative A for the modeled sectors (oil and gas, grazing, and recreation) would average approximately \$87 million per year between 2009 and 2028, and regional output would average approximately \$639 million per year, resulting from development and activities on BLM-administered land and mineral estate. The net present value of the stream of regional output, discounted at a 7 percent real discount rate (OMB 1992), would be approximately \$7.3 billion over 20 years. Table 4-38 summarizes and compares sector-level breakouts for earnings and output by alternative.

Alternative A would maintain the current management approach of permitting renewable energy development on a case-by-case basis. This may result in adverse impacts by increasing uncertainty for individual firms considering developing renewable energy in the Planning Area.

The BLM generally expects to meet market demand for locatable minerals and mineral materials and respond to applications consistent with current management. Alternative A would maintain the current management approach with respect to leasing of BLM-administered lands for exploration and development, and may have little to no change compared to current conditions.

Table 4-38. Average Annual Impacts on Earnings and Output, by Sector and Alternative for the Planning Area

Sector	Alternative A	Alternative B	Alternative C	Alternative D	Alternative E	Alternative F
Impacts on Annual Average Earnings (millions of 2011 \$)						
Oil and Gas	\$77.7	\$31.2	\$85.1	\$75.0	\$31.0	\$74.9
Livestock Grazing	\$5.9	\$4.2	\$5.9	\$5.9	\$4.2	\$5.9
Recreation	\$3.1	\$3.1	\$3.1	\$3.1	\$3.1	\$3.1
Total²	\$86.7	\$38.5	\$94.1	\$83.9	\$38.3	\$83.8
Impacts on Annual Average Output (millions of 2011 \$)						
Oil and Gas	\$607.7	\$243.5	\$665.1	\$586.2	\$242.7	\$585.8
Livestock Grazing	\$19.8	\$14.2	\$19.7	\$19.7	\$14.2	\$19.7
Recreation	\$11.6	\$11.6	\$11.6	\$11.6	\$11.6	\$11.6
Total²	\$639.1	\$269.4	\$696.4	\$617.6	\$268.6	\$617.2
Impacts on Net Present Value of Output Over 20 Years (millions of 2011 \$)¹						
Oil and Gas	\$6,976.6	\$2,795.2	\$7,635.4	\$6,729.6	\$2,786.4	\$6,725.7
Livestock Grazing	\$209.4	\$163.1	\$208.7	\$209.3	\$163.1	\$209.4
Recreation	\$120.0	\$120.0	\$120.0	\$120.0	\$120.0	\$120.0
Total²	\$7,306.0	\$3,078.4	\$7,964.1	\$7,059.0	\$3,069.6	\$7,055.0

¹Net present value from 2009 to 2028, discounted at 7 percent (rate from OMB 1992).

²Due to rounding, totals may not be additive.

IMPLAN Impact Analysis for Planning model

Impacts on Employment

Employment is a function of the level of economic activity (sales and purchases) among economic sectors. Thus, employment impacts are closely related to impacts on economic output. An increase in output implies an increase in employment and vice versa.

Based on the IMPLAN model, regional employment under Alternative A for the modeled sectors would average approximately 1,520 jobs per year between 2009 and 2028 due to activities on BLM-administered lands and mineral estate. The number of jobs is expressed as “annual job equivalents,” where one annual job equivalent (AJE) represents 12 months of employment. For example, one AJE could represent two jobs for 6 months each, or one job for 12 months. AJEs may represent either full-time or part-time jobs. Table 4-39 provides a comparison of jobs by sector under the alternatives.

Economic Conditions

Average annual earnings per job would differ for each of these sectors, but would be the same under all alternatives. Based on the IMPLAN model, earnings per job (expressed in year 2011 dollars) would average:

- Between \$55,000 and \$65,000 for jobs in oil and gas well drilling and completion.
- Between \$61,000 and \$75,000 for jobs in oil and gas production.
- Between \$20,000 and \$36,000 for jobs associated with cattle and sheep grazing.
- Between \$19,000 and \$20,000 for recreation-related jobs.

Table 4-39. Average Annual Impacts on Employment, by Sector and Alternative for the Planning Area

Sector	Number of Jobs ¹					
	Alternative A	Alternative B	Alternative C	Alternative D	Alternative E	Alternative F
Oil and Gas	1,177	472	1,289	1,135	470	1,134
<i>Direct</i>	614	246	672	592	245	591
<i>Indirect & Induced</i>	563	226	617	543	225	543
Livestock Grazing	185	133	184	185	133	185
<i>Direct</i>	106	76	105	106	76	106
<i>Indirect & Induced</i>	79	57	79	79	57	79
Recreation	158	158	158	158	158	158
<i>Direct</i>	131	131	131	131	131	131
<i>Indirect & Induced</i>	27	27	27	27	27	27
Total²	1,520	763	1,631	1,478	761	1,477
<i>Direct</i>	850	453	908	828	452	828
<i>Indirect & Induced</i>	670	310	723	650	309	649

Source: Calculated using the IMPLAN model, as described in the text.

¹Number of jobs is in annual job equivalents (AJE), where one AJE represents 12 months of employment. For instance, one AJE could represent one job for 12 months, or two jobs for 6 months.

²Due to rounding, totals may not be additive.

IMPLAN Impact Analysis for Planning model

Table 4-40 provides information on employment, disaggregated by economic sector, that would be associated with activities on BLM-administered land in each alternative. In each table cell, the first figure is the comprehensive impact (including indirect and induced impacts from related sectors) and the second figure, in parentheses, is the direct impact only. In all alternatives, mining is the sector with greatest employment, most of it directly related to activities on BLM land. The other leading sectors are arts, entertainment, and recreation services; agriculture and agricultural services; retail trade; construction; and business services. With the exception of business services, all of these sectors would see contributions from both direct and indirect/induced activity.

Table 4-40. Average Annual Impacts on Employment, by Subsector and Alternative for the Planning Area

Sector	Number of Jobs ¹					
	Total Contribution (Direct Contribution) ²					
	Alternative A	Alternative B	Alternative C	Alternative D	Alternative E	Alternative F
Agriculture & Agricultural Services	139 (106)	100 (76)	139 (105)	139 (106)	98 (75)	139 (106)
Mining (includes oil and gas services)	581 (564)	233 (226)	637 (618)	561 (544)	232 (225)	560 (543)
Utilities	7 (0)	3 (0)	7 (0)	6 (0)	3 (0)	6 (0)
Construction	128 (33)	52 (13)	140 (36)	124 (32)	52 (13)	124 (32)
Manufacturing	14 (1)	6 (1)	15 (1)	13 (1)	6 (1)	13 (1)
Wholesale Trade	51 (28)	21 (11)	55 (30)	49 (27)	21 (11)	49 (27)
Retail Trade	135 (32)	79 (32)	144 (32)	132 (32)	78 (32)	132 (32)

Business Services (e.g., administrative)	111 (0)	50 (0)	121 (0)	108 (0)	49 (0)	108 (0)
Social Services	73 (0)	33 (0)	79 (0)	71 (0)	33 (0)	71 (0)
Arts/Entertainment/Recreation Services	164 (83)	120 (83)	170 (83)	161 (83)	120 (83)	161 (83)
Other Services	74 (13)	41 (13)	78 (13)	72 (13)	41 (13)	72 (13)
Institutions	17 (0)	7 (0)	18 (0)	16 (0)	7 (0)	16 (0)

Source: Calculated using the IMPLAN model. Due to rounding, totals may not match exactly the totals reported in other tables in this section.

¹Number of jobs is in annual job equivalents (AJE), where one AJE represents 12 months of employment. For instance, one AJE could represent one job for 12 months, or two jobs for 6 months.

²The total contribution includes indirect and induced economic activity from related sectors (i.e., “upstream” and “downstream” sectors that supply materials and labor, or benefit from spending by workers in the sectors directly affected). For more information see the economic model description in the text.

IMPLAN Impact Analysis for Planning model

Impacts on Tax Revenue

Projected tax revenues for Alternative A resulting from oil and gas production on BLM-administered mineral estate would average \$54.0 million per year for federal royalties, \$25.9 million per year for state severance taxes, and \$29.5 million per year for local ad valorem taxes. Because specific well locations are not known at this time, there is not sufficient data to apportion the local tax receipts to individual counties. Table 4-41 provides a summary and comparison of tax revenues from oil and gas production for the alternatives.

**Table 4-41. Estimated Oil and Gas Tax Revenues by Alternative for the Planning Area
(millions of 2011 \$)**

Tax Type	Alternative A	Alternative B	Alternative C	Alternative D	Alternative E	Alternative F
Federal mineral royalties	\$54.0	\$21.6	\$59.1	\$52.1	\$21.6	\$52.1
State severance taxes	\$25.9	\$10.4	\$28.4	\$25.0	\$10.4	\$25.0
Local ad valorem production taxes	\$29.5	\$11.8	\$32.3	\$28.5	\$11.8	\$28.5
Total¹	\$109.5	\$43.9	\$119.8	\$105.6	\$43.8	\$105.6

Source: Calculated based on the IMPLAN model and state, federal, and local tax rates, as described in the text.

¹Due to rounding, totals may not be additive.

IMPLAN Impact Analysis for Planning model

Alternative B

Impacts on Regional Earnings and Output

Based on the IMPLAN model, regional earnings under Alternative B for the modeled sectors (oil and gas, grazing, and recreation) would average approximately \$38.5 million per year between 2009 and 2028, and regional output would average approximately \$269 million per year, due to activities on BLM-administered land and mineral estate. The net present value of the stream of regional output, discounted at a 7 percent real discount rate (OMB 1992), would be approximately \$3.1 billion over 20 years. Table 4-38 summarizes and compares sector-level breakouts for earnings and output by alternative.

Under Alternative B, 1,244,948 acres are renewable energy exclusion areas and an additional 1,691,663 acres are managed as avoidance areas. Approximately 251,203 acres (8 percent of BLM-administered surface) would be open to renewable energy development. Alternative B could increase development in areas open to renewable energy development compared to Alternative A, since it would decrease uncertainty for firms considering developing renewable energy in the Planning Area.

Alternative B would limit or restrict the amount of land open to exploration and development of these minerals more than Alternative A. However, restrictions may have a minor impact on overall economic conditions compared to current conditions.

Impacts on Employment

Based on the IMPLAN model, regional employment under Alternative B for the modeled sectors would average approximately 763 jobs per year between 2009 and 2028 due to activities on BLM-administered land and mineral estate. Alternative B would result in fewer jobs compared to Alternative A. Table 4-39 provides a comparison of jobs by sector under the alternatives.

Impacts on Tax Revenue

Projected tax revenues for Alternative B resulting from oil and gas production on BLM-administered mineral estate would average \$21.6 million per year for federal royalties, \$10.4 million per year for state severance taxes, and \$11.8 million per year for local ad valorem taxes. Because specific well locations are not known at this time, there is not sufficient data to apportion the local tax receipts to individual

counties; however, the restrictions on oil and gas development under Alternative B affect broad areas of land throughout the Planning Area, so the reductions in tax revenues (relative to Alternative A) would affect virtually all communities that currently produce oil and gas. Table 4-41 provides a summary and comparison of tax revenues from oil and gas production for the alternatives. Implementation of Alternative B would result in less estimated oil and gas tax revenues compared to Alternative A.

Alternative C

Impacts on Regional Earnings and Output

Based on the IMPLAN model, regional earnings under Alternative C for the modeled sectors (oil and gas, grazing, and recreation) would average approximately \$94 million per year between 2009 and 2028, and regional output would average approximately \$696 million per year, due to activities on BLM-administered land and mineral estate. The net present value of the stream of regional output, discounted at a 7 percent real discount rate (OMB 1992), would be approximately \$8.0 billion over 20 years. Table 4-38 summarizes and compares sector-level breakouts for earnings and output by alternative.

Under Alternative C, approximately 148,416 acres renewable energy exclusion areas and 1,611,040 acres are avoidance areas. Approximately 1.4 million acres (45 percent of the BLM-administered surface in the Planning Area) would be open to renewable energy development. Management of renewable energy under Alternative C could increase development compared to alternatives A and B, since it would reduce restrictions and open more area to renewable energy development. Similar to alternatives B and D, allocation of areas open to renewable energy could also increase renewable energy development by decreasing uncertainty for firms considering developing renewable energy in the Planning Area.

Alternative C would increase the amount of land open to exploration and development of locatable minerals and would slightly decrease the amount of land open to exploration and development of salable minerals compared to Alternative A (refer to Section 4.2 *Mineral Resources*). However, decreased restrictions and more areas open to mineral development may only have a minor impact on the regional economic conditions compared to current conditions.

Impacts on Employment

Based on the IMPLAN model, regional employment under Alternative C for the modeled sectors would average approximately 1,631 jobs per year between 2009 and 2028 due to activities on BLM-administered land and mineral estate. Alternative C would result in the greatest number of jobs compared to the other alternatives. Table 4-39 provides a comparison of jobs by sector under the alternatives.

Impacts on Tax Revenue

Projected tax revenues for Alternative C resulting from oil and gas production on BLM-administered surface would average \$59.1 million per year for federal royalties, \$28.4 million per year for state severance taxes, and \$32.3 million per year for local ad valorem taxes. Because specific well locations are not known at this time, there is not sufficient data to apportion the local tax receipts to individual counties. Table 4-41 provides a summary and comparison of tax revenues from oil and gas production for the alternatives. Implementation of Alternative C would result in the greatest estimated oil and gas tax revenues compared to the other alternatives.

Alternative D

Impacts on Regional Earnings and Output

Based on the IMPLAN model, regional earnings under Alternative D for the modeled sectors (oil and gas, grazing, and recreation) would average approximately \$84 million per year between 2009 and 2028, and regional output would average approximately \$618 million per year, due to activities on BLM-administered land and mineral estate. The net present value of the stream of regional output, discounted at a 7 percent real discount rate (OMB 1992), would be approximately \$7.1 billion over 20 years. Table 4-38 summarizes and compares sector-level breakouts for earnings and output by alternative.

Under Alternative D, 372,110 acres are renewable energy exclusion areas, and 1,500,395 acres are avoidance areas. Approximately 1,315,309 acres (41 percent of BLM-administered surface) would be open to renewable energy development. Similar to alternatives B and C, allocation of areas open to renewable energy development under Alternative D could increase development in areas open to renewable energy since it would decrease uncertainty for firms considering developing renewable energy in the Planning Area.

Alternative D would increase the amount of land open to exploration and development of locatable minerals and the amount of land open to exploration and development of salable minerals compared to Alternative A (refer to Section 4.2 *Mineral Resources*). However, decreased restrictions and more areas open to mineral development may have only a minor impact on economic conditions compared to current conditions.

Impacts on Employment

Based on the IMPLAN model, regional employment under Alternative D for the modeled sectors would average approximately 1,478 jobs per year between 2009 and 2028 due to activities on BLM-administered land and mineral estate. Table 4-39 provides a comparison of jobs by sector under the alternatives.

Impacts on Tax Revenue

Projected tax revenues for Alternative D due to oil and gas production on BLM-administered surface would average \$52.1 million per year for federal royalties, \$25.0 million per year for state severance taxes, and \$28.5 million per year for local ad valorem taxes. Because specific well locations are not known at this time, there is not sufficient data to apportion the local tax receipts to individual counties. Table 4-41 provides a summary and comparison of tax revenues from oil and gas production for the alternatives. Implementation of Alternative D would result in more estimated oil and gas tax revenues than Alternative B, but less than alternatives A and C.

Alternative E

Impacts on Regional Earnings and Output

Based on the IMPLAN model, regional earnings and output under Alternative E would be estimated to be similar to those under Alternative B for the modeled sectors (oil and gas, grazing, and recreation). Alternative E includes the greatest area of ROW exclusion and the most restrictive management on allowable surface disturbance of any alternative due to the inclusion of the Greater Sage-Grouse Key Habitat Areas ACEC. However, the management of new oil and gas leasing, motorized vehicle use restrictions and seasonal closures, recreation, and livestock grazing under Alternative E is similar to

Alternative B (for details, please see *Leasable Minerals – Oil and Gas, Recreation, and Livestock Grazing Management*).

Regional earnings under Alternative E would average approximately \$38.3 million per year, and regional output would average approximately \$269 million per year, due to activities on BLM-administered land and mineral estate. The net present value of the stream of regional output would be approximately \$2.8 billion over 20 years. Table 4-38 summarizes and compares sector-level breakouts for earnings and output by alternative.

Under Alternative E, 1,945,204 acres would be renewable energy exclusion areas. This represents 700,256 acres more than under Alternative B. An additional 988,459 acres are managed as avoidance areas. Approximately 254,151 acres (8 percent of BLM-administered surface) would be open to renewable energy development, the same as under Alternative B. Despite the greater acreage of exclusion areas, the BLM expects that wind-energy development on BLM-administered lands would be approved at the same rate as under Alternative B (see *Renewable Energy* for details).

Alternative E imposes the most restrictions on the development of locatable and salable minerals in the Planning Area of any alternative, and could result in the greatest restrictions to economic activity from these types of mining compared to any other alternative. However, at present it is not possible to quantify effects from locatable and salable minerals management changes among the alternatives, for lack of reliable and geographically detailed production forecasts.

Impacts on Employment

Based on the IMPLAN model, regional employment under Alternative E for the modeled sectors would average approximately 761 jobs per year between 2009 and 2028 due to activities on BLM-administered land and mineral estate. Alternative E would result in the least number of jobs compared to the other alternatives. Table 4-39 provides a comparison of jobs by sector under the alternatives.

Impacts on Tax Revenue

Projected tax revenues for Alternative E resulting from oil and gas production on BLM-administered mineral estate are estimated to be the same as under Alternative B. As in Alternative B, estimated tax revenues under Alternative E would average \$21.6 million per year for federal royalties, \$10.4 million per year for state severance taxes, and \$11.8 million per year for local ad valorem taxes. Estimated oil and gas tax revenues under Alternative E would be the same as under Alternative B, and would be the less than any of the other alternatives. Table 4-41 provides a summary and comparison of tax revenues from oil and gas production for the alternatives.

Alternative F

Impacts on Regional Earnings and Output

Based on the IMPLAN model, regional earnings and output under Alternative F for the modeled sectors (oil and gas, grazing, and recreation) would be similar to but slightly less than under Alternative D due to additional NSO restrictions for oil and gas development in greater sage-grouse PHMAs. This NSO restriction would reduce estimated oil and gas development when compared to alternatives A and D. The change in AUMs under Alternative F would be similar to Alternative D (see *Livestock Grazing Management* for details).

Regional earnings from activities on BLM-administered land and mineral estate under Alternative F would average approximately \$84 million per year, and regional output would average approximately \$617 million per year. The net present value of the stream of regional output would be approximately

\$7.1 billion over 20 years. Table 4-38 summarizes and compares sector-level breakouts for earnings and output by alternative.

Under Alternative F, 292,949 acres are managed as renewable energy exclusion areas, and 2,507,581 acres as avoidance areas. Approximately 607,429 acres would be open to renewable energy development. Although restrictions on ROW development under Alternative F in the Greater Sage-Grouse PHMAs ACEC may increase costs associated with this development relative to Alternative D, the BLM expects development of renewable energy on BLM-administered lands to be similar to that described under Alternative D.

Alternative F imposes similar restrictions to the development of locatable and salable minerals as Alternative D, but also includes additional restrictions on surface-disturbing activities within the Greater Sage-Grouse PHMAs ACEC that may restrict economic activity compared to alternatives A and D. Due to the lack of reliable production forecasts, it is not possible to quantify effects from locatable and salable minerals management changes among the alternatives at present.

Impacts on Employment

Based on the IMPLAN model, regional employment under Alternative F for the modeled sectors would average approximately 1,477 jobs per year between 2009 and 2028 due to activities on BLM-administered land and mineral estate. Table 4-39 provides a comparison of jobs by sector under the alternatives.

Impacts on Tax Revenue

Implementation of Alternative F would result in greater estimated oil and gas tax revenues than alternatives B and E, but less than for alternatives A or C. Projected tax revenues for Alternative F due to oil and gas production on BLM-administered surface would average \$52.1 million per year for federal royalties, \$25.0 million per year for state severance taxes, and \$28.5 million per year for local ad valorem taxes. Table 4-41 provides a summary and comparison of tax revenues from oil and gas production for the alternatives.

4.8.3 Health and Safety

Health and safety, as discussed in this document, includes AMLs, natural geologic hazards, and hazardous wastes and materials. Each of these hazards is analyzed in this section.

Direct impacts to health and safety would result from management of AMLs, geologic hazards, and hazardous materials and wastes that increase the potential for and risk of accidents in the areas in which AMLs, geologic hazards, or hazardous waste and materials spills or releases occur. Indirect impacts result from management that results in potential impacts to health and safety in a different time and space in which the AML, geologic hazard, or hazardous spills occurs.

Adverse impacts result from management that increases the potential for accidents and risks to health and safety. Beneficial impacts result from management that decreases the risk or potential for accidents associated with AMLs, geologic hazards, or hazardous wastes and materials.

Short-term impacts result from management that affects health and safety within 5 years. Short-term impacts include impacts to health and safety at the site of a hazardous waste spill. Long-term impacts to health and safety are those that occur and result after a period of more than 5 years. Long-term impacts may include the accumulation of hazardous wastes in water, air, or other resources that would affect health and safety.

4.8.3.1 Methods and Assumptions

Assumptions used in this impact analysis include the following:

- Most AML sites in the Planning Area (Map 95) are identified and characterized.
- “The BLM will set as its highest AML physical safety action priority the cleaning up of those AML sites situated at locations: (a) where a death or injury has occurred and the site has not already been addressed; or (b) situated on or in immediate proximity to developed recreation sites and areas with high visitor use” (BLM 2000). AML sites adversely affecting watersheds are also a high priority. The BLM continues to support the Wyoming DEQ AML Division in reclaiming AML sites on public surface.
- No assumptions were identified for natural geologic hazards.
- All new hazardous materials and waste sites are identified and characterized.
- Resource development activities identify any possible generation of hazardous waste.
- No substantial new hazardous materials uses and/or waste generation occurs within the Planning Area.
- The BLM’s Hazard Management and Resource Restoration Program responds to all hazardous material releases on public surface. Emergency cleanup actions are implemented on sites posing a substantial threat to the public and/or the environment.

4.8.3.2 Summary of Impacts by Alternative

Beneficial impacts to health and safety from management of AML sites occur under all alternatives; however, alternatives B, D, E, and F would have the most beneficial impacts, followed by Alternative A, and then Alternative C. Under all alternatives, the BLM and Wyoming DEQ will identify and plan for remediation of AML sites which would reduce potential adverse impacts to health and safety. Alternative C could result in the greatest risk to health and safety from the management of AMLs by not prioritizing sites for reclamation and by allowing activities in mitigated AMLs.

Principle impacts to health and safety from geologic hazard areas would result from management that increases activities in geologic hazard areas and subsequently increases the risk and potential for accidents in these areas. Providing warning signs for geologic hazards would result in similar impacts under all the alternatives. Under Alternative A, there is no specific management for activities in geologic hazard areas, compared to the prohibition of activities under Alternative B, and allowing activities in mitigated geologic hazard areas under alternatives C, D, and F. Adverse impacts to health and safety associated with geologic hazard management would be the least under alternatives B and E, followed by alternatives C, D, and F, and greatest under Alternative A.

Under all alternatives, the impacts from management of hazardous wastes and materials would be the same. The potential for impacts may vary by alternative based on the level of mineral activity under the alternatives. Alternative C would result in the greatest amount of mineral activity, and as a result, may increase the generation, storage, and transport of hazardous materials, which could increase the potential for health and safety impacts compared to the other alternatives. Under all alternatives, an active remediation program remains in place and hazardous materials in the Planning Area are managed to reduce risk to people and the environment.

4.8.3.3 Detailed Analysis of Alternatives

Impacts Common to All Alternatives

Abandoned Mine Lands

To reduce the threat of physical and environmental impacts from AML sites, the BLM will remediate sites based on risk.

Long-term beneficial impacts to health and safety would result from the Wyoming DEQ, AML Division continuing work with the BLM to mitigate hazards associated with AML sites in the Planning Area.

Implementation of the alternatives is not anticipated to result in additional AML sites or increase the risks at AML sites that may adversely affect health and safety.

Natural Geologic Hazards

Natural geologic hazards in the Planning Area are managed to reduce risks to the public by providing warnings and, where appropriate, developing mitigation measures to avoid and minimize impacts associated with geologic hazards.

Implementation of the alternatives would not result in any increase in the potential for geologic hazards; however, management may decrease the risks and potential impacts to health and safety resulting from geologic hazards.

Developing a geologic hazards database that ranks threats to public health and safety, informing applicants and project proponents of geologic hazards, and developing mitigation may reduce impacts to health and safety from geologic hazards by providing resources that would reduce the risk to humans from geologic hazards.

Hazardous Wastes and Materials

Increases in human presence and activity associated with recreation, mineral activity, and ROW development increase risks associated with generation, use, transportation, and storage of hazardous wastes and materials. Mineral activities are the most likely activities to increase the risk of hazardous wastes and materials to health and safety.

Impacts to health and safety from the management of hazardous waste and materials would be the same under all alternatives as there are no separate management actions for hazardous waste that differ among the alternatives.

Implementing hazardous materials management activities will address human health and environmental risks from hazardous materials. Due to the increase in recreational activity throughout the Planning Area, particularly in areas such as Rattlesnake Ridge outside of Worland, and in proximity to oil and gas fields, H₂S poses an increasing threat to public health and safety. In order to reduce the risks to public health, all H₂S plans would comply with Onshore Order #6, which identifies “uniform national requirements and minimum standards of performance expected from operators when conducting operations involving oil or gas that is known or could reasonably be expected to contain hydrogen sulfide.” In addition, the BLM will mitigate safety concerns associated with H₂S through signs, warning sirens, and public education. All of these management actions would reduce the potential for human health and safety risks from H₂S. Any potential impacts to health and safety from H₂S would increase in relation to the level of mineral activity that releases H₂S.

Hazardous materials in the Planning Area are managed to reduce risks to visitors, employees, and the environment, to restore contaminated lands, and to carry out emergency-response activities, as per appropriate laws, policies, and regulations. Management to reduce risk and contamination would reduce potential impacts to health and safety from hazardous wastes. Substantive indirect impacts related to risks from hazardous materials during remediation could exist.

Preparing Environmental Site Assessments on lands acquired or conveyed and notifying the public of conveyance of public lands affected by hazardous substances would reduce the potential for health and safety impacts from hazardous wastes. The preparation of Environmental Site Assessments would also ensure that contaminated lands are not conveyed out of federal ownership in keeping with Comprehensive Environmental Response, Compensation and Liability Act and ensure that the BLM would not acquire contaminated lands.

Requiring Hazardous Spill Response Plans for all projects involving hazardous materials would reduce the potential for adverse impacts to health and safety. Hazardous Spill Response plans would provide a strategy for responding to hazardous materials spills that would reduce short-term health and safety impacts from spills. Reporting spills and releases of chemicals, petroleum products, and produced water to the BLM, Wyoming DEQ, and Wyoming Oil and Gas Conservation Commission as required by Notice to Lessees-3A (DOI 1997), would reduce the potential for both short-term and long-term impacts to health and safety by controlling spills and facilitating an appropriate response to hazardous materials spills.

Alternative A

Alternative A would result in direct beneficial impacts to health and safety by conducting inventory of hazards at AML sites and prioritizing sites for reclamation in coordination with Wyoming DEQ.

Allowing activities in AML areas on a case-by-case basis may result in adverse impacts to health and safety by increasing the potential for accidents and risks associated with activity in these areas.

Implementation of Alternative A would result in beneficial impacts to health and safety by providing warning signs for geologic hazards. Warning signs would identify hazards and reduce the potential for accidents associated with geologic hazards.

Alternative B

Under Alternative B, as under Alternative A, AML sites are inventoried for hazards and prioritized for reclamation in coordination with Wyoming DEQ. However, Alternative B has a greater beneficial impact compared to Alternative A by identifying AML sites with warning signage and erecting protective fencing around shafts and adits. Additionally, under Alternative B activities are prohibited within ¼ mile of AML areas to further reduce risk to health and safety compared to Alternative A.

Identifying geologic hazard sites with warning signs would result in the same impact as described under Alternative A. However, inventorying geologic hazards and prohibiting activities in geologic hazard areas would reduce impacts to health and safety beyond Alternative A by further reducing the potential for accidents and health and safety risks in these areas.

Alternative C

Alternative C would result in fewer beneficial impacts than Alternative A by conducting inventory of AML sites but not prioritizing sites for reclamation. Additionally, allowing activities in mitigated AMLs may

result in adverse impacts to health and safety by increasing the potential for accidents and risks associated with activities in these areas. Impacts associated with allowed activity in AMLs would be greater than the other alternatives.

Alternative C has fewer beneficial impacts than Alternative B but more than Alternative A by providing warnings for geologic hazards and identifying hazards on a case-by-case basis. Under Alternative C, activities are allowed in mitigated geologic hazard areas, which may result in adverse impacts to health and safety by increasing the potential for accidents and risks to health and safety in these areas compared to the other alternatives.

Alternative D

Management under Alternative D would inventory AML sites for hazards and erect warning signs and protective fencing in a similar fashion as Alternative B, resulting in similar beneficial impacts. Adverse impacts may result from allowing activities in AML areas, but requiring avoidance, minimization and/or compensation may reduce the risk to human health and safety in these areas.

Safety measures taken to reduce the risks associated with geologic hazard sites would be the same as Alternative C, resulting in similar impacts.

Alternative E

Impacts to health and safety under Alternative E would be the same as those described under Alternative B; therefore, the impacts analysis for health and safety under Alternative B is representative of the impacts anticipated under Alternative E.

Alternative F

Impacts to health and safety under Alternative F would be the same as those described under Alternative D; therefore, the impacts analysis for health and safety under Alternative D is representative of the impacts anticipated under Alternative F.

4.8.4 Environmental Justice

This section addresses the potential for the alternatives to have disproportionate adverse impacts on minority and low-income populations, including direct, indirect, short-term, and long-term impacts. Laws, regulations, policies, and guidance considered in the analysis of disproportionate adverse impacts are identified in Appendix B.

Because the analysis of disproportionate adverse impacts depends on the impacts identified from management of resources, definitions of adverse impacts as they apply to environmental justice issues are closely related to the definitions of adverse impacts in other resource areas (e.g., social resources). For example, the displacement of a mobile home park that houses a low-income population in order to build a new road may be a disproportionate direct impact. An example of a disproportionate indirect impact would be a reduction in social services to low-income individuals that may result from decreased tax revenues as a result of decreased mineral production.

4.8.4.1 Methods and Assumptions

Since the analysis of disproportionate adverse impacts is based on other resource impacts, the assumptions for this analysis include the assumptions of other resource areas as they relate to the identification and analysis of impacts. In addition, this analysis assumes that the latest available demographic data from the United States Census and other sources accurately represent the population in the Planning Area.

In accordance with the BLM and CEQ guidance for assessing environmental justice in the planning process, an area is considered to contain a minority population if either the minority population of the impacted area exceeds 50 percent or the percentage of minority population in the impacted area is meaningfully greater than the percentage in the general population. The “general population” is defined as a relevant comparison area, such as the state.

The minority population in the four Planning Area counties in 2010 ranged from 5 percent (Hot Springs) to 16 percent (Washakie), compared with a state average of 14 percent. Only Washakie County has a higher minority population than the state. At the town level, one town in Washakie County (Worland) has a minority population higher than the state average. This town and Washakie County generally, have a relatively high concentration of minority population, as defined in BLM and CEQ guidance (compared to the state).

In terms of low-income populations, in 2007-2011 Hot Springs County had a poverty rate of 14 percent, which exceeds the state level of 10 percent. In 2000 (the latest year for which town-level data are available), several town across the Planning Area had a poverty rate higher than the state, and only a few towns had a lower rate. Thus, there are concentrations of low-income populations within several regions of the Planning Area, as defined in BLM and CEQ guidance.

4.8.4.2 Summary of Impacts by Alternative

The alternatives would be identical with respect to potential impacts on minority and low-income populations. No particular BLM actions proposed in the alternatives would cause disproportionate adverse impacts on minority or low-income populations. The BLM has considered all input from persons regardless of their race, ethnicity, income status, or other social and economic characteristics.

4.8.4.3 Detailed Analysis of Alternatives

Impacts Common to All Alternatives

The demographic conditions in the Planning Area indicate concentrations of low-income populations throughout the Planning Area, and concentrations of minority populations in the town of Worland and Washakie counties. However, there are no direct or indirect impacts of the alternatives that would impact these populations in a different way than the general population within the Planning Area. For example, the lower economic activity associated with Alternative B would cut across all sectors of the economy—from higher-skill managerial jobs to lower-skill service jobs. Thus, there would be no identifiable environmental justice issues or direct or indirect impacts associated with any of the alternatives that are specific to any minority or low-income community or population as defined in Executive Order 12898 or BLM IM 2002-164 (BLM 2002b).

While minority and low-income populations exist in the Planning Area, no particular BLM actions proposed in any of the alternatives have been identified as causing disproportionate adverse impacts on these populations.

Environmental justice guidance also requires that the BLM provides opportunities for people of all backgrounds to have a meaningful voice in the planning process. The BLM has provided numerous opportunities in a variety of different formats and has considered all input from persons regardless of their race, ethnicity, income status, or other social and economic characteristics. Refer to Chapter 5 for a description of public involvement activities associated with the RMP revision.

4.8.5 Tribal Treaty Rights

Adverse impacts to tribal treaty rights and trust responsibilities include, but are not limited to, limitations on access to tribal hunting, fishing, or resource collection areas reserved by treaty, economic issues, and other resource use and access issues. Beneficial impacts could include protection of culturally important archeological sites or sites of traditional or religious importance, and preservation of access to resources. Direct impacts are those that immediately affect resources, whether the impact is to access of the resource or its physical condition. Indirect impacts are related to improved access and can take the form of loss of setting through increased visitation, or reduction in the availability of a plant or animal resource through loss of habitat or over-hunting.

Because archeological sites that may be of cultural importance are finite resources, short-term impacts are the same as long-term impacts. However, impacts to plant or animal resources may be mitigated through conservation plans.

Impacts are identified in consultation with the appropriate tribal groups. The CYFO and WFO coordinate and consult with appropriate Native American groups to identify and consider their concerns in BLM land use planning and decision-making. Interested tribes review proposed land use planning decisions and other major BLM decisions for consistency with tribal land use and resource allocation plans; however, no treaty rights pertain directly to BLM-administered lands within the Planning Area.

4.8.5.1 Methods and Assumptions

Although there are no tribal treaty rights within the Planning Area, the following three assumptions guide the approach to planning that may involve non-treaty Tribal issues:

- All tribally sensitive sites in the Planning Area have not been identified.
- Identification of tribally sensitive sites will benefit heritage resources.
- Tribal consultation benefits heritage resources.
- See Section 4.5.1 *Cultural Resources* for additional assumptions applicable to the impacts analysis for Tribal Treaty Rights.

4.8.5.2 Summary of Impacts by Alternative

There are no tribal treaty rights or trust responsibilities within the Planning Area and as such there are no differences in impacts between the alternatives. Under all alternatives, the BLM would continue to consult with interested tribes regarding issues of importance to the tribes.

4.8.5.3 Detailed Analysis of Alternatives

Impacts Common to All Alternatives

Because no tribal treaty rights or trust responsibilities are known within or mandated by the CYFO or WFO, management actions on the part of the BLM would have no impact on such rights. Each alternative has measures to protect cultural resources, including those related to traditional uses and practices; however, there are no differences among the alternatives in managing tribal treaty rights and trust responsibilities. These are discussed and analyzed in Section 4.5.1 *Cultural Resources* of this chapter. The BLM consults and coordinates with potentially affected tribes as part of the planning process and will continue to consult with interested tribes regarding resource management issues of interest to the tribes. In accordance with federal regulations and policy (e.g., NHPA) the BLM will consult with potentially affected tribes for site-specific actions under all alternatives.

4.9 Cumulative Impacts

The CEQ defines cumulative effects as:

“The impact on the environment which results from the incremental impact of the action when added to other past, present, and reasonably foreseeable future actions regardless of what agency (federal or non-federal) or person undertakes such other actions (40 CFR 1508.7).”

The Bighorn Basin RMP Revision Project addresses the three components of this definition of cumulative effects as follows:

1. *Incremental impacts of the RMP revision.* The incremental impacts of the action (i.e., the revision of the three RMPs), are described for each resource in the preceding sections of this chapter as direct, indirect, short-term, and long-term impacts.
2. *Impacts from all past and present actions.* The impacts from past and present actions are captured in the baseline conditions presented in *Chapter 3 – Affected Environment*. As discussed in that chapter, the description of the current affected environment reflects past and present actions.
3. *Reasonably foreseeable future actions.* Other reasonably foreseeable future actions are identified in Appendix T and the total projected surface disturbance from these actions appears in the following section.

The analysis of cumulative impacts serves to place the projected incremental impacts from the proposed alternatives in the context of past, present, and future impacts. Combining the projected impacts of proposed alternatives with past, present, and future impacts necessarily involves projections and constrains analyses. Public documents prepared by federal, state, and local government agencies are the primary sources of information regarding past, present, and future actions. Speculative or uncommitted projects are not included in the projections. Analyses are limited, primarily due to incomplete documentation of all past and present impacts on private and public lands; challenges in predicting potential impacts for reasonably foreseeable future actions; the programmatic and strategic nature of proposed alternatives; the unknown nature and pace of resource uses and technological changes that could occur; and changing circumstances related to agency priorities, policies, and the economy. These limitations are addressed through the methods and assumptions described in the following section.

This section identifies 42 reasonably foreseeable future projects and actions in or adjacent to the Planning Area. The breakdown of the 42 projects by agency includes five BLM RMPs, one BLM Programmatic Wind Energy EIS, one BLM Programmatic Energy Distribution Corridor EIS, one BLM Programmatic Geothermal Leasing EIS, four County Land Use Plans, seven Conservation District Plans, six Watershed Plans, one Wyoming Department of Agriculture Strategic Plan, three Wyoming Game and Fish Department Plans, one Wyoming State Water Plan for the Wind/Bighorn River Basin, two Wyoming Statewide Outdoor Recreation and Trail Plans, one Wyoming State Historic Preservation Office Statewide Plan, one USFWS Plan, two NPS General Management Plans, one Wyoming State Plan, three County FMPs, one NPS FMP for Yellowstone National Park, and one National Fire Plan. Many of these plans have already been adopted, in which case the reasonably foreseeable actions stem from the ongoing implementation of the plans.

4.9.1.1 Methods and Assumptions

The CEQ suggests cumulative impact analyses should focus on meaningful impacts, and not exhaustively analyze all possible cumulative impacts (CEQ 1997b). Therefore, the analysis in this RMP and EIS focuses on past, present, and future actions anticipated to have environmental impacts similar to the kinds of impacts identified for implementing the alternatives including but not limited to those resulting in meaningful impacts to historically important resources, those with a potential for violating legal standards or laws, or other identified projects or actions in the geographic area of analysis (i.e., the Cumulative Impact Assessment Area [CIAA]) that relate to the identified cumulative impact issues.

To address the effects of these actions, the analysis is structured around a series of cumulative issue statements (described later in this section) that capture the major cumulative impacts in the CIAA. The BLM developed these issue statements using:

1. Issues identified during scoping.
2. Internal scoping (i.e., the professional judgment of BLM resource specialists and Cooperating Agencies).
3. A review of other reasonably foreseeable future actions in the CIAA.
4. Consideration of context and intensity of potential impacts.

For the cumulative impacts analysis, the BLM paid particular attention to: impacts to public health and safety; controversial issues or those with a substantial public interest; the uniqueness of resources affected; potential for violation of legal standards or laws; and potential impacts to legally protected resources.

To focus the scope of cumulative impact analysis, cumulative issues were considered in the context of baseline conditions (*Chapter 3 – Affected Environment*), the incremental impacts on individual resources described in this chapter, the actions and decisions described in the reasonably foreseeable future projects (Table 4-43), and the following factors as modified from the CEQ's *Considering Cumulative Effects Under the National Environmental Policy Act* (CEQ 1997b):

- Does the affected resource have substantial value relative to legal protection and/or ecological, cultural, economic, or social importance?
- Are reasonably foreseeable future actions anticipated to have environmental impacts similar to the kinds of impacts identified for RMP alternatives?
- Have any recent or ongoing NEPA analyses of similar actions in the geographic area identified important adverse or beneficial cumulative impact issues?
- Has the impact to the resource been historically important, such that the importance of the resource is defined by past loss, past gain, or investments to restore resources?

The cumulative impact analysis was further bound by considering the following factors:

- *Timeframe* – Timeframes are based on the duration of the direct and indirect effects of the proposed action and alternatives (the life of the RMP for most issues).
- *Geographic area* – The geographic area of analysis, or the CIAA, covers different geographic areas depending on the specific resource being evaluated. For the most part, the CIAA is the Bighorn Basin (including the portions in Montana) except for 1) issues involving air quality, for which the CIAA will be the affected air sheds and nearby Class I areas; 2) water quality, particularly surface water, which will include drainage areas flowing into and out of the Planning

Area (e.g., Wind River, which turns into the Bighorn River); and, 3) social and economic conditions, for which the CIAA is the four counties that overlap the Planning Area.

- *Analytical assumptions* – see the Assumptions for Analysis below.

4.9.1.2 Assumptions for Analysis

The BLM used the following methods and assumptions in the analysis of cumulative impacts:

- Projections for future oil and gas development activities are based on the *Reasonable Foreseeable Development Scenario for Oil and Gas* (BLM 2014a).
- For the purposes of estimating surface disturbance from reasonably foreseeable actions, for non-BLM activities (excluding oil and gas), the amount and density of activities is generally assumed to be the same for BLM and non-BLM actions, regardless of land ownership. Appendix T contains further information on these assumptions and the acreage of projected surface disturbance by alternative from non-BLM actions. Specific assumptions include:
 - The cumulative impacts from non-BLM mineral actions (excluding oil and gas) are based on the percent BLM vs. non-BLM mineral estate in the Planning Area.
 - The cumulative impacts from other non-BLM development activities are based on the percent BLM vs. non-BLM-administered surface in the Planning Area.
- The context and intensity of non-BLM activities are not anticipated to vary by alternative because these activities do not directly depend on management actions and allowable uses set forth in the RMP alternatives.
- Cumulative impacts, such as soil erosion, spread of invasive species, and habitat fragmentation, are anticipated to increase with the amount of surface disturbance (Table 4-42).
- Actions undertaken by private persons and entities are included and considered in public documents prepared by federal, state, and local government agencies. These public documents are often a source of information for actions undertaken by private entities.
- For the estimation of air quality emissions, the context and intensity of non-BLM activities are not anticipated to vary by alternative. The BLM estimates that on private and fee (i.e., non-federal) land in the Planning Area, there are 201 existing conventional gas wells and 1,342 existing oil wells. At the end of the planning cycle, the BLM projects the drilling of 511 new oil and gas wells on non-federal mineral estate in the Planning Area (BLM 2014a). The BLM used this information to estimate emissions from oil and gas wells for the 2015 and 2024 emission projection years. For natural gas emissions, cubic feet of natural gas produced during the planning cycle on non-federal mineral estate was estimated using expected natural gas production in 2015 and 2024 from projected federal wells in the Planning Area.
- For cumulative impacts associated with other activities (i.e., non-oil and gas), the amount and density of activities is assumed to be the same for both BLM and non-BLM actions; therefore, the analysis of non-BLM salable and locatable mineral activities is based on the proportional mineral estate ownership in the Planning Area (74 percent federal and 26 percent non-federal). The calculation of cumulative impacts for air quality from non-mineral, non-BLM activities is based on the proportion of surface ownership in the Planning Area (56 percent BLM-administered and 44 percent non BLM-administered). Alternative A continues management under the existing plans and is, therefore, assumed to provide the best baseline from which to estimate future emissions for non-BLM actions. Since the context and intensity of non-BLM actions are not anticipated to vary by alternative, the emissions from non-BLM actions estimated under Alternative A were carried forward under alternatives B, C, D, E, and F.

The majority of projects identified in Table 4-43 are programmatic and/or strategic in nature; therefore, the exact intensity or location of anticipated impacts cannot be quantified. For more quantitative analysis, the BLM projected the anticipated surface disturbance and air emissions from non-BLM reasonably foreseeable actions for the entire Planning Area (Appendix T). The estimates of reasonably foreseeable actions in Appendix T are based on historic and trend information, as well as the proportion of public to non-public land in the Planning Area. In addition to estimating reasonably foreseeable actions for BLM and non-BLM actions, Appendix T also projects short-term and long-term surface disturbance. Long-term surface disturbance describes the disturbed area remaining following reclamation. Table 4-42 summarizes projected surface disturbance for BLM and non-BLM reasonably foreseeable actions identified in Appendix T.

Where appropriate, analyses of historic and current trends are used to assess cumulative impacts. For example, the subdividing of private land in rural areas is expected to continue in the future.

Table 4-42. Cumulative Surface Disturbance in Acres from BLM and Non-BLM Reasonably Foreseeable Actions

Action	Alternative A	Alternative B	Alternative C	Alternative D	Alternative E	Alternative F
Total Acres Short-Term Disturbance from BLM Actions	136,253	73,940	245,642	140,175	71,829	137,064
Total Acres Reclaimed from BLM Actions	120,607	63,047	204,157	121,869	62,008	119,384
Total Acres Long-Term Disturbance from BLM Actions	15,646	10,893	41,485	18,306	10,676	17,663
Total Acres Short-Term Disturbance from Non-BLM Actions	24,129	26,183	24,154	24,135	26,183	24,129
Total Acres Reclaimed from Non-BLM Actions	14,494	16,573	14,494	14,498	16,573	14,494
Total Acres Long-Term Disturbance from Non-BLM Actions	9,636	9,610	9,661	9,638	9,610	9,636
Cumulative Long-Term Acres from Disturbance	25,282	20,502	51,146	27,944	20,412	27,299

Most projects identified in Table 4-43 are ongoing and provide a management framework for site-specific actions implemented during the life of the various projects. Though they are considered in this cumulative impacts analysis, refer to Chapter 3 – *Affected Environment*, for a detailed description of site-specific past and present (i.e., ongoing) actions. Only those reasonably foreseeable future actions resulting from the 42 projects identified in Table 4-43 and Appendix T are considered in this cumulative impacts analysis.

4.9.1.3 Cumulative Impacts

The cumulative impacts discussion is organized according to the following seven cumulative issues:

- Cumulative Issue 1:* The cumulative impact on air quality with regard to public health and welfare within the Planning Area and protected Class I areas outside the Planning Area.
- Cumulative Issue 2:* The cumulative impact of activities that disturb soil or vegetation cover on water quality.
- Cumulative Issue 3:* The cumulative impact of management actions on habitat for wildlife and special status wildlife species.
- Cumulative Issue 4:* The cumulative impact of management actions on global climate change.
- Cumulative Issue 5:* Cumulative impacts of management actions and constraints on recreation opportunities.
- Cumulative Issue 6:* The cumulative impact of management actions and projected development on the economic and social conditions of local communities.
- Cumulative Issue 7:* The cumulative impact of management actions on greater sage-grouse. *[Please see Chapter 7 of this document for the greater sage-grouse cumulative effects analysis.]*

To focus the cumulative impact analysis, the BLM determined the seven cumulative issues by using the approach described under Methods and Assumptions. Review of the EISs and associated plans for all 42 projects (Table 4-43) revealed that most reasonably foreseeable actions could be expected to produce environmental impacts similar to the incremental impacts identified for the RMP alternatives. Some resources (i.e., special status species, air quality) that could be affected by reasonably foreseeable future actions have substantial value relative to legal protection and/or ecological, economic, or social importance. Exceeding legal standards or thresholds protecting these resources is not anticipated from the cumulative impacts of BLM and non-BLM actions; however, the programmatic nature of most reasonably foreseeable actions prohibits precise prediction of cumulative impacts. As a result, subsequent environmental impact analysis during project implementation will include more detailed and site-specific analyses of cumulative impacts.

Cumulative Issue 1: The cumulative impact on air quality with regard to public health and welfare within the Planning Area and protected Class I areas outside the Planning Area.

Cumulative Impact Assessment Area

The Bighorn Basin and federal Class I areas within 100 miles.

Analysis of Cumulative Impacts

Base year (2008) and anticipated annual air emissions by alternative for 2018 are organized by project scenario and resource as shown in tables 4-46 through 4-57 for alternatives A through F (tables located at the end of *Cumulative Impacts*). These tables identify each anticipated emission category for projected BLM actions, projected non-BLM actions, and the cumulative total of these actions.

Typical sources contributing to potential cumulative impacts on air quality would include emissions from conventional oil and gas development, vehicle operations associated with mining activities, and general vehicular activity from local residents and tourism. In addition, open burning of agricultural fields, which is a traditional practice in the CIAA, would, along with wildland fires and prescribed burns, result in impacts on air quality from emissions of particulates and polyaromatic hydrocarbons and temporarily reduce visibility in areas. Permitted stationary sources of air emissions, such as the Western Sugar factory in Lovell, Wyoming would also continue to contribute to cumulative impacts on air quality.

Overall, air quality in the Bighorn Basin is good. Some concentrated emission sources may have health impacts to certain local residents. The *Washakie County Comprehensive Plan* notes that a number of emission sources in the county contribute to poor air quality which can disproportionately impact the county's senior and disabled population, who are more susceptible to dust and smoke than the general population (Washakie County 2012). Local policy that encourages land use and development that does not result in new, significant deteriorations of existing air quality would help to maintain current air quality, reduce air quality degradation, and protect public health. However, increases in population would likely bring more development and the potential for more emission sources that could degrade air quality in the Bighorn Basin.

BLM and non-BLM reasonably foreseeable actions are anticipated to increase emissions in the Planning Area over the life of the plan. For the Planning Area, the cumulative air quality impacts (as measured against NAAQS and WAAQS) are anticipated to have the same intensity on BLM- and non BLM-administered lands because it is assumed the density of activities are the same in both areas. This conclusion also assumes that cumulative impacts to air quality are equally distributed across the CIAA. Because of proposed development restrictions on BLM-administered land, the potential for adverse cumulative impacts to air quality are anticipated to be the least under Alternative E, which places the greatest restrictions on resource uses and management actions that contribute emissions, followed by alternatives B, F, D, and A. Cumulative emissions are projected to be highest under Alternative C due to fewer proposed development restrictions on BLM-administered land. Cumulative emissions within the Planning Area are not anticipated to result in air quality impacts that exceed NAAQS or WAAQS given the rather small amount of emissions from BLM and other activities.

Cumulative Issue 2: The cumulative impact of activities that disturb soil or vegetation cover on water quality.

Cumulative Impact Assessment Area

The Bighorn Basin and the reaches of Owl Creek.

Analysis of Cumulative Impacts

The *Soil, Water, and Biological Resources – Vegetation* sections in this chapter describe how surface disturbances, changes in vegetation cover, and other activities affect water quality by increasing or decreasing sediment loads in waterways or otherwise affecting water quality. In general, the more surface disturbance that occurs across the CIAA, the greater the potential impact to water quality. Adverse impacts to water quality would result from both short- and long-term disturbances, even though a majority of the area where surface disturbance is projected to occur on both BLM-administered land and state and private lands would be reclaimed. Sediment loading is of particular concern in Bighorn Lake, which provides for municipal and industrial water supplies and is a major recreation destination (USACE and BOR 2009).

Surface Water Quality

In the CIAA, stream-bank degradation and erosion and gully erosion, due to poor vegetative cover and surface disturbances, are the predominant sources of excessive sediment in waterways. On BLM-administered and private and state lands, surface disturbance caused by mineral and other development, the construction and maintenance of ROWs, and vegetation treatments (e.g., prescribed burns and mechanical fuels treatments) all contribute to short- or long-term losses of vegetation and increased sedimentation. In addition to surface-disturbing activities, impacts to water quality can result from a variety of other activities that can damage or remove vegetation and soil (e.g., improperly managed livestock grazing, OHV recreation, surface discharge of produced water, and concentrated use of riparian areas by wildlife). Sediment loading, along with other water quality issues such as the introduction of fecal coliform bacteria, occurs from private lands in the CIAA due to agricultural activities (e.g., irrigation runoff) and urban and rural subdivision development (Washakie County Conservation District 2006). Even given the high natural background sediment production in the Planning Area (USACE and BOR 2009; Washakie County Conservation District 2006), the South Big Horn Conservation District (2006) notes, “although flow from the rangelands and deserts contribute the majority and peak suspended sediment discharges to the rivers, irrigation wastewater significantly increases the sediment load in streams.” The cumulative impacts of BLM and non-BLM actions on water quality would likely be most pronounced along waterbodies with impaired water quality, such as those on the Wyoming DEQ’s 303(d) list (Wyoming DEQ 2008). The conditions of these waterbodies are partially linked to upland conditions, and they can carry large amounts of sediment downstream when surface flows occur.

As Table 4-42 shows, cumulative surface-disturbance acreage is projected to be highest under Alternative C and the lowest under alternatives B and E; Appendix T includes a breakdown of disturbance by activity. Proper management of surface-disturbing and other activities that can damage vegetation cover in the CIAA would lessen sediment loading and associated adverse impacts to water quality. The application of BMPs on private land is not required in many instances and, therefore, their application would likely be inconsistent across the CIAA. In addition, the management under each RMP alternative (see Chapter 2 *Resource Management Alternatives*) protects BLM-administered lands via restrictions on surface-disturbing and other activities and reclamation requirements of disturbed areas. This management would vary by alternative and would not apply to lands under state and private ownership. The scale and effectiveness of this protective management would be greatest under Alternative B, where the focus is on resource protection, and lowest under Alternative C, where the focus is on resource use and commodity production. As a result, cumulative impacts to water quality due to sediment loading are anticipated to be the most under Alternative C, followed by alternatives A, D, F, B, and E. However, even with the proper application of relevant guidelines, BMP, and restrictive management of resource uses across the CIAA, impacts to water quality from human activity would still continue to occur under all alternatives.

Programs related to education and coordination by Conservation Districts and county zoning regulations that attach minimum lot sizes to residential development may reduce sediment loading of streams in the CIAA. However, if trends associated with the subdivision of larger ranches into ranchettes continues across the Planning Area, and predicted population trends for Park and Big Horn counties occur (see Section 3.8.1 *Social Values*), increased building (e.g., residences or barns) and infrastructure construction, and the associated expansion of impermeable surfaces across the CIAA may lead to additional sediment loading of waterways. Depending on factors such as the type of development and the sediment contribution of the land use it replaces (e.g., agricultural rotational crops), such impacts may be beneficial.

Produced water from oil and gas development is regulated by the Wyoming DEQ, which establishes standards for water quality parameters such as total dissolved solid loads. Proper application of Wyoming DEQ water quality standards (Wyoming DEQ 2002) would lessen the potential for the introduction of water not meeting effluent limits, but this additional water would still result in adverse impacts to stream banks and gully erosion from altered flow regimes. The limited surface discharge of produced water anticipated in the Planning Area would limit the scale of these impacts.

Riparian Areas

In addition to general impacts from surface disturbance, BLM and non-BLM actions that affect riparian/wetland areas can result in substantial impacts to bank stability and the ability of vegetation to capture sediment and other water quality contaminants (see Section 3.1.4 *Water*). The majority of the surface lands along major waterways in the CIAA (i.e., the Bighorn River, Wind River, Clarks Fork of the Yellowstone River, and their associated tributaries, including the Nowood, Greybull, and Shoshone river systems) are privately owned. Of the 139,052 acres of riparian/wetland areas in the Planning Area, only 23,957 acres (17 percent) occur on BLM-administered surface. The large percentage of riparian/wetland areas on private lands means that actions by private landowners can have substantial impacts on the health of these systems and their performance of critical water quality protection functions. Programs and projects, such as those by County Conservation Districts, the National Resource Conservation Service, and county weed and pest districts, have had success in the implementation of proactive measures to improve riparian habitat and other vegetation and water sources (South Big Horn Conservation District 2012; Lumley et al. 2010). To manage riparian/wetland areas that occur on BLM-administered lands, alternatives A, B, D, E, and F apply proactive management measures that prohibit surface-disturbing activities in these areas and require active management of these to meet, or make progress towards meeting, PFC, DFC, or DPC. Management actions under alternatives E, B, F, D, A, and C would result in fewer beneficial impacts, respectively, to BLM-administered riparian/wetland areas. Actions by other entities to protect and restore riparian areas in the CIAA, coupled with protective management under alternatives A, B, D, E, or F may reduce cumulative adverse impacts to water quality by restoring functioning conditions in riparian areas. Such improvement would continue the current trend for these areas (see Section 3.4.3 *Vegetation – Riparian/Wetland Resources*).

Groundwater

The quality and quantity of groundwater in the CIAA is of concern as this water source makes up the majority of the municipal and residential water supply (South Big Horn Conservation District 2006; Big Horn County 2009). Alternatives proposed as part of this RMP revision would have impacts on groundwater through actions that allow or prohibit mineral development. In addition, municipal, mining, agricultural, and industrial use of this resource on state and private lands in the CIAA would affect groundwater quantity. Contamination of this resource from wastewater treatment and septic systems (Big Horn County 2009), as well as improper oil and gas well construction, and improper reinjection of produced water from oil and gas development are the principle groundwater quality concerns in the CIAA.

To limit adverse impacts to groundwater quality from wastewater, counties within the Planning Area are attempting to implement zoning restrictions and county level planning, such as the protection of sensitive groundwater areas in the Big Horn County Land Use Plan (Big Horn County 2009) through requiring larger residential lot sizes to reduce the concentration of wastewater discharge. Additionally, wells used for the reinjection of produced water require a permit from the Wyoming DEQ for construction and operation to insure the reinjected water does not enter into water bearing strata or resurface elsewhere. Though oil and gas development on state and private lands in the Planning Area is

not anticipated to vary by alternative, Alternative C is projected to result in the greatest number of new federal oil and gas wells and, therefore, the greatest potential for cumulative adverse impacts to groundwater, followed by alternatives A, D, F, B, and E.

Cumulative Issue 3: The cumulative impact of management actions on habitat for wildlife and special status wildlife species.

Cumulative Impact Assessment Area

The Bighorn Basin.

Analysis of Cumulative Impacts

The condition of wildlife and special status wildlife species habitat is described in Chapter 3 – *Affected Environment*, and potential impacts to wildlife habitat from BLM actions are described in Section 4.4.6 *Fish and Wildlife Resources – Wildlife* and Section 4.4.9 *Special Status Species – Wildlife* sections in this chapter.

Cumulative impacts on wildlife habitat would result primarily from surface-disturbing and other disruptive activities such as mineral development, road construction, vegetation treatments, rangeland improvements, and urban and rural expansion. These activities would result in short- and long-term impacts to wildlife habitat that may degrade and fragment habitat. Management actions to address the challenges associated with wildlife habitat impacts are listed by alternative in Chapter 2. Regardless of the alternative, the general approaches these management actions take to reduce impacts to wildlife habitat are the prohibition or restriction of certain resource uses and activities on BLM-administered land to control surface-disturbing and disruptive activities. These restrictions are generally applied to the following types of activities: oil and gas development, geophysical exploration, mineral materials disposal, renewable energy and ROW authorizations, and motorized vehicle use. Generally, the more surface disturbance and habitat loss from BLM actions, the greater the contribution to cumulative adverse impacts to wildlife and special status wildlife species. Of all the alternatives, Alternative C places the fewest restrictions on resource uses and surface-disturbing activities and would, therefore, result in the greatest adverse impacts to wildlife and special status wildlife species habitat.

Primary challenges for wildlife habitat management within BLM-administered land include poor habitat conditions, fire management, drought, increased development and urbanization, habitat fragmentation, OHV misuse, disease, hunter access, and the impacts of livestock grazing management on the frequency, quality, and composition of key forage species (see Chapter 3 *Affected Environment* for more information). The challenges associated with impacts to wildlife habitat are anticipated to continue under all alternatives. Additionally, surface-disturbing activities, wildfires, spread of invasive species, and activities that remove vegetation are anticipated to impact wildlife habitat regardless of land ownership. Wildlife habitat impacts from non-BLM actions in the CIAA are primarily anticipated from urban and energy development and associated infrastructure (e.g., roads, pipelines, powerlines), although the intensity of development on private lands is not expected to vary by alternative.

As noted in Chapter 3, many wildlife populations spend considerable time on non BLM-administered lands and are therefore proportionately impacted by the management of these lands. Important wildlife habitat such as migration corridors and crucial winter ranges extend across the patchwork of land ownership in the CIAA. For example, the Planning Area contains 2,484,330 acres of big game crucial winter range, of which 47 percent is on non BLM-administered lands (BLM 2009a). Surface disturbance and other development (e.g., oil and gas) on these lands are not subject to the same

restrictions designed to protect wildlife habitat on BLM-administered land and may increase the cumulative impacts on wildlife habitat. Given the varied land ownership pattern, protecting large blocks of intact habitat is a management challenge in the CIAA. The WGFD has, as part of its *Strategic Habitat Plan*, developed strategies to implement partnerships/projects with private landowners and land management agencies to preserve and restore habitat at the watershed or landscape level across land ownership boundaries (WGFD 2009a). Within the Shoshone and Bighorn National Forests, wildlife specific management would protect habitat along the edges of the basin. For example, in the Bighorn National Forest Plan, the USFS applies seasonal restrictions on motorized travel routes to reduce disturbance in key big game areas such as birthing areas and winter ranges (USFS 2005a).

Increased residential development and an expanded network of roads in portions of the CIAA may contribute to a reduction in suitable wildlife habitat. While the majority of population growth would likely occur in population centers where most of the job opportunities exist, such as in Cody, Powell, and Worland, rural development may have a greater proportional impact if the development occurs near sensitive wildlife habitat. In Washakie County, for example, the rural population increased by approximately 17 percent during the 1990s, accompanied by an increase in the number of second homes in and against the mountains where much of the big game crucial winter range occurs (Washakie County 2012). The trend in second home development is not isolated to Washakie County, occurring along the mountains in other parts of the Bighorn Basin, and would result in an increase in cumulative impacts on wildlife and their habitat. Additionally, the practice of subdividing larger private parcels to support development of residential subdivisions and ranchettes (e.g., 35-acre parcels) is expected to continue and contribute to wildlife habitat impacts (Big Horn County 2009). As larger tracts of land adjacent to public lands are subdivided, the WUI and its associated effects (e.g., habitat degradation and fragmentation, fire suppression, and spread of invasive species) are expected to increase. Some tracts of BLM-administered land may become disconnected or isolated from other native habitats and ultimately adversely affect CIAA biological diversity. In addition, with multiple land owners in the WUI, management of resources and resource uses affecting wildlife habitat, including invasive species spread, fire, wildlife, livestock grazing, motorized vehicle use, and development are expected to be varied.

Oil and gas development would result in one of the greatest impacts to wildlife habitats. While reclamation and mitigation procedures would reduce the short-term impact from surface disturbance associated with oil and gas development, permanent facilities such as roads and well pads would result in long-term impacts. Cumulative impacts would be greater where mineral development is more intense, such as in Oil and Gas Management Areas designated under alternatives C, D, and F, and on state and private land where fewer protections for habitat exist. Impacts would also be greater where oil and gas activity occurs in and around sensitive wildlife habitat such as crucial winter range. For example, several producing oil and gas fields overlap big game crucial winter range on private and state land along the Absaroka Front on the western edge of the Bighorn Basin. Cooperative management among landowners and the BLM in accordance with the Absaroka Front HMP would help to reduce the impacts to wildlife associated with mineral development in this area (BLM 1986a).

In general, cumulative impacts to special status wildlife species habitat would be the same as those for wildlife habitat. Surface-disturbing activities would tend to degrade and fragment habitat, having a greater impact where sensitive habitat and development occur. For example, many raptor nests occur near riparian areas, such as the Bighorn River corridor, where recreation and private development are common. On federal land, special status wildlife species would be protected by site-specific mitigation under the ESA and Wyoming BLM sensitive species guidance. However, on private and state lands, protection of non-federally listed species may not occur.

Cumulative impacts to wildlife and special status wildlife species habitat are anticipated to be least under alternatives B and E, which provide the most measures to minimize wildlife habitat loss and fragmentation and close the most wildlife habitat to oil and gas development in the CIAA, followed by alternatives F, D, A, and C. The greatest adverse cumulative impacts to wildlife habitat are anticipated under Alternative C because this alternative allows the most development with the least restrictions to address wildlife habitat conservation on BLM-administered lands. For this analysis, habitat impacts from non-BLM actions are assumed not to vary across alternatives. In addition, habitat impacts from non-BLM actions on private lands may be greater than impacts on public lands based on the fact that privately held lands are subject to fewer restrictions and generally experience more development compared to public lands.

To ensure consistency across the greater sage-grouse's range, the BLM's National Operation Center has conducted management zone and range-wide cumulative effects analyses. See Chapter 7 for the Bighorn Basin greater sage-grouse cumulative effects analysis.

Cumulative Issue 4: The cumulative impact of management actions on global climate change.

Cumulative Impact Assessment Area

Global.

Analysis of Cumulative Impacts

The lack of scientific tools (models with sufficient spatial and temporal resolution) to forecast climate change even at regional scales limits the ability to quantify effects of current and future management on global climate change. Given this current state of climate change science, it is not yet possible to associate specific actions with specific impacts in a given local area. As a result, a discussion of incremental impacts on climate change resulting from BLM actions when added to other past, present, and reasonably foreseeable future actions is not possible.

However, when added to past, present, and reasonably foreseeable future actions, the alternatives would result in overall differences in GHG emissions and contributions to climate change. Due to the lack of information for GHG emissions from past, present, and reasonably foreseeable future actions, cumulative impacts are analyzed qualitatively among the alternatives comparing management that would likely affect global climate change. Alternative C would result in the greatest cumulative impacts to climate change resulting from the most oil and gas development, the most surface disturbance, and the highest amount of fossil fuel combustion from motor vehicles, compared to the other alternatives. Alternatives B and E would result in the least cumulative impacts to climate change due to the least amount of oil and gas development, the least projected surface disturbance, and the most conservation of biological resources that retain sequestered carbon and minimize emissions. Alternatives D and F would result in greater cumulative impacts to climate change than alternatives B and E, less than Alternative C, and similar impacts to Alternative A (see Tables 4-10 and 4-15).

Implementation of the alternatives and other reasonably foreseeable future actions in the Planning Area would produce GHG emissions resulting in a minor contribution to climate change. Any noticeable effects of climate change in any given area result from the cumulative aggregation of all worldwide GHG emissions, global climate patterns, and other forces. As a result, the cumulative impacts to climate change resulting from BLM management and other past, present, and reasonably foreseeable future actions in the Planning Area would likely have no measurable effect on global climate change.

Cumulative Issue 5: Cumulative impacts of management actions and constraints on recreation opportunities.

Cumulative Impact Assessment Area

The Bighorn Basin, plus the BLM Billings Field Office, Montana.

Analysis of Cumulative Impacts

Recreation (Section 4.6.5) and *Comprehensive Travel and Transportation Management* (Section 4.6.4) describe how management actions under each alternative affect recreation opportunities in the Planning Area. As with direct and indirect impacts, cumulative impacts would most likely occur from surface-disturbing activities (primarily related to minerals development), which change recreational settings, and from constraints, which limit access and recreational motorized vehicle use.

Resource development and surface-disturbing activities (e.g., oil and gas development, fire and fuels management) on BLM-administered lands and private and state lands can result in increased visual intrusions, noise, and visitor contacts that interfere with realizing desired beneficial outcomes and displace recreational users from their desired setting-specific areas. Recreationists seeking undisturbed landscapes are particularly affected by surface disturbance, especially in back country and primitive recreation settings. While much of this activity would be mitigated or avoided on BLM-administered lands regardless of the alternative, many of the restrictions discussed in this RMP do not apply to private and state lands in the CIAA. Cumulative impacts to recreation would therefore be greatest at the intersection of primitive or back country recreation areas and private lands, especially in areas where mineral potential or urban development potential is highest. Alternatives B and E would result in the least cumulative surface disturbance and protects the most area suitable for primitive recreation (via lands with wilderness characteristics, WSRs, and recreation management areas), followed by alternatives F, D, A, and C. As discussed under Cumulative Issue 3, cumulative impacts to wildlife can result from mineral and residential development (particularly in areas where such development overlaps important wildlife habitat). Development may displace big game populations, resulting in adverse impacts to opportunities for hunting, a major recreation activity in the Planning Area. Though management under the RMP cannot dictate management on private and state lands, protecting habitat on BLM-administered lands would benefit hunting across the CIAA by protecting important life-cycle habitat for game species and thus insuring their continued presence. Alternatives B and E would result in the smallest loss of wildlife habitat and the greatest benefits from proactive management actions in the CIAA (e.g., closing areas to oil and gas development), followed by alternatives F, D, A, and C respectively.

Potential long- and short-term cumulative impacts to recreation may also occur from land use restrictions established to protect sensitive resources. Development activities that improve legal access to public lands, establish new and improve existing roads, and increase opportunities for motorized travel may benefit recreational experiences for motorized vehicle (OHV) recreationists. Alternative C would be the most effective at increasing motorized recreation opportunities, followed by alternatives A, D, F, B, and E. Increasing resource use and development may increase traffic on some roads and trails and increase the potential for long-term conflicts between commercial and recreational use of these roads. Conflict may also occur if development on private lands adjacent to BLM-administered lands includes sensitive noise receptors (i.e., second home development or rural subdivisions); such development would likely occur regardless of the RMP alternative. Construction of pipelines, fences, and transmission lines would increase hazards to recreational motorized vehicle users and reduce public

safety in certain areas. Management that results in a decrease in the amount of area available to motorized vehicle use on BLM-administered lands would be greatest under alternatives B and E, followed by alternatives F, D, A, and C. The availability of motorized recreation opportunities on private and state land is not anticipated to vary by alternative; however, increased access on adjacent BLM-administered lands may lead to increased use of non-BLM lands or, conversely, closing areas of BLM-administered land to motorized vehicles may displace these users to private or state lands.

Cumulative Issue 6: The cumulative impact of management actions and projected development on the economic and social conditions of local communities.

Cumulative Impact Assessment Area

The assessment area for cumulative social and economic conditions consists of the four counties that overlap the Planning Area.

Analysis of Cumulative Impacts

Analysis in this section primarily focuses on cumulative impacts related to oil and gas activity, ranching and livestock grazing, and quality of life, including nonmarket values.

The impacts of oil and gas drilling and production described in Section 4.8.2 *Economic Conditions* relate to activities only on BLM-administered surface and federal mineral estate within the Planning Area. However, oil and gas activity on private and state land is estimated to constitute a substantial portion of projected oil and gas activity in all alternatives (see Table 4-44 below). Specifically, in Alternative A, oil and gas drilling and production on state and private land would comprise about 30 percent of total activity; in alternatives B and E, about 51 percent; in Alternative C, about 28 percent; in Alternative D, about 30 percent; and in Alternative F about 31 percent. Note that the percentage is greatest in alternatives B and E. This is another way of saying that the overall change in earnings, employment, and output would be proportionally smaller than the reduction in activity on federal lands would suggest. To see this, note that the analysis earlier in Chapter 4 – focused on federal lands only – showed \$78 million in earnings and 1,177 jobs related to oil and gas drilling, completion, and production in Alternative A, and \$31 million in earnings and 472 jobs for the same activities in Alternative B – a 50 percent reduction. The comparable figures incorporating state and private production are \$111 million and 1,675 jobs for Alternative A, and \$64 million and 970 jobs for Alternative B – a 42 percent reduction. While the reduction from Alternative A to Alternative B would still be substantial, the stability of state and private production would moderate the change in federal policy.

Table 4-44. Cumulative (including State and Private) Impacts of Oil and Gas Development over the Life of the Plan in the Planning Area for Economic Conditions

Impact ¹	Alternative A	Alternative B	Alternative C	Alternative D	Alternative E	Alternative F
Annual Average Earnings	\$110.6	\$64.1	\$118.0	\$107.9	\$63.9	\$107.8
Annual Average Output	\$865.1	\$500.9	\$922.5	\$843.6	\$500.1	\$843.2
Net Present Value of Output	\$9,932.0	\$5,750.0	\$10,590.9	\$9,685.0	\$5,741.2	\$9,681.1
Annual Average Employment ²	1,675	970	1,787	1,633	968	1,632
Change from Alternative A – Earnings	N/A	-\$46.6	+\$7.4	-\$2.7	-\$46.7	-\$2.8
Change from Alternative A – Employment	N/A	-705	+112	-42	-707	-43
Percentage change from Alternative A (earnings, employment)	N/A	-42%	+7%	-2%	-42%	-3%
Percentage change from Alternative A (earnings, employment), for federal land only	N/A	-60%	+10%	-4%	-60%	-4%

Source: Calculated using the IMPLAN model, as described in the text. Includes oil and gas well drilling and completion, and production from new wells, as estimated in the BLM’s Reasonable Foreseeable Development Scenario for federal, state, and private land.

¹All dollar values are in millions of year 2011 dollars. Net present value of output is discounted at a 7 percent real discount rate, as recommended in OMB 2002.

²Employment is in annual job equivalents.

BLM Bureau of Land Management
 IMPLAN Impact Analysis for Planning model
 N/A not applicable

Similarly, the effect of oil and gas activities on state and private land moderates the changes in earnings and employment for alternatives C, D, and F. In Alternative C, oil and gas activity on federal lands would create 10 percent more jobs and earnings than Alternative A, but incorporating state and fee lands would reduce this effect to a 7 percent increase. In Alternative D, oil and gas activity on federal lands would create 4 percent fewer jobs and earnings than Alternative A, but incorporating state and fee lands would reduce this effect to a 2 percent decrease. Finally, in Alternative F, oil and gas activity on federal lands would create 4 percent fewer jobs and earnings than Alternative A, but incorporating state and fee lands would reduce this effect to a 3 percent decrease.

Under each alternative various management actions constrain mineral development on BLM-administered land for the protection of other resource values. These constraints can limit the mineral development activity on BLM-administered surface and mineral estate and constrict the minerals-based economy in the Planning Area. Table 4-45 summarizes the number of constrained federal wells and unconstrained non-federal wells for each alternative over the life of the plan.

Table 4-45. Reasonable Foreseeable Development Well Number Projections

Well Type	Alternative A	Alternative B	Alternative C	Alternative D	Alternative E	Alternative F
Number of Projected New Federal Wells	1,184	457	1,304	1,141	454	1,141
Projected Number of Abandoned New Federal Wells	228	89	250	220	89	220
Projected Productive New Federal Wells	956	368	1,054	921	365	921
Number of Projected New Non-federal Wells	511	511	511	511	511	511
Projected Number of Abandoned New Non-federal Wells	98	98	98	98	98	98
Projected Productive New Non-federal Wells	413	413	413	413	413	413
Cumulative New Wells (Federal and Non-federal)	1,695	968	1,815	1,652	965	1,652
Cumulative Abandoned New Wells (Federal and Non-federal)	326	187	348	318	187	318
Cumulative Productive New Wells (Federal and Non-federal)	1,369	781	1,467	1,334	778	1,334

Sources: BLM 2009d; BLM 2013a

The projected number of cumulative productive new wells is greatest under Alternative C (1,467) and the least under Alternative B (781). The percent increase/decrease from the number of new wells under Alternative A follows.

- Alternatives B and E – 43 percent decrease
- Alternative C – 7 percent increase
- Alternatives D and F – 3 percent decrease

A change in energy development and mining, whether increase or decrease, is likely to have a substantial social and economic impact within the Planning Area. As noted in the *Economic Conditions* section of this chapter, Alternative C is anticipated to result in the most substantial increase of economic opportunities with the highest projected job growth for the Planning Area. Alternatives D, F, B, and E would result in progressively greater decreases. Regional employment under Alternative C is also anticipated to average the greatest number of full and part-time jobs per year related to the oil and gas, livestock grazing, and recreation industries, which may result in beneficial impacts on quality of life. However, Alternative C may also result in adverse impacts to air quality, wildlife, and other resources that improve quality of life related to natural characteristics as priorities would be placed on the use of resources such as oil and gas development over the conservation of resources such as air quality and wildlife.

Comparatively, alternatives B and E would provide the least economic and social benefits as measured by jobs and income; priorities under these alternatives are centered on conservation of land and existing environmental conditions. Alternative D and Alternative F, respectively, would result in more opportunities than Alternative B, but fewer economic and social opportunities than Alternative C and Alternative A; the latter essentially represents the continuation of current trends. However, Alternative D would continue BLM’s current practice of allowing multiple uses, balancing the use of resources such as oil and gas reserves with the conservation of resources such as air quality, open space, and wildlife

range areas while providing an increase in job opportunities dispersed geographically across the Planning Area. Overall, Alternative D updates BLM's land and resource management guidelines in the Planning Area while preserving both job opportunities and nonmarket values associated with open space and the environment. Management under Alternative F is similar to Alternative D except in the Greater Sage-Grouse PHMA ACEC, where additional restrictions on the amount and type of development would apply. In the ACEC under Alternative F, open space and environmental considerations would be prioritized, potentially limiting job opportunities in comparison to Alternative D.

Past, present, and reasonably foreseeable future actions in the Planning Area and surrounding geographic areas would also affect both traditional economic measures (earnings, jobs, output) and nonmarket values in the Planning Area. For example, the BLM Lander Field Office RMP, which is being updated concurrent with the CYFO and WFO RMPs, would update BLM's direction and management plans in the Lander Field Office, which includes some land in Hot Springs County as well as several neighboring counties. Thus, the choice of alternatives in the Lander RMP could directly affect social and economic conditions in the Planning Area for the Bighorn Basin RMP. However, based on past BLM actions and present policy of balanced management of land and resources, the combined effects within the Planning Area – either on traditional economic measures or nonmarket values – would not likely be different from those under the alternatives considered in this planning effort.

A combination of market conditions and state and federal policy related to ranching and livestock grazing in Wyoming, and across the Rocky Mountain West, has created adverse economic conditions for many farms and ranches in the Planning Area. BLM management actions have the potential to help mitigate the effects of past and present trends that make livestock grazing more challenging, or to exacerbate those trends and further reduce the opportunities for livestock grazing operators. For example, some ranch owners raise money for retirement or other purposes by subdividing portions of their land into ranchettes and selling them to individuals. The sale of these ranchettes provides financial liquidity to ranchers who frequently have most of their assets in land, but generally results in increased building of fences, houses, and sometimes other structures (e.g., barns), changing the character of the landscape. Under all alternatives, this trend is likely to continue, because it is fundamentally related to (1) the nature of the ranching business (principally, the fact that most ranchers' assets are in land, and the fact that profit margins are generally low and can turn negative in drought or other adverse conditions) and (2) state laws that govern property subdivision, under which county zoning laws cannot regulate subdivisions of 35 acres and larger. However, RMP alternatives that adversely affect the profitability of ranching could serve to increase this trend. Specifically, alternatives B and E would have an adverse impact on continued profitability of livestock operators, and under this alternative, the subdivision, sale, and development of ranchettes could accelerate. This would result in a substantial cumulative impact, and the contribution of the BLM action would be cumulatively considerable. Alternatives A, C, D, and F would not be expected to exacerbate this cumulative impact.

Under all alternatives, however, potential cumulative impacts on livestock grazing operations could also result from a combination of activities and land uses occurring within the Planning Area primarily from surface-disturbing activities, human disturbances, and the presence of wildlife that compete with livestock for rangeland resources. Additionally, any increases in human population relative to increased job growth could create additional demands for recreational use of the public lands and could result in livestock displacement, increases in noxious weed infestation, and costs to operators and public land management areas. (However, only Alternative C would result in increased job growth compared to the current trend, and the increase would be small.)

Cumulative Impacts

Despite the potential for cumulative impacts resulting from various operations in the Planning Area, overall cumulative impacts of BLM and non-BLM actions are not anticipated to have long-term adverse impacts on livestock grazing on public lands, since anticipated impacts to grazing lands would occur gradually over the life of the plan, except in alternatives B and E where the impacts of livestock grazing withdrawals would be substantial for the reasons noted above. Additionally, the implementation of BLM's mitigation guidelines, reclamation requirements, surface-use restrictions, rangeland guidelines, vegetation treatments, and monitoring efforts would provide protection to forage resources on federal lands, which would help reduce overall impacts on livestock grazing resources and operations.

Cumulative Issue 7: The cumulative impact of management actions on greater sage-grouse.

To ensure consistency across the greater sage-grouse's range, the BLM's National Operation Center has conducted management zone and range-wide cumulative effects analyses. See Chapter 7 for the Bighorn Basin greater sage-grouse cumulative effects analysis.

4.10 Irreversible and Irretrievable Commitment of Resources

Section 1502.16 of CEQ regulations requires that the discussion of environmental consequences include a description of “...any irreversible or irretrievable commitment of resources which would be involved in the proposal should it be implemented.” An irreversible commitment of resources refers to decisions affecting the use of resources (generally nonrenewable resources) that limit the ability for future generations to use that resource. For example, extraction and processing of sand and gravel as part of an aggregate mining operation is considered an irreversible commitment of salable minerals. This action is irreversible because once the minerals are extracted and processed, they cannot be renewed in the ground within a reasonable timeframe, and are therefore unavailable for use by future generations. An irretrievable commitment of resources refers to decisions resulting in the loss of production or use of a resource. For example, a decision not to treat juniper encroachment into adjacent sagebrush habitat results in the irretrievable loss of forage production from the grassland community. This action is not irreversible, because a treatment applied to the encroaching juniper could restore the forage production of the sagebrush habitat.

Though the decision to select one of the six alternatives described in this **Proposed** RMP and **Final** EIS does not authorize implementation level (activity- or project-specific) activities, all of the alternatives contain decisions on the management of resources that may lead to future irreversible and irretrievable commitments of those resources. Decisions made in the selected plan serve to guide future actions and subsequent site-specific decisions. Following the signing of the RODs for the RMP revision, implementation plans will be developed and implemented by the BLM. Implementation decisions require appropriate project specific planning and NEPA analysis, and constitute BLM’s final approval authorizing on-the-ground activities to proceed. Assuming the BLM selects one of the action alternatives, and that subsequent implementation decisions authorize activity- or project-specific plans, irreversible and irretrievable commitment of resources would occur. For most resources, the RMP will provide objectives for management and guidance for future implementation level decisions to minimize the potential for irreversible and irretrievable commitments of resources.

Table 4-58 identifies the irreversible and irretrievable impacts to resources and resource uses that may occur as a result of implementing one of the six alternatives. No irreversible or irretrievable commitment of resources are anticipated for air quality, visual resources, lands and realty, renewable energy, ROW and corridors, CTTM, recreation, special designations, and socioeconomic resources.

Table 4-58. Irreversible and Irretrievable Resource Commitments

Resource	Irreversible	Irretrievable	Explanation
Physical, Biological, and Heritage Resources			
Soil	X		Surface-disturbing activities, nonmechanized activities, and natural processes cause soil erosion in the Planning Area. Soil formation can take thousands of years and, therefore, eroded soil and, to a lesser extent, lost productivity are considered unrecoverable.
Water		X	Depletion of surface water from in the Planning Area watersheds may result in an irretrievable commitment of water that would otherwise have contributed to the Missouri River System. Produced water from oil and gas wells in the Planning Area may be an irretrievable commitment of groundwater, depending on its use, once it reaches the surface. Increases in sediment, salinity, and nonpoint source pollution that result from surface-disturbing activities could result in degradation of water quality and an irretrievable loss of water utility.
Vegetation		X	Allowing surface-disturbing activities consistent with the BLM's multiple-use mandate would result in both long- and short-term alteration and removal of vegetation cover that would not be available to meet other resource objectives. In some instances, disturbance may result in a long-term shift in plant communities.
Fish and Wildlife		X	Activities that result in the alteration of habitat by shifting vegetation communities can displace wildlife, reduce carrying capacity, and change wildlife communities, resulting in lower species diversity and, thus, irretrievable commitment of these resources. Potential impacts to wildlife include obstacles and barriers affecting traditional ranges and migration corridors of big game and resulting in concentrated herbivory that may cause damage to habitat.
Cultural and Paleontological Resources	X		Any surface-disturbing activities may damage, destroy, or otherwise affect cultural and paleontological resources. Once disturbed, these resources cannot be replaced and the potential for collecting or preserving meaningful data is compromised.
Resource Uses			
Locatable Minerals	X		Allowing the removal of locatable minerals from the ground is considered an irreversible commitment of these resources.
Leasable Minerals	X		Allowing the removal of oil and gas or any solid leasable mineral from the ground is considered an irreversible commitment of these resources.
Mineral Materials	X		Allowing the removal of mineral materials from the ground is considered an irreversible commitment of these resources.
Forest Products		X	Any decision to prohibit silviculture treatments is an irretrievable commitment of the wood fiber produced.
Livestock Grazing		X	Forage consumed by livestock is unavailable for wildlife. Conversely, any decision to prohibit livestock grazing is also an irretrievable commitment of the forage produced.

4.11 Unavoidable Adverse Impacts

Assuming that the BLM selects one of the action alternatives and that subsequent implementation decisions authorize activity- or project-specific plans, unavoidable adverse impacts would occur. Unavoidable adverse impacts are the residual impacts of implementing management actions or allowable uses after BMPs and mitigation measures are applied. As discussed in Section 4.10 *Irreversible and Irretrievable Commitments of Resources*, the decision to select one of the four alternatives described in this RMP and EIS would not result in unavoidable adverse impacts because the decision does not authorize on-the-ground activities.; however, subsequent implementation level decisions may. This section describes the potential unavoidable adverse impacts that may occur from these implementation level decisions.

Surface-disturbing activities (e.g., construction of well pads and roads, pits and reservoirs, pipelines and powerlines, mining, and vegetation treatments), OHV use, fire and fuels management, some recreational activities, concentrated herbivory, and operation and maintenance of existing facilities and infrastructure in the Planning Area would cause fugitive dust, exhaust emissions, and smoke, thereby adversely affecting air quality through the release of HAPs, VOCs, CO, SO₂, NO, and PM₁₀ into the atmosphere. In addition, these activities would release CO₂, CH₄, and other GHGs into the atmosphere.

Surface-disturbing activities, motorized vehicle use and recreation, fire and fuels management, herbivory, and the operation and maintenance of existing facilities and infrastructure in the Planning Area would contribute to soil erosion and soil compaction, sediment loading of waterbodies, and the potential spread of invasive species. Invasive species will continue to spread via the wind, in water courses, and by attaching to livestock, wildlife, humans, and vehicles. The continued presence of invasive species in the Planning Area is considered an unavoidable impact.

Surface-disturbing activities and the development of mineral, energy, and other facilities in the Planning Area are expected to cause the unavoidable degradation, loss, and fragmentation of habitats, and therefore will unavoidably affect wildlife that depends on these habitats. Motorized vehicle use and recreational activities, fire and fuels management, concentrated herbivory, and the operation and maintenance of existing facilities and infrastructure in the Planning Area would contribute to the unavoidable degradation, loss, and fragmentation of habitats.

Protection of some resource values (e.g., wildlife, special status species, cultural, cave and karst, and paleontological resources) would adversely affect the development of minerals and renewable energy. Conversely, the development of minerals and renewable energy would adversely affect the distribution of some wildlife, special status species, and vegetative communities.

Surface-disturbing activities and development for resource uses would change the landscape, scenic quality, and setting in the Planning Area. Surface-disturbing activities, motorized vehicle use, theft and vandalism, and natural processes (e.g., erosion) would adversely affect cultural and paleontological resources in the Planning Area.

Bighorn Basin Resource Management Plan Revision Project

Proposed Resource Management Plan and Final Environmental Impact Statement

Wyoming - Cody & Worland Field Offices

Volume 3 of 4 Chapters 5 - 7, Glossary, and Maps

May 2015

The BLM's multiple-use mission is to sustain the health and productivity of public lands for the use and enjoyment of present and future generations.

The Bureau accomplishes this by managing such activities as outdoor recreation, livestock grazing, mineral development, and energy production, and by conserving natural, historical, cultural, and other resources on public lands.

CHAPTER 5 – PUBLIC INVOLVEMENT AND LIST OF PREPARERS

Public involvement, consultation, and coordination initiated prior to and occurred throughout preparation of the Bighorn Basin Resource Management Plan (RMP) revision and associated Environmental Impact Statement (EIS). The Bureau of Land Management (BLM) incorporated public involvement, consultation, and coordination through public meetings, informal meetings, individual contacts, news releases, newsletters, workshops, a planning website, and the *Federal Register*. This chapter describes the public involvement process, as well as other key consultation and coordination activities undertaken to prepare the EIS in support of the RMP revision. It also contains the List of Preparers in Table 5-3.

The BLM decision-making process is conducted in accordance with the requirements of the National Environmental Policy Act (NEPA), Council on Environmental Quality (CEQ) regulations implementing NEPA, and the United States Department of the Interior (DOI) and BLM policies and procedures implementing NEPA. NEPA and the associated regulatory and policy framework require that all federal agencies involve the interested public and potentially affected parties in their decision-making, consider reasonable alternatives to proposed actions, and prepare environmental documents that disclose the potential impacts of proposed actions and alternatives.

A Notice of Intent (NOI) published in the *Federal Register* on October 17, 2008, formally announced the BLM's intent to revise the existing plans and prepare the associated EIS. The NOI initiated the scoping process and invited participation of affected and interested agencies, organizations, and members of the public in determining the scope and issues to be addressed by alternatives and analyzed in the EIS. The BLM solicited additional public involvement, including cooperating agency meetings and workshops, to help identify issues to be addressed in developing a full range of land management alternatives. Subsequent to the release of the Draft RMP and Draft EIS on April 22, 2011, the BLM held six public meetings in June 2011 to discuss the commenting process, respond to questions, and solicit comments on the Draft RMP and Draft EIS. The BLM also held six public meetings in September of 2013 following the release of the Supplement to the Draft RMP and Draft EIS on July 12, 2013. Table 5-1 lists public involvement, coordination, and consultation events.

5.1 Public Involvement

In accordance with CEQ scoping guidance, the BLM provided opportunities for public involvement as an integral part of revising the RMP and preparing the EIS. CEQ scoping guidance defines scoping as the “process by which lead agencies solicit input from the public and interested agencies on the nature and extent of issues and impacts to be addressed and the methods by which they will be evaluated” (CEQ 1981). The scoping report, which summarizes public participation during scoping and issues identified during the scoping process, is available on the Bighorn Basin RMP website at: <http://www.blm.gov/wy/st/en/programs/Planning/rmps/bighorn.html>.

The intent of the scoping process is to provide an opportunity for the public, tribes, other government agencies, and interest groups to learn about the project and provide input on the planning issues, impacts, and potential alternatives that will be addressed in the EIS, and the extent to which those issues will be analyzed. In general, public involvement during scoping assists the agency through the following:

- Broadening the information base for decision-making
- Informing the public about the EIS and proposed RMP and the potential impacts associated with various management decisions

Public Involvement

- Ensuring public needs and viewpoints are brought to the attention of the agency
- Determining the scope and the significant issues to be analyzed in depth in the EIS

Table 5-1. Public Involvement, Coordination, and Consultation Events

Date	Location	Event
November 5, 2008	Thermopolis, Wyoming	Public Scoping Meeting

September 12, 2013	Worland, Wyoming	Supplemental EIS Public Meeting

EIS Environmental Impact Statement
RMP Resource Management Plan

5.1.1 Scoping Period

Publication of the NOI on October 17, 2008 announced the BLM's intention to revise existing plans and prepare an EIS. The scoping period provides an opportunity for the public to identify potential planning issues and concerns associated with the RMP and EIS. Information obtained by the BLM during scoping is combined with issues identified by the agencies to form the scope of the EIS.

5.1.2 Public Notification of Scoping

News Release

The BLM issued a news release to local media on October 14, 2008, describing the upcoming NOI and listing the time, date, and location of the public scoping meetings. Copies of the news release went out to numerous radio stations and newspapers within and outside the Planning Area. The news release was also posted on the Bighorn Basin RMP Revision Project website.

Postcard

Another means of outreach prior to the public scoping meetings included a postcard mailing announcing the scoping meetings. The BLM mailed the postcards to cooperating agencies, individuals and organizations on the project mailing list (see the following section, Scoping Meetings), as well as P.O. Box holders in the Planning Area. The BLM mailed 2,679 postcards on October 21, 2008, and more than 2,500 were successfully delivered.

Additional Sources of Public Information about the Scoping Process

In addition to news releases and other notifications from the BLM regarding the scoping process, some members of the public received notification from other sources. More than 15 articles and news bulletins regarding some aspect of the RMP process were published in newspapers, both within and outside the Planning Area. Many of the articles listed the dates for the scoping period and the dates, times, and locations of public scoping meetings. Most of the articles provided some background regarding the purpose of the RMP revision and information about the process. The County Commissioners for the counties within the Planning Area, all of whom are cooperating agencies, also contacted county residents and interest groups. The County Commissioners from Park County used an automated phone system, e-mails, and radio to contact thousands of county residents and invite them to attend the public meetings and participate in the scoping process. Big Horn, Washakie, and Hot Springs Counties performed similar outreach efforts including contacting county residents, posting flyers, and taking part in radio outreach.

Website

On October 17, 2008, the Bighorn Basin RMP Revision Project website came online. The website provides background information on the project, a description of the scoping process and meeting locations, instructions on how to submit comments, a map of the Planning Area, and copies of public information documents such as the NOI and the Preparation Plan. The website is one of the methods used to communicate project news and updates to the public. The website can be accessed at: <http://www.blm.gov/wy/st/en/programs/Planning/rmps/bighorn.html>.

5.1.3 Scoping Meetings

During the weeks of November 3, 2008 and November 10, 2008, the BLM hosted scoping meetings in six locations across the Planning Area. Table 5-1 lists the scoping meeting locations and dates. The six public scoping meetings provided the public with an opportunity to learn and ask questions about the project and the planning process and to submit their issues and concerns to the BLM. The BLM chose an open house format over a more formal public meeting format to encourage broader participation, to allow attendees to learn about the project at their own pace, and to enable attendees to ask questions of BLM representatives in an informal one-on-one setting.

In addition to members of the BLM Interdisciplinary Team, a total of 381 people attended the scoping meetings. The BLM provided four handouts and presented four display boards at each scoping meeting. BLM resource specialists also brought maps, photographs, pamphlets, and other visual aids to the meetings for use when speaking with the public.

The BLM encouraged meeting attendees to comment by submitting written comment forms (either at the meetings or via mail) or by sending an e-mail. Comment sheets were available to attendees at all meetings, as was a computer station where the public could type and submit their comments. Attendees to the November 14 public meeting received a notification of the extension of the scoping period until November 24, 2008. At the November 12 through November 14 meetings, attendees also received a survey from the County Commissioners.

5.1.4 Open Houses/Public Meetings

After the public scoping period closed, the BLM held two open house meetings in Cody and in Worland, Wyoming. Similar to the public scoping meetings, resource specialists and other representatives of the BLM were on hand to personally address questions and provide information to meeting participants. The BLM also hosted five public workshops to obtain information and input on travel management and recreational activities at locations throughout the Basin that were attended by 203 participants.

Mailing List

The BLM compiled a list of 158 individuals, agencies, and organizations that participated in past BLM projects or requested to be on the general mailing list. The BLM mailed the initial scoping postcard to each individual on this list. In addition to those on the general mailing list, the BLM purchased a mailing list covering the entire Bighorn Basin (over 16,000 addresses) and mailed postcards to P.O. Box addresses included in this basin-wide list (2,485 addresses). Visitors to the scoping meetings were asked to sign in and provide their mailing address so that they could also be added to the mailing list. Other additions to the mailing list include those individuals who have submitted requests to be added to the list. Duplicate entries, changes of address, and return-to-sender mailings were deleted from the official project mailing list as identified. Through this process, the general mailing list was revised to approximately 500 entries. Requests to be added to or to remain on the official mailing list will continue to be accepted throughout the planning process.

Newsletters

Periodic newsletters have been and are being developed and distributed to keep the public informed of the Bighorn Basin RMP Revision Project. The January 2009 newsletter summarized the public scoping period and invited the public to the recreation and travel management workshops. Eight newsletters have been mailed to individuals on the Bighorn Basin RMP mailing list.

Website

The Bighorn Basin RMP Revision Project website can be found at: <http://www.blm.gov/wy/st/en/programs/Planning/rmps/bighorn.html>. The site serves as a virtual repository for documents related to the development of the RMP, including announcements, newsletters, and documents. The documents are available in PDF format to ensure they are accessible to the widest range of interested parties. The website provides the public an opportunity to submit their comments for consideration as part of the planning process and to be added to the project mailing list.

Field Trips

Six field trips were held during the summer of 2010 to various locations within the Planning Area to provide on-site discussion of RMP topics and to describe opportunities for effective public comment in advance of the 90-day public comment period.

In addition, Field Managers and RMP project leader were available to discuss RMP issues at the invitation of external individuals and groups. Multiple outside groups requested information from BLM managers and staff during 2010.

5.1.5 Public Comment Period on the Draft RMP and Draft EIS

A notice of availability announcing the release of the Draft RMP and Draft EIS was published in the *Federal Register* on April 22, 2011 initiating a 90-day comment period. At the request of the public and cooperating agencies, the BLM extended the comment period by 45 days, for a total comment period of 135 days. The comment period ended on September 7, 2011. During the 135-day comment period, the BLM hosted six public meetings within the Planning Area to gather comments on the Draft RMP and Draft EIS and to answer questions from the public (see Table 5-1).

Notification

The BLM issued a news release April 22, 2011 announcing the release of the Draft RMP and Draft EIS, which provided the dates, times, and locations of the public meetings for the Draft RMP and Draft EIS. The BLM issued a subsequent news release on May 23, 2011 again providing the dates, times, and locations for the June public meetings. The news releases were also posted on the Bighorn Basin RMP Revision Project website.

Public Meetings

During the public comment period, the BLM held six public meetings in June of 2011 in towns and cities throughout the planning area (see Table 5-1). The meetings were held in an open-house format to encourage participation and allow for the public to have informal one-on-one discussions with BLM resource specialists. The public meetings provided additional opportunity for the public to ask questions and submit comments. BLM managers, resource specialists, and other representatives of the BLM were present during these meetings to discuss and answer questions.

Comment Analysis

Based on comments received during this period, the BLM revised the RMP where appropriate. Changes made to the Draft RMP and Draft EIS based on comments are reflected in the Proposed RMP and Final EIS. The Comment Analysis Report summarizes all substantive comments received during the 135-day public comment period and the BLM responses to those comments, including how the document was revised based on comments. The report is presented in Appendix A.

5.1.6 Public Comment Period on the Supplement to the Draft RMP and Draft EIS

A notice of availability announcing the release of the Supplement was published in the *Federal Register* on July 12, 2013 initiating a 90-day public comment period. The BLM initially scheduled 90 days for public comment, and the original date for the close of the comment period was October 12, 2013. However, due to the lapse in appropriations and the resulting federal government shutdown, the documents were not available on the BLM website from October 1 through October 16, 2013 and the comment period was extended 20 days, ending on November 1, 2013. During the 110-day comment period, the BLM hosted six public meetings within the Planning Area to gather comments on the Supplement and to answer questions from the public (see Table 5-1).

Notification

The BLM issued a new release to local media on July 12, 2013 announcing the release of the Supplement. The new release provided the dates, times, and locations of the six public meetings for the Supplement. The BLM issued a subsequent news release on August 21, 2013 again providing the dates, times, and locations for the September public meetings. The news releases were also posted on the Bighorn Basin RMP Revision Project website. On October 24, 2013, the BLM issued a third news release announcing the extension of the public comment period and new end date.

Public Meetings

During the comment period, the BLM held six public meetings in September of 2013 in towns and cities throughout the planning area (see Table 5-1). The meetings were held in an open-house format with presentations discussing the cause for the Supplement, outlining alternatives E and F, and providing guidance for making effective comments. Each presentation also included a question and answer session. The open house portions of the meetings were designed to allow attendees to learn about the project at their own pace and to enable them to ask BLM representatives questions in an informal one-on-one setting.

Comment Analysis

Based on comments received during the 110-day comment period, the BLM revised the RMP where appropriate. Changes made based on comments are reflected in the Proposed RMP and Final EIS, which integrates the content of the Draft RMP and Draft EIS and the Supplement. The Comment Analysis Report summarizes all substantive comments received during the 110-day comment period and the BLM responses to those comments. The report is presented in Appendix A.

5.1.7 Future Public Involvement

Public participation efforts will be ongoing throughout the remainder of the process of revising the RMP and developing the EIS. The Proposed RMP and Final EIS considered all substantive oral and written comments received during the comment periods for the Draft RMP and Draft EIS and the Supplement. Members of the public with standing will have the opportunity to protest the content of the Proposed RMP and Final EIS during the specified 30-day protest period. The Record of Decision will be issued by the BLM following the Governor's Consistency Review and protest resolution.

5.2 Consultation and Coordination

This section documents the consultation and coordination efforts undertaken by the BLM throughout the process of revising the RMP and developing the EIS. Title II, Section 202 of the Federal Land Policy and Management Act (FLPMA) directs the BLM to coordinate planning efforts with Native American Tribes, other federal departments, and agencies of the state and local governments as part of its land use planning process. The BLM is directed to integrate NEPA requirements with other environmental review and consultation requirements to reduce paperwork and delays (40 Code of Federal Regulations 1500.4-5). The BLM accomplished coordination with other agencies and consistency with other plans through ongoing communications, meetings, and collaborative efforts with the BLM Interdisciplinary Team, which includes BLM specialists, and federal, state, and local agencies.

The BLM is aware that there are specific state laws and local plans relevant to aspects of public land management that are discrete from, and independent of, federal law. However, BLM is bound by federal law. As a consequence, there may be inconsistencies that cannot be reconciled. The FLPMA and its implementing regulations require that BLM's land use plans be consistent with state and local plans only if those plans are consistent with the purposes, policies, and programs of federal laws and regulations applicable to public lands. Where state and local plans conflict with the purposes, policies, and programs of federal law there will be an inconsistency that cannot be resolved. While county and federal planning processes, under FLPMA, are required to be as integrated and consistent as practical, the federal agency planning process is not bound by or subject to county plans, planning processes, or planning stipulations.

5.2.1 Cooperating Agencies

The BLM invited local, state, federal, and tribal representatives to participate as cooperating agencies on the Bighorn Basin RMP Revision Project and EIS. The BLM invited the following entities to participate because they have jurisdiction by law or because they could offer special expertise:

Counties

- Big Horn County Commission
- Hot Springs County Commission
- Park County Commission
- Washakie County Commission

Conservation Districts

- Cody Conservation District
- Hot Springs Conservation District
- Powell-Clarks Fork Conservation District
- Meeteetse Conservation District
- Shoshone Conservation District
- South Big Horn Conservation District
- Washakie County Conservation District

Wyoming State Agencies

- Office of the Governor
- Department of Agriculture
- Department of Environmental Quality
- Game and Fish Department
- Office of Lands and Investments
- Oil and Gas Conservation Commission
- State Engineer's Office
- State Geological Survey
- State Historic Preservation Office

Federal Agencies

- U.S. Environmental Protection Agency (EPA), Region 8
- U.S. Forest Service – Shoshone National Forest/Wapati Ranger District
- U.S. Forest Service – Bighorn Ranger District

Tribes

- Northern Cheyenne Tribe Tribal Historic Preservation Office
- Crow
- Rosebud Sioux

The BLM formally invited the cooperating agencies to participate in developing the alternatives and RMP and EIS, and to provide data and other information relative to their agency responsibilities, goals, mandates, and expertise. Cooperating agencies provided input during the initial scoping process. The BLM held general meetings with cooperators to discuss procedures and processes. The BLM hosted teleconferences to obtain cooperator input on the Analysis of the Management Situation in February 2009. The BLM and cooperating agencies held several workshops to develop goals and objectives, a range of alternatives, and the Agency Preferred Alternative between March 2009 and February 2010. Cooperating agencies met with the Field Managers to relay concerns and propose options for the Preferred Alternative between October 2009 and February 2010. The BLM and cooperating agencies have routinely met to be orientated to process and procedures and to resolve process related issues. Though not in effect during meetings and consultation with cooperating agencies and the general public leading up the Draft RMP and Draft EIS, the BLM applied the guidance provided in Instruction Memorandum No. WY 2010-033 (BLM 2010d) in future public involvement activities for this revision project, including those with cooperating agencies.

Cooperating agencies were provided an opportunity to submit position statements for publication in the Draft RMP and Draft EIS. The intent of these position statements was to allow the cooperating agencies to express their agreement or disagreement on substantive elements of the alternatives or impacts and whether or not these disagreements were adequately resolved in the Agency Preferred Alternative. No position statements were provided opposing the Agency Preferred Alternative, and only the Wyoming Department of Agriculture and the Washakie County Conservation District provided positions statements for publication in the Draft RMP and Draft EIS, which are also included in this Proposed RMP and Final EIS (Appendix E).

The BLM held an additional cooperating agency workshop on January 31, 2013 to update the cooperators on the status of the RMP revision process and the need to prepare a Supplement to the Draft RMP and Draft EIS to incorporate additional considerations for the protection of greater sage-grouse. The meeting also presented an opportunity for cooperators to discuss and provide input on how impact analyses should be conducted for the new alternatives.

5.2.2 Section 7 Consultation

The Worland and Cody Field Offices contacted the U.S. Fish and Wildlife Service (USFWS) regarding Section 7 of the Endangered Species Act and the Bighorn Basin RMP revision. The BLM sent a scoping letter to the USFWS requesting comments concerning Section 7 consultation and the Bighorn Basin RMP revision project. On November 13 of 2008 the USFWS provided comments on (1) threatened and endangered species, (2) migratory birds, and (3) wetlands and riparian areas. Within these comments was also provided a list of threatened and endangered species likely to occur on BLM-administered land in the Worland and Cody Field Offices, for evaluating BLM Section 7 responsibilities. The USFWS was also provided opportunities to comment on chapters 2 and 4 of the Draft RMP and Draft EIS, and in November and December of 2009 comments were received on both chapters. The Worland and Cody Field Offices continued consultation with the USFWS regarding the RMP revision through completion of

the Final Biological Assessment and Proposed RMP and Final EIS. Consultation letters concerning the Bighorn Basin RMP revision project are located in Appendix E.

5.2.3 Consultation with the Wyoming Historic Preservation Officer

The Worland and Cody Field Offices initiated consultation with the Wyoming State Historic Preservation Office (SHPO) regarding the Bighorn Basin Resource Management Plan revision pursuant to the National Historic Preservation Act and the Wyoming State Protocol Agreement between BLM and the Wyoming SHPO. The BLM formally invited the Wyoming SHPO to be a cooperating agency; to participate in developing the alternatives and RMP and EIS; and to provide data and other information relative to their agency responsibilities, goals, mandates, and expertise concerning. The Wyoming SHPO participated in the development of the Preferred Alternative between March 2009 and February 2010. The BLM also provided the Wyoming SHPO with opportunities to comment on Chapters 2 and 4 of the Draft RMP and Draft EIS. On September 1, 2011 the Wyoming SHPO provided comments on the Draft RMP and Draft EIS regarding prehistoric and historic cultural resources within the Planning Area. The Worland and Cody Field Office continued consultation with the Wyoming SHPO regarding the RMP revision through completion of the Proposed RMP and Final EIS.

5.2.4 Native American Interests

Consultation with Native American tribes is part of the NEPA process and a requirement of FLPMA. The BLM invited Native American tribes to be cooperating agencies as part of the RMP revision and three tribes attended cooperator meetings. On October 10, 2008, the BLM sent letters to the following 11 tribes inviting them to be part of the planning process through consultation and public scoping meetings:

- Blackfeet
- Cheyenne River Sioux
- Crow
- Eastern Shoshone
- Nez Perce
- Northern Arapaho
- Northern Cheyenne
- Oglala Sioux
- Rosebud Sioux
- Salish & Kootenai
- Shoshone Bannock

The consultation letters invited Native American tribes to comment on interests or concerns related to management in the Planning Area and asked tribes to identify any places of traditional religious or cultural importance within the Planning Area. The chairman and cultural contacts for the 11 tribes invited to participate in the planning process are shown in Table 5-2. An example consultation letter between the Native American tribes and the BLM is included in Appendix E.

Following the scoping process, the BLM sent a letter to each of the above tribes requesting specific information to help identify areas of special concern for the tribes and presenting the opportunity for meetings or field trips with tribal representatives. BLM representatives followed these letters with

telephone calls to each tribe. In letters and during the follow-up calls, the BLM stressed its desire for the tribes to review and comment on the Draft RMP and EIS. On December 17, 2008 the BLM met with tribal representatives in Rapid City, South Dakota to discuss the RMP revision. Additional inquiries were made of interested tribes who might desire face-to-face opportunities to discuss RMP issues. In January 2010, Field Managers and staff met with the Northern Cheyenne Tribal Historic Preservation Officer to discuss the Tribe’s interest in RMP topics. Government-to-government consultation with the tribes continued throughout the RMP process. In 2013, the BLM sent additional consultation letters to the tribes listed in Table 5-2 informing them of the need to prepare a Supplement to the Draft RMP and EIS, and welcoming continued feedback.

Comments have not been received from any tribe during the scoping period, or the public comment periods on the Draft RMP and Draft EIS, or Supplement, however, consultation is an on-going process.

Table 5-2. Tribal Consultation

State	Tribe	Chairman	Cultural Contact
Idaho	Nez Perce	Silas C. Whitman, Chairman Nez Perce Tribal Executive Committee	Keith “Pat” Baird Tribal Historic Preservation Officer Nez Perce Tribe
Idaho	Shoshone-Bannock	Nathan Small, Chairman Shoshone-Bannock Tribes of the Fort Hall Reservation	Carolyn Boyer Smith Cultural Resource Coordinator HETO/Cultural Resources Shoshone-Bannock Tribes of the Fort Hall Reservation Cleve Davis, Environmental Program Manager Shoshone-Bannock Tribes of the Fort Hall Reservation

Montana	Crow	Darrin Old Coyote, Chairman Crow Tribal Council	Emerson Bull Chief Tribal Historic Preservation Officer George Reed Director, Cultural Resources Department
Montana	Northern Cheyenne	Llevando “Cowboy” Fisher, President Northern Cheyenne Tribal Council	James Walksalong, Interim Tribal Historic Preservation Officer Northern Cheyenne Tribe
Montana	Confederated Salish and Kootenai	Mr. E.T. “Bud” Moran, Chairman Confederated Salish and Kootenai Tribes of the Flathead Indian Nation	Ms. Marcia Pablo Tribal Historic Preservation Officer Confederated Salish and Kootenai Tribes of the Flathead Indian Nation
South Dakota	Cheyenne River Sioux	Harold Frazier Cheyenne River Sioux Tribal Council	Steve Vance Tribal Historic Preservation Officer
South Dakota	Oglala Sioux	Bryan Brewer, President Oglala Sioux Tribal Council	Michael Catches Enemy Tribal Historic Preservation Officer
South Dakota	Rosebud Sioux	Cyril “Whitey” Scott, President Rosebud Sioux Tribe	Russell Eagle Bear Tribal Historic Preservation Officer Rosebud Sioux Tribe

Table 5-2. Tribal Consultation (Continued)

State	Tribe	Chairman	Cultural Contact
Wyoming	Eastern Shoshone	Darwin St. Clair, Jr., Chairman Eastern Shoshone Tribe of the Wind River Reservation	Wilfred Ferris Tribal Historic Preservation Officer Eastern Shoshone Tribe of the Wind River Reservation
Wyoming	Northern Arapaho	Darrell O' Neal, Sr., Chairman Northern Arapaho Tribe	Yufna Soldier Wolf Tribal Historic Preservation Officer

5.3 Distribution List

The BLM sent postcards announcing the availability of the Bighorn Basin Proposed RMP and Final EIS to all mailing list entries including the public; media; educational institutions; federal, state, and local agencies; clubs, alliances, and societies; and other associations and councils. In addition, the BLM distributed electronic copies of the Proposed RMP and Final EIS to the following entities for their review and comment. Hardcopy documents were distributed to select libraries noted below.

Tribal Governments

- Blackfeet
- Cheyenne River Sioux
- Crow
- Eastern Shoshone
- Nez Perce
- Northern Arapaho
- Northern Cheyenne
- Oglala Sioux
- Rosebud Sioux
- Salish & Kootenai
- Shoshone-Bannock

Local Governments (Counties, Cities, Towns)

Big Horn County, Wyoming

- Big Horn County Commission
- South Big Horn Conservation District

Park County, Wyoming

- Park County Commission
- Cody Conservation District
- Meeteetse Conservation District
- Powell-Clarks Fork Conservation District

Washakie County, Wyoming

- Washakie County Commission
- Washakie County Conservation District

Hot Springs County, Wyoming

- Hot Springs County Commission
- Hot Springs Conservation District

State of Wyoming

- Senator Henry H.R. ‘Hank’ Coe
- Senator Gerald Geis
- Senator R. Ray Peterson
- Representative Mike Greear
- Representative Elaine Harvey
- Representative Samuel Krone
- Representative Dan Laursen
- Representative David Northrup
- Representative Nathan Winters

Wyoming State Agencies

- Office of the Governor, Environmental Policy Division
- Business Council
- Department of Environmental Quality
 - Air Quality Division
 - Land Quality Division
 - Water Quality Division
- Department of Agriculture
- Department of State Parks and Cultural Resources
 - State Museum
- Department of Transportation
- State Planning Office
- Game and Fish Department
- State Geologic Survey
- Office of State Lands and Investments
- State Engineer’s Office
- State Historic Preservation Office
- Department of Administration and Information
- Department of Employment, Research, and Planning Division

Wyoming State Boards/Commissions

- Air Quality Advisory Board
- Board of Wildlife Commissioners
- Agriculture Board
- Environmental Quality Council
- Farm Bureau Federation
- Land Quality Advisory Board
- Livestock Board
- Oil and Gas Conservation Commission
- State Grazing Board
- Trails Council

Congressional Delegation

- U.S. Senator Michael Enzi
- U.S. Senator John Barrasso
- U.S. Representative Cynthia Lummis

U.S. Department of the Interior

- Bureau of Indian Affairs
- U.S. Bureau of Reclamation
- National Park Service
 - Bighorn Canyon National Recreation Area
 - Yellowstone National Park
- U.S. Fish and Wildlife Service
- Bureau of Land Management
 - Washington, D.C.
 - Wyoming State Office, Cheyenne
 - Wyoming Field Offices: Worland and Cody

Other Federal Agencies

- U.S. Environmental Protection Agency
- U.S. Department of Agriculture Forest Service
 - Big Horn National Forest
 - Shoshone National Forest

Libraries

- Park County Library
- Big Horn County Public Library
- Washakie County Library
- Hot Springs County Library

Educational Institutions

- University of Wyoming

Media

Newspapers

- Northern Wyoming Daily News, Worland, Wyoming
- The Independent Record, Thermopolis, Wyoming
- Greybull Standard Tribune, Greybull, Wyoming
- Basin Republican Rustler, Basin, Wyoming
- The Cody Enterprise, Cody, Wyoming
- Powell Tribune, Powell, Wyoming
- Lovell Chronicle, Lovell, Wyoming
- Billings Gazette, Billings, Montana
- Wyoming Livestock Roundup, Casper, Wyoming
- Associated Press, Billings, Montana
- Casper Star Tribune, Casper, Wyoming
- Riverton Ranger, Riverton, Wyoming

Radio

- Big Horn Radio Network: KODI/KZMQ/KTAG/KKLX/KWOR, Cody AM and FM
- KPOW/KLZY, Powell AM and FM
- KTHE, Thermopolis AM
- KWOR/KKLX, Worland AM and FM
- KVOW/KTAK, Riverton AM and FM
- Wyoming Public Radio

5.4 List of Preparers

Table 5-3. List of Preparers

Name	Education (degree, year, school)	Title	Project Role	Years of Experience
Bureau of Land Management				
Holly Elliott	B.S. Environmental Science & Natural Resource Management with emphasis in Environmental Law/Policy, 2001, University of Nevada, Reno	Planning and Environmental Coordinator	Project Manager/Inspector and Team Leader	18
Caleb Hiner	B.S. Geosciences, 2001, Idaho State University	Senior Resource Advisor	Senior Resource Advisor	14
Delissa Minnick	J.D., 2006, University of Wyoming	Field Manager	Cody Field Office Manager	8
Rebecca Good	B.S. Geological Engineering, 1994, South Dakota School of Mines (SDSM&T) B.S. Geology, 1995, SDSM&T	Field Manager	Worland Field Office Manager	21
Jessica Montag	B.S. Recreation Resource Management, 1998, University of Minnesota M.S. Resource Management, 2000, University of Montana; Ph.D. Wildlife Biology, 2004, University of Montana	Economist	Social Conditions/ Economic Conditions	11
Sarah Beckwith	B.A. Environmental Studies and Geography, 1993, University of California, Santa Barbara	Public Affairs Specialist	Public Affairs	17
JoDee Cole	B.A. Anthropology, 1978, Southern Illinois University	Resource Information Specialist	GIS Data Management	37
Kierson Crume	B.A. Anthropology, 1995, University of New Mexico	Archaeologist	Cultural, including National Historic Trails	20
Jared Dalebout	B.A. Geology, 2003, Weber State University	Hydrologist	Water, Riparian/Wetlands, Aquatic Resources, Vegetation (Riparian/Wetland, Grasslands/Shrublands)	8
John Elliott	B.S. Range Management, 1993, University of Wyoming	Rangeland Management Specialist	Livestock Grazing	22
Jim Gates	B.S. Forest Resources, 1996, University of Idaho	Forester	Forestry	21
Monica Goepferd	B.S. Mining Engineering, 2002, Montana Tech	Supervisory Civil Engineer	Transportation, Facilities, Maintenance	11
Destin Harrell	B.A. Biology, 2000, Western State College	Wildlife Biologist	Wildlife, Special Status Species	14

Table 5-3. List of Preparers (Continued)

Name	Education (degree, year, school)	Title	Project Role	Years of Experience
Patricia (Tricia) Hatle	B.S. Range Science, 1991, University of Wyoming	Rangeland Management Specialist	Wild Horses	25
Cam Henrichsen	B.S. Range Science, 1990, South Dakota State University	Range Management Specialist	Wild Horses	24
Karen Hepp	B.S. Range/Wildlife, 1983, University of Nebraska	Rangeland Management Specialist	Rangeland Vegetation, Special Status Species	29
Charis A. Tuers	B.S. Environmental Engineering, 1997, Montana Tech	Air Quality Specialist	Air Quality	13
Gretchen Hurley	B.S. Natural Science & Mathematics, 1981, University of Wyoming	Geologist	Geology, Paleontology, Minerals	33
Rance Neighbors	B.S. Forestry, 2002, Auburn University	Natural Resource Specialist	Invasive Species	11
Paul Rau	B.S. Geography, 2000, University of Wyoming	Outdoor Recreation Planner	Visual Resource Management, OHV, Travel Management, Recreation, and Special Designations	13
David Seward	B.S. Range Management, 1995, University of Wyoming	Natural Resource Specialist	Surface Compliance	20
Carol Sheaff	BLM-Lands Academy, 2003, Northwest Community College, Various courses University of Nebraska, Kearney, Education	Realty Specialist	Lands & Realty, including Transportation/Access and ROWs, Renewable Energy Utility/Communication Corridors	31 – Retired
Tim Stephens	B.A. Greenville College, 1983 M.S. Environmental Biology, 1985, Emporia State University Teachers Certificate, 1988, Lawrence University, Appleton Wisconsin	Biologist	Fish & Wildlife, Special Status Species	25
Eve Warren	B.S. Wildlife Management, 1991, Utah State University M.S. Conservation Biology, 1993, Utah State University Ph.D. Range Science, 2001, Texas Tech University	Natural Resource Specialist	Rangeland Vegetation	23
Criss Whalley	B.S. Range Management, 1984, Humboldt State University M.S. Plant Science, 1987, University of Nevada, Reno	Rangeland Management Specialist	Livestock Grazing	28
Jim Wolf	B.S. Range Ecology, 1983, Colorado State University	Fire Management Specialist	Fire Ecology, Soil, Vegetation (Grasslands, Shrublands, Special Status Plants)	30

Table 5-3. List of Preparers (Continued)

Name	Education (degree, year, school)	Title	Project Role	Years of Experience
Consultants				
Laura Ziemke	B.A. Anthropology, Boise State University, 1993	Vice President	Project Manager	24
Alex Bartlett	B.G.S. Environmental Studies, emphasis in Environmental Policy, University of Kansas, 2006	Technical Specialist	Deputy Project Manager	8
Nathan Wagoner	M.S. Human Dimensions of Ecosystem Science and Management, Utah State University, Logan, Utah, 2006 B.S. Natural Resources Integrated Policy and Planning, The Ohio State University, Columbus, Ohio, 2003	Senior Project Manager	Deputy Project Manager	12
Kim Stevens	B.S. Geography, University of Utah, 1982	NEPA Specialist	Project Coordinator	12
Dan Nally	M.A. Urban and Environmental Policy and Planning, Tufts University, 2011 B.S. Biology, The College of William and Mary, 2007	NEPA Specialist	Technical Support	4
Karen DiPietro	Communications, Lewes Technical College, England, 1987	Publication Specialist	Editor	24
Jay Haney	M.S. Meteorology, Saint Louis University, 1980 B.S. Meteorology, Saint Louis University, 1978	Air Quality Specialist	Air Quality	33
Rob Fetter	M.S. Resource Economics, University of Massachusetts, 2002 B.S. Resource Economics, University of Massachusetts, 1999	Socioeconomics Specialist	Social Conditions/ Economic Conditions/ Environmental Justice	12
Alex Uriarte	Ph.D. Development Studies, University of Wisconsin, 2000 M.S. Economics, University of Wisconsin-Madison, 1996 M.S. Business Economics, Getúlio Vargas Foundation, São Paulo, Brazil, 1994 B.A. Economics, University of São Paulo, Brazil, 1989	Socioeconomics Specialist	Social Conditions/ Economic Conditions/ Environmental Justice	15
Lissa Johnson	B.A. Anthropology, University of Idaho, 1995	GIS Specialist	GIS	12

Table 5-3. List of Preparers (Continued)

Name	Education (degree, year, school)	Title	Project Role	Years of Experience
Joe Walsh	B.A. Physical Geography, University of California, Santa Barbara, 1993	GIS Specialist	GIS	18
Lucas Bare	MESM, Conservation Planning Specialization, Donald Bren School of Environmental Science & Management, University of California, Santa Barbara, California, 2009 BA, Biology, Bowdoin College, Brunswick, Maine, 2006	Manager	Technical Specialist	13
Randall Coleman	MURP, Urban and Regional Planning, University of Colorado, 2013 B.A. (cum laude), History and Spanish, Trinity University, 2005	Manager	Technical Specialist	8

CHAPTER 7 – CUMULATIVE IMPACTS (GREATER SAGE-GROUSE)

7.1 Greater Sage-Grouse Cumulative Effects Analysis: Bighorn Basin

This cumulative effects analysis (CEA) discloses the long-term effects on Greater Sage-Grouse (GRSG) from implementing each RMP/EIS alternative in conjunction with other past, present, and reasonably foreseeable future actions. In accordance with Council on Environmental Quality guidance, cumulative effects need to be analyzed in terms of the specific resource and ecosystem being affected (Council on Environmental Quality 1997). As discussed in Chapter 1, the purpose for the proposed federal action is to identify and incorporate appropriate conservation measures to conserve, enhance, and restore GRSG habitat by reducing, eliminating, or minimizing threats to GRSG habitat. The Western Association of Fish and Wildlife Agencies (WAFWA) delineated seven sage-grouse management zones (MZ) based on populations within floristic provinces as depicted in Figure 7-1 (Stiver et al. 2006). The MZ is the appropriate geographic scope for this analysis because it encompasses areas with similar floristic conditions containing important GRSG habitat. Therefore, the cumulative effects analysis study area for the Greater Sage Grouse extends beyond the Bighorn Basin planning area boundary and incorporates WAFWA Management Zone (MZ) II/VII. MZ II and VII are combined for the purpose of characterizing GRSG habitat conditions and impacts, as was done in the Baseline Environmental Report (Manier et al. 2013). The planning area is almost entirely located within MZ II/VII, with the exception of a small portion on the eastern boundary located in MZ I. This portion of MZ I land contains 76,700 acres of GHMA and 0 acres of PHMA, which represents one tenth of one percent of all GHMA across MZ I; thus the relative influence of cumulative actions in the MZ I portion of the Bighorn Basin RMP planning area would be negligible.

The analysis of BLM actions in MZ II/VII is focused on the GRSG habitat within the MZs and is primarily based on MZ-wide datasets developed by the BLM National Operations Center (NOC). Where quantitative data are not available, analysis is qualitative. This analysis includes past, present and reasonably foreseeable future actions for all land ownerships in the MZ, and evaluates the impacts of the Bighorn Basin RMP, by alternative, when added to those actions. Non-federal actions considered in this analysis include, but are not limited to, the following:

- State plans
- Coordination with states and agencies during consistency reviews
- Additional data from non-BLM-administered lands

The following diagram shows the boundaries of the WAFWA MZs and BLM and Forest Service planning areas. The Bighorn Basin planning area has a relatively small influence in the context of MZ II/VII because it contains relatively few priority habitat management areas (PHMA) or general habitat management areas (GHMA): 1,786,200 acres of PHMA out of 14,105,000 total acres in MZ II/VII; and 3,780,500 acres of GHMA out of 17,771,500 total acres in MZ II/VII). As a result, actions in the Bighorn Basin RMP/EIS may have less cumulative impact on GRSG than those in larger planning areas in MZ II/VII.

Figure 7-1. Western Association of Fish and Wildlife Agencies Greater Sage-Grouse Management Zones

Section 7.1.1 describes the methods used in the analysis. Section 7.1.2 lists assumptions used in the analysis. Section 7.1.3 describes existing conditions in MZ II/VII and in the Bighorn Basin planning area. Section 7.1.4, Regional Efforts to Manage Threats to GRSG, provides a broad-scale description of past, present, and reasonably foreseeable future federal, state, local, and private actions influencing GRSG in MZ II/VII. Section 7.1.5 summarizes the relevant cumulative actions occurring in MZ II/VII. Section 7.1.6 analyzes threats to GRSG in MZ II/VII and discusses the potential cumulative effects resulting from each threat for each alternative. Section 7.1.7, Conclusions, determines the cumulative effects on GRSG as a result of implementing each alternative in the Bighorn Basin RMP, in combination with other private, local, regional, state, and federal past, present, and reasonably foreseeable future actions in MZ II/VII.

7.1.1 Methods

The CEA uses the following methodology:

- Data from the USGS publication “Summary of Science, Activities, Programs, and Policies That Influence the Rangeland Conservation of Greater Sage-Grouse” (Manier et al. 2013) establishes the baseline environmental condition against which the alternatives and other past, present, and reasonably foreseeable future actions are compared. Data from this publication are presented in terms of priority habitat and general habitat.
- The USFWS’s 12-Month Findings for Petitions to List the Greater Sage-Grouse (*Centrocercus urophasianus*) as Threatened or Endangered (USFWS 2010) and the USFWS publication Conservation Objectives: Final Report (i.e., the COT report; USFWS 2013) were reviewed to identify the primary threats facing GRSG in each WAFWA MZ. Table 2 of the COT report lists threats to GRSG that are present and widespread in each population in the MZ.
- For MZ II/VII the list of threats that are directly or indirectly affected by BLM actions are energy development/mining, infrastructure, grazing/free roaming equids, conversion to agriculture/urbanization, fire, spread of weeds, recreation, and conifers (USFWS 2013). Two other threats listed in the COT report, sagebrush eradication and isolation/small population size, affect GRSG populations in MZ II/VII. While they are not addressed separately in this analysis, they are discussed as elements of other threats.
- Predation was not included as a threat in the final COT report and was not identified by USFWS as a significant threat to GRSG populations (USFWS 2010). Predation is a natural occurrence that may be enhanced by human habitat modifications such as construction of infrastructure that may increase opportunities for nesting and perching or increase exposure of GRSG nests. In such altered habitats, predators may exert an undue influence on GRSG populations. Predation is discussed in this CEA in the context of these other threats.
- Sagebrush eradication is a component of many threats. Isolation/small population size is not analyzed separately, because no management actions directly address this threat. These two threats are discussed as a component of other threats and in the conclusions. Not all the threats discussed in this section represent major threats to GRSG in each planning area in the MZ, but each poses a present and widespread threat to at least one population.
- Each threat is analyzed, and a brief conclusion for each threat is provided.
 - The BLM NOC compiled MZ-wide datasets for quantifiable actions in all proposed LUPs within MZ II/VII. These datasets provide a means by which to quantify cumulative impacts resulting from direct impacts of the threats identified in the COT report on BLM-administered lands.
 - The tables in this cumulative analysis display the number of acres across the entire MZ and the percentage of those acres that are located within the Bighorn Basin planning area. The total number of acres in the MZ includes the number of acres in the other BLM and Forest Service proposed plans plus the number of acres in the applicable Bighorn Basin RMP alternative. For example, the total number of acres for Alternative A includes all of the other proposed plans in MZ II/VII plus Bighorn Basin RMP Alternative A. Likewise, the Alternative B acreage includes all of the other proposed plans in MZ II/VII plus Bighorn Basin RMP Alternative B.
 - Data and information were gathered from other federal, state, and local agencies and tribal governments, where available, and were used to inform the analysis of cumulative impacts on GRSG from each of the threats in MZ II/VII.

- A discussion is provided for each alternative in Section 7.1.7. Each alternative considers the cumulative impacts on GRSG from each of the threats. It also considers whether those threats can be ameliorated via implementation of that particular alternative in conjunction with past, present, and reasonably foreseeable non-BLM/Forest Service and BLM actions in MZ II/VII.
- The list of reasonably foreseeable future actions was derived from each proposed BLM/Forest Service RMP in MZ II/VII to provide an MZ-wide overview of the ongoing and proposed land uses in both MZs.
- Baseline data that are consistent across planning areas and that analyze cumulative effects for each alternative, including the No Action Alternative and Proposed Plan, are used in this analysis.
- PHMA and GHMA were developed to protect the best habitat and highest population density of GRSG. Although PHMA and GHMA are not designated under Alternative A, spatial data was clipped to these boundaries by the BLM's NOC to provide a consistent lens for comparison across all alternatives.
- This analysis uses the most recent information available. For purposes of this analysis, the BLM has determined that the Proposed Plans for the other ongoing GRSG planning efforts in MZ II/VII are reasonable foreseeable future actions.

7.1.2 Assumptions

This cumulative analysis uses the same assumptions and indicators as those established for the analysis of direct and indirect effects on GRSG in Section 4.4.9. In addition, the following assumptions have been made:

- The timeframe for this analysis is 20 years.
- The CEA area extends beyond the planning area and encompasses all of WAFWA MZ II/VII.
- The magnitude of each major threat would vary geographically and may have more or less impact on GRSG in some parts of the MZs, depending on factors such as climate, land use patterns and topography.
- A management action within an alternative would contribute a net conservation gain to GRSG if its effect is to reduce the level of a threat to GRSG from the level detailed in the 2010 USFWS listing decision for GRSG (USFWS 2010). A net conservation gain is equivalent to an actual benefit or gain above baseline conditions. Baseline conditions are defined as the pre-existing conditions of a defined area and/or resource that can be quantified by an appropriate metric(s).
- The CEA quantitatively analyzes GRSG and their habitat in the MZ. Impacts on habitat are likely to correspond to impacts on populations within MZ II/VII, since reductions or alterations in habitat could affect reproductive success through reductions in available forage or nest sites. Human activity could cause disturbance to the birds preventing them from mating or successfully rearing offspring. Human activities could also increase opportunities for predation, disease, or other stressors (Connelly et al. 2004; USFWS 2010; Manier et al 2013).
- In order to have consistency of analysis across the various planning areas within the MZ, the proposed Connectivity Areas have been classified as PHMA for cumulative analysis.

7.1.3 Existing Conditions in WAFWA MZ II/VII, and the Bighorn Basin Planning Area

This section summarizes existing conditions and past and present actions in the Bighorn Basin RMP planning area (provided in more detail in Chapter 3) and MZ II/VII as a whole. Reasonably foreseeable future actions are discussed in Section 7.1.5.

GRSG Habitat and Populations

MZ II/VII consists of nine populations: Eagle-South Routt, Middle Park, Laramie, Jackson Hole, Wyoming Basin, Rich-Morgan, Uintah, North Park, and Northwest Colorado. The bulk of the Bighorn Basin RMP planning area constitutes the Wyoming Basin population, which contains the largest regional extent and highest breeding density of GRSG in the western U.S. Leks in the northern portion of MZ II/VII are the most highly connected in the range (Knick and Hanser 2011), while populations in southern portions of MZ II/VII (i.e., the Colorado Plateau) are less robust, with low lek connectivity and a 96 percent chance of populations declining below 200 males by 2037 (Garton et al. 2011; Knick and Hanser 2011).

In MZ II/VII, state and private lands account for approximately 43 percent of GRSG habitat, with BLM-administered and other federal land accounting for 57 percent (Manier et al. 2013, p. 118). The BLM also has some management authority over split-estate lands, with privately held surface land and federal subsurface mineral rights. The higher percentage of GRSG habitat on BLM-administered and other federal land means BLM management could play a key role in alleviating threats to GRSG across MZ II/VII; however, the Bighorn Basin planning area has a small footprint relative to other planning areas in MZ II/VII.

Table 7-1 provides a breakdown of landownership and acres of GRSG habitat in MZ II/VII. As the table shows, approximately 30 percent of priority habitats, and 30 percent of general habitats are on BLM-administered lands. In the Bighorn Basin planning area, there are approximately 5.6 million acres of GRSG habitat, including approximately 3.1 million acres (56 percent) on BLM-administered lands. The remaining 2.5 million acres (44 percent) of GRSG habitat comprise private, local state, and other federal and tribal lands.

Table 7-1. Management Jurisdiction in MZ II/VII by Acres of Priority and General Habitats

	Total Surface Area (Acres)	Priority (Acres)	General (Acres)	Non-habitat (Acres)
MZ II and VII	92,776,100 (100%)	17,476,000 (19%)	19,200,200 (21%)	56,099,900 (60%)
BLM	30,295,000 (33%)	9,021,200 (30%)	9,012,500 (30%)	12,261,300 (40%)
Forest Service	23,558,800 (25%)	162,000 (<1%)	452,500 (2%)	22,944,300 (97%)
Tribal and Other Federal	7,086,200 (8%)	784,000 (11.1%)	1,354,600 (19%)	4,947,600 (51%)
Private	27,405,400 (30%)	6,233,900 (22%)	7,394,800 (27%)	13,776,700 (50%)
State	4,053,900 (4%)	1,244,800 (31%)	979,800 (24%)	1,829,300 (45%)
Other	376,700 (<1%)	30,100 (8%)	6,000 (2%)	340,600 (90%)

BLM Bureau of Land Management
MZ Management Zone

Planning Area Habitat Conditions

Much of the Bighorn Basin RMP planning area is characterized by sagebrush shrub, foothill mountain sage and shrub, and desert salt shrub and greasewood. Livestock grazing, fire, fire suppression, and surface-disturbing activities have influenced many grassland/shrub vegetation types within the planning area. Leks within the planning area are generally located at mid-elevation sagebrush habitats. Nesting and brood-rearing habitat is sometimes associated with the lek and sometimes found at a distance from the lek in sagebrush habitat. No SFAs are located within the planning area.

Population Trends in Management Zone II/VII

The Wyoming Basin population within MZ II/VII is the largest population in the GRSG range with over 20,000 males attending leks annually. Although recent data suggests a population increase, long-term monitoring is trending downward and population modeling suggests this trend will continue (Garton et al. 2011).

Wyoming data suggest a cyclic pattern, with population lows in 1995, 2002 and 2013, and peaks in 2000 and 2006. Actual trends are difficult to discern due to the lower survey effort prior to 2007, meaning the number and proportion of active to inactive leks is unknown. Since 2007, the number of active leks in Wyoming has remained stable (approximately 1,100 active leks), but the number of males/active lek has declined by more than half (from 42 to 17 males/lek). (Christiansen 2013). Garton et al. (2015, p. 33) found that between 2007 and 2013, the Wyoming Basin population showed a 63 percent decline in the estimated minimum male population attending leks.

The isolation of many other populations on the fringes of MZ II/VII makes them particularly vulnerable to habitat loss and fragmentation. Subpopulation areas at greatest risk include the Laramie and Jackson Hole subpopulation areas, which are close to energy development and recreational areas and face fragmentation risk from infrastructure (USFWS 2013).

7.1.4 Regional Efforts to Manage Threats to GRSG

Across the Greater Sage-Grouse range, other BLM and Forest Service sub-regions are undergoing RMP revision or amendment processes similar to this one for the Bighorn Basin planning area. The Final EIS associated with each of these efforts has identified a Proposed Plan that meets the purpose and need of conserving, enhancing, and/or restoring GRSG habitat by reducing, eliminating, or minimizing threats. The management actions from the various Proposed Plans will cumulatively decrease the threat of GRSG habitat loss and will limit fragmentation throughout the range. Key actions present in many of the Proposed Plans include changes in land use allocations, mitigation framework, an adaptive management strategy, anthropogenic disturbance cap, and protective management actions in priority and general habitat areas.

The BLM has incorporated management of Sagebrush Focal Areas (SFAs) into its proposed plan management approach for GRSG. SFAs are a subset of PHMA and represent recognized “strongholds” for the species that have been noted and referenced by the conservation community as having the highest densities of the species and other criteria important for the persistence of the species. Portions of the SFAs that are located on BLM-administered and National Forest System lands would be petitioned for withdrawal from mineral entry, and are prioritized for management and conservation actions, including, but not limited to, review of livestock grazing permits/leases. Management of SFAs would enhance protection of GRSG in these areas, providing a net conservation gain to the species in light of other past, present, and reasonably foreseeable future actions considered in this CEA. Within MZ II/VII

there are two SFAs (Bear River Watershed Area, and Southwestern/South Central Wyoming), totaling approximately 3,895,500 acres.

The WAFWA Sage-Grouse Strategy (Stiver et al. 2006) outlines a plan for monitoring, research, outreach, and funding for conservation projects for GRSG. A basic premise of the WAFWA Sage-Grouse Strategy is that additional conservation capacity must be developed at all local, state, federal, and range-wide levels for both the short term (3 to 5 years) and for the long term (10 years or more) to ensure GRSG conservation.

Wyoming Statewide Efforts

Wyoming has established Core Population Areas to help delineate landscape planning units by distinguishing areas of high biological value. These areas are based on the locations of breeding areas and are intended to help balance GRSG habitat requirements with demand for energy development (Doherty et al. 2011).

In 2000, the Wyoming Sage-Grouse Working Group (WSGWG) was formed to develop a statewide strategy for GRSG conservation. This group prepared the Wyoming GRSG Conservation Plan (WSGWG 2003) to provide coordinated management and direction across the state. In 2004, local GRSG working groups were formed to develop and implement local conservation plans. Eight local working groups around Wyoming have completed conservation plans, many of which prioritize addressing past, present, and reasonably foreseeable threats at state and local levels, and prescribe management actions for private landowners to improve GRSG conservation at the local scale, consistent with the overall Wyoming Core Strategy. The Northeast Wyoming Sage-Grouse Conservation Plan was completed in 2006 and was updated in 2014 (Northeast Wyoming Sage-grouse Working Group 2014). The local and regional working group plans would assist in GRSG conservation through monitoring, public awareness, and voluntary conservation actions on private land.

Wyoming Executive Order

Wyoming Governor Matt Mead issued an executive order on June 2, 2011 that complemented and replaced several executive orders issued by his predecessor. The 2011 Wyoming executive order articulates the State's Core Population Area Strategy (Core Area Strategy) as an approach to balancing GRSG conservation and development. It also provides an approach to mitigating human disturbances to GRSG.

The Wyoming executive order applies to state trust lands starting in 2008. These trust lands cover almost 23 percent of GRSG habitat and benefit approximately 80 percent of the estimated breeding population in the state (USFWS 2010). All proposed activities are evaluated through a density/disturbance calculation tool to determine if the project would exceed recommended density/disturbance thresholds. Additionally, the order has stipulations to be included in such permits, with varying restrictions, depending on whether the proposed development activity occurs within or outside delineated Core Population Areas (Wyoming Executive Order, June 2, 2011).

In Core Areas, there is a 0.6-mile no surface occupancy (NSO) buffer around occupied leks and restrictions on activities in breeding and winter concentration habitat. Wyoming's Industrial Siting Council, which permits large development projects on all lands in the state, is subject to the terms of the executive order. This buffer provides protection for males during lekking season and acts in coordination with the density disturbance cap. The combination of protections could offer GRSG considerable regulatory protection when large wind energy and other development projects are being considered in Wyoming (USFWS 2010; Manier et al. 2013). Statewide modeling of trends under the

Core Area Strategy suggests that with effective enforcement statewide, the strategy could reduce population losses by 9 to 15 percent across Wyoming. Moreover, the number of Core Areas predicted to maintain 75 percent of their current populations could increase from 20 to 25 under long-term scenarios (Copeland et al. 2013). Combining the Core Area Strategy with \$250 million in target conservation easements (provided willing landowners and funding are available) could reduce population declines by another 9 to 11 percent (Copeland et al. 2013).

Core Population Areas in Wyoming also incorporate connectivity corridors (Wyoming Executive Order 2011). These are areas GRSG use to maintain connectivity between habitat areas (Manier et al. 2013). Connectivity reduces isolation, thereby also reducing a population's vulnerability to disease, drought, or other events that may result in extirpation.

Umbrella Candidate Conservation Agreement with Assurances for Wyoming Ranch Management

Candidate Conservation Agreements with Assurances are voluntary conservation agreements between the USFWS and one or more federal or private partners (e.g., the ranchers). In return for managing lands to benefit GRSG, landowners receive assurances against additional regulatory requirements should GRSG be listed under the Endangered Species Act. Within Wyoming, the USFWS and Wyoming Governor's Office in conjunction with the BLM, Natural Resources Conservation Service, Forest Service, and other agencies, have developed an umbrella Candidate Conservation Agreement with Assurances for range management activities. Enrolled landowners are expected to comply with grazing specific conservation measures including but not limited to: avoid (or rotationally utilize) known nesting and brood-rearing habitat as a location for activities that concentrate livestock such as stock tank placement branding and roundup; place salt or mineral supplements in sites minimizing impacts to GRSG habitat; and within 24 months develop and implement a written grazing management plan to maintain or enhance the existing plant community as suitable GRSG habitat (USFWS et al. 2013).

Sweetwater River Conservancy Habitat Conservation Bank

The Sweetwater River Conservancy Habitat Conservation Bank is the first conservation bank established for GRSG. Located in central Wyoming, the bank manages habitat for GRSG allowing energy development and other activities to proceed on other lands within Wyoming. A conservation bank is a site or suite of sites established under an agreement with the USFWS, intended to protect, and improve habitat for species. Credits may be purchased which result in perpetual conservation easements and conservation projects on the land to offset impacts occurring elsewhere. The Sweetwater River Conservancy Habitat Conservation Bank launched with 55,000 deeded acres of GRSG habitat, and could expand up to 700,000 acres on other lands owned by the Sweetwater River Conservancy contingent upon demand (USFWS 2015).

Wyoming Landscape Conservation Initiative

The Wyoming Landscape Conservation Initiative is a long-term science based effort to assess and enhance aquatic and terrestrial habitats at a landscape scale in southwest Wyoming, while facilitating responsible development through local collaboration and partnership. Collaborative efforts address multiple concerns at a scale that considers all activities on the landscape, and can leverage resources that might not be available for single agency projects. GRSG initiatives from the Wyoming Landscape Conservation Initiative have included habitat enhancement efforts (e.g., invasive weed treatment, prescribed grazing strategies), and GRSG research studies (Wyoming Landscape Conservation Initiative 2013).

Montana Statewide Efforts

The Montana Department of Fish, Wildlife and Parks (MFWP) is tasked with implementing the range-wide WAFWA Sage-Grouse Strategy (Stiver et al. 2006) in Montana.

In addition, the MFWP's Montana Management Plan and Conservation Strategy for Sage-Grouse was initiated in 2005 to protect, maintain, and restore GRSG habitat. The plan ranks threats to the species across the state and provides an overall strategy for public and private cooperation in conservation actions. In 2013, the governor established the Greater Sage-Grouse Habitat Conservation Advisory Council to provide recommendations on policies and actions for GRSG conservation and provide regulatory authority for conservation actions. The council provided these recommendations in January 2014. The governor subsequently issued an executive order on September 9, 2014 (State of Montana 2014), based on the council recommendations that provided the direction for future GRSG conservation in Montana.

Montana Executive Order

The Montana governor issued an executive order on September 9, 2014 (State of Montana 2014), based on the council recommendations that provided the direction for GRSG conservation in Montana.

Stipulations for development in the executive order and Montana Management Plan and Conservation Strategy for Sage-Grouse include but are not limited to:

- A 0.6-mile NSO buffer around the perimeter of active leks for new activities;
- Locating new overhead power lines and communication towers a minimum of 0.6 mile from the perimeter of active leks;
A minimum 2.0-mile buffer from active lek perimeters for main roads and a minimum 0.6-mile buffer for facility site access roads;
- A 5 percent limit on anthropogenic surface disturbance within the Density and Disturbance Calculation Tool examination area (based upon suitable habitat); and
- As authorized by permitting agency or agencies, activities (production, maintenance and emergency activity exempted), will typically be prohibited from March 15 through July 15 outside of the NSO perimeter of an active lek and within 2 miles of that perimeter in Core Population Areas where breeding, nesting, and early brood-rearing habitat is present.

Specifically, the following measures which would be implemented under the Proposed Plan, or are considered reasonably foreseeable future actions, would help meet the COT report objectives:

- Managing ROW exclusion and avoidance areas would help meet the COT report objective for infrastructure by limiting ROW/SUA development within PHMA. These actions would also help to meet the COT objectives for non-native, invasive plant species by reducing disturbances that promote the spread of weeds.
- Designating major and moderate oil and gas stipulations would limit development in PHMA, except where pre-existing valid rights apply. In these areas Conditions of Approval would limit disturbance.
- Implementation of state conservation plans and/or state executive orders would help meet all COT report objectives, particularly on non-BLM and non-National Forest System lands. Applying a 5 percent disturbance limit (under the Wyoming and Montana GRSG plans/executive orders) would reduce impacts contributing to population declines and range erosion associated with multiple threats including energy, mining, and infrastructure.

- Prioritizing conifer treatments closest to occupied GRSG habitats and near occupied leks, and where juniper encroachment is phase I or 2, would reduce the rate of pinyon-juniper incursion and help to maintain healthy native sagebrush plant communities.
- Continued implementation of the Natural Resource Conservation Service Sage-Grouse Initiative would help meet the COT objective for the threat of agriculture conversion, by securing conservation easements on private lands. Fence marking, implementing prescribed grazing systems, and vegetation seeding would help meet the COT objectives for range management structures, grazing, and non-native, invasive plant species.

The approach of the Montana executive order/Montana Management Plan and Conservation Strategy for GRSG is similar to the Wyoming executive order. Montana's plan will apply a disturbance cap in core habitat and will limit well density and apply timing limitations. The 0.6-mile buffer would protect males in the vicinity of leks during the breeding season; the density limits and disturbance cap would protect GRSG during nesting, brood-rearing, and winter concentration activities. The timing restrictions would reduce the potential for displacement or disruption during the breeding season.

Colorado Statewide Efforts

In 2008, the Colorado Division of Wildlife (now Colorado Parks and Wildlife [CPW]) developed a state conservation plan, which prioritized threats and identified key issues facing conservation. The plan included issues, objectives, and strategies in detail. The strategies for conservation discussed responsible parties, lead agency, timeline, and cost associated with implementation of the strategy.

In 2012, a state conservation plan revision process began, and in consultation with stakeholders, a matrix summarizing implementation and effectiveness of the strategies was developed (Colorado Package), along with a subsequent Synthesis Report. The Colorado Package identified a number of conservation efforts within Colorado which have resulted in positive impacts to GRSG including acquisition of conservation easements and habitat improvement projects (Colorado Department of Natural Resources 2013). The Synthesis Report provided additional information on the effectiveness of conservation efforts such as county zoning ordinances which support protection of GRSG habitat, and measures from the Colorado State Board of Land Commissioners (SLB) which will support adaptive management techniques to improve GRSG habitat (Colorado Department of Natural Resources 2014).

Utah Statewide Efforts

The Conservation Plan for Greater Sage-grouse in Utah (Utah Division of Wildlife Resources 2013) was designed to protect, enhance, and restore GRSG habitat, in an effort to reduce the threats to the species. The plan identifies 11 sage grouse management areas throughout the state (including lands within MZ II/VII), which represent areas of high habitat value. The plan calls for state and local efforts to obtain incentive-based negotiated covenants, easements, leases or other legal tools in order to protect habitat. Additionally, the plan identifies a five percent disturbance limitation of habitat on state or federally managed lands, intended to limit the effects of large scale disturbances.

Idaho Statewide Efforts

In 2006, Idaho developed a statewide plan for the conservation of GRSG (Idaho Sage-grouse Advisory Committee 2006). The plan includes a toolbox of conservation measures to address threats to the species, as well as research, monitoring, and evaluation guidelines and recommendations. The plan was designed to provide guidance, tools, and resources to the local working groups in Idaho, and to facilitate

development of their plans. Rural Fire Protection Districts have been established within the state to help suppress fires in GRSG habitat.

Similar to efforts in nearby states, the governor of Idaho is expected to issue an executive order providing direction for GRSG conservation in Idaho on state lands. This executive order is expected to be largely consistent with BLM and Forest Service direction, though exact details are not known and are speculative as of the time this FEIS is published.

Natural Resource Conservation Service Sage Grouse Initiative

The Natural Resource Conservation Service's (NRCS) Sage Grouse Initiative (SGI) is working with private landowners in 11 western states to improve habitat for GRSG (Manier et al. 2013). With approximately 31 percent of all sagebrush habitats across the range in private ownership (Stiver 2011, p. 39), including 37 percent of priority and general habitat in MZ II/VII (Manier et al. 2013, p. 118), a unique opportunity exists for the NRCS to benefit GRSG and ensure the persistence of large and intact rangelands by implementing long term contracts and conservation easements.

Participation in the SGI program is voluntary, but willing participants enter into binding contracts to ensure that conservation practices that enhance GRSG habitat are implemented. Participating landowners are bound by a contract (usually 3 to 5 years) to implement, in consultation with NRCS staff, conservation practices if they wish to receive the financial incentives offered by the SGI. These financial incentives generally take the form of payments to offset costs of implementing conservation practices and easements or rental payments for long-term conservation.

While potentially effective at conserving GRSG populations and habitat on private lands, incentive-based conservation programs that fund the SGI generally require reauthorization from Congress under subsequent farm bills, meaning future funding is not guaranteed.

As of 2015, SGI has secured conservation easements on 243,400 acres within MZ II/VII (NRCS 2015). On these and additional lands in the MZ, SGI has completed specific GRSG conservation actions, including implementation of grazing systems, conifer removal, vegetation seeding, and fence marking. These conservation actions are targeted at the critical threats in the MZ. Additionally, SGI clusters implementation to achieve landscape benefits (NRCS 2015).

Other Regional Efforts

A programmatic EIS by the Western Area Power Administration (WAPA) and the USFWS for the entire upper Great Plains will focus future wind energy developments in specific corridors outside of GRSG core habitat (WAPA 2013). In accordance with Section 7 of the ESA, preparation of the programmatic EIS has involved consultation between cooperating entities and the USFWS and preparation of a programmatic Biological Assessment to ensure that the action will not jeopardize the continued existence of any federally-listed species, including the federal candidate GRSG. At the time of this RMPA specific conservation measures for protecting GRSG and its habitat under the programmatic EIS are not developed.

Tribes, counties, and local working groups are playing a critical role in promoting GRSG conservation at the local level. Individual conservation plans have been prepared by most local working groups to develop and implement strategies to improve or maintain GRSG habitat and reduce or mitigate threats. The proposed conservation actions and recommendations in these plans are voluntary actions. The conservation plans located in Wyoming are used as instruments to inform the Wyoming executive order.

Local working group projects include monitoring, research, and mapping habitat areas, as well as public outreach efforts, such as landowner education and collaboration with federal, state, and other local entities. These efforts provide a net conservation gain to GRSG through increased monitoring and public awareness.

Local working group GRSG conservation plans in MZ II/VII include the following:

- Northwest Colorado (Northwest Colorado Greater Sage-Grouse Conservation Plan; 2008)
- Piceance/Parachute Roan Creek (Parachute-Piceance-Roan Greater Sage-Grouse Conservation Plan; 2008)
- Northern Eagle/Southern Routt (Northern Eagle County and Southern Routt County Greater Sage-Grouse Conservation Plan; 2004)
- North Park (North Park Greater Sage-Grouse Conservation Plan; 2001)
- Middle Park (Middle Park Sage Grouse Conservation Plan; 2001)
- Rich County (Rich County Sage-grouse Conservation Plan; 2006)
- Morgan-Summit (Morgan-Summit Greater Sage-Grouse Local Conservation Plan; 2006)
- Uintah Basin (Uinta Basin Greater Sage-Grouse Local Conservation Plan; 2007)
- Upper Green River Basin (Upper Green River Basin Sage-Grouse Grouse Conservation Plan; 2007)
- Upper Snake River Basin (Upper Snake River Basin Sage-Grouse Conservation Plan; 2008)
- Wind River/Sweetwater River Basin (Wind River/Sweetwater River Local Sage-Grouse Conservation Plan; 2007)
- Southwest Wyoming (Southwest Wyoming Sage-grouse Conservation Assessment and Plan; 2007)
- South Central Wyoming (South Central Sage-Grouse Conservation Plan; 2007)
- Bates Hole/Shirley Basin (Bates Hole/Shirley Basin Sage-grouse Conservation Plan; 2007)
- Bighorn Basin, Wyoming (Sage grouse Conservation Plan for the Bighorn Basin; Bighorn Basin Sage-grouse Local Working Group; 2007)

7.1.5 Relevant Cumulative Actions

This cumulative effects analysis considers the incremental impact of the Bighorn Basin RMP and alternatives in combination with other past, present, and reasonably foreseeable future federal and non-federal action on all lands in MZ II/VII. Where these occur within GRSG habitat, they would cumulatively add to the impacts of BLM- and Forest Service-authorized activities set forth in the Bighorn Basin Proposed Plan. In addition to the conservation efforts described above, relevant reasonably foreseeable future cumulative actions occurring on federal, private, or mixed landownership in MZ II/VII are described in the Proposed RMPAs/LUPAs for Northwest Colorado. The following list includes large-scale past, present, and reasonably foreseeable future actions in MZ II/VII that when added to the Proposed Plan and alternatives for the Bighorn Basin RMP, could cumulatively affect GRSG (see Table 7-12 for more detail):

- Hiawatha Regional Energy Development EIS
- LaBarge Platform Exploration & Development Project
- Continental Divide-Creston Natural Gas Project

- Moneta Divide Natural Gas and Oil Development Project
- Pinedale Anticline Project
- Black Fork Project (Formerly Moxa Arch Area Infill)
- Oil Shale and Tar Sands Programmatic EIS
- Atlantic Rim Natural Gas Field Development Project
- Chokecherry Sierra Madre Wind Farm
- Gateway South Transmission Line Project
- TransWest Express Transmission Line Project
- Gateway West Transmission Line Project
- Riley Ridge o Natrona Pipeline Project
- Invasive Plant Management EIS for the Medicine Bow – Routt National Forests, and Thunder Basin National Grassland
- Normal-Pressured Lance Natural Gas EIS
- Bird Canyon Field Infill EIS

These projects are incorporated into the following analysis as the relevant past, present, and reasonably foreseeable future projects associated with each threat to GRSG in MZ II/VII.

7.1.6 Threats to GRSG in MZ II/VII

The COT Report identifies the present and widespread threats facing GRSG in MZ II/VII as identifies energy development; infrastructure; grazing, including free-roaming equids; conversion to agriculture and urbanization; fire; spread of weeds; and recreation (USFWS 2013). These threats impact GRSG mainly by fragmenting and degrading their habitat. For example, the loss of sagebrush steppe across the West approaches or exceeds 50 percent in some areas. Habitat fragmentation and degradation is a primary factor in long-term declines in GRSG abundance across its historical range (USFWS 2010).

Habitat fragmentation reduces connectivity of populations and increases the likelihood of extirpation from random events such as drought or outbreak of West Nile virus. Furthermore, climate change is likely to affect habitat availability to some degree by decreasing summer flows and limiting growth of grasses and forbs, thereby limiting water and food supply (BLM 2012). Sensitive species such as GRSG, which are already stressed by declining habitat, increased development, and other factors, could experience additional pressures as a result of climate change.

Each COT report threat considered “present and widespread” in at least one population in MZ II/VII is discussed below. For more detail on the nature and type of effects and the direct and indirect impacts on GRSG in the planning area, see Chapter 4 of the Bighorn Basin PRMP/FEIS.

7.1.6.1 Energy Development

The COT report states that energy development should be designed to ensure that it will not impinge on stable or increasing GRSG population trends. For mining, the COT objective is to maintain stable to increasing GRSG populations and no net loss of GRSG habitats in areas affected by mining (USFWS 2013).

There are approximately 1,144,800 acres of GRSG habitat in MZ II/VII where energy development, including oil and gas, coal leasing, mineral materials, and non-energy leasable minerals, is occurring. In

addition, there are over 30,000,000 acres indirectly influenced by energy development (Manier et al. 2013, pp. 55-71).

Oil and Gas

Nature and Type of Effects

As discussed in Chapter 4, oil and gas development impacts GRSG and sagebrush habitats through direct disturbance and habitat loss from well pads, construction activities, seismic surveys, roads, power lines, and pipeline corridors. Indirect disturbances result from noise, gaseous emissions, vehicle traffic, changes in water availability and quality, and human presence. These factors could cumulatively or individually lead to habitat fragmentation in the long term (Connelly et al. 2004; Holloran 2005).

Oil and gas development also directly impacts GRSG through the species' avoidance of infrastructure. This development can also impact GRSG survival or reproductive success. Indirect effects include habitat quality changes, predator communities, and disease dynamics (Naugle et al. 2011).

Several studies completed in the Great Plains and Wyoming Basin have shown that breeding GRSG populations are affected at oil and gas well densities commonly permitted in Montana and Wyoming (Naugle et al. 2011). Doherty et al. (2010) found that although impacts were indiscernible at densities of less than one well per square mile, lek losses were two to five times greater in areas with development above this threshold. They also found that the abundance (number) of males per lek at the remaining leks declined by approximately 30 to 80 percent. These and other studies demonstrate that both direct and indirect impacts result from the impacts of energy development and geophysical exploration in GRSG habitat.

Studies have researched the efficacy of NSO stipulations for leasing and development within certain distances of a lek (Holloran 2005; Walker et al. 2007). Walker et al. (2007) found that in the Powder River Basin, buffer sizes of 0.25, 0.5, 0.6, and 1.0 mile resulted in an estimated lek persistence (the ability of leks to remain on the landscape) of approximately 5, 10, 15, and 30 percent, respectively; conversely, lek persistence in areas without oil and gas development averaged approximately 85 percent. 0.25-mile NSO lease stipulations were found to be insufficient to conserve breeding GRSG populations in Wyoming and Montana, when nearly 100 percent of the area within approximately 2 miles of leks remained open to full-scale development (Walker et al. 2007).

Research has also studied the effects of energy development on GRSG at distances greater than one mile. Naugle et al. (2011) reported that impacts of energy development on leks had been documented at distances greater than 3.5 miles from the lek. Holloran (2005) found impacts on abundance at a distance between 3 and 4 miles in western Wyoming. However, Naugle et al. (2011) also stated that impacts on leks caused by energy development were most severe nearer the lek.

The impacts of well density have also been researched. Naugle et al. (2011) found that impacts from energy development often extirpate leks from gas fields. Doherty (2008) documented that lek losses increased and male abundance decreased as well density increased in the Powder River Basin. Lek extirpation in areas with 8 wells per section (40 to 100 wells total) within 2 miles of the lek was 5 times more likely to occur than in areas with no wells within 2 miles. Male attendance at the remaining leks in these areas declined approximately 20 to 60 percent (Doherty 2008).

The effects of noise on GRSG have been quantified in several studies. Lyon and Anderson (2003) reported that oil and gas development influenced the rate of nest initiation of GRSG in excess of approximately 2 miles of construction activities. GRSG numbers on leks within approximately 1 mile of natural gas compressor stations in Campbell County, Wyoming, were consistently lower than numbers

on leks unaffected by this noise disturbance (Braun et al. 2002). Holloran and Anderson (2005) reported that lek activity decreased downwind of drilling activities, suggesting that noise caused measurable impacts. In addition to activities directly associated with oil and gas development, road traffic also generates noise. Knick et al. (2003) indicated that there were no active GRSG leks within approximately 1 mile of Interstate 80 across southern Wyoming; only 9 leks were known to occur between approximately 1 and 2.5 miles of Interstate 80.

Conditions in MZ II/VII

The Greater Green River Basin, Uintah-Piceance Basin, and North Park Basin are all important oil and gas reserves in MZ II/VII.

Oil and natural gas development-related wells indirectly influence 78 to 84 percent of priority habitats and general habitats respectively across MZ II/VII. BLM-administered lands are host to 54 percent of wells in priority habitats and 50 percent in general habitats within MZ II/VII (Manier et al. 2013). Therefore, BLM actions are likely to have a greater potential to ameliorate the adverse impacts of oil and gas development on GRSG habitat than any other single land management entity.

Oil and gas conservation measures across MZ II/VII are more widespread than in the past. Much oil and gas development on private lands previously occurred with minimal mitigation efforts, but restrictions are now in place to protect GRSG habitat under the Wyoming and Montana executive orders. Additionally, in Colorado, operators may be subject to consultation requirements under the Colorado Oil and Gas Conservation Commission rules, to determine if conditions of approval are necessary to minimize adverse impacts from proposed oil and gas operations in sensitive wildlife habitat (such as GRSG PHMA).

Impact Analysis

Table 7-2, Acres Open and Closed to Fluid Mineral Leasing in GRSG Habitat in MZ II/VII, and Table 7-3, Acres with NSO and CSU/TL Stipulation in GRSG Habitat in MZ II/VII, provide a quantitative summary of present fluid mineral leasing conditions on BLM-administered lands across MZ II/VII. An analysis of this summary along with other past, present, and reasonably foreseeable actions in MZ II/VII (Table 7-12) follows.

As stated under Methods and Assumptions, acreages in these tables are limited to BLM-administered lands and always assume implementation of Proposed Plans in other RMP planning areas across MZ II/VII. Tables displaying fluid mineral acreage include the federal mineral estate.

Table 7-2. Acres Open* and Closed to Fluid Mineral Leasing in GRSG Habitat in MZ II/VII

	Priority Habitat Management Areas		General Habitat Management Areas	
	MZ II/VII	Percent Within Planning Area	MZ II/VII	Percent Within Planning Area
Open* to Fluid Mineral Leasing				
Alternative A	208,000	100%	2,522,000	43%
Alternative B	0	0%	1,875,000	20%
Alternative C	0	0%	3,949,000	62%
Alternative E	0	0%	1,854,000	19%

This table displays the acres of PHMA and GHMA with NSO Stipulations and CSU/TL Stipulations in MZ II/VII; it also displays the percentage of those acres that are found within the planning area.

- CSU Controlled surface use
- GHMA General Habitat Management Areas
- GRSG Greater sage-grouse
- MZ Management Zone
- NSO No surface occupancy
- PHMA Priority Habitat Management Areas
- TL Timing limitations

As shown in Table 7-2 and Table 7-3, fluid mineral closures and stipulations within the Bighorn Basin RMP planning area generally exert limited influence due to their small acreage compared to the broader MZ. However, actions such as closing PHMA and GHMA to leasing, establishing 0.6 mile-lek buffers in accordance with the Wyoming executive order, applying the disturbance cap, and implementing NSO and CSU/TL stipulations within the planning area would help to reduce the threat of oil and gas development within the MZ.

Under Alternative A, 208,000 acres of PHMA in MZ II/VII would be open to fluid mineral leasing under standard lease terms and conditions (all of which would be located in the Bighorn Basin planning area). Additionally, 2,522,000 acres of GHMA would be open to leasing in the MZ. The lack of protective restrictions in these areas would increase the potential for harm or disturbance associated with new leasing projects. GRSG would be most vulnerable to disturbances from oil and gas leasing and development in the Bighorn Basin planning area; implementing other BLM proposed plans throughout the remainder of the MZ would result in greater long-term protections on BLM-administered lands in those areas. Conservation actions at the state and local level (e.g., state GRSG plans, conservation easements, etc.) would complement other BLM proposed plans while oil and gas related past, present,

and reasonably foreseeable future actions that result in surface disturbance would result in a continued threat to GRSG specifically within the planning area.

Acres of PHMA and GHMA closed to fluid mineral leasing in MZ II/VII would be greatest under Alternative B and E. As such, there would not be oil and gas development in these areas, reducing the potential impact to GRSG populations. The risk of habitat fragmentation or disturbance due to new oil and gas development would be reduced. The incremental effect of implementing alternatives B or E in conjunction with BLM proposed plans elsewhere in the MZ and the past, present, and reasonably foreseeable future actions disclosed in Table 7-12 would result in a net conservation gain to GRSG in MZ II/VII because these two alternatives are the most restrictive for oil and gas development.

Alternative C provides the fewest restrictions on energy development in MZ II/VII. For example, approximately 3,949,000 acres of GHMA would be open to fluid mineral leasing under standard conditions. Reasonably foreseeable future leasing projects would be less restricted under this alternative, which could increase the risk of habitat fragmentation or disturbance, particularly within the Bighorn Basin planning area. Implementation of the BLM/Forest Service Proposed Plans in other planning areas would help ameliorate the threat of oil and gas development in those areas, but this alternative would result in a lower net conservation gain than alternatives B, E, or the Proposed Plan.

Under the Proposed Plan, no PHMA in MZ II/VII would be open to fluid mineral leasing with standard terms and conditions; approximately 2,378,000 acres of GHMA would be open with standard terms and conditions. Closing PHMA to fluid mineral leasing or applying major or moderate stipulations would benefit GRSG by limiting new development in PHMAs. While new oil and gas development is likely to occur on lands not administered by the BLM, such projects may be subject to the requirements of the Wyoming executive order and other state plans, which would limit disturbance. The incremental effect of implementing the Proposed Plan in conjunction with other GRSG conservation actions in MZ II/VII would be a net conservation gain for GRSG because of the additional restrictions in PHMAs.

Acres of GRSG habitat open, closed, or subject to NSO and CSU/TL stipulations under Alternative F are similar to those under the Proposed Plan, with slightly more acres of GHMA closed to fluid mineral leasing. Because the past, present, and reasonably foreseeable future actions would remain the same, the cumulative effects on GRSG in MZ II/VII would be similar to those discussed under the Proposed Plan.

All BLM/Forest Service Proposed Plans within MZ II/VII include BMPs and required design features to minimize impacts on GRSG from oil and gas development on federal lands. In areas where mineral estate is currently unleased, these tools can be applied to future leases; in areas which are already leased, BMPs can be applied as conditions of approval for development of existing leases. Examples include: locating new compressor stations outside of PHMA to reduce noise disturbance; clustering operations and facilities as closely as possible; placing infrastructure in already disturbed locations where the habitat has not been fully restored; and restoring disturbed areas at final reclamation to the pre-disturbance landforms and desired plant communities. State plans contain similar measures to reduce impacts. Together, these measures would help protect unfragmented habitats, minimize habitat loss and fragmentation, and maintain conditions that meet GRSG life history needs. Recent research indicates that restored habitats lack many of the features sought by GRSG in their habitat areas, and may not support GRSG for long periods following restoration activities. In order to conserve GRSG populations on the landscape, protection of existing habitat through minimizing development, would provide the best hope for GRSG persistence (Arkle et al. 2014).

The effect of the alternatives and other conservation actions in the MZ (most notably the Montana and Wyoming executive orders) could be synergistic, meaning that the effects of the actions together is

greater than the sum of their individual effects. For example, applying buffers in PHMA and on state and private land would effectively conserve larger blocks of land than if these actions occurred individually. This would provide a landscape-scale net conservation benefit, especially in areas where little development has occurred to date.

Implementation of the Proposed Plan within the Bighorn Basin planning area, in combination with other BLM planning efforts and other GRSG conservation plans within MZ II/VII could affect proposed oil and gas development projects. Large-scale oil and gas projects which could potentially occur on GRSG habitat within MZ II/VII (such as the Hiawatha Regional Energy Development EIS, LaBarge Platform Exploration & Development Project, and Continental Divide-Creston Natural Gas Project as discussed in Table 7-12) would be subject to disturbance cap limitation requirements of the Wyoming executive order and/or BLM/Forest Service Proposed Plans. NSO and CSU/TL stipulations would also apply in GRSG habitat on BLM-administered lands. These restrictions would contribute to the greatest net conservation gain of any alternative because they would limit development in key habitat areas. Because leasing restrictions (e.g., closures in PHMA and NSO stipulations) under the Proposed LUPs in MZ II/VII would not preclude existing leases in PHMA and GHMA from being developed, reasonably foreseeable future projects for oil and gas development are likely to affect GRSG and sagebrush habitats. However, mitigation requirements in BLM/Forest Service LUPAs and state and other GRSG conservation plans would offset disturbances from future projects and result in a net conservation gain for GRSG.

Coal

Nature and Type of Effects

Coal extraction is a major mining activity in GRSG habitat (Braun 1998), and environmental effects include soil erosion, dust, noise, water pollution, acid-mine drainage, and air emissions. These environmental effects can result in GRSG behavioral disruptions and habitat removal or degradation. Although land disturbed by coal mining can be restored to a point that supports a diversity of vegetation, including big sagebrush, reclamation projects require long durations, and GRSG habitat may fail to be restored (Arkle et al. 2014).

Conditions in MZ II/VII

Coal surface leases indirectly influence 8 to 10 percent of priority habitats and general habitats respectively across MZ II/VII. Approximately 50 percent of coal leases in priority habitats (and 57 percent in general habitats) occur on private lands within MZ II/VII (Manier et al. 2013). Therefore, private actions are likely to have a greater potential to ameliorate the effects of coal development on GRSG than any other single land management entity.

Impact Analysis

Coal leasing and development is less extensive in the Bighorn Basin planning area than in other areas of MZ II/VII. As such, management actions in the Bighorn Basin RMP/EIS would have less influence in ameliorating the threat than other regional efforts. Because the Bighorn Basin RMP/EIS would have such a small impact on the broader MZ, there would be little variation in the effects on GRSG within MZ II/VII across the RMP/EIS alternatives.

Under all alternatives and the Proposed Plan, new coal lease applications on federal mineral estate would be subject to suitability determinations governed by 43 CFR, Part 3461.5. Under unsuitability criterion 15, the BLM may determine that portions of the MZ contain essential GRSG habitat and are

unsuitable for all or certain stipulated methods of coal mining. If the BLM made this determination, it would apply stipulations to restrict coal mining and protect GRSG, including possibly prohibiting surface coal mining. As such, the regulations under Criterion 15 of 43 CFR, Part 3461.5(o)(1) would reduce the potential for long-term impacts associated with new coal leasing projects on GRSG habitats and populations.

New coal leasing and development may also occur on non-federal lands in MZ II/VII, subject to state regulations (including reclamation requirements). Additionally, new coal leasing in Wyoming and Montana would be subject to the Surface disturbance limit as required by the Wyoming and Montana executive orders. These measures would help protect GRSG habitat on lands where 43 CFR, Part 3461.5(o)(1) do not apply.

The requirements of 43 CFR, Part 3461.5, Criterion 15, in combination with BLM planning efforts and state plans, would help reduce the threat from coal extraction and would provide a net conservation gain to GRSG in MZ II/VII.

Mineral Materials

Nature and Type of Effects

Development of surface mines (e.g., for sand, gravel and other common mineral materials found in MZ II/VII) may negatively impact GRSG numbers and disrupt the habitat and life-cycle of the species, similar to other types of mining activities (Braun 1998; Manier et al. 2013).

Conditions in MZ II/VII

Mineral material disposal sites indirectly influence 17 percent of priority habitats and 11 percent of general habitats across MZ II/VII. Approximately 65 percent of mineral material disposal sites in priority habitats and 60 percent of sites in general habitats occur on BLM-administered lands within MZ II/VII (Manier et al. 2013). Therefore, BLM actions are likely to have a greater potential to ameliorate the effects of mineral material disposal on GRSG than any other single land management entity.

Impact Analysis

As shown in Table 7-4, Acres Open and Closed to Mineral Material Disposal in GRSG Habitat in MZ II/VII, acres of PHMA and GHMA closed to mineral material disposal within the planning area generally have a relatively smaller influence, when compared to the broader MZ.

Table 7-4. Acres Open and Closed to Mineral Material Disposal in GRSG Habitat in MZ II/VII

	Priority Habitat Management Areas		General Habitat Management Areas	
	MZ II/VII	Percent Within Planning Area	MZ II/VII	Percent Within Planning Area
Open to Mineral Material Disposal				
Alternative A	7,530,000	19%	10,417,000	23%
Alternative B	6,680,000	8%	8,971,000	11%
Alternative C	6,126,000	0%	11,705,000	32%
Alternative E	6,126,000	0%	8,971,000	11%
Alternative F	7,556,000	19%	10,436,000	24%
Proposed Plan	7,181,000	15%	9,762,000	18%
Closed to Mineral Material Disposal				
Alternative A	3,487,000	2%	1,285,000	13%
Alternative B	4,398,000	22%	2,675,000	58%
Alternative C	3,433,000	0%	1,454,000	23%
Alternative E	4,952,000	31%	2,675,000	58%
Alternative F	3,461,000	1%	1,265,000	12%
Proposed Plan	3,495,000	2%	1,390,000	20%

Source: BLM 2015

This table displays the acres of PHMA and GHMA open and closed to mineral material disposal in MZ II/VII; it also displays the percentage of those acres that are found within the planning area.

GHMA General Habitat Management Areas
 GRSG Greater sage-grouse
 MZ Management Zone
 PHMA Priority Habitat Management Areas

Under Alternative A, 3,487,000 acres of PHMA are closed to mineral material disposal in MZ II/VII and 1,285,000 acres of GHMA are closed. 7,530,000 acres of PHMA would remain open, as would 10,417,000 acres of GHMA. Reasonably foreseeable future mineral material disposals in MZ II/VII could affect GRSG through habitat disturbance, fragmentation, or behavior disruptions, depending on the location and extent of the project; however, implementation of BLM/Forest Service Proposed Plans in other areas of MZ II/VII would restrict development, thereby reducing the risk of removing or fragmenting habitat elsewhere in MZ II/VII, particularly on federal lands. There would be a net conservation gain to GRSG in MZ II/VII, but it would be concentrated in areas outside the Bighorn Basin planning area and would have a less widespread beneficial impact on the Wyoming Basin population in the planning area.

Substantially more acres of PHMA and GHMA are closed under alternatives B and E. These closures would restrict the development of mineral materials on GRSG habitat on federal lands, thereby contributing to the protection of habitat. However, designating GRSG habitat as open or closed to mineral material disposal would not preclude existing facilities from continued operation. In areas where existing mineral material disposal sites affect GRSG (e.g., through noise disturbance or vehicle

collision risk), these impacts would likely continue. Impacts in other areas of MZ II/VII would be the same as under Alternative A.

Under Alternative C, 3,433,000 acres of PHMA would be closed to mineral material disposal in MZ II/VII and 1,454,000 acres of GHMA would be closed. While this Alternative closes the fewest acres of PHMA to mineral material disposal, implementation of state plans and BLM/Forest Service Proposed Plans in other areas of MZ II/VII are considered present and reasonably foreseeable future actions, respectively, which would contribute to the protection of habitat and a net conservation gain.

Under the Proposed Plan, 3,495,000 acres of PHMA would be closed to mineral material disposal in MZ II/VII; 1,390,000 acres would be closed in GHMA. On non-federal lands, the development limitations applied under the Wyoming executive order would reduce impacts to GRSG habitat across the state, and would encourage mineral material disposal in areas away from Core Areas. Together, the incremental effect would be a net conservation gain to GRSG.

Under Alternative F, slightly fewer acres of PHMA and GHMA in MZ II/VII would be closed to mineral material disposal in comparison to the Proposed Plan; the cumulative effects on GRSG are similar to those for the Proposed Plan, but less beneficial on BLM-administered lands within the planning area. This would impact the Wyoming Basin population's integrity more than populations elsewhere in the MZ.

Locatable Minerals

Nature and Type of Effects

Locatable minerals include gold, silver, uranium, and bentonite. Activities associated with locatable mineral development, such as stockpiling topsoil and extracting and transporting material, have direct impacts on GRSG through mortality and nest disruption. These actions also would reduce the functionality of the surrounding habitat via noise and light disturbance, resulting in lost and degraded PHMA and GHMA.

As with fluid mineral development, reclamation practices may help to reduce long-term impacts on GRSG and their habitat. Although disturbed areas have not been restored to near pre-disturbance conditions in the past, recent efforts have been directed toward restoring functional habitat. However, even with effective restoration, restored areas may not support GRSG populations at the same level as prior to disturbance.

Conditions in MZ II/VII

Within MZ II/VII, bentonite, gypsum, gold, and uranium are all commonly mined for commercial use.

Impact Analysis

As shown in Table 7-5, Acres Open and Recommended with Mineral Withdrawal, acres of GRSG habitat recommended for withdrawal generally represents a relatively small influence, when compared to the broader MZ.

Table 7-5. Acres Open and Recommended for Withdrawal from Mineral Entry in GRSG Habitat in MZ II/VII

	Priority Habitat Management Areas		General Habitat Management Areas	
	MZ II/VII	Percent Within Planning Area	MZ II/VII	Percent Within Planning Area
Open to Mineral Entry				
Alternative A	8,154,000	17%	8,910,000	27%
Alternative B	8,213,000	18%	8,830,000	27%
Alternative C	6,770,000	0%	10,413,000	38%
Alternative E	6,770,000	0%	8,825,000	27%
Alternative F	8,169,000	17%	8,993,000	28%
Proposed Plan	8,190,000	17%	8,940,000	28%
Recommended for Withdrawal from Locatable Mineral Entry				
Alternative A	890,000	0%	209,000	8%
Alternative B	941,000	6%	355,000	46%
Alternative C	887,729	0%	202,000	4%
Alternative E	2,383,000	63%	359,000	46%
Alternative F	894,000	1%	217,000	12%
Proposed Plan	893,000	1%	235,000	18%

Source: BLM 2015

This table displays the acres of PHMA and GHMA open to mineral entry and recommended for withdrawal from locatable mineral entry in MZ II/VII; it also displays the percentage of those acres that are found within the planning area.

GHMA General Habitat Management Areas
 GRSG Greater sage-grouse
 MZ Management Zone
 PHMA Priority Habitat Management Areas

Under Alternative A, 890,000 acres of PHMA would be recommended for withdrawal from locatable mineral entry in MZ II/VII. Additional acres of PHMA would be recommended for withdrawal under alternatives B, E, F, and the Proposed Plan. Acres of PHMA and GHMA recommended with withdrawal in MZ II/VII would be greatest under Alternative E. Under all alternatives, withdrawing lands from locatable mineral development is unlikely to mitigate existing or approved projects in GRSG habitat. However, withdrawing GRSG habitat from mineral entry would reduce the risk of sagebrush habitat loss or fragmentation caused by new locatable mineral development projects.

Under all alternatives, required design features would help minimize the impacts on GRSG from locatable mineral development on federal land. All BLM/Forest Service Proposed Plans within MZ II/VII include required design features. Examples include: locating facilities outside of PHMA to reduce noise disturbance; clustering operations and facilities as closely as possible; placing infrastructure in already disturbed locations where the habitat has not been fully restored; and restoring disturbed areas at final reclamation to the pre-disturbance landforms and desired plant communities.

Under the Proposed Plan, portions of SFAs would be recommended for withdrawal. As such, if these areas are withdrawn the Proposed Plan would provide a greater net conservation gain to GRSG populations by reducing disturbance to birds from mining activities.

Nonenergy Leasable Minerals

Nature and Type of Effects

Nonenergy leasable minerals include materials such as sulfates, silicates, and trona (sodium carbonate). Impacts on GRSG are similar to those from other types of mining as described above.

Conditions in MZ II/VII

In MZ II/VII, existing federal mineral prospecting permits for nonenergy leasable resources have a direct footprint on 378,400 acres of priority habitats and 557,100 acres of general habitats (Manier et al. 2013, P. 79).

Impact Analysis

Table 7-6, Acres Open and Closed to Nonenergy Leasable Mineral Leasing in GRSG Habitat in MZ II/VII, shows acres of GRSG habitat open and closed to nonenergy leasing in the MZ.

Table 7-6. Acres Open and Closed to Nonenergy Leasable Mineral Leasing in GRSG Habitat in MZ II/VII

This table displays the acres of PHMA and GHMA open and closed to nonenergy leasing in MZ II/VII; it also displays the percentage of those acres that are found within the planning area.

GHMA General Habitat Management Areas
 GRSG Greater sage-grouse
 MZ Management Zone
 PHMA Priority Habitat Management Areas

No federal lands within the Bighorn Basin planning area were designated as open or closed under the RMP; therefore, cumulative impacts to GRSG within MZ II/VII would vary little across all alternatives because past, present, and reasonably foreseeable future actions would not vary across alternatives. New nonenergy leasable projects occurring in GRSG habitat could impact GRSG and their habitat, depending on the location and extent of the development. Precluding nonenergy leasable development in PHMA and GHMA would reduce habitat disturbance and fragmentation as well as direct disturbance to GRSG, improving the likelihood of successful breeding and reproduction. Implementing a 3 percent disturbance cap under alternatives E, F, and 5 percent disturbance cap under Alternative B and the Proposed Plan would limit nonenergy mineral development over the long term and may reduce development more than alternatives A, or C. As a result, in combination with the disturbance cap applied under state plans, BLM actions in other planning areas in MZ II/VII, and other past, present, and reasonably foreseeable future actions, alternatives B, E, F, and the Proposed Plan would provide a net conservation gain to GRSG. This gain would be greatest under alternatives E and F, as these alternatives implement the most restrictive disturbance caps.

7.1.6.2 Infrastructure

Rights of Way/Special Use Authorizations

Nature and Type of Effects

As discussed in Chapter 4, power lines can directly affect GRSG by posing a collision and electrocution hazard, and can indirectly decrease lek attendance and recruitment by providing perches and nesting habitat for potential avian predators, such as golden eagles and ravens (Connelly et al. 2004). In addition, power lines are linear and often extend for many miles. Thus, ground disturbance associated with construction, as well as vehicle and human presence during maintenance activities, may introduce or spread invasive weeds over large areas, thereby degrading habitat. Impacts from roads may include direct habitat loss from road construction and direct mortality from collisions with vehicles. Roads may also facilitate predator movements, spread invasive plants, and increase human disturbance from noise and traffic (Forman and Alexander 1998).

Numerous studies have researched the impact of infrastructure on GRSG. For example, GRSG avoided nesting and summering near major roads (for example, paved secondary highways) in south-central Wyoming (LeBeau 2012), and traffic disturbance (1 to 12 vehicles per day) within 1.9 miles of leks during the breeding season reduced nest-initiation rates and increased distances moved from leks during nest site selection of female sage-grouse in southwestern Wyoming (Lyon and Anderson 2003). Nesting propensity (i.e., nest initiation rates) was 24 percent lower for females breeding on road-disturbed leks compared with undisturbed females, 56 percent of females breeding on disturbed leks initiated nests in consecutive years compared to 82 percent of females breeding on undisturbed leks, and females moved twice as far from leks to nest locations if breeding on disturbed leks (Lyon and Anderson 2003). Increased length of road (correlated with use), increased traffic levels on roads, and traffic activity during the early morning on roads within approximately 1.9 miles of leks negatively influence male lek attendance (Manier et al. 2013).

An examination of leks within 62 miles of Interstate 80 in Wyoming and Utah found no leks within 1.25 miles of the interstate, reduced numbers of leks within 4.7 miles of the interstate, and a positive distance-effect with higher rates of decline in lek counts between 1970 and 2003 on leks within 4.5 miles compared to leks 4.7 to 9.3 miles from the interstate (Connelly et al. 2004). Rates of decline in GRSG male lek attendance increased as traffic volumes on roads near leks increased, and vehicle activity on roads during the daily strutting period (i.e., early morning) had a greater influence on male lek attendance compared with roads with no vehicle activity during early morning in southwestern Wyoming (Holloran 2005). In central Wyoming, peak male attendance (i.e., abundance) at leks experimentally treated with noise recorded at roads decreased 73 percent relative to paired controls (Blickley 2012; Manier et al. 2013).

Transmission lines are especially prevalent in MZ II/VII (Manier et al. 2013) and their impact on GRSG in the MZ has been studied. Negative effects of power lines on lek persistence were documented in northeastern Wyoming; the probability of lek persistence decreased with proximity to power lines and with increasing proportion of power lines within a four-mile window around leks (Walker et al. 2007). Braun reported that use of areas near transmission lines by sage-grouse, as measured by pellet counts, increased as distance from transmission line increased up to 600 m (1968 feet) (Braun 1998). Sage-grouse avoided brood-rearing habitats within 2.9 miles of transmission lines in south-central Wyoming (LeBeau 2012; Manier et al. 2013).

Power lines may also cause changes in lek dynamics, with lower growth rates observed on leks within 0.25 miles of new power lines in the Powder River Basin of Wyoming as compared with those further from the lines. This was attributed to increased raptor predation (Braun et al. 2002). Raptors and corvids forage on average 3.1 to 4.3 miles from perching sites, potentially impacting 32 to 40 percent of the sage-grouse conservation area (Connelly et al. 2004). Removing or reducing the number of perching structures and landfills in key nesting, brood rearing, and lekking habitats may reduce predation pressure on sage-grouse (Bui 2009; Leu and Hanser 2011; Manier et al. 2013).

Conditions in MZ II/VII

Infrastructure, such as ROWs and associated facilities and urbanization, is prevalent throughout MZ II/VII.

Although not representative of all infrastructure ROW, transmission lines (greater than 115 kilovolt) indirectly influence 60 to 63 percent of priority habitats and general habitats respectively across MZ II/VII. Approximately 50 percent of transmission lines in priority habitats (and 45 percent in general habitats) are located on BLM-administered lands across GRSG habitats in MZ II/VII (Manier et al. 2013). Therefore, BLM actions are likely to have a greater potential to ameliorate the effects of transmission line ROW on GRSG than any other single land management entity.

Impact Analysis

Table 7-7, Acres of Rights-of-Way/Special Use Authorization Management within GRSG Habitat in MZ II/VII, lists the acres of ROW/SUA avoidance and exclusion within GRSG habitat by alternative.

Table 7-7. Acres of Rights-of-Way/Special Use Authorization Management within GRSG Habitat in MZ II/VII

	Priority Habitat Management Areas		General Habitat Management Areas	
	MZ II/VII	Percent Within Planning Area	MZ II/VII	Percent Within Planning Area

This table displays the acres of PHMA and GHMA within rights-of-way/special use authorization management areas in MZ II/VII; it also displays the percentage of those acres that are found within the planning area.

GHMA General Habitat Management Areas
 GRSG Greater sage-grouse
 MZ Management Zone
 PHMA Priority Habitat Management Areas

Past, present, and reasonably foreseeable projects within MZ II/VII identified in Table 7-12 indicate ROW/SUA applications are anticipated to continue to increase within MZ II/VII/. Major interstate transmission lines are currently proposed in MZ II/VII, and may contribute to the cumulative impacts on GRSG and their habitat. However, by implementing avoidance and exclusion management areas on BLM-administered lands, proposed transmission lines would be restricted in GRSG habitat. Exclusion areas would strictly prohibit ROW/SUA development, while avoidance areas may allow ROW/SUA development subject to restrictions and mitigation.

Exclusion and avoidance area management areas are intended to minimize disturbance to GRSG populations by limiting the siting of roads and other ROWs/SUAs which can increase bird mortality, habitat avoidance, habitat fragmentation. Additionally, the location of tall structures can increase predation (Connelly et al. 2004). These adverse impacts would be most prevalent under Alternative A and C, as these alternatives have the fewest acres of ROW/SUA avoidance and exclusion management areas within MZ II/VII.

Reasonably foreseeable future actions (as discussed in Table 7-12) include multi-state transmission lines which cross multiple land jurisdictions, including private, state, and federally owned lands. ROW exclusion and avoidance management under the Proposed Plan or any of the alternatives would not apply to non-federal lands. Therefore, the disturbance cap limitation under the Wyoming executive order, and other state plan incentives would have a greater impact towards ameliorating the threat.

Alternative A has the most acres of PHMA open to ROW/SUA development in MZ II/VII (822,000 acres), the majority of which are located within the Bighorn Basin planning area. All other action alternatives and the Proposed Plan reduce the number of PHMA acres open to ROW/SUA in MZ II/VII by 91%. Under Alternative A, 6,624,000 acres of GHMA would be open to ROW/SUA development in the MZ; this number is reduced for all other action alternatives and the Proposed Plan, except of Alternative C (7,166,000 acres). This would result in the smallest net conservation gain for GRSG because gains would be concentrated in other portions of MZ II/VII and would also be less pronounced on BLM-administered lands in the Bighorn Basin planning area.

Acres of GRSG habitat managed as ROW/SUA exclusion in MZ II/VII are highest under Alternative B and E and, because relevant cumulative actions do not vary across alternatives, these alternatives would provide the greatest net conservation gain in terms of acres that are closed or restricted for development. The Proposed Plan relies more on ROW avoidance management to protect GRSG habitat rather than ROW exclusion. While ROW avoidance areas do not afford the same level of protection as ROW exclusion areas, ROW developments in avoidance areas would be subject to restrictions and mitigation, which would limit impacts on GRSG habitats and populations. As a result, the incremental effect of implementing the Proposed Plan in conjunction with past, present, and reasonably foreseeable future actions would be a reduction in disturbance of GRSG leks, nests, and brood-rearing and wintering areas compared to other alternatives. The anthropogenic disturbance cap would also have a similar effect.

The cumulative impact of installing multi-state transmission lines and other ROWs/SUA would include adverse effects to some populations of GRSG within MZ II/VII. These effects may include lek abandonment; removal, degradation, and fragmentation of habitat; direct mortality through collisions with vehicles; impeding migration; increased risk of predation; and spread of noxious or invasive weeds. Construction of access roads and ancillary facilities in GRSG habitat would contribute to these negative effects. BMPs, design features, state or BLM field office-specific stipulations, and Forest Standards and Guidelines are incorporated into the NEPA documents for many of these proposed transmission line in MZ II/VII. However, the extent to which these measures are to be implemented during construction is uncertain. GRSG would be particularly vulnerable to the effects of new transmission lines in Colorado, where reasonably foreseeable future transmission line project routes are proposed in both GHMA and PHMA.

The effect of the alternatives and other conservation actions in the MZ (most notably the Montana and Wyoming executive orders) could be synergistic. By implementing restrictions on infrastructure in PHMA and on state and private lands together, the cumulative beneficial effect on GRSG would be greater than the sum of their individual effects because protections would be applied more consistently across the landscape. This is especially important in areas of mixed land ownership patterns where

complementary protections can benefit leks, early brood rearing habitat, or other important areas that do not follow geopolitical boundaries.

Presidential Priority transmission projects which are proposed in MZ II/VII (i.e., TransWest Express and Gateway West), would not be subject to GRSG conservation requirements in BLM/Forest Service GRSG RMP Amendments, but would be subject to requirements in applicable state plans as well as other state and federal laws and regulations. They would also develop their own suite of protective measures analyzed in project-specific NEPA documents. Whether or not these project-specific measures would adequately protect GRSG is unknown at this point in time because the measures have not been finalized. Regardless, impacts would likely be greater in Colorado where the proposed route would impact approximately 26 miles in PACs (key habitats that are essential for GRSG conservation) and 57 miles in PHMA in the Little Snake and White River BLM Field Offices. This impact would be especially harmful to fringe GRSG populations in Colorado, as some are less robust than those in Wyoming and southern Montana. In Wyoming, the routes avoid Core Areas due to that state plan's requirements; this would reduce impacts in Wyoming.

Under all alternatives and the Proposed Plan, the cumulative effect of constructing multiple new transmission lines and other ROWs/SUAs is likely to result in negative effects to GRSG and their habitat. However, implementation of the BLM/Forest Service Proposed Plans in combination with other regional efforts would restrict the extent to which proposed ROWs/SUA could be located in or near GRSG habitat, providing more benefit to the species than current management.

Renewable Energy

Nature and Type of Effects

Impacts on GRSG from renewable energy development, such as that for wind and solar power, are similar to those from nonrenewable energy development. Additional concerns associated with wind energy developments are rotor blade noise, structure avoidance, and mortality caused by collisions with turbines (Connelly et al. 2004).

A study on specific effects of wind development on sage-grouse in south-central Wyoming showed that the relative probability of a GRSG nest failing (eggs not hatching) or brood failing (all chicks lost within 35 days post-hatch) increased with proximity to the nearest wind turbine. This study investigated short-term response of sage-grouse to a wind energy facility; additional impacts may be realized in the longer term following addition of wind turbines, due to the time lags associated with responses of breeding populations to infrastructure (Garton et al. 2011).

Conditions in MZ II/VII

While most federal lands are not currently leased or developed for wind or solar energy resources, areas of potential development coincide closely with GRSG habitats in MZ II (Manier et al. 2013). Within the Bighorn Basin planning area, renewable energy potential is present, but existing facilities are limited. Although not representative of all renewable energy development, wind turbines indirectly influence less than 1 to 2 percent of priority habitats and general habitats respectively across MZ II/VII. Private lands are host to 70 percent of wind turbines affecting GRSG in priority habitats (and 73 percent in general habitats) within MZ II/VII (Manier et al. 2013). If this trend continues into the future, conservation actions on private land are likely to have a greater potential to ameliorate the effects of wind energy development than any other single land management entity.

Impact Analysis

Table 7-8, Acres of Wind Energy Management Areas in GRSG Habitat in MZII/VII, lists acres of wind energy ROW/SUA by alternative.

Table 7-8. Acres of Wind Energy Management Areas in GRSG Habitat in MZ II/VII

	Priority Habitat Management Areas		General Habitat Management Areas

This table displays the acres of PHMA and GHMA within wind energy management areas in MZ II/VII; it also displays the percentage of those acres that are found within the planning area.

- GHMA General Habitat Management Areas
- GRSG Greater sage-grouse
- MZ Management Zone
- PHMA Priority Habitat Management Areas

No PHMA would be managed as open to wind ROWs/SUAs in MZ II/VII under any of the alternatives or the Proposed Plan. All action alternatives and the Proposed Plan would manage GHMA as open to wind ROWs/SUAs in MZ II/VII to varying degrees with Alternative C (5,542,000 acres) and the Proposed Plan (5,461,000 acres) designating the most open acres within the MZ.

Alternative B and E would manage more acres of GRSG habitat in MZ II/VII as wind ROW/SUA exclusion compared to the other alternatives and the Proposed Plan. This would include 4,214,000 acres of PHMA and 1,407,000 acres of GHMA managed as ROW/SUA exclusion under Alternative B; 4,915,000 acres of PHMA and 1,407,000 acres of GHMA under Alternative E.

The Proposed Plan relies more on wind ROW avoidance management to protect GRSG habitat rather than wind ROW exclusion. Similar to other ROWs, this approach preserves management flexibility in situations where landownership is mixed. Without this flexibility, rerouting ROWs/SUAs across nonfederal land may result in a longer route, increasing disturbance of GRSG leks, nests, and brood-rearing and wintering areas more than direct routing across federal land.

Managing wind ROW/SUA avoidance and exclusion areas in GRSG habitat would reduce or minimize impacts from wind utility infrastructure on BLM-administered land by prohibiting or restricting new ROWs/SUAs. In addition, renewals or upgrades of existing facilities could incorporate additional conservation actions. Collocation or clustering of facilities would reduce impacts on GRSG habitat and would reduce disturbance in new areas.

Reasonably foreseeable future projects within MZ II/VII include renewable energy developments, such as the Chokecherry/Sierra Madre Wind Farm in southern Wyoming. Projects which require state agency review or approval would be subject to the Wyoming executive order permitting process for development in Core Areas, which would encourage ROW/SUA development outside of Core Areas and restrict surface occupancy within 0.6 miles of occupied leks.

Impacts would be minimized on BLM-administered land across all alternatives by adhering to the wildlife protection provisions of the Wind Energy Development Programmatic EIS (BLM 2005). Implementation of wind energy ROW/SUA avoidance in PHMA for all BLM/Forest Service Proposed Plans, in combination with the disturbance caps under the state plans, exclusion zones in other BLM planning areas and other past, present, and reasonably foreseeable future actions, would provide the greatest net conservation gain to GRSG in MZ II/VII.

7.1.6.3 Grazing/Free-Roaming Equids

Nature and Type of Effects

In general, livestock can influence habitat by modifying plant biomass, plant height and cover, and plant species composition. As a result, livestock grazing could cause changes in habitat that alter species abundances and composition in GRSG insect prey. Changes in plant composition could occur in varying degrees and could change vegetative structure, affecting cover for nesting birds. Grazing could also alter fire regimes (Davies et al. 2010).

If not managed properly, cattle and sheep grazing could compact soil, enrich soil with nutrients, trample vegetation and nests, directly disturb GRSG, and negatively affect GRSG recruitment. Cattle and sheep also can reduce invertebrate prey for GRSG or increase their exposure to predators (Beck and Mitchell 2000, Pp. 998-1,000; Knick 2011; Coates 2007, Pp. 28-33). Grazing in riparian areas can destabilize streams and riverbanks, cause the loss of riparian shade, and increase sediment and nutrient loads in the aquatic ecosystem (George et al. 2011). Stock watering tanks can contribute to stream and aquifer

dewatering and may concentrate livestock movement and congregation in sensitive areas (Vance and Stagliano 2007).

Grazing can be used to reduce fuel load and reduce the risk of wildfire (Connelly et al. 2004, Pp. 7, 28-30). Under certain conditions, grazing can reduce the spread of invasive grasses, if applied early in the season before the grasses have dried (Strand and Launchbaugh 2013). Light to moderate grazing does not appear to affect perennial grasses, which are important to nest cover (Strand and Launchbaugh 2013). However, excessive grazing can eliminate perennial grasses and lead to expansion of invasive species such as cheatgrass or Japanese brome (Reisner et al. 2013).

A well-developed understory of grass, forbs, and deciduous shrubs is critical for GRSG and other wildlife. Impacts on habitat vary with livestock densities and distribution; the more evenly livestock is distributed, the lower its impact on any given area (Gillen et al. 1984). However, cattle show a strong preference for certain areas, leading to high use in some areas and little to no use in others. Livestock grazing is generally limited by slopes of greater than 60 percent, dense forests and vegetation, poor or little upland forage, and lack of water (Holechek et al. 2010).

Although livestock grazing is the most widespread land use across the sagebrush biome, it exerts a more limited influence on soils and vegetation than land uses that remove or fragment habitat (e.g., mineral extraction or infrastructure development). GRSG are able to co-exist with grazing animals when properly managed. Thus, reducing AUMs or acres open to grazing would not necessarily restore high-quality GRSG habitat.

Reducing grass height caused by livestock grazing in GRSG nesting and brood-rearing areas has been shown to negatively impact nesting success. Livestock grazing could reduce the suitability of breeding and brood-rearing habitat, which would impact GRSG populations (USFWS 2010).

Since the passage of the 1934 Taylor Grazing Act, range conditions on BLM-administered lands have improved due to improved grazing management practices and decreased livestock numbers and annual duration of grazing. In addition, the BLM has applied Standards for Rangeland Health since 1997. The purpose of this practice is to enhance sustainable livestock grazing and wildlife habitat, while protecting watersheds and riparian ecosystems.

For BLM-administered lands, Standards for Rangeland Health require the BLM to ensure rangelands are capable of sustaining viable populations and a diversity of native plant and animal species appropriate to the habitat. Habitats that support or could support threatened species, endangered species, or species of special concern sensitive species will be maintained or enhanced. The BLM Washington Office Instruction Memorandum 2009-018 serves as an aid to BLM field offices in determining priorities for focusing resources when processing permits and leases. The IM is based upon rangeland health, and considers critical habitat conditions, conflicts with GRSG, and whether projects have been proposed for implementing the Healthy Lands initiative. The authorized officer shall take appropriate action upon determining that existing management needs to be modified to ensure that standards are met or are making significant progress towards meeting standards. Modifying management could involve a variety of actions including, but not limited to, changing animal kind, changing season of use, adjusting AUMs, adjusting livestock numbers, implementing a grazing prescription or implementing range improvement projects.

On National Forest Systems lands, livestock grazing is administered in accordance to the Multiple Use and Sustained Yield Act of 1960. As with BLM-administered lands, the Forest Service issues livestock grazing permits for a period of up to 10 years that are generally renewable if it is determined that the terms and conditions of the permit are being met and the ecological condition of the rangelands are meeting the fundamentals of rangeland health.

Range improvements could result in livestock overusing important GRSG areas. For example, developing springs would generally change vegetative composition from a high diversity of grasses and forbs, important to broods, to one dominated by grasses.

Concentrated livestock use can remove standing vegetation and subsequently reduce associated insects and forbs, both of which are important to GRSG broods. Allowing spring developments along ephemeral streams and wetlands and allowing livestock watering tanks would decrease GRSG habitat. Springs, seeps, and wetland areas are vitally important to GRSG broods; therefore, allowing spring developments could reduce resources for GRSG.

Other direct and indirect effects may occur from range improvements. Water developments may also contribute to the increased occurrence of West Nile virus (Walker and Naugle 2011). Barbed wire fences contribute to direct mortality through fence collisions (Stevens et al. 2011).

Conditions in MZ II/VII

In general, the risks to GRSG and their habitat associated with improper grazing practices are less in the northerly, wetter parts of GRSG range (i.e., MZ I and northern portions of MZ II/VII) than across the arid semi-deserts of the rest of MZ II/VII. Nonetheless, livestock grazing is widespread across MZ II/VII, and may, if improperly conducted, pose a substantial threat to GRSG habitat (Stiver et al. 2006).

A large portion of the central regions of MZ II/VII (approximately 5 million acres) is federally managed wild horse and burro range, suggesting potential effects to GRSG from livestock grazing and the compounding effects of free-roaming equids (Manier et al. 2013). Within MZ II/VII, 19.9 percent of priority habitats are negatively influenced by free-roaming equids (Manier et al. 2013). Two designated herd management areas (HMAs) occur on BLM-administered lands in the planning area, both which contain GHMA and PHMA.

Impact Analysis

Table 7-9, Acres Available and Unavailable to Livestock Grazing in GRSG Habitat in MZ II/VII, lists the acres of PHMA and GHMA available and unavailable for grazing, by alternative.

Table 7-9. Acres Available and Unavailable to Livestock Grazing in GRSG Habitat in MZ II/VII

	Priority Habitat Management Areas		General Habitat Management Areas	
	MZ II/VII	Percent Within Planning Area	MZ II/VII	Percent Within Planning Area
Available to Livestock Grazing				
Alternative A	8,901,000	13%	9,667,000	21%
Alternative B	7,786,000	0	8,829,000	13%
Alternative C	7,786,000	0%	10,782,000	29%
Alternative E	7,786,000	0	1,194,000	98%
Alternative F	8,901,000	13%	9,667,000	21%
Proposed Plan	8,901,000	13%	9,705,000	21%
Unavailable to Livestock Grazing

This table displays the acres of PHMA and GHMA available and unavailable to livestock grazing in MZ II/VII; it also displays the percentage of those acres that are found within the planning area.

GHMA General Habitat Management Areas
 GRSG Greater sage-grouse
 MZ Management Zone
 PHMA Priority Habitat Management Areas

Under Alternative A, 8,901,000 acres of PHMA would be available to livestock grazing in MZ II/VII; 9,667,000 acres of GHMA acres would be available. Under Alternative F and the Proposed Plan, a similar amount of GRSG habitat acres are available for livestock grazing on federal lands. Alternatives B and E place more restrictions on grazing by designating more acres of PHMA and GHMA within the MZ as unavailable to livestock grazing. These restrictions would help to protect GRSG habitat from the potential effects of improper livestock grazing on BLM-administered lands and National Forest System lands.

As literature suggests that moderate grazing is compatible with GRSG habitat (Strand and Launchbaugh 2013), closing acres to grazing may not itself benefit or harm GRSG. As described above under Nature and Type of Impacts, possibly equally or more beneficial is restricting range improvements in GRSG habitat, limiting fencing, and effectively implementing range health standards on grazing allotments in GRSG habitat.

The COT report objectives for livestock grazing are to manage grazing in a manner consistent with local ecological conditions. This type of management would maintain or restore healthy sagebrush shrub and native perennial grass and forb communities and conserve essential habitat components for GRSG. The

COT report also states that land managers should avoid or reduce the impact of range management structures on GRSG habitat.

Under the Proposed Plan, management actions specifically related to GRSG would help reduce the threat of grazing throughout the MZ to meet the COT report objectives. For example, allotments within PHMAs, (focusing on those containing riparian areas, including wet meadows), will be prioritized for field checks to help ensure compliance with the terms and conditions of the grazing permits. Field checks could include monitoring for actual use, utilization, and use supervision. Other alternatives do not include a similar action, therefore the Proposed Plan would afford greater protection to GRSG from improper grazing practices on BLM-administered lands by increased monitoring of PHMAs.

In addition, all BLM/Forest Service Proposed LUPs in MZ II/VII would prioritize SFAs for grazing permit renewals, to determine if modification is necessary prior to renewal. This would provide an opportunity to adjust forage levels to meet rangeland health standards, thereby reducing the risk of non-functioning rangelands impacting GRSG habitats. The BLM establishes an appropriate management level for each HMA, which represents the population objective for free-roaming equids. Under all alternatives and the Proposed Action, the BLM has the ability to adjust appropriate management levels of wild horses if resource damage occurs. Additionally, under all action alternatives and the Proposed Plan, HMA plans will be updated to include GRSG objectives. This will result in a net conservation gain for GRSG. Under alternatives B, E, F, and the Proposed Plan, the BLM would apply season restrictions from February 1 to July 31 within the two HMAs in the Bighorn Basin planning area. Therefore, the cumulative net conservation gain in MZ II/VII would be slightly greater compared to alternatives A and C, as seasonal surface disturbance restrictions for wild horse management would also benefit GRSG during nesting and early brood-rearing season.

BLM/Forest Service grazing and free-roaming equid management actions in MZ II/VII would not apply on non-federal lands. Conservation initiatives conducted through the NRCS's SGI would have a greater direct impact towards ameliorating the threat on these lands. Since 2010, SGI has enhanced rangeland health through rotational grazing systems, re-vegetating former rangeland with sagebrush and perennial grasses and control of invasive weeds. On privately-owned lands, SGI has developed a prescribed grazing approach that balances forage availability with livestock demand. This system allows for adjustments to timing, frequency, and duration of grazing, ensuring rangelands are managed sustainably to provide continued ecological function of sagebrush-steppe. A primary focus of the prescribed grazing approach is maintenance of key plant species, such as deep-rooted perennial grasses that have been shown to be essential for ecological resistance to invasive annual grasses (Reisner et al. 2013, pp. 1047-1048). These actions help to alleviate the adverse impacts associated with improper grazing practices outlined above under Nature and Type of Effects. Within MZ II/VII, SGI has implemented 552,600 acres of prescribed grazing systems. This program is likely the largest and most impactful program on private lands within MZ II/VII. Because of its focus on priority areas for conservation, which often overlap PHMA, the SGI's past, present, and reasonably foreseeable work has had and likely will continue to have a cumulative beneficial impact on GRSG when considered alongside protective BLM management actions in PHMA.

Candidate Conservation Agreements with Assurances are another tool being implemented to protect private lands from the threat of improper grazing. Candidate Conservation Agreements with Assurances are voluntary conservation agreements between the USFWS and one or more federal or private partners (e.g., the BLM). In return for managing lands to benefit GRSG, landowners receive assurances against additional regulatory requirements should GRSG be listed under the Endangered Species Act. Within Wyoming, the USFWS and Wyoming Governor's Office in conjunction with the BLM, Natural Resources Conservation Service, Forest Service, and other agencies, have developed an umbrella Candidate

Conservation Agreement with Assurances for range management activities. Enrolled landowners are expected to comply with grazing specific conservation measures including but not limited to: avoid (or rotationally utilize) known nesting and brood-rearing habitat as a location for activities that concentrate livestock such as stock tank placement branding and roundup; place salt or mineral supplements in sites minimizing impacts to GRSG habitat; and within 24 months develop and implement a written grazing management plan to maintain or enhance the existing plant community as suitable GRSG habitat (USFWS et al. 2013). The incremental effects of the Natural Resources Conservation Service actions under the SGI, (including fence marking and conservation easements), Candidate Conservation Agreements with Assurances, and state efforts to maintain ranchland, BLM management actions (related to grazing and free-roaming equids) would provide a net conservation gain to GRSG in MZ II/VII.

7.1.6.4 Spread of Weeds

Nature and Type of Effects

As discussed in Chapter 4, invasive weeds alter plant community structure and composition, productivity, nutrient cycling, and hydrology. Invasive weeds also may cause declines in native plant populations, including sagebrush habitat, through such factors as competitive exclusion and niche displacement. Invasive plants reduce and may eliminate vegetation that GRSG use for food and cover. Invasive weeds fragment existing GRSG habitat and reduce habitat quality by competitively excluding vegetation essential to GRSG. Invasive weeds can also create long-term changes in ecosystem processes, such as fire cycles and other disturbance regimes that persist even after an invasive plant is removed (Connelly et al. 2004).

Roads and recreation can promote the spread of invasive weeds through vehicular traffic. Weed infestations can further exacerbate the fragmentation effects of roadways. Irrigation water has also supported the conversion of native plant communities to hayfields, pasture, and cropland, thus fragmenting sagebrush habitats. Excessive grazing in these habitats can lead to the demise of the most common perennial grasses in this system and an abundance of invasive species such as cheatgrass or Japanese brome (Reisner et al. 2013).

Conditions in MZ II/VII

By means of seeds carried by wind, humans, machinery, and animals, invasive and noxious weeds have invaded and will continue to invade many locations in MZ II/VII, including the planning area. Cheatgrass (one of the primary invasive species threatening GRSG habitat) is found throughout MZ II/VII, and is generally more abundant in comparison to MZ I due to more favorable climate conditions.

The BLM currently manages weed infestations through integrated weed management, including biological, chemical, mechanical, manual, and educational methods. It is guided by the 1991 and 2007 Records of Decisions (RODs) for Vegetation Treatment on BLM Lands in Thirteen Western States (BLM 1991) and by the 2007 Programmatic Environmental Report (BLM 2007). Weeds are managed in cooperation with county governments and represent a landscape-level approach across management jurisdictions.

Impact Analysis

Increased surface disturbance, motorized transportation, and animal and human activity would increase the chance for invasive plants to establish and spread.

The BLM and National Forest System manage weed infestations through integrated weed management practices, which include biological, chemical, mechanical, manual, and educational methods. This

general approach for combating infestations will continue under all alternatives and the Proposed Plan. Increased activity (e.g., surface disturbance, motorized transportation, and animal or human activity) would increase the likelihood for the spread and establishment of invasive plants, regardless of surface land ownership. Alternatives A and C would place the fewest constraints on resource uses, and would allow for the most acres of surface disturbing activities within GRSG habitat in MZ II/VII. Therefore, the potential for invasive weed spread and establishment would be greatest under this alternative, and effects to GRSG (e.g., reduction in quality of habitat) would be more pronounced. Reasonably foreseeable future projects which result in surface disturbance within or near GRSG habitat could increase the likelihood of invasive weed spread under these alternatives.

Relevant cumulative actions that result in surface-disturbing activities would increase the potential for the spread of invasive weeds on federal and non-federal lands. Projects subject to the general stipulations outlined in the Wyoming and Montana executive orders are required to control noxious and invasive weed species and to use native seed mixes during reclamation processes. These stipulations would benefit GRSG Core Areas by limiting the spread or establishment of invasive species, particularly on lands that lack BLM protective regulatory mechanisms. Additionally, the Colorado Package has identified GRSG conservation strategies related to invasive weeds, such as interagency cooperation, mapping, monitoring, and integrated weed management treatments. However, complete weed eradication within MZ II/VII is not anticipated under any alternative or the Proposed Plan because of the scale and scope of efforts needed for complete eradication.

Alternatives B and E, would place the most restrictions on resource uses within GRSG habitat on BLM-administered land. Therefore, less disturbance associated with resource uses is likely to occur under these alternatives, which would reduce the potential for invasive weed spread and establishment on BLM-administered lands. Protective stipulations, in combination with state and county noxious weed regulations, continued integrated weed management practices, and other past, present and reasonably foreseeable future actions would provide a net conservation gain to GRSG habitats and populations in MZ II/VII under the Proposed Plan and the other RMP alternatives by restoring degraded sagebrush habitat and increasing native forbs, thus improving nest cover and food supply.

7.1.6.5 Conversion to Agriculture/Urbanization

Nature and Type of Effects

Converting sagebrush habitat to agricultural use, causes direct loss of habitat available for GRSG. Habitat loss also decreases the connectivity between seasonal habitats, increasing population isolation and fragmentation. Fragmentation then increases the probability for decline of the population, reduced genetic diversity, and extirpation from stochastic events (Knick and Hanser 2011).

In addition to reducing the land area available to support GRSG, habitat loss and fragmentation also results in other disturbances, such as human traffic, that increase the potential for wildfire and invasive plant spread.

Converting cropland has eliminated or fragmented sagebrush on private lands in areas with deep fertile soils or irrigation potential. Sagebrush remaining in these areas has been limited to the agricultural edge or to relatively unproductive environments that are ill-suited to sustaining leks, although these area may be beneficial for brood-rearing GRSG depending upon the particular crop.

Biofuel production and small grain prices have increased the conversion to cropland of native grasslands or lands formerly enrolled in the US Department of Agriculture's Conservation Reserve Program. This conversion of private lands further emphasizes the cumulative importance of BLM-administered lands

and associated private grazing lands in maintaining large blocks of native grassland and shrubland habitats suitable for GRSG.

Conditions in MZ II/VII

Less than 1 percent of priority habitats and 2 percent of general habitats in MZ II/VII are directly influenced by agricultural development (Manier et al. 2013). Approximately 4 percent of habitat has been converted for agricultural use in the Wyoming Basin compared to 19 percent in the Great Plains (i.e., MZ I), (Knick et al. 2011).

Urban development also results in permanent loss of GRSG habitat. Human population centers continue to grow and expand across the range. The direct footprint of urban development is higher in priority habitats in MZ II/VII compared to other parts of the GRSG range, though it is still low (approximately 1 percent) compared to other threats (Manier et al. 2013). However, percentages and associated disturbance are higher in some areas. In some Colorado counties, fifty percent of sage-grouse habitat has been subdivided, while an estimated 3 to 5 percent of all historical habitat in Colorado has been converted into urban areas (Braun 1998; USFWS 2010).

Impact Analysis

The BLM does not convert public lands to agriculture. As such, the only direct authority it has over conversion to agriculture is by retaining or disposing of lands in the realty program. Disposing of lands could increase the likelihood they will be converted to agriculture, depending on their location and the policies of the new management authority. Lands retained under BLM management will not be converted to agriculture under any alternative.

As shown below in Table 7-10, Acres Identified for Retention and Disposal in GRSG Habitat in MZ II/VII, these acreages vary relatively little between alternatives.

Table 7-10. Acres Identified for Retention and Disposal in GRSG Habitat in MZ II/VII

	Priority Habitat Management Areas		General Habitat Management Areas	
	MZ II/VII	Percent Within Planning Area	MZ II/VII	Percent Within Planning Area
Acres Identified for Retention				
Alternative A	7,278,000	15%	8,855,000	22%
Alternative B	7,414,000	17%	8,808,000	21%
Alternative C	6,185,000	0%	9,946,000	30%
Alternative E	7,414,000	17%	8,808,000	21%
Alternative F	7,290,000	15%	8,890,000	22%
Proposed Plan	7,301,000	15%	8,928,000	22%
Acres Identified for Disposal				
Alternative A	46,000	48%	189,000	44%
Alternative B	26,000	8%	127,000	17%
Alternative C	24,000	0%	213,000	51%
Alternative E	26,000	8%	127,000	17%
Alternative F	36,000	33%	156,000	32%
Proposed Plan	24,000	0%	156,000	33%

GHMA General Habitat Management Areas
 GRSG Greater sage-grouse
 MZ Management Zone
 PHMA Priority Habitat Management Areas

BLM land tenure adjustments require site-specific NEPA analysis, and land sales must meet specific disposal criteria. Lands identified for disposal in MZ II/VII are typically small isolated parcels that are difficult to manage and do not have high resource value. BLM land tenure adjustments are not anticipated to be a significant contributing element to the threat of agricultural conversion because of the small number of acres involved and the criteria in place that would reduce the likelihood of disposing of parcels containing significant wildlife value, (such as those lands containing leks, early brood rearing habitat, or winter habitat). As a result, cumulative impacts would vary relatively little across alternatives and BLM/Forest Service management would have little impact on alleviating this threat.

Studies of agricultural conversion risk on grasslands have shown a high probability of grassland plots being converted to cropland under current economic and climatic conditions (Rashford et al. 2013). The recent federal Farm Bill tried to discourage converting prairie to cropland by denying crop insurance for such conversions. Nevertheless, if corn and other crop prices remain high, the economic incentive to convert parcels to cropland in GRSG habitat areas will continue and will potentially increase.

The COT Report objectives for converting land to agriculture are to avoid further loss of sagebrush habitat for agricultural activities (both plant and animal production) and to prioritize restoration. In areas where taking agricultural lands out of production has benefited GRSG, the programs supporting

these actions should be targeted and continued (USFWS 2013). In accordance with this objective, the NRCS's SGI program focuses on maintaining ranchland that provides habitat for GRSG.

This voluntary program provides private landowners with monetary incentives to protect GRSG habitat, often through conservation easements. As a result, private land containing GRSG habitat is protected from conversion to agriculture or other development for the life of the conservation agreement. The conservation easements and other conservation incentives, such as restoration of water features and fence marking, can enhance the ability of private ranchlands to support GRSG. As of 2015, SGI has secured conservation easements on 243,400 acres within MZ II/VII, and marked or removed 23 miles of fence (NRCS 2015). This has preserved habitat and reduced the risk of direct mortality on these lands.

These efforts, in conjunction with BLM management, would provide a net conservation gain to GRSG in MZ II/VII, but its impact would be localized and not likely to ameliorate the threat because of limited management authority.

7.1.6.6 Fire

Nature and Type of Effects

Sagebrush killed by wildfire often requires many years to recover, especially after large fires. Contiguous old-growth sagebrush sites are at high fire risk, as are large blocks of contiguous dead sagebrush and sagebrush sites with a substantial cheatgrass understory. Before recovering, these sites are of limited use to GRSG, except along the edges and in unburned islands.

Because of its widespread impact on habitat, fire has been identified as a primary factor associated with GRSG population declines. Depending on the species of sagebrush and the size of a burn, a return to a full pre-burn community cover can take from 25 to 120 years (Baker 2011). In addition, fires can reduce invertebrate food sources and may facilitate the spread of invasive weeds.

While most sagebrush subspecies are killed by fire and slow to reestablish, cheatgrass recovers within one to two years of a fire from seed in the soil. This annual recovery leads to a reoccurring fire cycle that prevents sagebrush reestablishment (USFWS 2010, P. 13932).

BLM management to prevent or control wildfires can also affect GRSG and habitat. Increased human activity and noise associated with fire suppression, fuels treatments, and prescribed fire in areas occupied by GRSG could affect nesting, breeding, and foraging behavior. Important habitats could be altered because of the use of heavy equipment, hand tools, and noise.

In addition, suppression may initially result in higher rates of conifer encroachment in some areas. In the initial stages of encroachment, fuel loadings remain consistent with the sagebrush understory. As conifer encroachment advances, fire return intervals are altered by decreasing understory abundance. The depleted understory causes the stands to become resistant to low intensity wildfires; over years, the accumulating conifer loads contribute to larger-scale wildfires and confound control efforts due to extreme fire behavior.

Conditions in MZ II/VII

Fuels models predict fire risk as generally low across MZ II/VII with 10 percent of priority habitats and general habitats at high risk for fire (Manier et al. 2013). Within the Bighorn Basin planning area, wildfires and prescribed burns are more prevalent at lower elevations, except near river bottoms where vegetation density is higher. Upslope of the basin bottom, wildfires and prescribed burns are more common.

Impact Analysis

BLM/Forest Service management actions in MZ II/VII that emphasize wildfire suppression in GRSG habitat would benefit the species by limiting habitat loss in the event of a wildfire. BLM/Forest Service Proposed Plans would prioritize suppression immediately after life and property to conserve GRSG habitat. In GHMA, suppression would be prioritized where wildfires threaten priority sage-grouse habitat.

The Wyoming and Montana executive orders emphasize fire suppression in Core Population Areas, while recognizing other suppression priorities may take precedent. This would benefit GRSG habitat during wildfire planning and response, particularly on lands not administered by the BLM or Forest Service.

WAFWA's guidance on fire and fuels management for GRSG conservation (WAFWA 2014) promotes coordination among local fire response agencies similar to a "natural disaster" response; it emphasizes the importance of fuel breaks and the need to incorporate GRSG habitat objectives in fire management, as well as the use of grazing as a fuel reduction tool.

On the local level, the Bighorn Basin Sage-grouse Conservation Plan (Bighorn Basin Sage-grouse Local Working Group 2007) includes recommended management practices related to fire and fuels management such as evaluate all wildfires greater than 40 acres in occupied GRSG habitat to determine if rehabilitation of the burned area is needed; and protect and maintain areas of unburned sagebrush within perimeter of treated areas to allow for use in the untreated portion of a pasture or allotment.

Recognition of the importance of sagebrush habitat during interagency wildfire response would benefit the GRSG in the event of an unplanned fire. The Interagency Standards for Fire and Fire Aviation Operations "Red Book" includes a BMP for GRSG habitat conservation for wildlife and fuels management (BLM 2013). This document serves as supplemental policy or guidance for the BLM, Forest Service, and USFWS. This BMP would benefit the GRSG (particularly during interagency wildland fire operations) by utilizing spatial habitat data and using predictive services to prioritize and preposition firefighting resources in critical habitat areas. The coordination of federal, state, and local fire prevention actions, changes in fire management, and other past, present, and reasonably foreseeable future actions would provide a net conservation gain to GRSG in MZ II/VII. The gain would be greatest under the Proposed Plan because of increased fire and fuels management flexibility (e.g., by designing fuels treatments in protect and improve GRSG habitat), interagency coordination, and emphasis on preserving and restoring GRSG habitat.

7.1.6.7 Recreation

Nature and Type of Effects

Recreation such as camping, bicycling, wildlife viewing, horseback riding, fishing, and hunting can be dispersed, concentrated (e.g., OHV use and developed campsites), or permitted (e.g., BLM Special Recreation Permit). The BLM also manages Special Recreation Management Areas (SRMAs), where recreation is a primary resource management consideration.

Recreation on federally administered lands that use the extensive network of double-track and single-track routes have an impact on sagebrush and GRSG. Ecological impacts of roads and motorized trails include mortality due to collisions; behavior modifications due to noise, activity, and habitat loss; alteration of physical environment; nutrient leaching; erosion; invasive plants spread; increased use; and alteration by humans due to accessibility (Knick et al. 2011). Recreation activities can degrade GRSG habitat through direct impacts on vegetation and soils, introduction or spread of invasive species, and

habitat fragmentation. This occurs in areas of concentrated use, trailheads, staging areas, and routes and trails.

Motorized activities, including OHV use, are expected to have a larger footprint on the landscape. They are anticipated to have the greatest level of impact due to noise levels, compared to nonmotorized uses such as hiking or equestrian use. Cross-country motorized travel, which is permitted in designated areas on BLM-administered lands but not on National Forest System lands, would increase the potential for soil compaction, loss of perennial grasses and forbs, and reduced sagebrush canopy cover. Losses in sagebrush canopy could be the result of repeated, high-frequency, cross-country OHV use over long periods. In addition, the chances of wildfire are increased during the summer, when fire dangers are high and recreation is at its highest.

Dispersed uses expand the human footprint. Closing areas to recreation and reclaiming unused, minimally used, or redundant roads in and around sagebrush habitats during seasonal use by GRSG may reduce the footprint and presumably impacts on wildlife. Restricting access to important habitat areas during seasonal use (lekking, nesting, brood-rearing, and wintering) may decrease the impacts associated with humans. However, access restriction will not eliminate other impacts, such as invasive plant spread, predator movements, cover loss, and erosion (Manier et al. 2013).

Conditions in MZ II/VII

BLM, Forest Service, and other agencies provide a variety of dispersed recreation opportunities within MZ II/VII governed by laws, policy, and guidance. Recreation also occurs on private land with fewer restrictions. Within the planning area, year-round dispersed recreational opportunities are available. Increased visitation to small towns and destination resorts contribute to the increased use of public lands within the planning area. The central and eastern portions of the planning area, as well as the western slopes of the Big Horn Mountains provide more accessible public access to BLM-administered lands, and therefore increased levels of recreation compared to the Absaroka Foothills region where public access is more limited.

Impact Analysis

Table 7-11, Acres of Travel Management Designations in GRSG Habitat in MZ II/VII, shows acres of GRSG habitat open, limited, or closed to travel in MZ II/VII.

Table 7-11. Acres of Travel Management Designations in GRSG Habitat in MZ II/VII

	Priority Habitat Management Areas		General Habitat Management Areas	
	MZ II/VII	Percent Within Planning Area	MZ II/VII	Percent Within Planning Area
Open

Proposed Plan	112,000	3%	366,000	16%

Source: BLM 2015

This table displays the acres of PHMA and GHMA within travel management designations of open, limited and closed in MZ II/VII; it also displays the percentage of those acres that are found within the planning area.

GHMA General Habitat Management Areas
 GRSG Greater sage-grouse
 MZ Management Zone
 PHMA Priority Habitat Management Areas

The COT Report objectives for recreation are to maintain healthy native sagebrush communities, based on local ecological conditions, and to manage direct and indirect human disturbance (including noise) to avoid interruption of normal GRSG behavior (USFWS 2013). Limits on road use under the action alternatives and the Proposed Plan, and limits on OHVs would help meet these objectives.

As shown in Table 7-11, acres of GRSG habitat closed to motorized vehicles would be greatest under Alternative B and E; and less under all other alternatives and the Proposed Plan. However, the vast majority of GRSG habitat on BLM/Forest Service lands in MZ II/VII would be designated as limited to existing routes. As such, OHVs would be prohibited from traveling off existing routes, which would

reduce the risk of direct and indirect effects from recreational motorized vehicles. Approximately 5,000 acres of PHMA in MZ II/VII would be open to OHV use under all alternatives and the Proposed Plan; between 53,000 and 67,000 acres of GHMA would be open under all alternatives and the Proposed Plan. In these areas, habitat degradation, behavior disruptions, and the potential for other direct and indirect effects caused by recreational use would be higher. However, these lands constitute a relatively small percentage of all PHMA and GHMA in MZ II/VII, therefore, the effects would be localized and no notable differences are anticipated in cumulative impacts across the alternatives.

On the local level, the Bighorn Basin Sage-grouse Conservation Plan (Bighorn Basin Sage-grouse Local Working Group 2007) includes recommended management practices related to recreation management such as includes recreation recommended management practices such as restricting organized recreational activities between March 15 and July 15 within two miles of a lek site, and discourage dispersed camping within important riparian habitats occupied by GRSG during late summer. Other local working groups within MZ II/VII include similar recommendations.

Implementation of the action alternatives and Proposed Plan described above, in concert with travel management planning on BLM-administered lands within MZ II/VII, the disturbance caps applied under the state plans, and other past, present, and reasonably foreseeable future actions would help reduce the threat of recreation and travel on GRSG populations and habitats and would provide a net conservation benefit to GRSG in MZ II/VI.

7.1.6.8 Conifers

Nature and Type of Effects

Conifer woodlands, especially juniper (*Juniperus* spp.) and in some regions pinyon pine (*Pinus edulis*), may expand into sagebrush habitat and reduce availability of habitat for GRSG. Conifer expansion may be encouraged by human activities, including fire suppression and grazing (Miller et al. 2011). If woodland development is sufficient to restrict shrub and herbaceous understory growth, habitat quality for GRSG will be reduced (Connelly et al. 2004). Mature trees offer perch sites for raptors; thus, woodland expansion may also increase the threat of predation, as with powerlines (Manier et al. 2013). Locations within approximately 1000 yards of current pinyon-juniper woodlands are at highest risk of expansion (Bradley 2010). The greatest risks from conifer encroachment are thought to be in the Great Basin, with smaller risks (6 to 7 percent of PH and GH) in the Wyoming Basin (Connelly et al. 2004; Manier et al. 2013). Studies have shown that GRSG incur population-level impacts at very low levels of conifer encroachment (Baruch-Mordo et al. 2013).

Conditions in MZ II/VII

Approximately 46 percent of conifer encroachment risk in priority habitats (and 43 percent in general habitats) occur on BLM-administered lands within MZ II/VII (Manier et al. 2013). Therefore, BLM actions are likely to have a greater potential to ameliorate the effects of conifer encroachment on GRSG than any other single land management entity.

Impact Analysis

Specific required design features common to all BLM/Forest Service plans in MZ II/VII include removal of standing and encroaching trees within 100 meters of occupied leks and other habitats (e.g., nesting, wintering, and brood rearing). Additionally, reintroduction of appropriate fire regimes would limit conifer encroachment into the sagebrush plant communities. These actions would benefit GRSG by improving the quality of habitat throughout the MZ.

Additionally, under all action alternatives and the Proposed Plan, conifer removal treatments would be prioritized closest to occupied GRSG habitats and near occupied leks, and where juniper encroachment is phase 1 or phase 2. This action would benefit GRSG by improving the quality of habitat and functionality. Alternative A, does not prioritize conifer removal treatments in areas closest to occupied GRSG habitats, therefore the risk of conifer encroachment would be greater under this alternative.

Recommendations within the Wyoming GRSG Conservation Plan (WSGWG 2003) call for removal of juniper and other conifers where they have invaded sagebrush sites important to GRSG, which could help ameliorate the threat on non-BLM lands. In Colorado, the Colorado Parks and Wildlife has conducted conifer treatments totaling 2,600 acres (Colorado Department of Natural Resources 2013).

SGL has helped reduce the threat of early succession conifer encroachment through mechanical removal on 10,500 acres of private lands within MZ II/VII. The majority of these efforts were located inside PACs (NRCS 2015), helping to preserve historic fire return intervals and important GRSG habitat. While the threat of conifer encroachment is likely to continue under all alternatives and the Proposed Plan, implementing mechanical treatments, reintroduction of appropriate fire regimes, and implementing BLM/Forest Service required design features and BMPs (e.g., removing standing and encroaching trees within 100 meters of occupied leks and other GRSG habitats) under all action alternatives and the Proposed Plan, would result in a net conservation gain for GRSG.

7.1.7 Conclusions

In addition to BLM management in RMP planning areas throughout MZ II/VII, GRSG will also be impacted by management and conservation at state, regional, and local levels. This analysis takes into account each alternative in the Bighorn Basin RMP in conjunction with state and private initiatives, and past, present, and reasonably foreseeable future actions. For purposes of this analysis, the BLM has determined that the Proposed Plans for the other ongoing GRSG and RMP planning efforts in MZ II/VII are reasonable foreseeable future actions.

Some of the most important past, present, and reasonably foreseeable future actions benefitting GRSG populations on private land in MZ II/VII are the conservation easements coordinated by the Natural Resources Conservation Service SGI, State of Wyoming, State of Colorado, BLM, Forest Service, and other agencies and organizations. As of 2015, SGI has secured conservation easements on 243,400 acres within MZ II/VII. Additionally, SGI has worked with landowners to increase fence marking, seeding of native vegetation, remove conifers, and implement prescribed grazing systems to help alleviate the adverse impacts associated with historic improper grazing practices. Future coordination of private landowners within SGI is expected to provide further benefits to GRSG habitat.

This coordination with private landowners enhances conservation in addition to what BLM management can accomplish on federal lands. Ranchers in MZ II/VII are also using Candidate Conservation Agreement with Assurances with the USFWS. Under these instruments, the ranchers voluntarily agree to manage lands to reduce threats to GRSG in exchange for a guarantee that they will not be subject to additional regulations should the species become listed. While ranchers have used these agreements across GRSG range, thus far the agreements have been applied to only a small number of ranches in Wyoming and Montana.

As discussed in Section 7.1.4, Wyoming, Montana, Utah, Colorado, and Idaho have adopted statewide plans to promote GRSG conservation throughout MZ II/VII. Wyoming's plan implements a Core Population Area Strategy with well density limitations, timing restrictions, and a uniform 5 percent disturbance cap across all landownership types. These measures would improve GRSG population levels

if effectively enforced (Copeland et al. 2013). Other state plans include similar, if sometimes less aggressive, measures to reduce impacts on state lands. In Montana, a 5 percent limit on anthropogenic disturbance is applied within the Density and Disturbance Calculation Tool examination area (based upon occupied leks within any given Core population area). Similarly in Utah, the Conservation Plan for Greater Sage-grouse in Utah (Utah Division of Wildlife Resources 2013), includes under certain circumstances, a general limit on new permanent disturbance of 5 percent of habitat on state or federally managed lands within any particular Sage-grouse Management Area.

Alternative A: Current Management

Under Alternative A, current management would continue on BLM-administered lands within the Bighorn Basin planning area. The Bighorn Basin plan would not designate PHMA, GHMA, or SFAs, and would not manage any additional ROW avoidance or exclusion areas. Appropriate and allowable uses and restrictions with regard to such activities as mineral leasing and development, recreation, utility corridors, and livestock grazing would also remain unchanged.

Management prescriptions to protect GRSG currently in place include restricting surface disturbance and occupancy within a 0.25-mile radius of occupied GRSG leks and within 2 miles of occupied leks in GRSG nesting and early brood-rearing habitats. Additionally, the BLM prohibits surface-disturbing activities in GRSG winter concentration areas from November 15 to March 14. These management actions would continue to be implemented under Alternative A.

In the rest of MZ II/VII, other BLM/Forest Service LUP planning efforts would implement their Proposed Plans to improve protection of GRSG and their habitat. In addition, other regional GRSG conservation strategies as discussed in Section 7.1.4, would be implemented on non-federal lands. As a result, the lack of protections under the Alternative A would be offset to an extent by more protective management elsewhere MZ II/VII. However, in the Bighorn Basin planning area, current management would do little to reduce the threats from energy development, mining, and infrastructure on GRSG wintering and breeding grounds. Although current management actions, including the temporary BLM GRSG IMs, provide a limited array of conservation measures that are intended to avoid continued degradation of GRSG habitat in MZ II/VII, they would not be subject to the same development restrictions in GRSG habitat under Alternative A as they would under the action alternatives or the Proposed Plan. Thus, Alternative A would not meet the goals and objectives in this plan to identify and incorporate conservation measures for GRSG and may meet the COT report objectives for present and widespread threats to GRSG, but only in localized areas and not on BLM-administered lands within the Bighorn Basin planning area.

Alternative B

Alternative B emphasizes conservation of biological resources, including habitat for fish and wildlife, maintenance of contiguous blocks of native plant communities, ecosystem management, protection of natural functions in riparian areas, and control of invasive species. Alternative B extends the protective buffers around GRSG habitat, prohibiting surface-disturbing activities within 0.6 mile of occupied GRSG leks and seasonally mitigating surface disturbing activities in GRSG nesting and early brood-rearing habitat. GRSG Key Habitat Areas are closed to mineral leasing and area closed to motorized vehicle use from March 15 to June 30. Alternative B would meet the objectives presented in the COT report for fire, invasive plants, range management, recreation, infrastructure, energy, and mining by implementing management actions which specifically address these threats.

Implementing these protective measures on BLM-administered lands within the Bighorn Basin RMP planning area would help preserve GRSG habitat by limiting resource use activities in PHMA and GHMA. In the rest of MZ II/VII, other BLM/Forest Service LUP planning efforts would implement their Proposed Plans to improve protection of GRSG and their habitat. In addition, other regional GRSG conservation strategies as discussed in Section 7.1.4, would be implemented on non-federal lands. The incremental effects of Alternative B combined with implementation of other regional efforts would result in a net conservation gain for GRSG in MZ II/VII.

Alternative C

Alternative C emphasizes resource uses with reduced constraints. Compared to the other alternatives, Alternative C conserves the least land for physical, biological, and heritage resources; and is the least restricted to motorized vehicle use and energy and mineral development. Under this alternative, the BLM would not manage to maintain contiguous blocks of native plant communities or minimize fragmentation.

In the rest of MZ II/VII, other BLM/Forest Service LUP planning efforts would implement their Proposed Plans to improve protection of GRSG and their habitat. In addition, other regional GRSG conservation strategies as discussed in Section 7.1.4, would be implemented on non-federal lands. COT objectives for fire, invasive plants, range management, recreation, infrastructure, energy, and mining would likely be met in these areas. However, within the Bighorn Basin planning area, the limited protective measures would not meet the goals and objectives to identify and incorporate conservation measures for GRSG and would not meet the COT report objectives.

Alternative E

Impacts under Alternative E are the same as Alternative B outside of GRSG Key Habitat Areas. Within GRSG Key Habitat Areas, Alternative E includes additional management actions and an ACEC designation. Alternative E emphasizes conservation of biological resources with more constraints on resource uses than any other alternative. Alternative E would meet the objectives presented in the COT report for fire, invasive plants, range management, recreation, infrastructure, energy, and mining by implementing management actions which specifically address these threats.

Implementing these protective measures on BLM-administered lands within the Bighorn Basin RMP planning area would help preserve GRSG habitat by limiting resource use activities in PHMA and GHMA. In the rest of MZ II/VII, other BLM/Forest Service LUP planning efforts would implement their Proposed Plans to improve protection of GRSG and their habitat. The Proposed Plans include better management flexibility to reduce the potential for development spilling over onto adjacent lands in an unrestricted manner; however, this is less of an issue within the Bighorn Basin planning area, due to the fewer non-BLM administered lands. In addition, other regional GRSG conservation strategies as discussed in Section 7.1.4, would be implemented on non-federal lands. The incremental effects of other regional efforts combined with implementation of Alternative E would result in a net conservation gain for GRSG in MZ II/VII, but the strict protective measures on BLM-administered land in the Bighorn Basin planning area may have an unintended effect of reducing gains for GRSG in the planning area via the effects described above.

Alternative F

Impacts under Alternative F are the same as the Proposed Plan outside of GRSG PHMA. Within GRSG PHMA, Alternative F includes additional management actions and an ACEC designation. Alternative F generally emphasizes conservation of biological resources, while placing moderate constraints on resource uses and reclamation and mitigation requirements to reduce impacts to resource values. Alternative F would meet the objectives presented in the COT report for fire, invasive plants, range management, recreation, infrastructure, energy, and mining by implementing management actions which specifically address these threats.

In the rest of MZ II/VII, other BLM/Forest Service LUP planning efforts would implement their Proposed Plans to improve protection of GRSG and their habitat. In addition, other regional GRSG conservation strategies as discussed in Section 7.1.4, would be implemented on non-federal lands. The incremental effects of other regional efforts combined with implementation of the Alternative F would result in a net conservation gain for GRSG in MZ II/VII.

Proposed RMP (Alternative D)

The Proposed Plan generally increases conservation of biological resources compared to current management. The Proposed Plan also emphasizes moderate constraints on resource uses and reclamation and mitigation requirements. This would reduce the potential for development occurring solely on private land where less protections are afforded to GRSG. The Proposed Plan would meet the objectives presented in the COT report for fire, invasive plants, range management, recreation, infrastructure, energy, and mining by targeting these threats in the RMP/EIS and implementing management actions which specifically address these threats.

In the rest of MZ II/VII, other BLM/Forest Service LUP planning efforts would implement their Proposed Plans to improve protection of GRSG and their habitat. In addition, other regional GRSG conservation strategies as discussed in Section 7.1.4, would be implemented on non-federal lands. Reasonably foreseeable future actions in MZ II/VII such as proposed oil and gas developments, interstate transmission lines, and other land disturbance projects would be subject to the requirements set forth in the BLM/Forest Service Proposed Plans which encompass MZ II/VII, where those projects occur on federal decision area lands. For non-federal lands, reasonably foreseeable future projects may be subject to disturbance caps, buffer restrictions, and other requirements of GRSG state plans, as well as site specific mitigation measures.

Regional efforts combined with the incremental effect of implementing the Proposed Plan would result in a net conservation gain for GRSG in MZ II/VII.

Summary

The primary threats affecting GRSG populations throughout MZ II/VII are energy development, infrastructure, grazing/free-roaming equids, spread of weeds, conversion to agriculture, fire, recreation, and spread of conifers (USFWS 2013).

Infrastructure and energy development are of particular concern in MZ II/VII because they affect the greatest amount of land. Numerous multi-state transmission lines are proposed through GRSG habitat, as are large-scale oil and gas field developments in excess of 100,000 acres. Implementation of the BLM/Forest Service Proposed Plans in MZ II/VII is unlikely to preclude such projects from proceeding, especially Presidential Priority transmission line projects that are not subject to GRSG protective measures in the BLM/Forest Service planning efforts; however, GRSG protective measures are being

considered in the project specific analysis. The cumulative effect of the conservation measures in the Proposed Plan will result in protection of GRSG populations. In some localized areas, small populations may be at continued risk due to the cumulative effect of reasonably foreseeable future infrastructure and energy development projects over the next 20 years, when combined with unplanned events such as wildfires, drought, or West Nile virus outbreaks. However, the restrictions on land use, in combination with project-specific BMPs and RDFs and other regional efforts would achieve an overall net conservation gain for the regional population and would help mitigate the effects on small, at risk populations.

Implementation of alternatives B, E, F, and the Proposed Plan are anticipated to result in a net conservation gain for GRSG in MZ II/VII when compared to current management (Alternative A). Alternatives B and E emphasize conservation of biological resources, and contain more restrictions on resource uses than the other alternatives. While not as extensive as alternatives B or E, Alternative F and the Proposed Plan include GRSG conservation measures and resource use allocations which would improve baseline conditions.

Although small fringe populations may be at continued risk of decline in the next 20 years, implementing alternatives B, E, F, or the Proposed Plan in combination with other regional efforts (such as the Proposed Plans for other BLM planning areas; conservation strategies in the Montana, Wyoming, Idaho, Utah, and Colorado state plans; increased land protections via NRCS SGI, and local habitat restoration efforts) would effectively conserve the region-wide population of GRSG in MZ II/VII.

7.1.8 MZ-Wide Reasonably Foreseeable Future Actions Summary Table

Table 7-12 includes a selection of some of the larger projects from the reasonably foreseeable future actions tables in the RMPAs/LUPAs for MZ II/VII. The full tables can be found in each EIS within the MZ.

Table 7-12. Reasonably Foreseeable Future Actions in Management Zone II/VII Likely to Impact GRSG Habitat

MZ	Planning Area	GRSG Population(s) Affected	Project Name	Project Location	Project Description, Estimated Footprint	Project Status
Energy and Mining						
II/VII	Northwest Colorado, 9-Plan	Wyoming Basin, Northwest Colorado	Hiawatha Regional Energy Development EIS	Sweetwater County, Wyoming; Moffat County, Colorado	Proposed development of up to 4,208 new natural gas wells on approximately 157,361 acres of mixed federal, state, and private lands. The project area overlaps with lands identified as GRSG Core Areas. 91% of the project area is managed by the BLM.	Proposed
II/VII	9-Plan	Wyoming Basin	LaBarge Platform Exploration & Development Project	Lincoln and Sublette County, Wyoming	Proposed development of up to 838 new oil and gas wells on 218,000 acres of private, state, and federal lands. Approximately 154,000 acres of surface lands are administered by the BLM.	Proposed

Table 7-12. Reasonably Foreseeable Future Actions in Management Zone II/VII Likely to Impact GRSG Habitat (Continued)

MZ	Planning Area	GRSG Population(s) Affected	Project Name	Project Location	Project Description, Estimated Footprint	Project Status
II/ VII	9-Plan	Wyoming Basin	Continental Divide-Creston Natural Gas Project	Carbon and Sweetwater Counties, Wyoming	Proposed development of up to 8,950 additional natural gas wells on 1.1 million acres of land, including GRSG Core Areas. The proposed facilities would add to the existing network of wells, pipelines, access routes and electrical distribution systems. Approximately 59 percent of the project area is on federally-owned lands.	Proposed
II/ VII	Lander, 9-Plan	Wyoming Basin	Moneta Divide Natural Gas and Oil Development Project	Fremont and Natrona Counties, Wyoming	Proposed development of approximately 4,250 natural gas and oil wells on 265,000 acres of land (including approximately 169,500 acres of land administered by the BLM). The project area includes GRSG Core Areas.	Proposed
II/ VII	9-Plan	Wyoming Basin	Pinedale Anticline Project	Sublette County, Wyoming	Proposed development of natural gas resources within nearly 200,000 acres of land, of which approximately 80 percent is federal surface ownership. The project area occurs within GRSG Core Areas.	Ongoing
II/ VII	9-Plan	Wyoming Basin	Blacks Fork Project (Formerly Moxa Arch Area Infill)	Sweetwater, Uinta, and Lincoln Counties, Wyoming	Proposed infill drilling project, on approximately 7,500 hydrocarbon wells within 633,532 acres of mixed federal, state, and private lands.	Proposed
II/ VII	9-Plan, Northwest Colorado, Utah	Wyoming Basin, Northwest Colorado	Oil Shale and Tar Sands Programmatic EIS	Colorado, Utah, and Wyoming	Amendment of 10 BLM RMPs to designate certain public lands as available for application for leasing and future exploration and development of oil shale and tar sands resources. A ROD was signed in 2013 which made approximately 678,000 acres available for potential development of soil shale, and approximately 132,000 acres available for development of tar sands.	Ongoing
II/ VII	9-Plan	Wyoming Basin	Atlantic Rim Natural Gas Field Development Project	Carbon County, Wyoming	Ongoing development of oil gas resources on 270,080 acres of land, of which 173,672 are federal surface estate. A ROD was signed in 2007. The project area includes GRSG Core Areas.	Ongoing
II/ VII	9-Plan	Wyoming Basin	Chokecherry/Sierra Madre Wind Farm	Carbon County, Wyoming	Proposed development of approximately 1,000 wind turbines and associated ancillary facilities on 220,000 acres of land. The project area includes private, state, and federally managed lands, and overlaps with GRSG Core Areas.	Proposed

Table 7-12. Reasonably Foreseeable Future Actions in Management Zone II/VII Likely to Impact GRSG Habitat (Continued)

MZ	Planning Area	GRSG Population(s) Affected	Project Name	Project Location	Project Description, Estimated Footprint	Project Status
II/ VII	9-Plan	Wyoming Basin	Normally-Pressured Lance Natural Gas EIS	Sublette County, Wyoming	Proposed development of approximately 3,500 natural gas wells within 141,000 acres of state, private, and BLM-administered lands.	Proposed
II/ VII	9-Plan	Wyoming Basin	Bird Canyon Field Infill Project	Sublette and Lincoln Counties, Wyoming	Proposed drilling and production of 348 new natural gas wells within 17,612 acres of BLM-administered land.	Proposed
Rights-of-way						
II/ VII	9-Plan, Northwest Colorado, Utah	Wyoming Basin, Rich-Summit-Morgan, Uintah, North Park, NWCO, Strawberry Valley, Carbon	Gateway South Transmission Line Project	17 Counties in Wyoming, Colorado, and Utah	Proposed 500 kV transmission line which would begin near Medicine Bow, Wyoming, and would extend south and west to a proposed substation near Mona, Utah. The proposed transmission line would span over 400 miles, with a 250-foot right-of-way, and would cross multiple land jurisdictions including lands administered by the BLM.	Proposed
II/ VII	9-Plan, Northwest Colorado, Utah	Wyoming Basin, Northwest Colorado, Sheeprock, Strawberry Valley, Carbon, Bald Hills	TransWest Express Transmission Line Project	Wyoming, Colorado, Utah, and Nevada	Proposed 600 kV transmission line extending from south-central Wyoming to southern Nevada. The transmission line corridor would span over 700 miles and would cross private, state, and federally owned lands. The proposed route and alternative routes under consideration would cross priority and general habitats.	Proposed
II/ VII	9-Plan, Idaho and Southwest Montana	Wyoming Basin, East Central, Northern Great Basin, Box Elder	Gateway West Transmission Line Project	Wyoming and Idaho	Proposed 230 kV and 500 kV transmission line project between Glenrock, Wyoming, and Melba, Idaho. Approximately 1,000 miles of new high-voltage transmission lines would be constructed. The project would cross multiple land jurisdictions, including sage grouse Core Areas in Wyoming.	Proposed
II/ VII	9-Plan	Wyoming Basin	Riley Ridge to Natrona Pipeline Project	Sublette, Sweetwater, Fremont, and Natrona Counties, Wyoming	Proposed 243-mile pipeline from Riley Ridge to Big Piney, Wyoming. The pipeline would consist of a 50-foot right-of-way, and would cross GRSG Core Areas.	Proposed
II/ VII	9-Plan	Wyoming Basin	Zephyr Power Line Transmission Project	Wyoming, Colorado, Utah, and Nevada	Proposed 500 kV transmission line spanning between Chugwater, Wyoming to just south of Las Vegas, Nevada.	Proposed

Table 7-12. Reasonably Foreseeable Future Actions in Management Zone II/VII Likely to Impact GRSG Habitat (Continued)

MZ	Planning Area	GRSG Population(s) Affected	Project Name	Project Location	Project Description, Estimated Footprint	Project Status
Weeds						
II/ VII	9-Plan, Northwest Colorado	Wyoming Basin, Northwest Colorado, Powder River Basin, North Park	Invasive Plant Management EIS for the Medicine Bow - Routt National Forests, and Thunder Basin National Grassland	Wyoming and Colorado	Proposed treatment of invasive plant species using adaptive and integrated invasive plant treatment methods. These include manual, mechanical, biological, aerial, and ground herbicide applications. Potential treatment areas include GRSG Core Areas.	Proposed

***Proposed Resource Management Plan and
Final Environmental Impact Statement***

Bighorn Basin Resource Management Plan Revision Project

Glossary

GLOSSARY

Abandoned Mine: An abandoned hardrock mine on or affecting public lands administered by the Bureau of Land Management (BLM), at which exploration, development, mining, reclamation, maintenance, and inspection of facilities and equipment, and other operations ceased as of January 1, 1981 (the effective date of BLM's Surface Management regulations codified at 43 Code of Federal Regulations (CFR) Subpart 3809) with no evidence demonstrating that the miner intends to resume mining. For many abandoned mines, no current claimant of record or viable potentially responsible party exists. Abandoned mines generally include a range of mining impacts, or features that may pose a threat to water quality, public safety, and/or the environment (BLM no date).

Abandoned Mine Land (AML) Program: BLM program that focuses on reclaiming hardrock abandoned mine lands on or affecting public lands administered by BLM. The primary goal of the program is to remediate and reduce actual or potential threats that pose physical safety risks and environmental degradation. BLM applies risk-based criteria and uses the watershed approach to establish project priorities. The program also works to return mine-impacted lands to productive use(s) (BLM No Date).

Active Preference: see *Active Use*.

Active Use: The current authorized livestock grazing use. Active use may constitute a portion, or all, or permitted use. Active use does not include a temporary non-use or suspended use of forage within all or a portion of an allotment.

Additionality: The conservation benefits of compensatory mitigation are demonstrably new and would not have resulted without the compensatory mitigation project. (BLM Manual Section 1794).

Aeolian: Pertaining to the wind, especially said of such deposits as loess and dune sand, of sedimentary structures such as wind-formed ripple marks, or of erosion and deposition accomplished by the wind; also the erosive action of the wind and deposits that are transported by the wind (American Geological Institute 2005).

Alfisols: Moderately leached soils with a subsurface zone of clay accumulation and a low base status.

Allotment: An area of land where one or more livestock operators graze their livestock. Allotments are BLM lands, but may also include other federally managed, state-owned, and private lands. An allotment may include one or more separate pastures. Livestock numbers and periods of use are specified for each allotment.

Allotment Categorization: Grazing allotments and rangeland areas used for livestock grazing are assigned to an allotment category during resource management planning. Allotment categorization is used to establish priorities for distributing available funds and personnel during plan implementation to achieve cost-effective improvement of rangeland resources. Categorization is also used to organize allotments into similar groups for purposes of developing multiple use prescriptions, analyzing site-specific and cumulative impacts, and determining trade-offs.

Category "I" (Improvement): The category for allotments where (1) present range condition is unsatisfactory and where range condition is expected to decline further; (2) present grazing management is not adequate; (3) the allotment has potential for medium to high vegetative production but production is low to moderate; (4) resource conflicts/controversy with livestock grazing are evident; (5) there is potential for positive economic return on public investment (BLM 1990). Additionally, allotments are categorized as Improvement where current livestock grazing management or level of use on public land is, or is expected to be, a significant causal factor in the

non-achievement of land health standards, or where a change in mandatory terms and conditions in the grazing authorization is or may be necessary. When identifying Category I allotments, review condition of critical habitat, conflicts with sage-grouse, and whether projects have been proposed specifically for implementing the Healthy Lands Initiative (BLM 2008a).

Category "M" (Maintain): The category for allotments where (1) the present range condition and management are satisfactory with good to excellent condition and will be maintained under present management, or fair condition and improving with improvement expected to continue under present management or opportunities for BLM management are limited because percentage of public land is low or acreage of public lands is small; (2) the allotment has a potential for moderate or high vegetative production is producing at or near this potential; (3) there are no significant land-use resource conflicts with livestock grazing; (4) land ownership status may or may not limit management opportunities; (5) opportunities for positive economic return from public investment may exist (BLM 1990). Additionally, allotments are categorized as Maintain where land health standards are met or where livestock grazing on public land is not a significant causal factor for not meeting the standards and current livestock management is in conformance with guidelines developed by the State Directors in consultation with Resource Advisory Councils. Allotments where an evaluation of land health standards has not been completed, but existing monitoring data indicates that resource conditions are satisfactory (BLM 2008a).

Category "C" (Custodial): The category for allotments where (1) present range condition is not in a downward trend; (2) the allotment has a low vegetative production potential and is producing near this level; (3) there may or may not be limited conflicts between livestock grazing and other resources; (4) present management is satisfactory or is the only logical management under existing conditions; and (5) opportunities for a positive economic return on public investments do not exist (BLM 1990). Additionally, allotments are categorized as Custodial where public lands produce less than 10 percent of the forage in the allotment or are less than 10 percent of the land area. An allotment should generally not be designated Category C if the public land in the allotment contains: (1) critical habitat for a threatened or endangered species, (2) wetlands negatively affected by livestock grazing (BLM 2008a).

Allotment Management Plan: A written program of livestock grazing management, including supportive measures if required, designed to attain specific management goals in a grazing allotment.

Alluvial: Composed of alluvium or deposited by a stream or running water.

Alluvium: A general term for all deposits resulting from the operations of modern rivers and creeks, including the sediments laid down in riverbeds, floodplains, and fans at the foot of mountain slopes.

Analysis Area: Any lands, regardless of jurisdiction, for which the BLM synthesizes, analyzes, and interprets data for information that relates to planning for BLM-administered lands.

Animal Unit Month (AUM): A standardized measurement of the amount of forage necessary for the sustenance of one cow unit or its equivalent for 1 month (approximately 800 pounds of forage).

Animal-unit: Considered to be one mature cow of approximately 1,000 pounds, either dry or with calf up to 6 months of age, or their equivalent, based on a standard amount of forage consumed.

Anticline or Anticlinal: A fold, generally convex upward, whose core contains the stratigraphically older rocks; also configuration of folded, stratified rocks in which the rocks dip or incline in two directions away from the crest, like the two halves of a pitched roof (BLM 2006; American Geological Institute 2005).

Appropriate Management Level: The number of adult horses or burros (expressed as a range with an upper and lower limit) to be managed within an HMA. The appropriate management level range is the number of adult wild horses and burros within which herd size will be allowed to fluctuate. The upper limit of the range is the maximum number of wild horses and burros that results in a thriving natural ecological balance and avoids a deterioration of the range; the lower limit of the range is the number that allows the population to grow to the appropriate management level upper limit over 4 to 5 years, without the need for gathers to remove excess wild horse and burros in the interim.

Archaeology: A method of the discovery, study and reconstruction of past human cultures from material remains such as artifacts and sites.

Archaeological Site: A place which holds evidence of past human activity.

Archeological Landscape District: A significant concentration, linkage, or continuity of cultural resource sites important in history or prehistory (BLM 2002b).

Archaic: Ancient, old, or surviving from an earlier people. Archaic can also mean relating to an earlier time.

Area of Critical Environmental Concern (ACEC): An area within the public lands designated for special management attention to protect and prevent irreparable damage to important historic, cultural, or scenic values, fish and wildlife resources, or other natural systems or processes, or to protect life and safety from natural hazards. According to 43 CFR 1601.0-5a, "The identification of...[an] ACEC shall not, of itself, change or prevent change of the management or use of public lands."

Areas Administratively Unavailable to Leasing: BLM H-1601-1 – Land Use Planning, Appendix C.4 uses the term "areas closed to oil and gas leasing." Areas administratively unavailable or closed to oil and gas leasing are areas where it has been determined that other land uses or resource values cannot be adequately protected with even the most restrictive oil and gas leasing stipulations; appropriate protection can be ensured only by making the areas administratively unavailable to oil and gas leasing for the life of the plan. Lands currently under lease would remain leased for the life of the leases. After expiration of these leases, no lands would be available for lease.

Aridisols: Soils developed in arid environments with subsurface development that contains calcium carbonate (CaCO₃).

Arroyo: A deep gully from the Spanish word riachuelo meaning stream, brook, small river or the dry bed of a waterway in the southwestern part of the United States.

Arroyo Traps: A dead end arroyo that was deep and broad enough to trap bison. Hunters drove a group of bison into one. When the stampeding bison reached the dead end, hunters armed with spears slaughtered the struggling animals.

Artifact: Any object made, modified, or used by humans usually, but not necessarily portable.

Assessment Unit: A mapable volume of rock within a total petroleum system that encompasses accumulations (discovered and undiscovered) that share similar geologic traits and socio-economic factors. Accumulations within an assessment unit should constitute a sufficiently homogeneous population such that the chosen methodology of resource assessment is applicable. A total petroleum system might equate to a single assessment unit. If necessary, a total petroleum system can be subdivided into two or more assessment units in order that each unit is sufficiently homogeneous to assess individually. An assessment unit may be identified as conventional, if it contains conventional accumulations, or as continuous, if it contains continuous accumulations.

Associated Settings: The geographic extent of the resources, qualities, and values or landscape elements within the surrounding environment that influence the trail experience and contribute to resource protection. Settings associated with a National Scenic or Historic Trail include scenic, historic, cultural, recreation, natural (including biological, geological, and scientific), and other landscape elements (see resources, qualities, and values).

Atlatl: A spear thrower that extended the range of a thrown spear. Using it caused the spear to go faster and farther than when it was thrown without an atlatl.

Avoid: A term used to address mitigation of some activity (i.e., resource use). Paraphrasing the Council on Environmental Quality Regulations (40 CFR 1508.20), avoidance means to circumvent, or bypass, an impact altogether by not taking a certain action, or parts of an action. Therefore, the term "avoid" does not necessarily prohibit a proposed activity, but it may require the relocation of an action, or the total redesign of an action to eliminate any potential impacts resulting from it.

Avoidance Areas: Areas where negative routing factors exist. ROWs either will not be granted in these areas, or—if granted—will be subject to stringent terms and conditions. In other words, ROWs would be *restricted* (but not necessarily prohibited) in these avoidance areas.

Avoidance Mitigation: Avoiding the impact altogether by not taking a certain action or parts of an action. (40 CFR 1508.20(a)) (e.g., may also include avoiding the impact by moving the proposed action to a different time or location).

Back Country Byway:

Back Country Byway Type I: Byways that are either paved or have an all-weather surface. Normal passenger cars can easily negotiate the roads. They are usually narrow, slow-speed, secondary roads. None of the byways follow the main highways.

Back Country Byway Type II: Roads that require high-clearance trucks or four-wheel-drive vehicles, although passenger cars may be able to negotiate them under good conditions. These roads are not paved but often have an improved gravel surface. They often cross dry, rocky arroyos, have rough rutted sections, and have occasional steep grades and sharp curves.

Back Country Byway Type III: Byways requiring four-wheel-drive vehicles and others such as dirt bikes and all-terrain vehicles (ATVs). These roads are often unimproved dirt tracks. Expect steep grades, rocky and muddy sections, and possible route-finding. Do not attempt these byways in a two-wheel-drive vehicle, the consequences could be serious for operator/passenger and car.

Back Country Byway Type IV: Trails that are managed for snowmobile, dirt bike, mountain bike, or ATV use.

Basal Area: An area of land that is occupied by the cross-section of tree trunks and stems at their base.

Baseline: The pre-existing condition of a defined area and/or resource that can be quantified by an appropriate metric. During environmental reviews, the baseline is considered the affected environment that exists at the time of the review's initiation, and is used to compare predictions of the effects of the proposed action or a reasonable range of alternatives.

Basement Rock: A complex of undifferentiated rocks that underlies the oldest sedimentary rocks (SOP and WLA no date).

Basin: An extent of land where water from rain or snow melt drains downhill into a body of water, such as a river, lake, reservoir, estuary, wetland, sea or ocean. The basin includes both the streams and rivers that

convey the water as well as the land surfaces from which water drains into those channels, and is separated from adjacent basins by a drainage divide.

Best Management Practices (BMP): A suite of techniques that guide, or may be applied to, management actions to aid in achieving desired outcomes. Best management practices are often developed in conjunction with land use plans, but they are not considered a land use plan decision unless the land use plan specifies that they are mandatory. They may be updated or modified without a plan amendment if they are not mandatory.

Benefits-Based Management: Method for prescribing wildland recreation management from analysis in identifying and applying psychological motivators of participants in leisure activities. Benefits-based management is used in prescribing management, administration, monitoring, and marketing actions based on identified on-site desired experiences and lasting desired beneficial outcomes from activities influenced from the local recreational setting character conditions.

Big Game Crucial Winter Range: Winter habitat on which a wildlife species depends for survival. Because of severe weather conditions or other limiting factors, no alternative habitat would be available.

Biodiversity: The range of biological resources present in a particular region. It can be measured by the numbers and types of different ecosystems, species, or the genetic variation within species.

Biologically Significant Unit: In Wyoming, the Biologically Significant Unit for greater sage-grouse is Priority Habitat Management Areas (PHMAs), regardless of whether PHMAs cross multiple planning boundaries.

Borrow Material: A term used in conjunction with construction. The term refers to unprocessed material excavated from a borrow pit for use as fill at another location.

Bow and Arrow: A bow is a weapon for shooting arrows. It is made of a flexible material, often wood, that is bent by a string that is fastened to each end. An arrow is a straight slender stick that has a projectile point at one end and feathers on the other.

C Category (Custodial): see *Allotment Categorization*.

Carbon Dioxide Flood: A carbon dioxide flood (CO₂) is an enhanced oil recovery technique that injects fluid into the reservoir. When carbon dioxide is injected, it mixes with the oil and the two compounds dissolve into one another. The injected CO₂ acts as a solvent to overcome forces that trap oil in tiny rock pores and helps sweep the immobile oil left behind after the effectiveness of water injection decreases, resulting in increased oil production (EnCana 2005).

Carbon Isotope Excursion: A marked deviation in the atmospheric C¹³/C¹² ratio due to a change in the global primary productivity level.

Carrying Capacity: The maximum stocking rate possible which is consistent with maintaining or improving vegetation or related resources. It may vary from year to year on the same area due to fluctuating forage production.

Casual Collecting: The collecting of a reasonable amount of common invertebrate and plant paleontological resources for non-commercial personal use, either by surface collection or the use of non-powered hand tools resulting in only negligible disturbance to the Earth's surface and other resources.

Category (see *Allotment Categorization*): The criteria used for the placement of the allotments into categories based on resource potential, resource use conflicts or controversy, opportunity of positive economic return on public investments, and the present management situation (BLM 1990).

Cattleguard: A device or structure, at points where roads or railroads cross a fence line, that is so designed that vehicular travel is uninterrupted, but crossing by all kinds of livestock is restricted.

Causal: Relating to a cause or causes; relating to a cause of effect.

Cheatgrass: Cheatgrass (*Bromus tectorum*) is an annual grass that forms tufts up to 2 feet tall. The leaves and sheaths are covered in short, soft hairs. The flowers occur as drooping, open, terminal clusters that can have a greenish, red, or purple hue. Flowering occurs in the early summer. These annual plants will germinate in fall or spring (fall is more common), and senescence usually occurs in summer. Cheatgrass invades rangelands, pastures, prairies, and other open areas. Cheatgrass has the potential to completely alter the ecosystems it invades. It can completely replace native vegetation and change fire regimes and is most problematic in areas of the western United States with lower precipitation levels.

Class I Wells: Injection wells that are:

- (1) Used by generators of hazardous waste or owners or operators of hazardous waste management facilities to inject hazardous waste beneath the lowermost formation containing, within ¼ mile of the well bore, an underground source of drinking water.
- (2) Other industrial and municipal disposal wells that inject fluid beneath the lowermost formation containing, within ¼ mile of the well bore, an underground source of drinking water.
- (3) Radioactive waste disposal wells that inject fluid below the lowermost formation containing an underground source of drinking water within ¼ mile of the well bore.

Class II Wells: Injection wells that are:

- (1) Brought to the surface in connection with natural gas storage operations, or conventional oil or natural gas production, and may be commingled with wastewaters from gas plants, which are an integral part of production operations, unless those waters are classified as a hazardous waste at the time of injection.
- (2) For enhanced recovery of oil or natural gas.
- (3) For storage of hydrocarbons that are liquid at standard temperature and pressure.

Closed: Generally denotes that an area is not available for a particular use or uses; refer to specific definitions found in law, regulations, or policy guidance for application to individual programs.

Clovis Point: Spear point made by early Paleo-Indians; characterized by a short, shallow channel on one or both faces; larger than a Folsom point.

Colluvium: Rock fragments, sand, or soil material that accumulates at the base of slopes; slope wash (BLM 2008b).

Commercial Forestland: Capable of producing 20 cubic feet of wood fiber from commercial species per acre per year and has not been withdrawn from forest product harvest by law or statute.

Commodity: An economic good, such as a product of agriculture or mining.

Communal Hunt: A hunt in which all the group's able people joined. It may involve a number of groups and employ a technique that could kill many animals, such as bison (or buffalo) jump.

Communication Site Management Plan: A plan that provides for effective administration of a communications site. The site plan defines the principles and technical standards adopted in the site designation. The site plan provides direction for the day-to-day operations of the site in connection with

the lease. The site plan shall delineate the types of uses that are appropriate at this site and the technical and administrative requirements for management of the site. The site plan should reflect the complexity of the current situation and the anticipated demand for the site.

Community: (1) An assemblage of populations of plants and/or animals in a common spatial arrangement. (2) As assemblage of plants occurring together at any point in time, while denoting no particular ecological status. (3) A unit of vegetation.

Community Phase: A unique assemblage of plants and associated dynamic soil property levels that can occur within a state (Caudle et al. 2013).

Community Recreation-tourism Market: A community or communities dependent on public lands recreation or related tourism use, growth, or development. Major investments in facilities and visitor assistance are authorized within SRMAs where the BLM's strategy is to target demonstrated community recreation-tourism market demand. Here, recreation management actions are geared toward meeting primary recreation-tourism market demand for specific activity, experience, and benefit opportunities. These opportunities are produced through maintenance of prescribed natural resource or community setting character and by structuring and implementing management, marketing, monitoring, and administrative actions accordingly.

Compensatory Mitigation: Compensating for the (residual) impact by replacing or providing substitute resources or environments. (40 CFR 1508.20)

Compensatory Mitigation Projects: Specific, on-the-ground actions to improve and/or protect habitats (e.g., chemical vegetation treatments, land acquisitions, conservation easements).

Compensatory Mitigation Sites: The durable areas where compensatory mitigation projects will occur.

Comprehensive Weed Management Plan: A plan for controlling invasive plant species that incorporates integrated weed management techniques and accounts for pertinent considerations, such as management actions and allocations affecting weeds.

Context and Intensity (NEPA): Determining the significance of an impact under NEPA requires consideration of the context and intensity. Context is the significance of an action that must be analyzed in its current and proposed short- and long-term effects on the whole of a given resource (e.g., the affected region). Intensity refers to the severity of the effect, expressed qualitatively (relative comparable terms) or quantitatively (empirically measurable units).

Continuous Grazing: The grazing of a specific unit by livestock throughout a year or that part of the year during which grazing is feasible. The term is not necessarily synonymous with yearlong grazing, since seasonal grazing may be involved.

Cool-Season Plant: A plant which generally makes the major portion of its growth during the late fall, winter, and early spring. Cool-season species generally exhibit the C3 photosynthetic pathway.

Nonconsumptive Use: This is a use that does not reduce supply. For example, wildlife viewing does not reduce the supply of wildlife as opposed to big game hunting, which reduces the supply of big game.

Contrast: Opposition or unlikeness of different forms, lines, colors, or texture in a landscape.

Controlled Surface Use (CSU): Surface occupancy or use will be restricted or prohibited unless the operator and surface managing agency arrive at an acceptable plan for mitigation of anticipated impacts. Identified resource values require special operational constraints that may modify the lease rights. CSU is used for operating guidance, not as a substitute for the no surface occupancy (NSO) or timing limitations.

Cordage: Plant fibers twisted into cord, rope, or yarn.

Core Areas: An area of habitat of an appropriate size, configuration, and plant community type as to be capable of supplying all elements for the long-term security of a population of a given species (County of Riverside No Date).

Cover: (1) The plants or plant parts living or dead, on the surface of the ground. Vegetative cover or herbage cover is composed of living plants and litter cover of dead parts of plants. (2) The area of ground cover by plants of one or more species.

Critical Growing Season (Growth Period): A specified period of time in which plants need to develop sufficient carbohydrate reservoir and produce seed. This period of time varies by growth form. For example: Cool season bunchgrasses: May 1 – July 15; Warm season perennial grasses: June 1 – July 30; Riparian vegetation: July 1 through August 30.

Cryic Soils: Soil temperature regime that has mean annual soil temperatures between 0°C and 8°C (32°F and 47°F) (University of Wyoming 1999).

Cultural Resource Inventory Levels: A three-tiered process for discovering, recording, and evaluating cultural resources.

Class I - A review of existing literature and oral informant data combined with an analysis of a specific geographic region (e.g., an area of potential effect, drainage basin, resource area, etc.).

Class II - A sampling survey usually aimed at developing and testing a predictive model of cultural resource distribution.

Class III - An on-the-ground survey to discover, record, and evaluate cultural resources within a specific geographic area (e.g., usually an area of potential effect for a proposed undertaking).

Cultural Resources Setting Consideration Zones (SCZ): Zones of view shed management of “X” distance or the visual horizon, whichever is closer, from the external site boundaries, created to reduce visual and acoustic impacts to cultural resources for which the elements of setting and association are important. Where the vegetation, rock formations, open space, and bodies of water that made up the environmental setting during the periods of prehistoric or historic occupation or use are intact, management actions will be modified to maintain the long term integrity of those features. The current integrity of environmental features or factors related to the location, use, formation, or preservation of the site will be the important factors for determining appropriate management actions.

Culture: The customs, beliefs, and ways of life of a group of people.

Cultivate: To raise crops; to water, loosen the soil, and weed around growing plants.

Cultivation: The process of preparing the land and caring for growing crops.

Dark Zone Cave: An environmental zone found in deep and extensive caves. This cave zone is typified by complete darkness, almost constant temperature and humidity, and a unique array of cave-adapted organisms.

dB (decibel): A unit of measurement of the loudness or strength of a signal. One decibel is considered the smallest difference in sound level that the human ear can discern. Decibels are a relative measurement derived from two signal levels: a reference input level and an observed output level. A decibel is the logarithm of the ratio of the two levels. One Bel is when the output signal is 10 times that of the input and one decibel is 1/10 of a Bel.

Declared Pest: Any animal or insect which the board and the Wyoming weed and pest council have found, either by virtue of its direct effect, or as a carrier of disease or parasites, to be detrimental to the general welfare of persons residing within a district.

Declared Weed: Any plant which the board and the Wyoming weed and pest council have found, either by virtue of its direct effect, or as a carrier of disease or parasites, to be detrimental to the general welfare of persons residing within a district (State of Wyoming 1973).

Deferment: Delay of livestock grazing on an area for an adequate period of time to provide for plant reproduction, establishment of new plants, or restoration of vigor of existing plants. Rest is not defined as deferment in the Cody Field Office.

Deferred Grazing: The use of deferment in grazing management of a management unit, but not in a systematic rotation including other units. In the Cody Field Office, this is usually used to identify grazing use after the growing season, generally after August 15.

Deferred-rotation: Any grazing system which provides for a systematic rotation of the deferment among pastures.

Dendrochronology: The study of tree-ring dating. The science of dating events and weather patterns in former times by studying growth rings in trees. One can determine the age of a tree by counting its rings.

Designated Noxious Weeds: Weeds, seeds, or other plant parts that are considered detrimental, destructive, injurious, or poisonous, either by virtue of their direct effect or as carriers of diseases or parasites that exist within this state, and are on the designated list.

Designated Pests: Animals or insects which are on the designated list considered detrimental to the general welfare of the state (State of Wyoming 1973).

Designated Roads and Trails: A network of roads and trails specifically identified as the official travel and transportation network for a given area on which some type of motorized vehicle use is allowed either seasonally or year-long. Designated roads and trails are identified on maps, identified by signs in the field, and may be assigned road numbers for inventory and identification purposes. This may include routes on the official BLM transportation plan that are routinely maintained as well as routes that were user-created and which receive no regular maintenance. Vehicle travel is permitted only on roads and vehicle routes designated by the BLM. In areas where no formal travel management plan has been implemented, motorized use is limited to existing roads and trails on an interim basis.

Desired Future Condition (DFC): A portrayal of the land or resource conditions which are expected to result if goals and objectives are fully achieved (BLM and USFS 2001).

Desired Future Condition (DFC) for Riparian and Wetlands (after 20-40 years of management):

- Proper functioning conditions on all riparian and wetland habitats.
- Riparian and wetland vegetation supports proper functioning condition of biologic, hydrologic, and physical components of streams and wetlands.
- Systems are vertically stable (no downcutting).
- Floodplain connectivity.
- Herbaceous plant communities are composed of functional and structural plant groups that are dominated by deep-rooted native species that support streambank and shoreline stability, floodplain development, water quality, and nutrient cycling. Also includes woody species and cottonwoods within the site's potential.
- Management of invasive, noxious, and undesirable species.
- Provide 'Yellow, Red and Blue Ribbon' streams on those systems with fish habitat potential.

Desired Plant Community (DPC): Of the several plant communities that may occupy a site, the DPC is the community that has been identified through a management plan to best meet the plan's objectives for the site. At a minimum, it must protect the site.

Destination Recreation-Tourism Market: National or regional recreation-tourism visitors and other constituents who value public lands as recreation-tourism destinations. Major investments in facilities and visitor assistance are authorized within special recreation management areas (SRMAs) where the BLM's strategy is to target demonstrated destination recreation-tourism market demand. Here, recreation management actions are geared toward meeting primary recreation-tourism market demand for specific activity, experience, and benefit opportunities. These opportunities are produced through maintenance of prescribed natural resource setting character and by structuring and implementing management, marketing, monitoring, and administrative actions accordingly.

Determination (Standards and Guidelines [S&G]): Document recording the authorized officer's finding that existing grazing management practices or levels of grazing use on public lands grazing either are or are not significant factors in failing to achieve the standards and conform with the guidelines within a specified geographic area (preferably watershed or a group of contiguous watersheds) (BLM 2001).

Diet: What people and living organisms eat is their diet. A diet is a combination of foods and liquids that provide the necessary nutrients for the body.

Digging Stick: A pointed, wooden stick used to dig and pry edible roots from the ground.

Disruptive Activity: Those activities that disrupt or alter wildlife actions at key times, during important activities, or in important areas (feeding, breeding, nesting, herd movement, winter habitat). Disruptive activities are those which can result in reductions of energy reserves, health, reproductive success, or population. Some examples of disruptive activities include geophysical (seismic), well plugging or work-over operations that last 24 to 48 hours or longer, road reclamation, and wild horse grazing and management. Emergency activities, rangeland monitoring, recreational activities, livestock grazing and management, and other field activities are not considered disruptive activities (BLM 2008f).

Domestication: The process of taming or making usable for humans.

Drive Line: Alignments of stone, brush, logs or other materials designed to control the movement of animals during hunts.

Driveway: A strip of land specifically designated for the controlled movement of livestock.

Drought: (1) A prolonged chronic shortage of water, as compared to the norm, often associated with high temperatures and winds during spring, summer, and fall. (2) A period without precipitation during which the soil water content is reduced to such an extent that plants suffer from lack of water.

Dung: Animal manure. Solid waste material passed from the bowels of animals. Scientists study dung to learn what animals and humans ate in the past.

Durability (protective and ecological): The maintenance of the effectiveness of a mitigation project for the duration of the associated impacts, which includes resource, administrative/legal, and financial considerations (adopted and modified from BLM Manual Section 1794).

Ecological Site: A distinctive kind of land with specific soil and other physical characteristics that differs from other kinds of land in its ability to produce distinctive kinds and amounts of vegetation and in its ability to respond to management actions and natural disturbances.

Ecological Site Description (ESD): The official documentation of an ecological site describing the distinctive properties and characteristics, the abiotic and biotic relationships, and the ecological dynamics

of the site. In addition an ESD also provides interpretations about land uses and ecosystem services that a particular ecological site can support and management alternatives for achieving land management objectives.

Ecological Status: Ecological status is the present state of vegetation of a range site in relation to the potential natural community for that site. It is an expression of the relative degree to which the kinds, proportions and amounts of plants in a plant community resemble that of the potential natural plant community for the site. Four classes are used to express the degree to which the production or composition of the present plant community reflects that of the potential natural community (climax).

Ecosystem: A complete, interacting system of living organisms and the land and water that make up their environment; the home places of all living things, including humans.

Eligible River: An eligible river segment found through administrative study to meet the criteria for designation as a component of the National System, as specified in Section 4(a) of the Wild and Scenic Rivers Act.

Endangered Species: A plant or animal species whose prospects for survival and reproduction are in immediate jeopardy, as designated by the Secretary of the Interior, and as is further defined by the Endangered Species Act.

Enhanced Recovery: The use of artificial means to increase the amount of hydrocarbons that can be recovered from a reservoir. A reservoir depleted by normal extraction usually can be restored by secondary or tertiary methods of enhanced recovery.

Enhancement: A management action designed to improve visual quality.

Entisols: Soils with little or no development.

Environment: The conditions around an area that affect it. These include geography, soil, climate, plants, and animals.

Ephemeral Stream: A stream that flows only in direct response to precipitation, and whose channel is at all times above the water table. Confusion over the distinction between intermittent and ephemeral streams may be minimized by applying Meinzer's suggestion that the term "ephemeral" be arbitrarily restricted to streams that do not flow continuously for at least 30 days (Prichard et al. 1998). Ephemeral streams support riparian areas when streamside vegetation reflects the presence of permanent subsurface water.

Epicontinental Seaway: Shallow sea extending far into a continent.

Epidemic: An outbreak of a pest or disease in a high proportion of the individuals of a population in a geographic area. For example, outbreaks of bark beetles causing mortality in a large portion of pine trees in a forest.

Evaluation (S&G): An evaluation is conducted to arrive at 2 outcomes. Firstly, an evaluation conducts an analysis and interpretation of the findings resulting from the assessment, relative to land health standards, to evaluate the degree of achievement of land health standards. Secondly, an evaluation conducts an analysis and interpretation of information--be it observations or data from inventories and monitoring--on the causal factors for not achieving a land health standard. An evaluation of the causal factors provides the foundation for a determination (see *Determination*) (BLM 2001).

Evidence: Data which are used to prove a point, or which clearly indicate a situation.

Excavation (Archaeological): Carefully removing layers of dirt or sediment to find objects or features made by people from long ago.

Exceedance: An event in which measurements of ambient air quality are above the national ambient air quality standard (NAAQS) or Wyoming Department of Environmental Quality (DEQ) standard set for a particular pollutant. For example, an annual average nitrogen dioxide value of $110 \mu\text{g}/\text{m}^3$ is an exceedance of both the NAAQS and Wyoming DEQ annual average standard for nitrogen dioxide of $100 \mu\text{g}/\text{m}^3$.

Exclusion Areas: Areas with sensitive resource values where rights-of-way (ROWs) and 302 permits, leases, and easements would not be authorized.

Existing Roads and Trails (interim existing roads and trails): Defined as routes existing prior to the date the OHV designation is announced in the *Federal Register*. These routes may have been constructed and maintained or may be two-track routes created and maintained by the passage of motor vehicles and which receive regular use. Roads and trails may be added, modified, or deleted by the Bureau from the inventory through authorizations as needs arise. Recent CTTM guidance (BLM Handbook 8342-1) directed the BLM to manage all BLM-administered public lands under "Designated Roads and Trails". Existing roads and trails is to be used on an interim basis until a Travel Management Plan designates each individual route as open or closed for motorized use. The term "interim existing roads and trails", or "existing roads and trails" are used to identify areas of low priority for travel management planning.

Extensive Recreation Management Areas (ERMA): See *Recreation Management Areas*.

Extinct: No longer existing or active; died out.

Extinction: Bring to an end, wiping out, or destruction.

Fault: A fracture in bedrock along which there has been vertical and/or horizontal movement caused by differential forces in the earth's crust (BLM 2008f).

Fire Management Plan: Identifies appropriate strategies to achieve resource objectives. Identifies fire policy, objectives, and prescribed actions; may include maps, charts, tables, and statistical data.

Fire Regime Condition Class: A classification of the amount of departure from the natural fire regime. The departure results in changes to one or more of the following ecological components: vegetation characteristics (e.g., species composition, structural stages, stand age, canopy closure, and mosaic pattern), fuel composition, fire frequency, severity, and pattern, and other associated disturbance (e.g., insect and disease mortality, grazing, and drought). The three condition classes are listed below:

Condition Class 1:

- The historic disturbance regime is largely intact and functioning (e.g., has not missed a fire return interval)
- Potential intensity and severity of fire within historic range
- Effects of disease and insects within historic range
- Hydrologic functions within normal historic range
- Vegetation composition and structure resilient to disturbances
- Nonnative species currently not present or to a limited extent
- Low risk of loss for key ecosystem components.

Condition Class 2:

- Moderate alterations to historic disturbance regime evident (e.g., missed one or more fire return intervals)
- Effects of disease and insects pose an increased risk of loss of key community components

- Riparian areas and associated hydrologic function show measurable signs of adverse departure from historic conditions
- Vegetation composition and structure shifted toward conditions less resilient to disturbances
- Populations of nonnative species may have increased, increasing the risk of further increases following disturbance.

Condition Class 3:

- Historic disturbance regime significantly altered; historic disturbance processes and impacts may be precluded (e.g., missed several fire return intervals)
- Effects of disturbance (fire, insects, and disease) may cause significant or complete loss of key community components
- Hydrologic functions may be adversely altered; high potential for increased sedimentation and reduced streamflows
- Invasive, nonnative species may be common and in some cases the dominant species on the landscape; disturbance will likely increase both the dominance and geographic extent of these invasive species
- Highly altered vegetation composition and structure predisposes community to disturbance events outside the range of historic availability; disturbance may have effects not observed or measured before.

Fire Return Interval: The number of years between two successive fire events at a specific site or area.

Flaring/Venting: The controlled burning (flare) or release (vent) of natural gas that cannot be processed for sale or use because of technical or economic reasons.

Floodplain Connectivity: Maintenance of lateral, longitudinal, and vertical pathways for biological and hydrological processes in the floodplain. Examples of failures to maintain connectivity could include culverts or levees that restrict flow in the floodplain and that focus overbank flow into the channel.

Floristic Province: Areas of ecological and biological issues similarity (Stiver et al. 2006).

Flushing Livestock: Flushing livestock is the holding of livestock in an invasive, nonnative plant species (INPS) seed-free area where they are fed an INPS seed-free ration for 72 hours, thus flushing INPS seed from the animals' digestive systems.

Fluvial: Pertaining to rivers, streams, and floodplains (BLM 2006).

Folsom Point: A spear or atlatl dart point made by later Paleo-Indians. Characterized by a long, shallow channel on one or both faces; smaller than a Clovis point.

Foothill: A low hill near the base of a mountain or range of mountains.

Forage: Browse and herbage that are available and may provide food for grazing animals or be harvested for feeding. To search for or consume forage.

Forage Production: The weight of forage that is produced within a designated period of time on a given area (e.g., pounds per acre). The weight may be expressed as either green, air-dry, or oven-dry. The term may also be modified as to time of production such as annual, current years, or seasonal forage production.

Foreground-Middle Ground Zone: An area that can be seen from a travel route for a distance of 3 miles (foreground) to 5 miles (middle ground) where management activities might be viewed. A distance from 5 to 15 miles is called the *Background Zone* and the area beyond 15 miles is called the *Seldom-Seen Zone*.

Foreland Basin: A linear sedimentary basin in a foreland which subsides in response to flexural loading of the lithosphere by adjacent thrust sheets; also a depression that develops adjacent and parallel to a mountain belt (American Geological Institute 2005).

Forestland: Capable of producing 20 cubic feet of wood fiber from commercial species per acre per year.

Fossil: Fossils are any naturally occurring evidence of life older than 10,000 years.

Frigid (soils): The frigid soil temperature regime has mean annual soil temperatures below 8°C (47°F) but above 0°C (32°C). Frigid soils are described as cool (University of Wyoming 1999).

Functional/Structural Groups: A suite of species that are grouped together, on an ecological site basis, because of similar shoot (height or column) or root (fibrous vs. tap) structure, photosynthetic pathways, nitrogen fixing ability, or life cycle (University of Wyoming 1999).

Fundamentals of Rangeland Health: Overarching principles of rangeland health, listed at 43 CFR § 4180.1, which establish BLM policy of managing for healthy rangelands (60 Federal Register (FR) at 9954). State or regional standards and guidelines must provide for conformance with the Fundamentals of Rangeland Health (43 CFR § 4180.2(b)) (BLM 2001).

Geographic Information System (GIS): A computer system capable of storing, analyzing, and displaying data and describing places on the earth's surface.

Geologic Province: A spatial entity with common geologic or geomorphic attributes. A province may include a single dominant structural element such as a basin or a fold belt, or a number of contiguous related elements.

Geologic Resources: Resources associated with the scientific study of the Earth, including its composition, structure, physical properties, and history. Geologic resources commonly include the study of minerals (mineralogy) and rocks (petrology); the structure of the Earth (structural geology) and volcanic phenomena (volcanology); and landforms and the processes that produce them (geomorphology and glaciology).

Glacier: A large mass of ice that moves slowly down a slope or valley.

Goal: A broad statement of a desired outcome. Goals are usually not quantifiable and may not have established timeframes for achievement.

Goal Interference: Recreationist pursuing desired beneficial outcomes is not able to realize the positive aspects of a visit because of the behavior of someone else.

Granitic: General term for all light-colored, granite-like igneous rocks (BOR no date).

Graze: (1) The consumption of standing forage by livestock or wildlife. (2) To put livestock to feed on standing forage.

Grazing: To graze.

Grazing License or Permit: Official written permission to graze a specific number, kind, and class of livestock for a specified period on a defined allotment or management area.

Grazing Management: The manipulation of grazing and browsing animals to accomplish a desired result.

Grazing Management Plan: A program of action designed to secure the best practicable use of the forage resource with grazing or browsing animals.

Grazing Period: The length of time that animals are allowed to graze on a specific area.

Grazing Permit: A document that authorizes grazing use of the public lands under Section 3 of the Taylor Grazing Act. A grazing permit specifies terms and conditions under which permittees make grazing use during the term of the permit. Terms and conditions include the area authorized for grazing use, the number of livestock, period of use, and amount of use in AUMs and others.

Grazing Preference: (1) Selection of plants, or plant parts, over others by grazing animals. (2) Grazing preference means a superior or priority position against others for the purpose of receiving a grazing permit or lease. This priority is attached to base property owned or controlled by the permittee or lessee. (Title 43 CFR 4100.0-5).

Grazing Season: (1) On public lands, and established period for which grazing permits are issued. May be established on private land in a grazing management plan. (2) The time interval when animals are allowed to utilize a certain area.

Grazing System: A specialization of grazing management which defines the periods of grazing and non-grazing.

Great Basin: is a large, arid region of the western United States, commonly defined as the contiguous watershed region, roughly between the Rocky Mountains and the Sierra Nevada, that has no natural outlet to the sea (WordIQ no date).

Greenhouse Gas (GHG): Greenhouse gases are those gaseous constituents of the atmosphere, both natural and anthropogenic, that absorb and emit radiation at specific wavelengths within the spectrum of infrared radiation emitted by the Earth's surface, the atmosphere, and clouds. This property causes the greenhouse effect. Water vapor (H₂O), carbon dioxide (CO₂), nitrous oxide (N₂O), methane (CH₄), and ozone (O₃) are the primary greenhouse gases in the Earth's atmosphere.

Growing Season: In temperate climates, that portion of the year when temperature and moisture permit plant growth.

Guidelines: Actions or management practices that may be used to achieve desired outcomes, sometimes expressed as best management practices. Guidelines may be identified during the land use planning process, but they are not considered a land use plan decision unless the plan specifies that they are mandatory.

Guzzler: A water development for wildlife.

Habitat: The natural abode of a plant or animal, including all biotic, climatic, and edaphic factors affecting life.

Habitat Fragmentation: The destruction or splitting up of continuous habitat by a physical barrier (e.g., fence) or a land use that results in surface disturbance (e.g., road construction, development, or agriculture).

Habitat Guild: A group of species that tend to occur in similar types of habitats.

Habitat Management Area (HMA): An area containing a specific habitat type(s) that is managed for the maintenance or recovery of a particular species.

Habitat Management Plan (HMP): A written and approved activity plan for a geographical area of public lands which identifies wildlife habitat management actions to be implemented in achieving specific objectives related to RMP planning document decisions (BLM 1987).

HABS/HAER: The Historic American Buildings Survey/Historic American Engineering Record (HABS/HAER) is an integral component of the federal government's commitment to historic preservation. The program documents important architectural, engineering and industrial sites throughout the United States and its territories. A complete set of HABS/HAER documentation, consisting of measured drawings, large-format photographs, and written history plays a key role in accomplishing the mission of creating an archive of American architecture and engineering and in better understanding what historic resources tell us about America's diverse ethnic and cultural heritage. To insure that such evidence is not lost to future generations, the HABS/HAER Collections are archived at the Library of Congress, where they are made available to the public.

Hazard Fuels: A fuel complex defined by kind, arrangement, volume, condition, and location that presents a threat of ignition and resistance to control.

Hazardous Material: A substance or combination of substances that, because of quantity, concentration, or physical, chemical, or infectious characteristics, may either: (1) cause or significantly contribute to an increase in mortality or an increase in serious, irreversible, or incapacitating, illness; or (2) pose a substantial present or potential hazard to human health or environment when improperly treated, stored, transported, or disposed of, or otherwise managed.

Heavy Equipment Use: This phrase is used in fire management and is relative to limiting fire suppression tactics. In this context it refers to not using dozers, skidders, or graders in areas where important resource values are in need of protection. Fire engines and water tenders used during suppression activities would be allowed.

Held by Production: Leases that become productive and do not terminate until all wells on the lease have ceased production.

High Potential Historic Site: Historic sites related to the route or sites in close proximity thereto which provide opportunity to interpret the historic significance of the trail during the period of its major use. The criteria for consideration of sites as high potential historic sites include historic significance, presence of visible historic remnants, scenic quality, and relative freedom from intrusion. High potential historic sites are assumed to contain remnants, artifacts, and other properties eligible for the National Register of Historic Places, pending evaluation. Under the National Trails System Act, high potential historic sites located on federally owned land are referred to as Federal Protection Components.

High Potential Route Segment: Segments of a trail which would afford a high-quality recreation experience in a portion of the route having greater than average scenic values or affording an opportunity to vicariously share the experience of the original users of a historic route. National Historic Trail high potential route segments are assumed to contain remnants, artifacts, and other properties eligible for the National Register of Historic Places, pending evaluation. Under the National Trails System Act, high potential route segments located on federally owned land are referred to as Federal Protection Components.

Historic: Referring to the time after written records or after the Europeans first came and wrote about the people and events in America.

Historic Trails: Generally those routes utilized during the initial exploration and settlement of an area. These routes are known from maps and other documents and may also retain physical integrity on the ground (see also *National Historic Trails*).

History: The study of past events and times through use of written and recorded sources. In some cases, oral sources may also be available.

House Pit: A dwelling that had an excavated floor and a roof of poles covered with branches or hides. An earth sheltered home that was probably used on a seasonal basis.

Hunter-gatherers: People who depend on seasonally available wild animals and plants for food to survive.

Hydrologic Units: The United States is divided and sub-divided into successively smaller hydrologic units which are classified into four levels: regions, sub-regions, accounting units, and cataloging units. The hydrologic units are arranged within each other, from the smallest (cataloging units) to the largest (regions).

I Category (Improve): See *Allotment Categorization*.

Impact Analysis for Planning (IMPLAN 2000) Model: IMPLAN is a regional economic model that provides a mathematical accounting of the flow of money, goods, and services through a region's economy. The model provides estimates of how a specific economic activity translates into jobs and income for the region. It includes the "ripple effect" (also called the "multiplier effect") of changes in economic sectors that may not be directly impacted by management actions, but are linked to industries that are directly impacted. In IMPLAN, these ripple effects are termed indirect impacts (for changes in industries that sell inputs to the industries that are directly affected) and induced impacts (for changes in household spending as household income increases or decreases due to the changes in production).

Important Cultural Resources: All historic properties allocated to Conservation for Future, Scientific, and Traditional use categories. Additionally on a case by case basis some historic properties assigned to Experimental, and Public use categories may be determined to be included in this class of resource.

Important Cultural Sites: See *Important Cultural Resources*.

Inceptisol: A soil order in the United States Department of Agriculture (USDA) soil taxonomy characterized by young soils just starting to show horizon development.

Increaser: Plant species of the original vegetation that increase in relative amount, at least for a time, under continued disturbance to the norm.

Indicator: An indicator is a component of a system whose characteristics (for example, presence, absence, quantity, and distribution) can be observed, measured, or monitored based on sound scientific principles. An indicator can be evaluated at a site- or species-specific level. Monitoring of an indicator must be able to show change within timeframes acceptable to management and be capable of showing how the health of the ecosystem is changing in response to specific management actions. Selection of the appropriate indicators to be observed, measured, or monitored in a particular allotment is a critical aspect of early communication among the interests involved on-the-ground. The most useful indicators are those for which change or trend can be easily quantified and for which agreement as to the significance of the indicator is broad based.

Indigenous: Born, growing, or produced naturally (native) in an area, region or county.

Infestation: The inhabitation of a host by large numbers of pests, such as bark beetles on pine trees. Invasion by large numbers of parasites or pests.

Infiltration: The downward entry of water into the soil or other material.

Integrated Weed Management: The use of all appropriate weed control measures, including fire, as well as mechanical, chemical, biological, and cultural techniques, in an organized and coordinated manner on a site-specific basis.

Interested Public: Interested public means an individual, group, or organization that has: (1)(i) Submitted a written request to BLM to be provided an opportunity to be involved in the decision making process as

to a specific allotment, and (ii) Followed up that request by submitting written comment as to management of a specific allotment, or otherwise participating in the decision making process as to a specific allotment, if BLM has provided them an opportunity for comment or other participation; or (2) Submitted written comments to the authorized officer regarding the management of livestock grazing on a specific allotment (CFR 4100.0-5).

Interim Management Policy (IMP): The policy and guidelines under which the BLM manages lands under wilderness review (known as Wilderness Study Areas). This policy is referred to as the "interim" management policy because it applies to specific areas of the public lands for a limited amount of time, depending upon various stages and schedules of the review process (BLM Manual 8550).

Intermittent Stream: A stream that flows only at certain times of the year when it receives water from springs or from some surface source such as melting snow in mountainous areas. Confusion over the distinction between intermittent and ephemeral streams may be minimized by applying Meinzer's suggestion that the term "intermittent" be arbitrarily restricted to streams that flow continuously for periods of at least 30 days (Prichard et al. 1998).

Invasive Species: According to Executive Order 13112, an invasive species is an alien species whose introduction does or is likely to cause economic or environmental harm or harm to human health. The executive summary of the National Invasive Species Management Plan further clarifies and defines an invasive species as a species that is non-native to the ecosystem under consideration and whose introduction causes or is likely to cause economic or environmental harm or harm to human health.

Inventory: Gathering of baseline information (including quantitative data, cultural knowledge, and qualitative observations) about condition of resources. Examples of inventory are Ecological Site Inventory, and Population Counts of Threatened or Endangered Species (BLM 2001).

Karst Region: Karst topography is a landscape shaped by the dissolution of a layer or layers of soluble bedrock, usually carbonate rock such as limestone or dolomite. Due to subterranean drainage, there may be very limited surface water, even to the absence of all rivers and lakes. Many karst regions display distinctive surface features, with sinkholes or dolines being the most common. However, distinctive karst surface features may be completely absent where the soluble rock is mantled, such as by glacial debris, or confined by a superimposed non-soluble rock strata. Some karst regions include thousands of caves, even though evidence of caves that are big enough for human exploration is not a required characteristic of karst.

Key Area (grazing): A relatively small portion of a rangeland selected because of its location, use, or grazing value as an area on which to monitor the effects of grazing use. It is assumed that key areas, if selected properly, will reflect the effects of current grazing management over all or a part of a pasture, allotment or other grazing unit.

Key Area (greater sage-grouse): Sagebrush habitat where there are known leks, brood-rearing or winter sage-grouse habitat (BLM 2004).

Key Species: Those species which must, because of their importance, be considered in a management program, or forage species whose use serves as an indicator of the degree of use of associated species.

Kinds of Livestock (animal): An animal species or species group such as sheep, cattle, goats, deer, horses, elk, antelope, etc.

Lacustrine: Pertaining to, produced by, or formed in a lake or lakes (BLM 2006).

Land: The total natural and cultural environment within which production takes place; a broader term than soil. In addition to soil, its attributes include other physical conditions, such as mineral deposits,

climate, and water supply; location in relation to centers of commerce, populations, and other land; the size of the individual tracts or holdings; and existing plant cover, works of improvement, and the like.

Land Health: Degree to which the integrity of the soil and the ecological processes of ecosystems are sustained (BLM 2001).

Land Tenure: To improve the manageability of BLM lands and improve their usefulness to the public, the BLM has numerous authorities for "repositioning" lands into a more consolidated pattern, disposing of lands, and entering into cooperative management agreements. These land-pattern improvements are completed primarily through the use of land exchanges, but also through land sales, jurisdictional transfers to other agencies, and through the use of cooperative management agreements and leases. These ownership or jurisdictional changes are referred as "Land Tenure Adjustments."

Lands with Wilderness Characteristics: Lands that have been inventoried and found to contain wilderness characteristics as defined in Section 2(c) of the Wilderness Act of 1964.

Landscape Character: The arrangement of a particular landscape as formed by the variety and intensity of the landscape features and the four basic elements of form, line, color, and texture. These factors give the area a distinctive quality which distinguishes it from its immediate surroundings.

Leasable Minerals: Those minerals or materials subject to lease by the federal government under the Mineral Leasing Act of 1920. They include coal, phosphate, asphalt, sulphur, potassium, and sodium minerals; oil and gas, as well as geothermal resources.

Lease: (1) A legal document that conveys to an operator the right to drill for oil and gas; (2) the tract of land, on which a lease has been obtained, where producing wells and production equipment are located. Contractual instruments granting rights to use specific managed public lands, with certain conditions, for specific purposes such as livestock grazing, timber harvesting, and energy or mineral development.

Lease Notice or Information Notice: Provides more detailed information concerning limitations that already exist in law, lease terms, regulations, or operational orders. A Lease Notice also addresses special items the lessee should consider when planning operations, but does not impose new or additional restrictions (Uniform Format for Oil and Gas Lease Stipulations, March 1989. Rocky Mountain Regional Coordinating Committee). An information notice has no legal consequences, except to give notice of existing requirements, and may be attached to a lease by the authorized officer at the time of lease issuance to convey certain operational, procedural or administrative requirements relative to lease management within the terms and conditions of the standard lease form. Information notices shall not be a basis for denial of lease operations (43 CFR 3101.1-3).

Lease Stipulation: A provision that modifies standard lease rights and is attached to and made a part of the lease (Uniform Format for Oil and Gas Lease Stipulations, March 1989. Rocky Mountain Regional Coordinating Committee). The authorized officer may require stipulations as conditions of lease issuance. "Stipulations shall become part of the lease and shall supersede inconsistent provisions of the standard lease form. Any party submitting a bid... shall be deemed to have agreed to stipulations applicable to the specific parcel..." (43 CFR 3101.1-3).

Lek: A traditional courtship display area attended by male sage-grouse in or adjacent to sagebrush dominated habitat. A lek is designated based on observations of two or more male sage-grouse engaged in courtship displays. Before adding the suspected lek to the database, it must be confirmed by an additional observation made during the appropriate time of day, during the strutting season. Sign of strutting activity (tracks, droppings, feathers) can also be used to confirm a suspected lek. Sub-dominant males may display on itinerant (temporary) strutting areas during population peaks. Such areas usually fail

to become established leks. Therefore, a site where small numbers of males (<5) are observed strutting should be confirmed active for two years before adding the site to the lek database.

Lentic: Standing water riparian/wetland areas such as lakes, ponds, seeps, bogs, and meadows (University of Arizona No Date).

Limited Area: Means an area restricted, at certain times, in certain areas, and/or to certain vehicle use. These restrictions may be of any type, but can generally be accommodated within the following type of categories: Number of vehicles; type of vehicles; time of season of vehicle use; permitted or licensed use only; use on existing roads and trails; use on designated roads and trails; and other restrictions.

Livestock: Domestic animals.

Livestock Carrying Capacity: The maximum stocking rate possible without inducing damage to vegetation or related resources. It may vary from year to year on the same area due to fluctuating forage production.

Livestock Management: Application of technical principles and business methods to livestock production.

Livestock Operation: The management of a ranch or farm so that a significant portion of the income is derived from the production of livestock.

Livestock Production: (1) The weight, number of animals, etc., that a particular range, seeded pasture, or management system produces. (2) The business of producing livestock.

Locatable Minerals: Minerals subject to exploration, development, and disposal by staking mining claims as authorized by the Mining Law of 1872, as amended. This includes deposits of metallic minerals such as gold, silver, and other uncommon materials not subject to lease or sale.

Lotic: Running water riparian/wetland areas such as rivers, streams, and springs (University of Arizona No Date).

M Category (Maintain): See *Allotment Categorization*.

Major Constraints (Oil and Gas): Any stipulations or conditions of approval which may restrict the timing or placement of oil and gas developments and may result in an operator dropping the development proposal. Major constraints include NSOs, areas of overlapping TLS that last more than 6 months, areas closed to surface-disturbing activity, areas where surface-disturbing activity is prohibited, and VRM Class I areas. Leaseholders have the right to explore, develop, and produce mineral resources from any valid, existing lease, even if the area containing the lease were proposed to be closed to future leasing.

Major Land Resource Areas (MLRA): Broad geographic areas that are characterized by a particular pattern of soils, climate, water resources, vegetation, and land use.

Management Plan: A program of action designed to reach a given set of objectives.

Management Zone (greater sage-grouse): Biologically based management areas determined using sage-grouse populations and sub-populations identified within distinct floristic provinces. Management Zones reflect ecological and biological issues and similarities, not political boundaries. In addition, the vegetation communities found in the floristic provinces, as well as the management challenges within a given Management Zone, are similar and sage-grouse and their habitats are likely responding similarly to environmental factors and management actions (Stiver et al. 2006).

Mass Wasting: Down slope movement of soil or rock as a result of gravity.

Measureable Targeted Outcomes: A quantitative scale used to measure explicitly stated targeted experience and benefit outcomes as prescribed in each Recreation Management Area (SRMA, RMZ, Separate ERMA) through monitoring methods such as on site surveys, focus groups, or other means

appropriate and as funding allows to sample and collect data. Measurable targeted outcomes is ranged on a probability scale where 1=not at all, 2=somewhat, 3=neutral, 4=moderate, 5=total realization.

Mechanized Use: Use of public lands by human-powered vehicles (such as mountain bicycles).

Medicine Wheel: A stone structure or alignment which may include a ring, spokes, cairns, or other features. Many are rings with radial spokes and cairns in the center and along the ring. Others are simple radial spokes or combinations of both (Brumley 1988). These features are believed to have functions in ceremonial practices including astronomically based calendars. They are commonly found in association with other stone features (Brumley 1988).

Megafauna: Large animals especially in the last Ice Age or Pleistocene. These animals are now extinct and include mammoths, mastodons, American lions, American camels, and saber-toothed cats.

Mesic: Related to conditions of moderate moisture or water supply. Used to describe organisms occupying moist habitats.

Metamorphic Rock: Rocks that have undergone a fundamental change as the result of heat, pressure, and the chemical action of pore fluids and gases.

Middle Rocky Mountain Foreland: A sub-province within the Rocky Mountain System geologic province (see *Geologic Province*) that includes complex mountains with many intermontane foreland basins (see *Foreland Basin*) and plains.

Mineral Materials (Salables): Materials such as common varieties of sand, stone, gravel, pumice, pumicite, and clay that are not obtainable under the mining or leasing laws, but can be acquired under the Mineral Materials Act of 1947, as amended.

Mineral Withdrawal: A formal order that withholds federal lands and minerals from entry under the Mining Law of 1872, as amended, and closes the area to mineral location (i.e., staking mining claims) and development.

Minimization Mitigation: Minimizing impacts by limiting the degree or magnitude of the action and its implementation (40 CFR 1508.20 [b]).

Minimum Impact Suppression Techniques: The application of strategy and tactics that effectively meet suppression and resource objectives with the least environmental, cultural and social impacts.

Mitigation:

- Avoiding the impact altogether by not taking a certain action or parts of an action.
- Minimizing impacts by limiting the degree or magnitude of the action and its implementation.
- Rectifying the impact by repairing, rehabilitating, or restoring the affected environment.
- Reducing or eliminating the impact over time by preservation and maintenance operations during the life of the action.
- Compensating for the impact by replacing or providing substitute resources or environments.

Mitigation Measures: Methods or procedures designed to reduce or lessen the adverse impacts caused by management activities.

Moderate (recreation outcomes): See *Measurable Targeted Outcomes*.

Moderate Constraints (Oil and Gas): Any stipulations or conditions of approval which may restrict the timing or placement of oil and gas development, but would not otherwise restrict the overall

development. Moderate constraints include all timing restrictions (TLS), CSUs, areas where surface-disturbing activity is avoided, and VRM Class II areas.

Mollisol: Dark colored grassland type soils with high base status.

Monitoring: The orderly collection, analysis, and interpretation of resource data to evaluate progress toward meeting management objectives.

Multiple Use Reservoir: A human-created lake or pond with a combination of balanced uses, including, but not limited to, recreation, livestock watering, watershed health, and wildlife and fish.

National Historic Trails: A protected area designation containing historic trails and surrounding areas authorized under the National Trails System Act of 1968. National Historic Trails may only be designated by an act of Congress.

National Register of Historic Places: The official list of the Nation's historic places worthy of preservation. Properties listed or eligible for listing are associated: with events, activities, or developments that were important in the past; with the lives of people who were important in the past; with significant architectural history, landscape history, or engineering achievements; or have already, or have the potential, to yield important information through investigation about our past. These may include districts, sites, buildings, structures, and objects that possess integrity of location, design, setting, materials, workmanship, feeling, and association as appropriate.

National Trail Management Corridor: Allocation established through the land use planning process, pursuant to Section 202 of Federal Land Policy and Management Act and Section 7(a)(2) of the National Trails System Act ("rights-of-way") for a public land area of sufficient width within which to encompass National Trail resources, qualities, values, and associated settings and the primary use or uses that are present or to be restored.

National Wild and Scenic Rivers System: A system of nationally designated rivers and their immediate environments that have outstanding scenic, recreational, geologic, fish and wildlife, historic, cultural, and other similar values and are preserved in a free-flowing condition. The system consists of three types of streams:

- (1) Recreation – rivers or sections of rivers that are readily accessible by road or railroad and that may have some development along their shorelines and may have undergone some impoundments or diversion in the past;
- (2) Scenic – rivers or sections of rivers free of impoundments with shorelines or watersheds still largely undeveloped but accessible in places by roads; and
- (3) Wild – rivers or sections of rivers free of impoundments and generally inaccessible except by trails, with watersheds or shorelines essentially primitive and waters unpolluted.

Native American: The people living in North and South America prior to European exploration. Many groups of people today are Native Americans and have ancestors who lived on these continents for thousands of years before Columbus came. They are also called American Indian, First American, Alaska Native and Native People.

Native Species: A species that is a part of the original fauna or flora of a given area in question.

Native Species Status: Native Species Status (NSS) refers to the population status of species native to the area in which their habitats occur. The NSSs are divided into the following categories:

NSS1 Native Species Status 1

Populations are greatly restricted or declining, extirpation appears possible; or ongoing significant loss of habitat.

NSS2 Native Species Status 2

Populations are declining, extirpation appears possible; habitat is restricted or vulnerable, but no recent or ongoing significant loss; species may be sensitive to human disturbance; or

Populations are declining or restricted in numbers and (or) distribution, extirpation is not imminent; ongoing significant loss of habitat.

NSS3 Native Species Status 3

Populations are greatly restricted or declining, extirpation appears possible; habitat is not restricted, vulnerable, but no loss; species is not sensitive to human disturbance; or

Populations are declining or restricted in numbers and (or) distribution, extirpation is not imminent; habitat is restricted or vulnerable, but no recent or ongoing significant loss species may be sensitive to human disturbance; or

Species is widely distributed; population status or trends are unknown, but are suspected to be stable; ongoing significant loss of habitat.

NSS4 Native Species Status 4

Populations are greatly restricted or declining, extirpation appears possible; habitat is stable and not restricted; or

Populations are declining or restricted in numbers and (or) distribution, extirpation is not imminent; habitat is not restricted, vulnerable, but no loss; species is not sensitive to human disturbance; or

Species is widely distributed, population status or trends are unknown, but are suspected to be stable; habitat is restricted or vulnerable, but no recent or ongoing significant loss; species may be sensitive to human disturbance; or

Populations that are stable or increasing and not restricted in numbers and (or) distribution; ongoing significant loss of habitat.

Natrargid: Aridisols with an accumulation of clay and sodium.

Natural Fire Regime: The general classification of the role fire would play across a landscape in the absence of modern human mechanical intervention, but including the influence of aboriginal burning (Agee 1993, Brown 1995).

Nature and Purposes: The term used to describe the character, characteristics, and congressional intent for a designated National Trail, including the resources, qualities, values, and associated settings of the areas through which such trails may pass; the primary use or uses of a National Trail; and activities promoting the preservation of, public access to, travel within, and enjoyment and appreciation of National Trails.

Necessary Tasks (Clause): Work requiring the use of motor vehicles. Examples include using motor vehicles to repair range improvements, manage livestock, perform geophysical exploration activities and other types of leasable mineral exploration activity (other than casual use), and performing mining claim functions resulting in less than 5 acres of surface disturbance as described in 43 CFR 3809.

Net Conservation Gain: The actual benefit or gain above baseline conditions.

No Surface Occupancy (NSO): Used to prohibit the physical presence of oil and gas operations and associated facilities on the surface of Public Lands in a specified area to protect sensitive surface resource values. The NSO provision is reserved for use in fluid mineral land use planning and allocation decisions and lease stipulations. Other terms, such as restricted area, avoidance area, exclusion area, etc., are used with non-fluid mineral functions.

Nomad: A person who belongs to a group of people who have no permanent home, but wander from place to place searching for water, food, or grazing land.

Nonconsumptive Use: A use that does not reduce supply. For example, wildlife viewing does not.

Nonmarket Values: These values are not revealed through market transactions that establish market prices. For example, clean air, open space, preservation of critical wildlife habitat, etc., are not traded in the market place and therefore there is no market price for them. Nonetheless, there is a value for these resources that can be measured based on how much people would be willing to pay for them.

Objective: A description of a desired condition for a resource. Objectives can be quantified and measured and, where possible, have established timeframes for achievement.

Occupied Lek: A lek that has been active during at least one strutting season within the last 10 years.

Off-Highway Vehicle (OHV): Any motorized vehicle capable of, or designed for, travel on or immediately over land, water, or other natural terrain, excluding (1) any nonamphibious registered motorboat; (2) any military, fire, emergency, or law enforcement vehicle being used for emergency purposes; (3) any vehicle whose use is expressly authorized by the authorized officer, or otherwise officially approved; (4) vehicles in official use; and (5) any combat or combat support vehicle when used in times of national defense emergencies.

Off-Highway Vehicle (OHV) Management Designations: All public lands are required to have off-highway vehicle area designations. Areas must be classified as open, limited, or closed to motorized travel activities. Travel by over-snow vehicles is subject to the same requirements and limitations as all other vehicles unless specifically addressed otherwise in activity plans.

Closed: Vehicle travel is prohibited in the area. Access by means other than motorized vehicle is usually permitted. This designation is used if closure to all vehicular use is necessary to protect resources, to ensure visitor safety, or to reduce conflicts. Use of vehicles in closed areas may be allowed for certain reasons; however, such use shall be made only with the approval of the authorized officer.

Open: Vehicle travel is permitted in the area (both on and off roads) if the vehicle is operated responsibly in a manner not causing, or unlikely to cause, significant undue damage to or disturbance of the soil, wildlife, wildlife habitats, improvements, cultural or vegetative resources, or other authorized uses of the public lands. These areas are used for intensive OHV use where there are no compelling resource needs, user conflicts, or public safety issues to warrant limiting cross-country travel.

Limited: (a) Vehicle travel is permitted only on roads and vehicle routes which were in existence prior to the date of publication in the Federal Register. Vehicle travel off of existing vehicle routes is permitted only to accomplish necessary tasks and only if such travel does not result in resource damage. Random travel from existing vehicle routes is not allowed. Creation of new routes or extensions and (or) widening of existing routes are not allowed without prior written agency approval.

(b) Vehicle travel is permitted only on roads and vehicle routes designated by the BLM. Vehicle travel off of designated vehicle routes is permitted only to accomplish necessary tasks and only if such travel does not result in resource damage. Random travel from designated vehicle routes is not allowed. In areas where final designation has not been completed, vehicle travel is limited to existing roads and vehicle routes as described above. Designations may include, but are not limited to, the following:

- (1) Vehicle route is open to vehicular travel.
- (2) Vehicle route is closed to vehicular travel.
- (3) Vehicle travel is limited by number or type of vehicle such as:
 - Vehicle route limited to four-wheel drive vehicles only.
 - Vehicle route limited to motorbikes only.
- (4) Vehicle route limited to ATVs only.
- (5) Area is closed to over-snow vehicles.
- (6) Vehicle travel is limited to licensed or permitted use.
- (7) Vehicle travel is limited to time or season of use.

Where specialized restrictions are necessary to meet resource management objectives, other limitations also may be developed. The BLM may place other limitations, as necessary, to protect other resources, particularly in areas that motorized OHV enthusiasts use intensely or where they participate in competitive or group events.

Oil and Gas Management Area: Intensively developed existing fields to be managed primarily for oil and gas exploration and development.

Old-Growth Forest: Ecosystem distinguished by old trees and related structural features. Old growth encompasses the later stages of stand development that typically differs from earlier stages in several ways, including tree size, accumulation of large dead woody material, number of canopy layers, species composition, and ecosystem function. Old-growth forest is typically distinguished by the following:

- Large-sized trees of specific species
- Wide variation in age classes and stocking levels
- Accumulations of large-sized dead standing and fallen trees
- Decadence in the form of broken or deformed tops and boles
- Multiple canopy layers
- Canopy interspaces and understory patchiness (BLM 2008c).

Open: Generally denotes that an area is available for a particular use or uses. Refer to specific program definitions found in law, regulations, or policy guidance for application to individual programs.

Open Area (Vehicle Use): All types of vehicle use is permitted at all times anywhere in the area. However, motor vehicles may not be operated in a manner causing or likely to cause significant, undue damage to or disturbance of the soil, wildlife, wildlife habitat, improvements, cultural or vegetative resources or other authorized uses of the public lands (see 43 CFR 8340.0-5) (Manual 1626 Travel and Transportation Management). Accordingly, in “Open” areas, driving off-road to perform necessary tasks, for recreational activities, or any other purpose, is allowed. The experience in the western United States suggests that “Open” designations encourage route proliferation and unlimited cross-country driving and is causing degradation of the lands and resources. It is the policy of the BLM in Wyoming to limit the use of “Open” designations to areas suitable for unlimited off-road driving such as sand dune areas that are essentially devoid of vegetation.

Operator: Any person who has taken formal responsibility for the operations conducted on the leased lands.

Outbreak: The infestation of a relatively small and contained grouping of trees by bark beetles.

Outstandingly Remarkable Values: Values among those listed in Section 1(b) of the Wild and Scenic Rivers Act: “scenic, recreational, geological, fish and wildlife, historical, cultural, or other similar values.” Other values that may be considered include, but are not limited to, ecological, biological or botanical, paleontological, hydrological, traditional cultural uses, water quality, and scientific values. The Wild and Scenic Rivers Act does not further define outstandingly remarkable values. Agency resource professionals develop and interpret criteria in evaluating river values (unique, rare, or exemplary) based on professional judgment on a regional, physiographic, or geographic comparative basis.

Over-the-snow Vehicle: A motor vehicle that is designed for use over snow and that runs on a track or tracks and/or a ski or skis, while in use over snow.

Overgrazing: Continued heavy grazing that exceeds the recovery capacity of the forage plants and creates deterioration of the grazing lands (Valentine 1990).

Paleo-Indian: The name given to the oldest known cultural group in North America.

Paleocene Eocene Thermal Maximum (PETM): The Paleocene-Eocene Thermal Maximum (PETM) is one of the most intense and abrupt intervals of global warming in the geological record. It occurred around 56 million years ago, at the boundary between the Paleocene and Eocene epochs and lasted about 200,000 years. This warming has been linked to a similarly rapid increase in the concentration of greenhouse gases in Earth’s atmosphere, which acted to trap heat and drive up global temperatures by more than 5 degrees Celsius in just a few thousand years. The fossil record gives us the means of understanding how life was affected by the PETM, and so provides an excellent opportunity to study the relationships between evolution, extinction, migration and climate change. See <http://www.palaeontologyonline.com/articles/2011/the-paleocene-eocene-thermal-maximum/>.

Paleoclimate Change: Changing climatic conditions during past geologic ages.

Paleoecological: Relating to the study of ancient or prehistoric ecosystems (National Park Service no date).

Paleontological Locality: A geographic point or area where a fossil or associated fossils are found in a related geological context. A paleontological locality is confined to a discrete stratigraphic layer, structural feature, or physiographic area.

Paleontological Resource Monitoring: The systematic examination for and often collection of paleontological resources associated with surface disturbance.

Paleontological Resources: Paleontological resources are any fossilized remains, traces, or imprints of organisms, preserved in or on the Earth's crust, that are of paleontological interest and that provide information about the history of life on Earth.

Paleontological Resources Protection Stipulations:

Collecting: The project proponent/Operator is responsible for informing all persons associated with this project including employees, contractors and subcontractors under their direction that they shall be subject to prosecution for damaging, altering, excavating or removing any vertebrate fossils or other scientifically significant paleontological resources from the project area. Collection of vertebrate fossils (bones, teeth, turtle shells) or other scientifically significant paleontological resources is prohibited without a permit. Unlawful removal, damage, or vandalism of paleontological resources will be prosecuted by federal law enforcement personnel.

Discovery: If vertebrate or scientifically significant paleontological resources are discovered on BLM-administered land during operations, the Operator shall suspend operations that could disturb the materials, and immediately contact the BLM Cody or Worland Field Manager. The BLM will arrange for evaluation of the find by an appropriate BLM paleontologist, Paleontological Coordinator, or Paleontological Use Permittee within an agreed timeframe. The BLM will determine the need for any mitigation actions that may be necessary. Any mitigation would be developed in consultation with the Operator, who would be responsible for the cost of site evaluation and mitigation of project effects to the paleontological resources. Depending on site evaluation, operations within 100 feet of a paleontological discovery will not be resumed in written authorization to proceed is issued by the Field Office Manager.

Avoidance: All vertebrate or scientifically significant paleontological resources found as a result of the project/action will be avoided during operations. Avoidance in this case means "no action or disturbance within a distance of at least 100 feet of the outer edge of the paleontological locality".

Paleontology: The study of ancient life, particularly the fossil record (BLM 2008d).

Parturition Areas: Documented birthing areas commonly used by females. They include calving areas, fawning areas, and lambing grounds. These areas may be used as nurseries by some big game species.

Pasture: (1) A grazing area enclosed and separated from other areas by fencing or other barriers; the management unit for grazing land. (2) Forage plants used as food for grazing animals. (3) Any area devoted to the production of forage, native or introduced, and harvested by grazing. (4) A group of subunits grazed within a rotational grazing system.

Pemmican: A mixture of dried meat mixed with crushed berries and fat. It was used as food on hunting trips and other journeys because it kept well without spoiling.

Perennial Stream: A stream that flows continuously. Perennial streams generally are associated with a water table in the localities through which they flow (Prichard et al. 1998).

Permit: Contractual instruments granting rights to use specific managed public lands, with certain conditions, for specific purposes such as livestock grazing, timber harvesting, paleontology, and energy or mineral development.

Permitted Use: (1) The forage allocated by, or under the guidance of, an applicable land use plan for livestock grazing in an allotment under a permit or lease and is expressed in AUMs. (2) A paleontologist must have a valid paleontological resource use permit before collecting or disturbing fossil resources on BLM-administered lands. Permitted uses for paleontology include activities related to paleontological surveys, excavation and consulting.

Permittee: One who holds a permit to graze livestock on state, federal, or certain privately-owned lands.

Period of Use: The time of livestock grazing on a range area based on type of vegetation or stage of vegetative growth.

Pest: With the exception of vascular plants classified as invasive nonnative plant species, a pest can be any biological life form that poses a threat to human or ecological health and welfare. For the purposes of this planning effort, an “animal pest” is any vertebrate or invertebrate animal subject to control by Animal and Plant Health Inspection Service (APHIS). APHIS is currently BLM’s authorized agent for controlling “animal pests.” For this reason, “animal pests” will be considered a subset of Pest. An annoying or troublesome animal or thing; nuisance.

Pestle: A tool used to mash or grind substances.

Petroglyph: Pictures created on rock faces by removing a portion of the rock by pecking, abrading, incising, or scratching.

Pictograph: Picture created on a rock face by applying pigment or charcoal.

Planning Area: A geographic area for which land use and resource management plans are developed and maintained.

Play Area (OHV): An area where on- or off-route OHV use is nearly unrestricted. Often attracting many riders, such areas may be on dunes, in sand and gravel pits, and in other areas that present challenges to OHV users. Structured recreation management is applied to these areas so as to appropriately manage for health and safety, resource protection, and use and user conflicts. Play areas are designated on OHV “Open” Areas. See *Open Area* (BLM 2007a).

Pleistocene: The epoch of geologic time, about 1.6 million to 10,000 years ago, characterized by the appearance and disappearance of continental ice sheets.

Potential Fossil Yield Classification (PFYC): Occurrences of paleontological resources are closely tied to the geologic units that contain them. The probability for finding paleontological resources can be broadly predicted from the geologic units present at or near the surface. Using the PFYC system, geologic units are classified based on the relative abundance of vertebrate fossils or scientifically significant invertebrate or plant fossils, with a higher class number indicating a higher potential. The classification uses a ranking of 1 through 5, with Class 5 assigned to units with a very high potential for paleontological resources. The classifications are described below.

Class 1 – Very Low. Igneous or metamorphic geologic units, or other units not likely to contain recognizable fossil remains. Management concern is very low or negligible, Assessment or mitigation is usually unnecessary except in very rare or isolated occurrence.

Class 2 – Low. Sedimentary geologic units that are not likely to contain vertebrate fossils or scientifically significant invertebrate and plant fossils. Management concern for paleontological resources is generally low. Assessment or mitigation is usually unnecessary except in rare or isolated occurrences.

Class 3 – Moderate or Unknown. Fossiliferous sedimentary geologic units where fossil content varies in significance, abundance and predictable occurrence; or sedimentary units of unknown fossil potential. Management concern may extend across the entire range of management. PFYC 3 (Moderate) Units may require field surveys for determination of appropriate course of actions. Mitigation may be necessary before and/or during these actions. Avoidance or non-site monitoring may be necessary during project activities. Justification required for survey decisions

on PFYC 3 (Moderate) formations (i.e., whether a survey is required or not). PFYC 3 (Unknown) Units will require pre-disturbance field surveys prior to surface disturbing activities or land tenure adjustments. Mitigation may be necessary before and/or during these actions. Avoidance or non-site monitoring may be necessary during project activities.

Class 4 – High. Geologic units containing a high occurrence of vertebrate fossils or scientifically significant invertebrate or plant fossils, but may vary in occurrences and predictability. Surface disturbing activities may adversely affect paleontological resources in many cases, management concern for paleontological resources is high, depending on the proposed action. Pre-disturbance field surveys are usually necessary prior to surface disturbing activities or land tenure adjustments. Mitigation will often be necessary before and/or during these actions. Avoidance or non-site monitoring may often be necessary during project activities.

Class 5 – Very High. Highly fossiliferous geologic units that consistently and predictably produce vertebrate fossils or scientifically significant invertebrate or plant fossils. Paleontological resources are highly susceptible to adverse impacts from surface disturbing activities. Management concern for paleontological resources is very high. Pre-disturbance field surveys are usually necessary prior to surface disturbing activities or land tenure adjustments. Mitigation will often be necessary before and/or during these actions. Avoidance or non-site monitoring may often be necessary during project activities. Special management designations may be appropriate for protection or interpretation. These units are often the focus of illegal collecting activities.

Potential Natural Community (PNC): The biotic community that would become established if all successional sequences were completed without interference by humans under the present environmental conditions. Natural disturbances are inherent in development. PNCs can include naturalized nonnative species.

Pottery: Earthenware or clayware pots, dishes, or vases. These cups, bowls, and other dishes or objects were made from clay and hardened by heat.

Prairie Dog “Complex”: Defined as a cluster of two or more prairie dog towns within 3 kilometers of each other (Clark and Stromberg 1987; Luce 2003), and bounded by either natural or artificial barriers (Whicker and Detling 1998) which effectively isolate one cluster of colonies from interacting/interchanging with another. Prairie dogs may commonly move among colonies of a cluster, and thereby foster reproductive/genetic viability, but exhibit little emigration/immigration between clusters. A cluster may include some currently unoccupied, though physically suitable (i.e., vegetation, soils, topography, etc.), land immediately adjacent to occupied colonies that support other prairie dog-associated (ecosystem function), obligate or facultative species (e.g., swift fox, mountain plover, burrowing owl, etc.).

Preference: (1) Selection of plants, or plant parts, over others by grazing animals. (2) In the administration of public lands, “Grazing preference” or “preference” means a superior or priority position against others for the purpose of receiving a grazing permit or lease. This priority is attached to base property owned or controlled by a permittee or lessee (43 CFR Part 4100).

Prehistory/Prehistoric: Information about past events prior to the recording of events in writing. The period of prehistory differs around the world depending upon when written records became common in a region.

Prescribed Burning: Controlled application of fire to wildland fuels in either their natural or modified state under specified environmental conditions that allow the fire to be confined to a predetermined area and at the same time to produce the fire intensity and rate of spread required to attain planned resource management objectives.

Prescribed Fire: The introduction of fire to an area under regulated conditions for specific management purposes.

Priority Fish Species: Priority fish species are species considered to be sport fish and native species.

Priority Habitat Area (greater sage-grouse): Habitat designated to maintain sage-grouse distribution and population sustainability. In this document, management for priority habitat is based on areas encompassed by either Priority Habitat Management Areas or Key Habitat Areas.

Produced Water: Groundwater removed to facilitate the extraction of minerals, such as coal, oil, or gas.

Projectile Point: A point or tip attached to a projectile to increase its ability to penetrate a target. These points are frequently made from stone, bone, ivory, antler, wood, or metal. The method, shape and material used to manufacture these points are frequently used to identify the groups making and using them.

Proper Functioning Condition: Riparian-wetland areas are functioning properly when adequate vegetation, landform, or large woody debris is present to:

- (1) dissipate stream energy associated with high waterflows, thereby reducing erosion and improving water quality;
- (2) filter sediment, capture bedload, and aid floodplain development;
- (3) improve flood-water retention and ground-water recharge;
- (4) develop root masses that stabilize streambanks against cutting action;
- (5) develop diverse ponding and channel characteristics to provide the habitat and the water depth, duration, and temperature necessary for fish production, waterfowl breeding, and other uses; and
- (6) support greater biodiversity.

Proper Grazing: Proper grazing is the practice of managing forage use by grazing animals at a sustainable level that maintains rangeland health. Proper grazing will maintain or increase plant cover, including residue, which acts to slow down or reduce runoff, increase water infiltration, and keep erosion and sedimentation at or above acceptable levels within the potential of ecological sites within a given geographic area (e.g., watershed, grazing allotment, etc.).

Protohistoric: Immediately before written history. The period when artifacts imported from other continents are found but for which no historic records exist.

Public Land: Land or interest in land owned by the United States and administered by the Secretary of the Interior through the BLM, except lands located on the Outer Continental Shelf, and land held for the benefit of Indians, Aleuts, and Eskimos.

Range: Any land supporting vegetation suitable for grazing including rangeland, grazable woodland and shrubland. Modifies resources, products, activities, practices and phenomena pertaining to rangeland.

Range Condition: (A) A generic term relating to present status of a unit of range in terms of specific values or potentials. Specific values or potentials must be stated. (B) Some agencies define range condition as follows: The present state of vegetation of a range site in relation to the climax (natural potential) plant community for that site. It is an expression of the relative degree to which the kinds, proportions, and amounts of plants in a plant community resemble that of the climax plant community for the site.

Range Improvement Project: A structural improvement requiring placement or construction to facilitate management or control distribution and movement of grazing or browsing animals. Such improvements may include, but are not limited to, fences, wells, troughs, reservoirs, water catchments, pipelines, and cattleguards. The project also may include a practice or treatment which improves rangeland condition and or resource production for multiple use. Nonstructural types of projects may include, but are not limited to, seeding and plant control through chemical, mechanical, and biological means or prescribed burning.

Range Management: A distinct discipline founded on ecological principles and dealing with the use of rangelands and range resources for a variety of purposes. These purposes include use as watersheds, wildlife habitat, grazing by livestock, recreation and aesthetics, as well as other associated uses.

Range Site: Synonymous with ecological site when referring to rangeland. An area of rangeland which has the potential to produce and sustain distinctive kinds and amounts of vegetation to result in a characteristic plant community under its particular combination of environmental factors, particularly climate, soils, and associated native biota. Some agencies use range site based on the climax concept, not potential natural community.

Rangeland: Land on which the native vegetation is predominantly grasses, grass-like plants, forbs, or shrubs suitable for grazing or browsing. This includes lands re-vegetated naturally or artificially when routine management of that vegetation is accomplished mainly through manipulation of grazing. Rangelands include natural grasslands, savannas, shrublands, most deserts, tundra, alpine communities, coastal marshes, and wet meadows.

Rangeland Health: The degree to which the integrity of the soil and ecological processes of rangeland ecosystems are sustained.

Raptor: Bird of prey with sharp talons and a strongly curved beak, such as hawks, falcons, owls, vultures, and eagles.

Reasonable Access: For lands not involving Wilderness Study Areas (WSAs), reasonable access means access determined on a case by case basis using site specific NEPA analysis. Access to private land across public land in a WSA is addressed in the Wilderness Interim Management Policy for lands under Wilderness Review (IMP).

Recreation and Public Purposes Act (R&PP): The Recreation and Public Purposes Act (43 USC 869 et. seq.) authorizes the sale or lease of public lands for recreational or public purposes to state and local governments and to qualified nonprofit organizations. Examples of typical uses under the act are historic monument sites, campgrounds, schools, fire houses, law enforcement facilities, municipal facilities, landfills, hospitals, parks, and fairgrounds.

Recreation Area Management Plan (RAMP): An officially approved document for a specific area of public land that identifies the management actions to be implemented to achieve recreation related decisions made in a management framework of a resource management plan. The Recreation Area Management Plan is the link between the allocation of land for recreation uses in the multiple-use planning process and the actions necessary to implement such allocations (BLM 2005).

Recreation Experiences: Psychological outcomes realized either by recreation-tourism participants as a direct result of their on-site leisure engagements and recreation-tourism activity participation or by nonparticipating community residents as a result of their interaction with visitors and guests within their community or interaction with the BLM and other public and private recreation-tourism providers and their actions.

Recreation Management Areas: Recreation management areas are units within a planning area guiding recreation management on public lands having similar recreation related issues and concerns. There are two types of recreation management areas, extensive and special (ERMAs and SRMAs):

Extensive Recreation Management Areas (ERMA): The ERMAs are identified areas where recreation is planned for and actively managed on an interdisciplinary-basis in concert with other resources/resource programs. ERMAs offer recreation opportunities that facilitate visitors' freedom to pursue a variety of outdoor recreation activities and attain a variety of outcomes. They include all lands that are not designated as an SRMA or closed to public use. Recreation management actions within an ERMA are limited to only those of a custodial nature and address visitor health and safety, resource protection and use and user conflicts.

Special Recreation Management Areas (SRMA): SRMAs are designated administrative units where a commitment has been made to emphasize recreation by managing for specific recreation opportunities and settings on a sustained or enhanced, long-term basis. SRMAs are designated through the land use plan process. Plans establish SRMA management objectives and identify supporting management actions and allowable uses.

Recreation Management Zones: Subunits within a SRMA managed for distinctly different recreation products. Recreation products are composed of recreation opportunities, the natural resource and community settings within which they occur, and the administrative and service environment created by all affecting recreation-tourism providers, within which recreation participation occurs.

Recreation Niche: The place or position within the strategically targeted recreation-tourism market for each SRMA that is most suitable (i.e., capable of producing certain specific kinds of recreation opportunities) and appropriate (i.e., most responsive to identified visitor or resident customers), given available supply and current demand, for the production of specific recreation opportunities and the sustainable maintenance of accompanying natural resource or community setting character.

Recreation Opportunities: Favorable circumstances enabling visitors' engagement in a leisure activity to realize immediate psychological experiences and attain more lasting, value-added beneficial outcomes from the combination of recreation settings, activities, and experiences provided by the area.

Recreation Opportunity Spectrum: A means of classifying and managing recreational opportunities based on physical, social, and managerial settings. Each of the following six ROS classes is defined in terms of its combination of activity, setting, and experience: Primitive, Semi-Primitive Non-Motorized, Semi-Primitive Motorized, Road Natural, Rural, and Urban.

Recreation Setting Characteristics (RSC): RSCs are derived from the Recreation Opportunity Spectrum. It is a continuum divided into a spectrum of classes from primitive to urban recreation settings. The continuum of classes is characterized by three components; physical, social and operational.

Recreation Settings: The collective distinguishing attributes of landscapes that influence and sometimes actually determine what kinds of recreation opportunities are produced.

Recreation-Tourism Market: Recreation and tourism visitors and local residents who affect local governments and private sector businesses and the communities or other places where these customers originate (local, regional, national, or international). Based on analysis of supply and demand, land use plans strategically identify primary recreation-tourism markets for each special recreation management area—destination, community, or undeveloped.

Reference State: A reference state is recognized in each state-and-transition model that describes the ecological potential and natural or historical range of variability of the ecological site (Caudle et al. 2013).

Renewable Energy: Energy generated from renewable resources such as sunlight, wind, and biomass.

Required Design Features (RDFs): Required Design Features (RDFs) are required for certain activities in all priority greater sage-grouse habitat. RDFs establish the minimum specifications for certain activities to help mitigate adverse impacts. However, the applicability and overall effectiveness of each RDF cannot be fully assessed until the project level when the project location and design are known. Because of site-specific circumstances, some RDFs may not apply to some projects (e.g., a resource is not present on a given site) and/or may require slight variations (e.g., a larger or smaller protective area). All variations in RDFs would require that at least one of the following be demonstrated in the NEPA analysis associated with the project/activity:

- A specific RDF is documented to not be applicable to the site-specific conditions of the project/activity (e.g., due to site limitations or engineering considerations). Economic considerations, such as increased costs, do not necessarily require that an RDF be varied or rendered inapplicable;
- An alternative RDF is determined to provide equal or better protection for greater sage-grouse or its habitat;
- A specific RDF will provide no additional protection to greater sage-grouse or its habitat.

Reserve Common Allotment – A reserve common allotment is an area which is designated in the land use plan as available for livestock grazing but reserved as an area available for use as an alternative to grazing in another allotment in order to facilitate rangeland restoration treatments and recovery from natural disturbances such as drought or wildfire. The reserve common allotment would provide needed flexibility that would help the agency apply temporary rest from grazing where vegetation treatments and/or management would be most effective.

Residual Impacts: Impacts from an authorized land use that remain after applying avoidance and minimization mitigation; also referred to as unavoidable impacts.

Resource Management Plan: A land use plan as prescribed by the Federal Land Policy and Management Act which establishes, for a given area of land, land-use allocations, coordination guidelines for multiple-use, objectives and actions to be achieved.

Resource Uses: Activities that utilize resources, such as minerals development, livestock grazing, forestry, OHV use, and recreation.

Resources, Qualities, and Values: The significant scenic, historic, cultural, recreation, natural (including biological, geological, and scientific), and other landscape areas through which such trails may pass as identified in the National Trails System Act (see associated settings).

Rest: Leaving an area ungrazed, thereby foregoing grazing of one forage crop. Normally rest implies absence of grazing for a full growing season or during a critical portion of plant development; i.e., seed production. In the Cody Field Office, rest is defined as foregoing grazing for a full grazing year defined as starting on March 1 and ending on February 28.

Rest-Rotation: A grazing-management scheme in which rest periods, usually for a full growing season, for individual grazing units are incorporated into a grazing rotation.

Restricted Disposal: Parcels identified for restricted disposal may be disposed of under the Recreation and Public Purposes Act, by exchange, may limit the disposal to a particular type of entity capable of preserving

the resource values, or may include the use of covenants in the deed or land sale patent to ensure the resource values are protected.

Right-of-Way (ROW) Corridor: Public land where rights-of-way are concentrated and where the placement of future rights-of-way would be favored over lands that are currently unaffected by these disturbances. The designation of right-of-way corridors would be used to facilitate the regional development of major rights-of-way, by linking right-of-way concentration areas between planning areas. Major rights-of-ways are defined as ROW authorizations for pipelines 24-inches in diameter or greater or high voltage transmission lines greater than 115 kilovolts.

Rights-of-Way (ROW): A ROW grant is an authorization to use a specific piece of public land for a specific project, such as roads, pipelines, transmission lines, and communication sites. The grant authorizes rights and privileges for a specific use of the land for a specific period of time.

Riparian: A form of wetland transition between permanently saturated wetlands and upland areas. These areas exhibit vegetation or physical characteristics reflective of permanent surface or subsurface water influence. Lands along, adjacent to, or contiguous with perennially and intermittently flowing rivers and streams, glacial potholes, and the shores of lakes and reservoirs with stable water levels are typical riparian areas (See BLM Manual 1737). Included are ephemeral streams that have vegetation dependent upon free water in the soil. All other ephemeral streams are excluded.

Riparian/Wetland Functionality Classification:

Functional-At-Risk: Riparian/wetland areas that are in functional condition, but an existing soil, water, or vegetation attribute makes them susceptible to degradation.

Proper Functioning Condition (PFC): A riparian or wetland area is considered to be in proper functioning condition when adequate vegetation, landform, or large woody debris is present to do the following:

- Dissipate stream energy associated with high water flows, thereby reducing erosion and improving water quality
- Filter sediment, capture bedload, and aid floodplain development
- Improve floodwater retention and groundwater recharge
- Develop root masses that stabilize streambanks against cutting action
- Develop diverse ponding and channel characteristics to provide the habitats and the water depth, duration, and temperature necessary for fish production, waterfowl breeding, and other uses
- Support greater biodiversity.

Non-functional: Riparian or wetland areas that clearly are not providing adequate vegetation, landform, or large woody debris to dissipate stream energy associated with high flows and thus are not reducing erosion, improving water quality, and so on, as listed above. The absence of certain physical attributes, such as a floodplain where one should be, are indicators of nonfunctioning conditions.

Unknown: Riparian or wetland areas that the BLM lacks sufficient information on to make any form of determination.

Roasting Pit: A pit dug into the ground that was used for cooking. The pit contained fire-cracked rocks, charcoal, ash, and sometimes the remains of whatever was cooked.

Rotation (forest): The period of years between when a forest stand (i.e., primarily even-aged) is established (i.e., regeneration) and when it receives its final harvest. This time period is an administrative decision based on economics, site condition, growth rates, and other factors (BLM 2007b).

Rotation Grazing: A grazing scheme where animals are moved from one grazing unit in the same group of grazing units to another without regard to specific graze: rest periods or levels of plant defoliation.

Salable Minerals: Common variety of minerals on public lands, such as sand and gravel, used mainly for construction. Salable minerals are disposed of by sales to the public or free-use permits to government agencies or nonprofit organizations.

Scenic Area: An area whose landscape character exhibits a high degree of variety and harmony among the basic elements which results in a pleasant landscape to view.

Scenic Quality: The relative worth of a landscape from a visual perception point of view. Scenic quality is rated as Class A (high), Class B (medium), or Class C (low).

Season-long Use: Grazing throughout the growing period, with little or no effort to control the amount of distribution of livestock use in area/pasture/allotments. Generally defined in the Cody Field Office as starting on April 1 and ending September 30.

Seasonal Grazing: Grazing use throughout a specific season.

Seasonal Ranges: The Wyoming Game and Fish Department has identified various ranges for big game species. These ranges are defined as follows:

Summer or Spring-Summer-Fall: A population or portion of a population of animals uses the documented habitats within this range annually from the end of previous winter to the onset of persistent winter conditions.

Severe Winter Relief: A documented survival range, which may or may not be considered a crucial range area as defined above. It is used to a great extent, but only in extremely severe winters. It may lack habitat characteristics that would make it attractive or capable of supporting major portions of the population during normal years, but is used by and allows at least a significant portion of the population to survive the occasional extremely severe winter.

Winter: A population or portion of a population of animals annually uses the documented suitable habitat sites within this range in substantial numbers during the winter period only.

Winter/Year-long: A population or a portion of a population of animals makes general use of the documented suitable habitat sites within this range on a year-round basis. During the winter months there is a significant influx of additional animals into the area from other seasonal ranges.

Year-long: A population or substantial portion of a population of animals makes general use of the suitable documented habitat sites within the range on a year-round basis. On occasion, animals may leave the area under severe conditions.

Section 106 of the National Historic Preservation Act: “The head of any Federal agency having direct or indirect jurisdiction over a proposed federal or federally assisted undertaking in any state and the head of any federal department or independent agency having authority to license any undertaking shall, prior to the approval of the expenditure of any federal funds on the undertaking or prior to the issuance of any license, as the case may be, take into account the effect of the undertaking on any district, site, building, structure, or object that is included in or eligible for inclusion in the National Register. The head of any such federal agency shall afford the Advisory Council on Historic Preservation established under Title II of this Act a reasonable opportunity to comment with regard to such undertaking” (16 U.S.C. 47 df).

Sedimentary Rock: Rock that has formed through the deposition and lithification of sediment, especially sediment transported by water (rivers, lakes, and oceans), ice (glaciers), and wind; or rocks that are chemically precipitated (BLM 2008c).

Sensitive Sites or Resources: Sensitive sites or resources refer to significant cultural resources that are or may be eligible for nomination to the National Register of Historic Places. This category also refers to cultural resources that require management under the American Indian Religious Freedom Act, the Native American Grave Repatriation Act or Executive Orders independent of the National Register of Historic Places.

Sensitive Species: Species designated as sensitive by the BLM State Director include species that are under status review, have small or declining populations, live in unique habitats, or require special management. BLM Manual 6840 provides policy and guidance for special status species management. The BLM Wyoming Sensitive Species Policy and List are provided in a memorandum updated annually. Primary goals of the BLM Wyoming policy include maintaining vulnerable species and habitat components in functional BLM ecosystems and preventing a need for species listing under the Endangered Species Act.

Seral Stage: One of a series of plant communities that follows another in time on a specific ecological site.

Setting: Setting is the physical environment of a historic property and how the property evokes a sense of feeling and association with past events. Accordingly, setting refers to the character of the place in which the property played its historic role. It involves how, not just where, the property is situated and its relationship to surrounding features and open space. These features and their relationships should be considered not only within the exact boundaries of the property, but also between the property and its surroundings.

Shaman: A medicine man or religious leader; a person who calls upon the spirits to cure the sick and to control events (weather or hunting).

Significant Factor (S&G): Principal causal factor in the failure to achieve the land health standard(s) and conform with the guidelines. A significant factor would typically be a use that, if modified, would enable an area to achieve or make significant progress toward achieving the land health standard(s). To be a significant factor, a use may be one of several causal factors contributing to less-than-healthy conditions; it need not be the sole causal factor inhibiting progress towards the standards.

Significant Paleontological Resource: Any paleontological resource that is considered to be of scientific interest, including most vertebrate fossil remains and traces, and certain rare or unusual invertebrate and plant fossils.

Site: A location, place. Is a term used by archaeologists for places that prehistoric and historic people lived in or used. Sites are places where humans left things behind.

Slope: A slant or incline of the land surface, measured in degrees from the horizontal, or in the percent (defined as the number of feet or meters change in elevation per 100 of the same units of horizontal distance); may be further characterized by direction (exposure).

Soil Moisture Regimes: The categorization of the presence or absence of water in soils.

Aridic: Soils dry more than half of the time when they are warm enough for plant growth. These soils are too dry for annual cropping and many require irrigation for crop production.

Udic: The udic moisture regime implies that, in 6 or more out of 10 years, the soil moisture control section is not dry in any part for as long as 90 cumulative days per year.

Ustic: The ustic moisture regime implies that moisture is limited but is present at a time when conditions are suitable for plant growth.

Xeric: The xeric moisture regime implies that, in 6 or more out of 10 years, the soil moisture control section is dry in all parts for 45 or more consecutive days in the four months following the winter solstice.

Soil Write-up Area (SWA): The smallest geographical unit delineation to be used as a base for collecting vegetation data and resource information. It is the smallest mapped soil – vegetation unit. For management purposes, SWA boundaries can be set on administrative boundaries such as allotments, pasture, wildlife habitat areas or watersheds.

Special Recreation Management Areas (SRMA): A public lands unit identified in land use plans to direct recreation funding and personnel to fulfill commitments made to provide specific, structured recreation opportunities (i.e., activity, experience, and benefit opportunities). Both land use plan decisions and subsequent implementing actions for recreation in each SRMA are geared to a strategically identified primary recreation-tourism market – destination, community, or undeveloped, as well as a corresponding and distinguishing recreation management strategy. Recreation setting conditions are prescribed as part of the land-use allocation decision. Subsequent implementing actions, as identified in the activity planning framework, are proactive and address management, marketing and visitor information, and monitoring and administration.

Special Status Species: Special status species are species proposed for listing, officially listed as threatened or endangered, or are candidates for listing as threatened or endangered under the provisions of the endangered species act; those listed by a state in a category such as threatened or endangered implying potential endangerment or extinction; and those designated by the State Director as sensitive (BLM 6840 Manual 2001). Special Status Species may include wildlife (including fish and invertebrate) or plant species.

Species: A taxon or rank species; in the hierarchy or biological classification, the category below genus.

Species Diversity: The number, different kinds of, and relative abundances of species present in a given area.

Split-Estate: Surface land and mineral estate of a given area under different ownerships. Frequently, the surface will be privately owned and the minerals federally owned.

Spring: Flowing water originating from an underground source.

SRMA: See *Recreation Management Areas*.

Stakeholder: Federal, state, or local governments and agencies, or other entities where a Memorandum of Understanding, Cooperative Agreement, Interagency Agreement, or other such agreement has been executed with the BLM, or an applicant for a BLM authorization or permit.

Stand Basal Area: The sum of the cross-sectional area of all living trees in a stand, measured at "breast height" or 4.5 feet high on the uphill side of the trees.

Stand Productivity: Measured by comparison to site index. If the site index is 75 feet at 100 years, but the stand averages 65 feet at 100 years, then a factor such as high basal area or mistletoe might be decreasing stand productivity.

Stand Vigor: General term that refers to the current growth and health of the stand. Live crown ratio is a measure of stand vigor. For example, most stands with an average live crown ratio of 50% or more have vigorous growth. Most stands with an average of less than 20% live crown ratio have poor vigor.

Standard: A description of the physical and biological conditions or degree of function required for healthy, sustainable lands (e.g., land health standards).

State-Listed Species: Species proposed for listing or listed by a state in a category implying, but not limited to, potential endangerment or extinction. Listing is either by legislation or regulation.

Stipulations: Requirements that are part of the terms of a mineral lease. Some stipulations are standard on all Federal leases. Other stipulations may be applied to the lease at the discretion of the surface management agency to protect valuable surface resources and uses.

Stock Trail: A trail constructed across a natural barrier to permit movement of livestock to otherwise inaccessible areas.

Stocking Rate: The number of specific kinds and classes of animals grazing a unit of land for a specified time period. May be expressed as AUMs or animal unit days per acre, hectare, or section, or the reciprocal (area of land/AUM or day).

Stratigraphy: The science of studying layers of materials, as in rock layers in the Earth or deposits in archaeological sites. Cultural remains and dirt become buried over time and, usually, the layer on the bottom is the oldest, the layer on the top is the youngest. Dirt of different layers is often colored differently.

Suitable River: An eligible river segment found through administrative study to meet the criteria for designation as a component of the National System, as specified in Section 4(a) of the Wild and Scenic Rivers Act.

Surface Water Classes and Uses: The following water classes are a hierarchical categorization of waters according to existing and designated uses. Except for Class 1 waters, each classification is protected for its specified uses plus all the uses contained in each lower classification. Class 1 designations are based on value determinations rather than use support and are protected for all uses in existence at the time of or after designation. There are four major classes of surface water in Wyoming with various subcategories within each class (see “Wyoming Surface Water Classification List” for current listing).

Class 1 – Outstanding Waters: Class 1 waters are those surface waters in which no further water quality degradation by point source discharges other than from dams will be allowed. Nonpoint sources of pollution shall be controlled through implementation of appropriate best management practices. Pursuant to Section 7 of these regulations, the water quality and physical and biological integrity that existed on the water at the time of designation will be maintained and protected. In designating Class 1 waters, the Environmental Quality Council shall consider water quality, aesthetic, scenic, recreational, ecological, agricultural, botanical, zoological, municipal, industrial, historical, geological, cultural, archeological, fish and wildlife, the presence of substantial quantities of developable water, and other values of present and future benefit to the people.

Class 2 – Fisheries and Drinking Water: Class 2 waters are waters, other than those designated as Class 1 that are known to support fish or drinking water supplies or where those uses are attainable. Class 2 waters may be perennial, intermittent, or ephemeral and are protected for the uses indicated in each subcategory listed below. Five subcategories of Class 2 waters exist.

Class 3 – Aquatic Life Other than Fish: Class 3 waters are waters other than those designated as Class 1 that are intermittent, ephemeral, or isolated waters, and because of natural habitat conditions, do not support nor have the potential to support fish populations or spawning or certain perennial waters that lack the natural water quality to support fish (e.g., geothermal areas). Class 3 waters provide support for invertebrates, amphibians, or other flora and fauna that

inhabit waters of the state at some stage of their life-cycles. Uses designated on Class 3 waters include aquatic life other than fish, recreation, wildlife, industry, agriculture, and scenic value. Generally, waters suitable for this classification have wetland characteristics; and such characteristics will be a primary indicator used in identifying Class 3 waters. There are four subcategories of Class 3 waters.

Class 4 – Agriculture, Industry, Recreation, and Wildlife: Class 4 waters are waters other than those designated as Class 1 where it has been determined that aquatic life uses are not attainable pursuant to the provisions of Section 33 of these regulations. Uses designated on Class 4 waters include recreation, wildlife, industry, agriculture and scenic value (Wyoming DEQ, Wyoming Surface Water Quality Standards).

Surface-Disturbing Activities: An action that alters the vegetation, surface/near surface soil resources, and/or surface geologic features, beyond natural site conditions and on a scale that affects other Public Land values. Examples of surface disturbing activities may include: operation of heavy equipment to construct well pads, roads, pits and reservoirs; installation of pipelines and power lines; and the conduct of several types of vegetation treatments (e.g., prescribed fire, etc.). Surface disturbing activities may be either authorized or prohibited. (Information Bulletin WY-2007-029).

Suspension: The temporary withholding from active use, through a decision issued by the authorized officer or by agreement, of part or all of the permitted use in a grazing permit or lease (43 CFR Part 4100). These AUMs could potentially be re-authorized for use if range conditions improve.

Sustainability: The ability of an ecosystem to maintain ecological processes and functions, biological diversity, and productivity over time.

Syncline or Synclinal: A fold in rocks in which the rock layers dip inward from both sides toward the axis, like a hot dog bun (BLM 2002a).

Tank: A reservoir of any construction for water storage.

Tanning: The process which turns animal hides into leather.

Technical/Economically Feasible: Actions that are practical or feasible from the technical and economic standpoint and using common sense, rather than simply desirable from the standpoint of the applicant. It is the BLM's sole responsibility to determine what actions are technically and economically feasible. The BLM will consider whether implementation of the proposed action is likely given past and current practice and technology; this consideration does not necessarily require a cost-benefit analysis or speculation about an applicant's costs and profit. (Modified from the Council on Environmental Quality's 40 Most Asked Questions and BLM NEPA Handbook, Section 6.6.3)

Tentative Classification: The process where rivers are segmented according to the criteria and classes established in Section 2(b) of the Wild and Scenic Rivers Act. These classifications are based on an analysis of the present level of development within the stream corridor at the time the inventory was completed. These classifications also control the level of development that may occur within a stream corridor, once a stream is determined eligible or suitable and a classification is assigned. The classifications are:

- (1) recreational: rivers or sections of rivers that are readily accessible by road or railroad and that may have some development along their shorelines and may have undergone some impoundments or diversion in the past.
- (2) scenic: rivers or sections of rivers free of impoundments, with shorelines or watersheds still largely undeveloped but accessible in places by roads.

- (3) **wild:** rivers or sections of rivers free of impoundments and generally inaccessible except by trails, with watersheds or shorelines essentially primitive and waters unpolluted.

Threatened Species: Any plant or animal species defined under the Endangered Species Act as likely to become endangered within the foreseeable future throughout all or a significant portion of its range; listings are published in the *Federal Register*.

Timeliness: The lack of a time lag between impacts and the achievement of compensatory mitigation goals and objectives (BLM Manual Section 1794).

Timing Limitations (TLS): Prohibits surface use during specified time periods to protect identified resource values (BLM 2009).

Tipi: A cone-shaped tent used especially by Plains Indians usually made of skins or bark spread over a frame of poles. Also spelled tepee or teepee.

Torrifluents: Entisols formed in stream deposited materials under limited moisture conditions.

Torriorthents: Entisols formed under very limited moisture conditions.

Traditional Cultural Property: A cultural property eligible for inclusion in the National Register because of its association with cultural practices or beliefs of a living community that (A) are rooted in that community's history, and (B) are important in maintaining the continuing cultural identity of the community. "Traditional" in this context refers to those beliefs, customs, and practices of a living community of people that have been passed down through the generations, usually orally or through practice. The traditional cultural significance of a historic property is derived from the role the property plays in a community's historically rooted beliefs, customs, and practices.

Trail: A linear route managed for human-powered, stock, or off-highway vehicle forms of transportation or for historical or heritage values. Trails are not generally managed for use by four-wheel drive or high clearance vehicles.

Travois: A device used by Plains Indians to move things. It consisted of two long poles with a platform or netting to carry objects. Originally pulled by dogs, horses were later used to pull it.

Trend: The direction of change in ecological status or resource value rating observed over time. Trend in ecological status should be described as toward, or away from the potential natural community, or as not apparent. Trend in resource value rating for a specific use should be described as up, down or not apparent. Trends in resource value rating for several uses on the same site at a given time may be in different directions, and there is no necessary correlation between trends in resource value rating and trend in ecological status.

Two-track Vehicle Trails: A two-track is where perennial vegetation is devoid or scarce, or where wheel tracks are continuous depressions in the soil yet evident to the casual observer and are vegetated.

Undeveloped Recreation-tourism Market: National, regional, or local recreation-tourism visitors, communities, or other constituents who value public lands for the distinctive kinds of dispersed recreation produced by the vast size and largely open, undeveloped character of their recreation settings. Major investments in facilities are excluded within special recreation management areas where the BLM's strategy is to target demonstrated undeveloped recreation-tourism market demand. Here, recreation management actions are geared toward meeting primary recreation-tourism market demand to sustain distinctive recreation setting characteristics; however, major investments in visitor services are authorized both to sustain those distinctive setting characteristics and to maintain visitor freedom to choose where to go and what to do—all in response to demonstrated demand for undeveloped recreation.

Unoccupied Lek: There are two types of unoccupied leks, “destroyed” and “abandoned.” Unoccupied leks are not protected during surface disturbing activities.

Uplands: Lands at higher elevations than alluvial plains or low stream terraces; all lands outside the riparian-wetland and aquatic zones.

Use: (1) The proportion of current years forage production that is consumed or destroyed by grazing animals. May refer either to a single species or to the vegetation as a whole. (2) Utilization of range for a purpose such as grazing, bedding, shelter, trailing, watering, watershed, recreation, forestry, etc.

Ustorthents: Entisols formed under limited moisture conditions.

Utilization: The proportion or degree of current year’s forage production that is consumed or destroyed by animals (including insects). It may refer either to a single plant species, a group of species, or to the vegetation as a whole, generally expressed as a percentage.

Vegetation: Plants in general, or the sum total of the plant live above and below ground in an area.

Vegetation Treatments:

Mechanical Treatment: Use of vehicles such as wheeled tractors, crawler type tractors, or specially designed vehicles with attached implements designed to cut, uproot or chop existing vegetation. Includes manual treatments involving hand tools, and hand operated power tools to cut, clear or prune herbaceous and woody species.

Biological Treatments: Intentional use of domestic animals, insects, nematodes, mites, or pathogens that weaken or destroy vegetation.

Chemical Treatments: Use of chemicals (herbicides), to kill or injure plants.

Vegetative Diversity: The variety of vegetative types in an area, including species, the genetic differences among species and populations, the communities and ecosystems in which vegetation types occur, and the structure and seral stage of these communities. Vegetative diversity includes rare as well as common vegetative types, and typically supports a diverse array of animal species and communities.

Viewshed: Term used in Visual Resource Management (VRM) to describe “...landscape that can be seen under favorable atmospheric conditions from a viewpoint (key observation point) or along a transportation corridor” (BLM 1984).

Vision Quest: A method used by American Indians, and others to seek spiritual power and knowledge through a vision of a guardian spirit or other entity. The process normally involves fasting and praying for extended periods of time.

Visual Resource Management (VRM) Classes:

Class I: The objective of this class is to maintain a landscape setting that appears unaltered by humans. It is applied to wilderness areas, some natural areas, wild portions of wild and scenic rivers, and other similar situations in which management activities are to be restricted.

Class II: The objective of this class is to design proposed alterations so as to retain the existing character of the landscape. The level of change to the characteristic landscape should be low. Management activities may be seen, but should not attract the attention of the casual observer. Any changes must repeat the basic elements of form, line, color, and texture found in the predominant natural features of the characteristic landscape.

Class III: The objective of this class is to design proposed alterations so as to partially retain the existing character of the landscape. Contrasts to the basic elements (form, line, color, and texture)

caused by a management activity may be evident and begin to attract attention in the characteristic landscape; however, the changes should remain subordinate to the existing characteristic landscape.

Class IV: The objective of this class is to provide for management activities that require major modification of the existing character of the landscape. Contrasts may attract attention and be a dominant feature of the landscape in terms of scale; however, changes should repeat the basic elements (form, line, color, and texture) inherent in the characteristic landscape.

Rehabilitation Area: Change is needed or change may add acceptable visual variety to an area. This class applies to areas where the naturalistic character has been disturbed to a point at which rehabilitation is needed to bring it back into character with the surrounding landscape. This class would apply to areas identified in the scenic evaluation where the quality class has been reduced because of unacceptable cultural modification. The contrast is inharmonious with the characteristic landscape. It may also be applied to areas that have the potential for enhancement; i.e., add acceptable visual variety to an area or site. It should be considered an interim or short-term classification until one of the other VRM class objectives can be reached through rehabilitation or enhancement. The desired VRM class should be identified.

Visual Resources: The visible physical features of a landscape (topography, water, vegetation, animals, structures, and other features) that constitute the scenery of an area.

Voluntary Non-Use: When a grazing permittee voluntarily agrees to not use a portion of the allotted AUMs in an allotment.

Watershed: See *Basin*.

Weed: Any undesirable or troublesome plant, especially one that grows profusely where it is not wanted. Weeds can be native or non-native, invasive or noninvasive, and noxious or not noxious.

Wetlands: Areas that are inundated or saturated by surface or groundwater often and long enough to support and under normal circumstances do support a prevalence of vegetation typically adapted for life in saturated soil conditions.

Wilderness: A congressionally designated area of undeveloped federal land retaining its primeval character and influence, without permanent improvements or human habitation, that is protected and managed to preserve its natural conditions and that (1) generally appears to have been affected mainly by the forces of nature, with human imprints substantially unnoticeable; (2) has outstanding opportunities for solitude or a primitive and unconfined type of recreation; (3) has at least 5,000 acres or is large enough to make practical its preservation and use in an unimpaired condition; and (4) may also contain ecological, geological, or other features of scientific, educational, scenic, or historic value. The definition contained in Section 2(c) of the Wilderness Act of 1964 (78 Stat. 891) (from H-6310-1, Wilderness Inventory and Study Procedures).

Wilderness Characteristics: Wilderness characteristics include size, the appearance of naturalness, outstanding opportunities for solitude, or a primitive and unconfined type of recreation. They may also include ecological, geological, or other features of scientific, educational, scenic, or historical value. However Section 2(c) of the Wilderness Act of 1964 has been updated by IM-2003-195, dated June 20, 2003. Indicators of an area's naturalness include the extent of landscape modifications, the presence of native vegetation communities, and the connectivity of habitats. Outstanding opportunities for solitude or primitive and unconfined types of recreation may be experienced when the sights, sounds, and evidence of other people are rare or infrequent, in locations where visitors can be isolated, alone or secluded from

others, where the use of the area is through non-motorized, non-mechanical means, and where no or minimal developed recreation facilities are encountered.

Wilderness Study Area: A roadless area or island that has been inventoried and found to have wilderness characteristics as described in Section 603 of FLPMA and Section 2 (c) of the Wilderness Act of 1964 (78 Stat. 891).

Wildland Fire: A general term describing any non-structure fire that occurs in the vegetation and/or natural fuels.

Wildfire: Unplanned ignition caused by lightning, volcanoes, unauthorized and accidental human-caused fires and escaped prescribed fires.

Prescribed Fire: Any fire intentionally ignited by managed under an approved plan to meet specific objectives.

Wildland Industrial Interface: The area where industrial development meets or intermingles with undeveloped wildland.

Wildland Urban Interface (WUI): Healthy Forest Recreation Act 2003: defines wildland urban interface (WUI) (section 101) as an area within or adjacent to an at risk community that has been identified by a community in its wildfire protection plan or, for areas that do not have such a plan, an area extending; (1) ½ mile from the boundary of an at risk community, or (2) 1½ miles when other criteria are met. (e.g., a sustained steep slope or a geographic feature aiding in creating an effective fire break or is condition class III land, or (3) is adjacent to an evacuation route.

Wildlife Habitat Management Area (WHMA): Special management areas that are designed to protect or preserve certain qualities or uses for wildlife and plant species. The environment in these areas is unique in some respects, and it is therefore desirable to apply different management prescriptions to these areas from those of the surrounding public lands. The integration of different land management goals, objectives, and actions will be implemented to ensure that the integrity of these areas will be maintained. They will be directed toward habitat management rather than species management and encompass featured species and species diversity to ensure compliance with existing laws; prevent species from becoming threatened or endangered; and provide values and uses for the public. The BLM will implement site-specific management actions in coordination with other agencies to maintain and/or improve these unique wildlife habitat management areas (BLM 2008e).

Wildlife Security Area: A geographic location or area that typically provides for some, if not all, of the wildlife species cover and forage needs and where wildlife are free from human caused disturbance and/or disruption.

Wildlife-Disturbing Activity: BLM-authorized activities other than routine maintenance that may cause displacement of or excessive stress to wildlife during critical life stages. Wildlife-disturbing activities include human presence, noise, and activities using motorized vehicles or equipment.

Withdrawal: Removal or withholding of public lands, by statute or Secretarial order, from operation of some or all of the public land laws. A mineral withdrawal includes public lands potentially valuable for leasable minerals, precluding the disposal of the lands except with a mineral reservation clause, unless the lands are found not to contain a valuable deposit of minerals. A mineral withdrawal is the closing of an area to mineral location and development activities.

Woodlands: Not capable of producing 20 cubic feet of wood fiber from commercial species per acre per year.

Yearlong Grazing: Continuous grazing for a calendar year. In the Cody Field Office, the year is defined at starting on March 1 and ending on February 28.

Yellowcake: Yellowcake is the product of the uranium extraction (milling) process. Early production methods resulted in a bright yellow compound, hence the name yellowcake. The material is a mixture of uranium oxides that can vary in proportion and color from yellow to orange to dark green (blackish), depending at which temperature the material was dried (level of hydration and impurities). Higher drying temperatures produce a darker, less soluble material. Yellowcake is commonly referred to as U_3O_8 and is assayed as pounds U3O8 equivalent. This fine powder is packaged in drums and sent to a conversion plant that produces uranium hexafluoride as the next step in the manufacture of nuclear fuel.

Bighorn Basin Resource Management Plan Revision Project

Proposed Resource Management Plan and Final Environmental Impact Statement

Wyoming - Cody & Worland Field Offices

Volume 4 of 4 Appendices

May 2015

The BLM's multiple-use mission is to sustain the health and productivity of public lands for the use and enjoyment of present and future generations.

The Bureau accomplishes this by managing such activities as outdoor recreation, livestock grazing, mineral development, and energy production, and by conserving natural, historical, cultural, and other resources on public lands.

1.0 INTRODUCTION

The Bighorn Basin Resource Management Plan (RMP) Revision Project is a combined effort to revise RMPs for the Bureau of Land Management (BLM) Cody Field Office (CYFO) and BLM Worland Field Office (WFO). This document refers to the combined CYFO and WFO planning areas as the Planning Area. The BLM published the Notice of Availability (NOA) announcing the release of the Bighorn Basin Draft RMP and Draft Environmental Impact Statement (EIS) for public review and comment in the Federal Register on April 22, 2011. This notice initiated the 90-day comment period. At the request of the public and cooperating agencies, the BLM extended the comment period by 45 days, for a total comment period of 135 days. The comment period ended on September 7, 2011. During the 135-day comment period, the BLM hosted six public meetings within the Planning Area to gather comments on the Draft RMP and Draft EIS and to answer questions from the public.

In July 2012, the BLM Rocky Mountain Regional Interdisciplinary Team identified the need to prepare a Supplement to the Bighorn Basin Draft RMP and Draft EIS (the Supplement) to consider incorporation of proposed management actions in designated greater sage-grouse Key and Priority Habitat Areas and to thoroughly consider the conservation measures identified in the Greater Sage-grouse National Technical Team (NTT) Report on National Greater Sage-Grouse Conservation Measures (Sage-grouse NTT 2011), as referenced in BLM Instruction Memorandum (IM) 2012-044 (BLM National Greater Sage-Grouse Land Use Planning Strategy). The NOA announcing the release of the Supplement published in the *Federal Register* on July 12, 2013, initiated a 90-day comment period. The BLM initially scheduled 90 days for public comment and the original date for the close of the comment period was October 12, 2013. However, due to the lapse in appropriations and the resulting federal government shutdown, the documents were not available on the BLM website from October 1 through October 16, 2013 and the BLM extended the comment period 20 days; ending on November 1, 2013. During the 110-day comment period, the BLM held six public meetings within the Planning Area (in the same locations as meetings for the Draft RMP and Draft EIS) to discuss the content of the Supplement and to answer questions.

This report provides a summary of public comments received on the Bighorn Basin Draft RMP and Draft EIS during the comment period as well as public comments received on the Supplement during the subsequent comment period. During the Draft RMP and Draft EIS comment period, the BLM received a total of 46,009 comment documents: 44,951 were submitted by email, 1,029 were submitted in hard copy or sent by mail, 11 documents were received during public meetings, and 18 submissions were received through the BLM website. During the Supplement comment period, the BLM received a total of 2,145 comment documents: 2,112 were submitted by email, 32 were submitted in hard copy or sent by mail, and 1 was received through the BLM website. No comments were submitted at the public meetings held for the Supplement.

A public comment document refers to the entire written submission from a commenter (e.g., full letter, e-mail, etc.), whereas a comment refers to an individual and identifiable substantive expression of interest or issue statement included within a public comment document. For example, a letter (i.e., public comment document) received within the comment period may contain one or more separate comments. A commenter refers to the individual or organization who submitted the comment document. Of the 46,009 documents received, the BLM identified 45,454 comment documents as form letters regarding the Draft RMP and Draft EIS. During the Supplement comment period, the BLM received a total of 2,145 documents, of which 2,067 were identified as form letters. The BLM defined form letters as letters containing identical text submitted by more than five individuals.

This report provides a summary of the full range of public issues and concerns as submitted during the comment periods. The submitted comments and summary presented in this report do not necessarily represent the sentiments of the public as a whole. However, this summary does attempt to provide fair representation of the wide range of views submitted during the comment periods. In consideration of these views, it is important for the public and decision makers to understand that this process does not attempt to treat input as if it were a vote. Instead, comment analysis is a process that allows the BLM to review and consider received comments, develop appropriate responses, revise the Draft RMP and Draft EIS in response to comments, and support the BLM's decision-making process.

The remainder of this report is organized as follows:

- **Content Analysis Process** – Describes how the BLM received, recorded, and categorized comment documents and comments.
- **Commenter Demographics** – Presents demographic information associated with submitted comment documents including geography and affiliation of commenters.
- **Summary of Public Responses to the Draft RMP and Draft EIS and Supplement** – Provides a breakdown of the number of comments received by issue category, a summary of comments received, and BLM's response to comments received.
- **Analysis of Comments** – Outlines the parameters for substantive and non-substantive comments and provides a brief summary of comments and responses.
- **Attachment A: Draft RMP and Draft EIS Public Comment Response Index** – Includes instructions on how to use the tables in Attachments A and B. It also includes an index listing the names of all commenters and their associated comment document number.
- **Attachment B: Draft RMP and Draft EIS Individual Comments and Index to Summary Comments and Summary Responses** – Includes all substantive public comments received during the comment period along with an index to help users find their associated summary comments and response.
- **Attachment C: Supplement Public Comment Response Index** – Includes instructions on how to use the tables in Attachments C and D, as well as an index listing the names of all commenters and their associated comment document number.
- **Attachment D: Supplement Individual Comments and Index to Summary Comments and Summary Responses** – Includes all substantive public comments received during the comment period along with an index to help users find their associated summary comments and response.
- **Attachment E: Comment Documents** – Includes all substantive public comment documents received during the public comment periods.

Attachments B, D, and E are available on the Bighorn Basin RMP project website at:
<http://www.blm.gov/wy/st/en/programs/Planning/rmps/bighorn.html>.

2.0 COMMENT ANALYSIS PROCESS

The BLM defines comment analysis as a systematic method of compiling, categorizing, and evaluating written comments made by individuals, federal and state agencies, Tribal governments, elected representatives, and other organizations on the Draft RMP and Draft EIS and Supplement in order to identify substantive issues for review and response by BLM decision makers. The comment analysis process provides a methodical approach for the BLM to revise text in the RMP and EIS based on comments provided during the two comment periods. Additionally, through the comment analysis

process, BLM supplemented the project mailing list of commenters and compiled demographic information on the geographic distribution of commenters (see Section 3.0 of this report).

Public comment documents include hardcopy comments received at the public meetings and electronic or written comment documents postmarked or received via the project website within the comment periods. Methods of comment document submittal included mail, email, website submittals, and public meetings. All individuals attending public meetings were encouraged to submit comments in writing.

2.1. Analysis Process

The BLM comment analysis team utilized the program CommentWorks to catalogue, number, review, categorize, and respond to comments received during the Draft RMP and Draft EIS comment period as well as the Supplement comment period.

Upon receipt of a public comment document, a member of the comment analysis team logged the comment document into an Microsoft Excel comment tracking spreadsheet, assigned the document a unique identifier (i.e., Document 10001), and converted the comment document to a searchable electronic (i.e., PDF) document and a text file. The analysis team then added all pertinent commenter information (e.g., name, affiliation, address, and type of comment document) into CommentWorks and uploaded the electronic documents into the system.

The first step in the analysis process was to identify individual substantive comments within a public comment document. The comment analysis team identified each individual substantive comment based on guidance in the BLM National Environmental Policy Act (NEPA) Handbook (H-1790-1). Substantive comments are those that do one or more of the following:

- Question, with reasonable basis, the accuracy of information in the RMP and EIS;
- Question, with reasonable basis, the adequacy of, methodology for, or assumptions used for the environmental analysis;
- Present new information relevant to the analysis;
- Present reasonable alternatives other than those analyzed in the RMP and EIS; or
- Cause changes or revisions in one or more of the alternatives.

Comments that were not considered substantive included the following:

- Comments in favor of or against the proposed action or alternatives without reasoning that meet the substantive comment criteria listed above;
- Comments that only agree or disagree with BLM policy or resource decisions without justification or supporting data that meet the substantive criteria listed above;
- Comments that do not pertain to the Planning Area or scope of the Bighorn Basin RMP Revision Project; or
- Comments that take the form of vague, open-ended questions.

The analysis team established an issue coding structure for all substantive comments within CommentWorks that was used to bracket and sort comments into logical groups or issue categories (e.g., air quality, cumulative impacts, process and procedure). CommentWorks is the comment tracking and analysis platform within the ePlanning system, which is being used for the Bighorn Basin RMP Revision Project. A list of all issue categories identified for the Draft RMP and Draft EIS is located below in Table A-1. Table A-2 lists the issue categories for the Supplement.

Appendix A – Comment Analysis
Comment Analysis Process

Once assigned an issue category, the BLM reviewed individual substantive comments and provided direction to develop a response. The comment analysis team then used the individual comments and direction to analyze, group, and summarize comments, and to develop responses to the summary comments.

When reviewing comments, the analysis team looked not only for each action or change requested by the public, but also for any supporting information to capture the comment and its context. In doing so, paragraphs within a comment letter may have been divided into several comments because of multiple comments being presented or, alternatively, sections of a letter may have been combined to form one coherent comment.

It is important to note that during the process of identifying individual comments and concerns, the BLM treated all comments equally. The BLM did not weigh comments based on organizational affiliation and the number of duplicate comments did not increase the priority or merit of one comment over another. The process was not one of counting votes and the BLM did not make any efforts to tabulate the exact number of people for, or against, any given aspect of the Draft RMP and Draft EIS and Supplement. Rather, the BLM focused on an understanding of the content of a comment, information that would lead to a reasoned choice among the alternatives, and appropriate responses and revisions.

Table A-1. Draft RMP and Draft EIS Issue Categories

Issue Categories		
Air Quality	Master Leasing Plans	Soils
Areas of Critical Environmental Concern	Mineral Potential and Reasonably Foreseeable Development	Special Status Species
Climate Change	Minerals	Travel and Transportation Management
Cultural	NEPA	Vegetation
Cumulative Impacts	Paleontology	Visual Resource Management
Extension Request	Process and Procedure	Water
Fire and Fuels	Readability and Format	Wild and Scenic Rivers
Fish	Recreation	Wild Horses
Historic Trails	Renewable Energy	Wilderness Characteristics
Invasive Species	Rights-of-Way	Wilderness Study Areas
Lands and Realty	Greater Sage-Grouse	Wildlife
Livestock Grazing	Socioeconomic	-

Issue categories identified for the Supplement are listed below in Table A-2.

Table A-2. Supplement Issue Categories

Issue Categories		
Air Resources	Leasable Minerals – Oil and Gas	Socioeconomic
Areas of Critical Environmental Concern	Livestock Grazing Management	Special Status Species
Consultation	Locatable Minerals	Trails and Travel Management
Cultural	Minerals – General	Vegetation
Cumulative Impacts	Out of Scope	Visual Resource Management
Extension Request	Paleontological	Water
Fire and Fuels	Planning Issues	Wild Horses
Greater Sage-Grouse	Recreation	Wilderness Characteristics
Invasive Species	Renewable Energy	Wildlife
Lands and Realty	Rights of Way and Corridors	-
Laws, Regulations, Guidance, Process	Riparian-Wetland	-

3.0 COMMENTER DEMOGRAPHICS

This section provides a summary of commenter demographics. Demographic analysis allows the BLM to form an overall picture of issues, as well as a better understanding of who is submitting comments, the geographic distribution of commenters, their affiliations, and the format of the public comment documents.

3.1. Geographic Representation

The BLM tracked the geographic representation for each comment document that included such information. Tables A-3 and A-4 identify the number of comment documents received from individual geographic locations (excluding form letters). Figures 3 and 4 depict the geographic distribution of comment documents received from within the Planning Area, documents received from outside the Planning Area but within the state of Wyoming, and documents received from out of state. The BLM received the greatest number of comment documents for the Draft RMP and Draft EIS from commenters within the Planning Area. The greatest number of comment documents received for the Supplement were from commenters outside the State of Wyoming.

Figure A-2. Number of Supplement Commenter Documents by Geography

Note: Comments received through e-mail which did not contain mailing addresses or geographic representation accounted for a total of 15 submissions. Form letters were counted once based on the geographic location of the originating entity for the master form letter.

3.2. Organizational Affiliation

The BLM received comments from a range of entities including federal agencies, state agencies, local governments, non-governmental organizations, private industries, and unaffiliated individuals (Table A-5 and Figures 3 and 4). The BLM affiliated comment documents with a government or non-governmental organization if the document was received on official letterhead or was received through an official agency or organization email address. The BLM classified all other comment documents as unaffiliated individuals. The BLM received the greatest number of comment documents from unaffiliated individuals.

Table A-5. Number of Comment Documents by Affiliation (excluding form letters)

Affiliation	Number of Draft RMP and Draft EIS Public Comment Documents	Number of Supplement Public Comment Documents
Federal Agency	3	3
State Agency	9	2
Local Government	9	3
Non-Governmental Organization	18	22

Figure A-3. Number of Draft RMP and Draft EIS Comment Documents by Affiliation

Note: Form letters were counted once based on the geographic location of the originating entity for the master form letter. See Section 3.4 for a breakdown of form letter affiliations.

Figure A-4. Number of Supplement Comment Documents by Affiliation

Note: Form letters were counted once based on the geographic location of the originating entity for the master form letter. See Section 3.4 for a breakdown of form letter affiliations.

3.3. Public Comment Document Method of Delivery

The BLM received comment documents through a variety of delivery methods. Table A-6 identifies the number of documents received by method of delivery (e.g., email, letter, and website). The BLM received the greatest number of comment documents on the Draft RMP and Draft EIS through email (44,951) and mail (1,029). The BLM received the greatest number of comment documents on the Supplement through email (2,112) and mail (32).

Table A-6. Number of Public Comment Documents by Method of Delivery

Method of Delivery	Draft EIS and Draft RMP Number	Supplement Number
Email	44,951	2,112
Website	18	1
Mail	1,029	32
Public Meeting	11	0
Total	46,009	2,145

3.4. Form Letters

The BLM received 45,454 form letters from eight separate originating entities during the Draft RMP and Draft EIS comment period and 2,067 form letters from 2 non-governmental organizations and 55 from an unknown organization during the Supplement comment period. The BLM designated the first form letter from each originating entity as the “master” comment document and the BLM reviewed each subsequent form letter to ensure that the content was identical to the master comment document. The form letters were received primarily by email with the exception of 1 Marathon Oil form letter and 787 Greater Yellowstone Coalition postcards that were received by mail. Because the form letters contained identical text to their corresponding master comment document, the BLM analyzed the eight master comment documents. In those cases where form letters included additional text, they were reviewed and processed if substantive individual comments were identified. Table A-7 identifies the originating entity, affiliation, and number of each form letter received.

Table A-7. Form Letters Received by Affiliation

Originating Entity	Affiliation	Number Received on Draft RMP and Draft EIS	Number Received on Supplement
Natural Resources Defense Council	Non-Governmental Organization	43,286	-
Sierra Club	Non-Governmental Organization	98	7
Wilderness Society	Non-Governmental Organization	735	-
Greater Yellowstone Coalition	Non-Governmental Organization	1,222	-
Marathon Oil	Private Industry	73	-
Bighorn Basin RMP General Letter	Unaffiliated Individuals	12	-
Unknown Letter	Unaffiliated Individuals	-	55
Wild Horses Letter	Unaffiliated Individuals	20	-
Ward Letter	Unaffiliated Individuals	8	-
WildEarth Guardians	Non-Governmental Organization	-	2,005
Total		45,454	2,067

4.0 ANALYSIS OF COMMENTS

The BLM received 46,009 comment documents during the Draft RMP and Draft EIS comment period. As noted above, of the 46,009 letters received, 45,454 were form letters (which represented eight master form letter documents) and 571 were not form letters. The BLM analyzed a total of 579 comment documents, which included the 8 master form letter documents and 571 other comment documents.

The BLM received 2,145 comment documents during the Supplement comment period. Of the 2,145 letters received, 2,067 were form letters (which represented three master form letter documents) and 76 were not form letters. For the Supplement, the BLM analyzed a total of 78 comment documents, including the 3 master form letters documents and 76 other comment documents.

The 579 Draft RMP and Draft EIS public comment documents and 78 Supplement public comment documents contained substantive and non-substantive comments. Representative non-substantive comments included requests to be added to the project mailing list, requests for a copy of the Draft RMP and Draft EIS, personal preference or opinion, comments and questions that were not supported, and comments which are outside the scope of the Draft RMP and Draft EIS or Supplement. Non-substantive comments received during the two comment periods are further described in Section 4.1.3.

In accordance with the BLM’s NEPA Handbook (H-1790-1), comments received on the Bighorn Basin RMP and EIS were analyzed and responded to if they: “are substantive and relate to inadequacies or inaccuracies in the analysis or methodologies used; identify new impacts or recommend reasonable new alternatives or mitigation measures; or involve substantive disagreements on interpretations of significance.” (See 40 Code of Federal Regulations [CFR] 1502.19, 1503.3, 1503.4, 1506.6, and 516 DM 4.17). BLM’s NEPA Handbook (H-1790-1) identifies the following comment category examples and appropriate responses.

Substantive Comments:

- **Questions, with a reasonable basis, the accuracy of the information in the environmental impact statement.** Factual corrections should be made in the Proposed RMP and Final EIS in response to comments that identify inaccuracies or discrepancies in factual information, data, or analysis.
- **Questions, with a reasonable basis, the adequacy of environmental analysis as presented.** Comments that express a professional disagreement with the conclusions of the analysis or assert that the analysis is inadequate may or may not lead to changes in the EIS. Interpretations of analyses should be based on professional expertise. Where there is disagreement within a professional discipline, a careful review of the various interpretations are warranted. In some cases, public comments may necessitate an evaluation of analytical conclusions. If, after reevaluation, the manager responsible for preparing the EIS does not think that a change is warranted, the response should provide the rationale for that conclusion.
- **Comments that identify new impacts, alternatives, or mitigation measures.** If public comments on a RMP and EIS identify impacts, alternatives, or mitigation measures that were not addressed in the draft, the manager responsible for preparing the RMP and EIS should determine if they warrant further consideration. If they do, that official must determine whether the new impacts, new alternatives, or new mitigation measures should be analyzed in either: the Proposed RMP and Final EIS; a supplement to the Draft RMP and Draft EIS; or a completely revised and recirculated Draft RMP and Draft EIS.
- **Disagreements with Significance Determinations.** Comments may directly or indirectly question determinations regarding the significance or severity of impacts. A reevaluation of these determinations may be warranted and may lead to changes in the Proposed RMP and Final EIS. If, after reevaluation, the manager responsible for preparing the EIS does not think that a change is warranted, the response should provide the rationale for that conclusion.

Non- Substantive Comments

- **Expressions of Personal Preferences.** Comments that express personal preferences or opinions on the proposal do not require further agency action. They are summarized whenever possible and brought to the attention of the manager responsible for preparing the RMP and EIS. Personal preferences and opinions generally will not affect the analysis.
- **Other.** In addition to the five categories from the NEPA Handbook described above, the BLM added a sixth category named “other” which includes requests for copies of the RMP and EIS, requests to be added to the project mailing list, requests for comment extensions, and comments that are outside the scope of the RMP and EIS. These comments are considered non-substantive and do not require further agency action.

4.1. Comment Submittals by Issue Category

Within the 579 received Draft RMP and Draft EIS comment documents, excluding multiple copies of form letters, the BLM identified 1,224 individual substantive comments covering a broad range of issue categories. The greatest number of substantive comments were associated with minerals (132), wildlife (126), livestock grazing (107), and NEPA-related comments (105). Attachment A includes an index for users to identify their comment documents and Attachment B includes all individual substantive comments and an index for users to identify the corresponding BLM summary comments and responses. Table A-8 and Figure A-5 identify the number of comments submitted by issue category for the Draft RMP and Draft EIS.

Table A-8. Number of Comments per Issue Category – Draft RMP and Draft EIS

Issue Category	Number of Comments Per Issue Category
Areas of Critical Environmental Concern	25
Air Quality	54
Climate Change	8
Cultural	25
Cumulative Impacts	4
Extension Request	12
Fire and Fuels	12
Fish	17

Water	42
Wild and Scenic Rivers	3
Wild Horses	30
Wilderness Characteristics	64
Wilderness Study Areas	12
Wildlife	126
Total	387

Note: Duplicative comments in form letters were only counted once.

The BLM identified 920 individual substantive comments within the 78 comment documents received on the Supplement, excluding multiple copies of form letters. The greatest number of substantive comments were related to greater sage-grouse (323), Leasable Minerals – Oil and Gas (121), livestock grazing management (60), and Socioeconomics (59). Attachments C and D include indexes for users to identify their comment documents on the Supplement. Individual substantive comments on the Supplement are presented in Attachment D with an index for users to identify the corresponding BLM summary comments and responses. Table A-9 and Figure A-6 identify the number of comments submitted by issue category for the Supplement.

Note: Duplicative comments in form letters were only counted once.

4.2. Substantive Comment Summary and Response

To provide a user-friendly method of understanding the broad themes and topics of concern expressed in the substantive comments, the BLM grouped individual comments with similar topics and concerns and developed 61 summary comments and responses for the Draft RMP and Draft EIS and 51 summary comments and responses for the Supplement. The summary comments and responses are presented below, and are generally organized alphabetically by BLM resource program or other appropriate issue categories (e.g., purpose and need) as described in Tables A-1 and 2. The summary comment numbers below can be used to track the summary comment and response to the individual comments presented in Attachments B and D on the project website:

<http://www.blm.gov/wy/st/en/programs/Planning/rmps/bighorn.html>. Comments on the Draft RMP and Draft EIS are identified with 2000 series numbers and comments on the Supplement are identified with 3000 series numbers.

4.2.1. Draft RMP and Draft EIS

The summary comment numbers below can be used to track the summary comment and response to the individual comments in Attachment B.

Air Quality

- Summary Comment #2009:** Commenters expressed concern about the inclusion and/or omission of air quality monitoring stations utilized to represent baseline air quality conditions in the Planning Area. Specifically, commenters argued that the use of the monitoring station located in Yellowstone National Park and other locations outside the Planning Area are inadequate because conditions at those monitoring stations are not similar to conditions in the Planning Area.
- Commenters indicated that the impact analysis did not adequately justify why data from selected monitoring stations were included and data from other monitoring stations were not included. Commenters requested additional information including maps depicting monitoring station locations, the criteria used to select monitoring stations, justification of the ability of monitoring sites to adequately characterize air quality in the Planning Area, and consideration of additional air quality monitors (including the Worland monitor).
- Commenters also questioned the authority of the BLM to regulate air quality in the region and the State of Wyoming overall. Commenters requested additional text clarifying the scope of BLM’s authority in regulating air quality.
- Summary Response:** The BLM considered including data from additional monitoring stations that may provide more localized data. If the BLM determined data from additional monitoring stations was more appropriate for the analysis, the data were incorporated into the Proposed RMP and Final EIS. Following the consideration of including data from additional monitoring stations, the BLM identified why monitoring

stations were added or excluded from the analysis in the Proposed RMP and Final EIS.

As stated in the Draft EIS and clarified in the Final EIS, the State of Wyoming has primacy with regard to air quality. The law requires the BLM to adhere to Wyoming Department of Environmental Quality (WDEQ) air quality standards. As the RMP is a planning level document, it is not possible to anticipate specific projects and specific air quality mitigation needs at this time. Accordingly, the BLM will consider mitigation for specific projects as needed. Special requirements to alleviate air quality impacts would be included on a case-by-case basis in future use authorizations (including lease stipulations for new leases) within the scope of the BLM's authority. The BLM has worked closely with the WDEQ and Environmental Protection Agency throughout the development of this RMP, and will continue that close working relationship in the development of specific projects in the future.

Summary Comment #2009_1:

Commenters expressed concern about various instances of inadequate, inaccurate or insufficient information/data throughout the air quality impact analysis. For instance, commenters indicated that National Ambient Air Quality Standards (NAAQS) levels were not included or accurately listed for criteria pollutants including, but not limited to, ozone and carbon dioxide. Additionally, commenters noted that standard metrics were not utilized to determine visibility conditions within the Planning Area. Commenters questioned the use of qualitative data rather than quantitative data in assessing potential air quality impacts. Commenters also indicated that the analysis failed to clearly address or present whether or not “levels of concern” have been reached for specific criteria pollutants including oxides of nitrogen and sulfur. Commenters questioned why a thorough cumulative impact assessment of air quality was not included for the Planning Area.

Summary Response:

The BLM utilized the best available data for the air quality analysis. In response to comments, the BLM reviewed the air quality analysis and revised any observed discrepancies and/or inaccuracies and added additional information including standard metrics used to determine visibility conditions, a list of criteria pollutants with concentrations that have reached a “level of concern,” and other information, as appropriate. The BLM included a specific air quality cumulative impact analysis.

Additionally, the BLM provided an updated emissions inventory and included an air resources appendix within the Proposed RMP and Final EIS.

Summary Comment #2009_2:

Commenters requested additional reference to applicable air quality laws and policies and that management demonstrate compliance with WDEQ regulations and other applicable regulations. Commenters

expressed concern about the valuation of sources that would potentially contribute to air emissions/impacts. For example, commenters indicated that the BLM concluded, without warrant, that construction activities associated with oil and gas development would produce more fugitive dust than development associated with other construction activities such as renewable energy development. Additionally, commenters indicated that distant/regional sources would contribute a higher concentration of air emissions than local sources.

Summary Response:

The BLM revised the air quality related text in the Proposed RMP and Final EIS including updating references to applicable air quality laws, regulations, and rules, and other revisions as appropriate. In addition, the BLM updated the emission inventory spreadsheets in the Proposed RMP and Final EIS. Emission spreadsheets were updated with the latest emission factors for motor vehicles, off-road engine types, and other activities corresponding to the base year (2005), and the out years, 2015 and 2024.

Areas of Critical Environmental Concern

Summary Comment #2001:

Commenters questioned if the existing and newly proposed Areas of Critical Environmental Concern (ACECs) meet the relevance and importance criteria as stated in 43 CFR 1610.7-2(a). Commenters also questioned whether these areas require special management to (1) protect the area and prevent irreparable damage to resources or natural systems, and (2) protect life and promote safety in areas where natural hazards exist. Commenters questioned how the BLM applied the relevance and importance criteria and requested additional documentation to support the findings. In some cases, commenters cited specific research supporting their position that the areas did not need special management. In addition, commenters requested more detailed information and citations in the text.

Summary Response:

The ACEC Evaluation Report (June 2010) documents the evaluation process for existing and newly proposed ACECs. The report outlines how each proposed ACEC meets or does not meet the relevance and importance criteria. The report is available on the project website at: <http://www.blm.gov/wy/st/en/programs/Planning/rmps/bighorn.html>.

The Proposed RMP and Final EIS includes additional citations to the ACEC report and other sources as appropriate to support the determinations.

Climate Change

Summary Comment #2003:

Commenters recommended management to consider and address climate change impacts on ecosystems, wildlife, and other resources. Commenters identified several technical edits including requests for

clarification of language, quantification of air emissions data, and mitigation measures for greenhouse gas emissions. In addition, to be compliant with Secretarial Order 3289 commenters requested that BLM include information specific to climate change planning actions in the Planning Area.

Summary Response:

The Proposed RMP and Final EIS incorporates revisions to the climate change sections of Chapters 3 and 4 based on commenter input. The BLM provided additional information throughout the text, made technical edits, and provided updated emission inventory information, as appropriate.

The BLM reviewed the document to ensure consistency with existing federal laws and guidance related to analyzing climate change in NEPA documents. Regarding the development and implementation of management that is responsive to potential climate change impacts on species and ecosystems, the BLM determined that the timing, impacts, and other variables associated with climate change are too uncertain to base long-term management decisions for the planning timeframe (20 years). The BLM will address management issues and planning for climate change impacts through re-evaluation to determine validity of RMP decisions and associated analysis in light of new climate change information and details about subsequent proposed actions in the Planning Area and continued compliance with federal guidance on climate change.

Cultural Resources

Summary Comment #2004:

Commenters expressed concern about surface-disturbing activity prohibitions for cultural resources. Specifically, commenters indicated that the 3- and 5-mile buffers for cultural sites would prevent development throughout a significant portion of the Planning Area. Additionally, commenters indicated that the management actions associated with alternatives B and D could potentially interfere with existing leasing rights. In some cases, commenters questioned why certain cultural resources were not specifically discussed in the analysis. Commenters also recommended clarifying terminology used in the management actions and impact analysis for cultural resources.

Summary Response:

The BLM is required to comply with Section 106 of the National Historic Preservation Act. As part of this compliance, cultural resource surveys are conducted prior to development on BLM surface to identify and provide field verified data regarding presence of cultural resources and heritage resources. It is often through these site specific surveys that cultural resources are identified and inventoried; the BLM acknowledges that it does not have a complete inventory of all cultural resources in the Planning Area, making an accurate calculation of acreages where a given management action would apply impossible. Therefore, for analysis purposes, an

assumption is made that the restriction would apply, although through site-specific analysis it may be determined that the restriction is not necessary.

The Proposed RMP and Final EIS presents an adequate range of alternatives for analysis purposes. Alternatives B and D are more restrictive than alternatives A and C. In relation to restrictions on surface-disturbing activities, the range of alternatives and analysis included current management (which only applies case-by-case restrictions on development) and other management actions (such as Alternative B, which includes restrictions out to 5 miles for certain cultural sites) to protect the elements that contribute to the sites eligibility under 36 CFR 60.4 (a), (b), or (c). The intent and extent of the application of these management actions is clarified in the Proposed RMP and Final EIS.

The National Trails System Act establishes that the purpose of a National Historic Trail is the identification and protection of the historic route and the historic remnants and artifacts for public use and enjoyment. The BLM manages, to the greatest extent possible, National Trails to safeguard the nature and purposes of the trail and in a manner that protects the values for which the trail was designated. BLM establishes a National Trail Management Corridor to achieve this purpose. The BLM requires the National Trail Management Corridor to be of sufficient width to constitute a manageable administrative unit that is identifiable on the ground and includes a public land area of sufficient width within which to encompass National Trail resources, qualities, values, and associated settings and the primary use or uses that are present or to be restored. The National Trail resources, qualities, values are the significant scenic, historic, cultural, recreation, natural (including biological, geological, and scientific), and other landscape areas through which such trails may pass as identified in the National Trails System Act.

The BLM revised the text in the Proposed RMP and Final EIS as needed to address commenter concerns regarding terminology.

Cumulative Impacts

Summary Comment #2005:

Commenters indicated that the overall cumulative effects analysis failed to adequately address potential impacts to various resources including, but not limited to, wildlife, vegetation, livestock grazing, and water quality. Additionally, commenters raised concerns about projects and emerging technologies that were not considered in the Reasonably Foreseeable Development (RFD), specifically, projects that involve horizontal and directional drilling technologies. Commenters also indicated that the analysis of range improvements and other management actions did not address cumulative impacts to various

resources including, but not limited to, wildlife, vegetation, and water quality or consistency with existing livestock grazing permits. Commenters also noted that the RMP and EIS should further discuss the capacity of resources to absorb cumulative effects.

Summary Response:

After additional review, the BLM determined the current cumulative impacts analysis is appropriate to compare impacts among the alternatives and adequately informs the decision-making process. The cumulative impacts analysis focuses on issues identified during scoping and other stakeholder coordination efforts. Chapter 3 of the RMP and EIS describes existing conditions resulting from past actions, including the current state of the environment resulting from cumulative past actions.

The RFD assumes technology improvement rates (Final RFD page 3) based on available information. Projects and technologies considered in the cumulative analysis are those that are proposed or highly probable, based on known opportunities or trends at the time of analysis, rather than projects or technologies that are potential or contemplated.

Fire and Fuels

Summary Comment #2008:

Commenters indicated that the overall analysis of fire and fuels requires explanations that are more descriptive, quantifications, and scientific reference. Specifically, commenters questioned or raised concerns pertaining to: (1) the amount of and specific cover types that would be affected by prescribed fires/fuel treatments; (2) why no background information or quantification are included for existing fuel conditions; and (3) how the alternatives are analyzed and compared. In addition, commenters requested a more detailed analysis of cheatgrass in an effort to determine if prescribed fires of cheatgrass should be permitted if prescribed fires of cheatgrass would result in adverse impacts to sage-grouse habitats. Moreover, commenters expressed concerns with the analysis and classification of natural fire regimes and questioned the feasibility of restoring natural fire regimes to the entire landscape.

Summary Response:

The BLM updated the fire and fuels section to include details regarding the expansion of cheatgrass by burns, indicators for making a reasoned choice among the alternatives, and various technical edits, as appropriate. The BLM also provided additional references as needed to support statements within the fire and fuels section. The BLM considered requests for text edits on an individual basis and addressed as necessary in the final document.

The BLM provides detailed information regarding fire regimes, condition classes, and background information for the Planning Area along with detailed maps at a course scale within the Fire Management Plan (FMP). On page 68 of the FMP, there is a condition

class map, which shows acres burned by vegetation type; additionally the FMP provides maps showing chemical, mechanical, and other treatment by vegetation type. The FMP and supporting maps are available at:
<http://www.blm.gov/wy/st/en/programs/Fire/planning.html>

Fish

Summary Comment #2002: Commenters identified a number of technical edits related to fish and their habitats. These edits included requests to use alternative language, corrections to technical statements and/or terms, definitions of terms, and clarification of language. In addition, commenters requested that BLM include a variety of references in the text as well as in the alternatives. Commenters asked that BLM incorporate recently released and updated information to the extent possible. Commenters also noted instances where proposed BLM management could be incompatible with current Wyoming law.

Summary Response: The BLM revised the *Fish and Wildlife - Fish* sections of the Proposed RMP and Final EIS based on commenter input. The BLM revised terminology definitions, technical edits, additional references, and changes to the management actions. The BLM updated all references that cite material or guidance to reflect the most current information.

The BLM reviewed the Draft RMP and Draft EIS to ensure the proposed management actions complied with all applicable laws and guidance; the BLM disagrees that the management of fish and fisheries proposed in the Draft RMP and Draft EIS violate applicable laws and guidance.

Historic Trails

Summary Comment #2010: Commenters indicated general concern regarding the proposed designation and protection offered to historic trails in the Planning Area, identified potential trails for BLM to apply protection, and indicated total surface acreage for historic trails is not provided within the alternatives tables. Specific concerns raised by commenters included the prohibition of surface-disturbing activities within 2 to 5 miles of a historic trail and improper designation of trail segments as being eligible for protections offered to historic trails.

Summary Response: BLM completed a Class I Regional Overview, in compliance with Section 106 of the National Historic Preservation Act, prior to the Draft RMP and Draft EIS. The intent of the Class I Regional Overview was to provide an accurate representation of historic trails and allow designation and protection of historic trail segments in the Planning Area.

Only the trail segments with current integrity of setting would have their setting managed; as noted throughout the RMP, the BLM has no

authority to manage activities on private or state lands, and management of setting for historic trails would not apply to these lands.

At this time, the BLM does not have sufficient information to determine the acreage of BLM-administered land where setting is important to the trail's eligibility to be placed on the NRHP and where the trail retains integrity.

The BLM provided additional information and clarification regarding historic trails where appropriate in the Historic Trails sections of the Proposed RMP and Final EIS.

Invasive Species

Summary Comment #2012:

Commenters indicated that the overall analysis of invasive species required increased information on management actions, additional quantification, and more field verified data. Specifically, commenters questioned or raised concerns pertaining to a lack of emphasis and direction regarding invasive weed management, inadequate Geographic Information System (GIS) reporting of invasive species acreages and locations in the Planning Area, and lack of quantitative information for measuring impacts and comparing alternatives. Commenters requested an updated and expanded field verified inventory of all invasive species in the Planning Area along with representative GIS mapping, acreages, and indicators to be used when comparing alternatives.

Summary Response:

The BLM acknowledges that complete inventories of invasive species are not currently available and that such inventories cannot be completed for this RMP revision project given budget and time constraints. The BLM also recognizes that there are more acres infested with cheatgrass and noxious weeds in the Planning Area than the numbers cited in the Draft RMP and Draft EIS. However, the BLM is not required to complete full inventories of all resources before conducting land use planning. Further discussion regarding BLM's treatment of invasive species and limitations on occurrence and spread of such species is available in Section 3.4.4 of the Proposed RMP and Final EIS.

The BLM reviewed GIS and other data presented in the Draft RMP and Draft EIS and made corrections or added clarification as appropriate. Specifically, the BLM clarified in Chapter 3 that the discrepancy between the 2004 and 2007 inventory data for invasive annual bromes resulted from the use of two different data sources. Further, an area may be infested with annual bromes, but annual bromes may not be the dominant vegetation cover. The difference, when land status is considered, is approximately 6,000 acres. The BLM cited these two data sources in the Proposed RMP and Final EIS.

For invasive species, acres of surface disturbance are used as an impact indicator; however, the BLM recognizes that the proportion of areas subject to surface disturbance that become infested with weeds is variable and will depend on a number of factors that are not known at the RMP level.

Lands and Realty

Summary Comment #2013: Commenters questioned how the total percent of land closures for leasing were determined and also inquired about the references and methodology used by the BLM when identifying land classifications, withdrawals, lands for disposal, and segregations among the alternatives. In addition, commenters requested clear requirements for re-analyzing the appropriateness of leasing expired or expiring leases.

Summary Response: The BLM revised the lands and realty sections based on commenter input and incorporated additional information and clarification regarding methodologies for identifying land tenure adjustments, land use classifications, and indirect impacts. The BLM also reviewed management actions and land use allocations associated with mineral leasing and updated the Minerals and Lands and Realty sections, as appropriate.

Land tenure adjustments criteria are further explained in Appendix M of the Proposed RMP and Final EIS.

Summary Comment #2013_1: Several commenters indicated that the overall analysis of lands and realty requires more descriptive explanations/definitions, clarification on BLM's analysis methods, and additional scientific reference. Specifically, commenters questioned or raised concerns pertaining to: (1) lack of discussion on how valid existing lease rights will relate or be impacted by land use decisions in the RMP and EIS; (2) BLM's methodology for determining the least restrictive stipulations for achieving resource objectives; (3) explanation of how geophysical explorations that do not require road construction can receive a Categorical exclusion (CX); and (4) detailed descriptions of special designations which qualify as acquisition areas.

Additionally, commenters noted missing information or editorial items in the Lands and Realty section and maps including missing GIS acreages within the Alternative A attribute table; inaccuracies in reported acreages for current oil and gas leasing; and reference citations pertinent to the lands and realty planning process which should be included.

Summary Response: The BLM revised the Lands and Realty section based on commenter input and provided additional reference information where available and appropriate. Within the Proposed RMP and Final EIS the BLM

provided additional information, clarification, definitions, and indicators and methods used to analyze impacts, as appropriate.

CXs are not always the best approach in land use planning, and do not apply to all road construction activities in the Planning Area. All projects receive NEPA review appropriate to the project proposal; all determinations as to the applicability of a CX are made on a case-by-case basis.

The BLM calculated the number of acres in the text from the areas depicted on representative GIS maps. In some cases, polygons on the maps may look larger than they should because RMP decisions do not apply to private or state-owned lands that may fall within the areas. The BLM believes all terms and descriptions are consistent throughout the Proposed RMP and Final EIS. Without specific examples where such inconsistencies exist, the BLM is unable to provide further response.

Livestock Grazing

Summary Comment #2074:

Commenters expressed concern regarding the lack of disclosure of direct impacts to livestock grazing. Specifically, commenters requested a more detailed description for each alternative of the direct impacts that would result from management actions that change Animal Unit Month (AUM) allocations in the Planning Area.

Summary Response:

The BLM developed and analyzed alternatives in the Proposed RMP and Final EIS using the best available information in compliance with federal laws, guidelines, and policies. The BLM included references that support decisions with regard to Livestock Grazing Management and made text edits on an individual basis as necessary.

The analysis in the Proposed RMP and Final EIS only considers losses of AUMs that occur as a result of closures or long-term surface disturbance. The Proposed RMP and Final EIS does not set utilization levels for livestock grazing, as those levels are established in site-specific Allotment Management Plan (AMPs). As stated in Appendix W, “utilization levels will be considered during the allotment monitoring, assessment, and evaluation process, as well as during activity plan development and the NEPA and permit/lease renewal process.” Because an RMP is a high level planning document that does not include site-specific actions, it is not possible to predict if and where adjustments to utilization levels will be needed or their effects on permittees or AUMs.

Summary Comment #2076:

Commenters recommended additional text on the process for modifying AUMs and AMPs and balancing livestock grazing and other resources.

Specific suggestions included that the BLM work directly with the permittees on monitoring and management development, and that

comprehensive monitoring studies and conflict resolution and mediation processes precede any AMP modification or elimination of grazing allotments.

Other comments requested language clarifications or additional analytic assumptions to characterize the influence of livestock grazing on other resources in a more positive light.

Summary Response:

The BLM reviewed all sections pertinent to livestock grazing management and determined that the impact analysis conclusions in the Proposed RMP and Final EIS are appropriate. It is reasonable to consider and analyze changes in AUM or other grazing management in areas where current livestock grazing has the potential to result in adverse effects on wildlife, special status species, or other resources; it is not a foregone conclusion that where livestock grazing has historically occurred there is no potential for conflicts with other resources and uses.

The BLM clarified language in Chapter 3 to state that changes to grazing management are implemented when rangelands are not meeting standards due to current livestock grazing.

Summary Comment #2011:

Commenters requested that the BLM incorporate additional text to better address livestock grazing management, particularly related to the BLM's proposed management of potential conflicts between livestock grazing and other resources and uses. Specifically, commenters requested more discussion on the impacts of livestock grazing on special status species (e.g., grizzly bears and greater sage-grouse) and wildlife; changes to vegetation as a result of livestock grazing; policies and specific management actions or changes to current management to guide livestock grazing activities in identified greater sage-grouse seasonal habitats; and reserve common allotments.

Commenters requested additional information on current livestock grazing AUMs by allotment and clarification of certain terms and concepts (particularly if livestock grazing was considered a surface-disturbing activity and the meaning of the phrase in consideration of other resource values).

Summary Response:

One method to deal with actual or perceived conflicts between livestock grazing and other land use allocations is to eliminate the conflict by removing livestock grazing. Alternative B uses this approach. Alternatives A, C, and D prescribe varying methods of addressing competing land use allocations. The BLM analyzed a reasonable range of alternatives by including one alternative that reduces conflicts through removing livestock grazing, and three that prescribe other methods.

No areas were proposed for closure to livestock grazing due to grizzly bears; the impacts to grizzly bears from livestock grazing are discussed

in Chapter 4 and the Draft Biological Assessment (available on the project website). The BLM believes that properly managed livestock grazing is compatible with maintaining quality sagebrush habitat (see Appendix W), and such use would be compatible with management or objectives to preserve or enhance this habitat type.

The phrase “consistent with other resource objectives” occurs throughout this document and is intended to reference the fact that the BLM is required to consider multiple uses of the public lands under its management. The BLM discloses projected AUMs for each alternative. Actual AUM adjustments are made through subsequent implementation level analysis and decisions. Any future adjustments, if necessary, would be based upon site-specific AMPs. For example, discussions of how managing livestock grazing to meet DPC would affect livestock grazing permittees is not appropriate for an RMP level analysis as it would require a site-specific analysis. Because the RMP is a high level planning document that does not authorize these types of site-specific actions, it is not possible to predict if and where such adjustment will be needed or their effects on permittees.

The BLM updated the Livestock Grazing Management sections to include additional information on the types of activities that are addressed in AMPs, clarification on reserve common allotments, and polices used to guide livestock management activities. The BLM addressed requested text edits, additional information, and references as deemed necessary. In addition, the BLM reviewed and revised the Proposed RMP and Final EIS as necessary to reflect the fact that the BLM does not consider livestock grazing or other herbivory to be a surface-disturbing activity.

Master Leasing Plans

Summary Comment #2014:

Commenters raised concerns about the potential closure of lands available for leasing and the resulting impacts on future lease sales in the Planning Area as well as the potential for slowed production and exploration activities. Additionally, commenters indicated that the BLM did not identify resources of concern in the three areas nominated for Master Leasing Plans (MLPs) reviews and requested the BLM to re-evaluate potential impacts associated with further land closures consistent with IM 2010-117. Moreover, commenters requested the use of phased leasing as a way to resolve potential resource conflicts in the Planning Area.

Commenters raised concerns regarding the lack of clear management and detailed information regarding conflicts between existing leases and the protections of important resources, specifically ACECs, lands with wilderness characteristics, and critical wildlife habitat. In addition, commenters indicated oil and gas leasing actions presented within the BLM Preferred Alternative are inconsistent with guidelines

established in the BLM IM 2010-117 Oil and Gas Leasing Reform. Specifically, commenters indicated under the Preferred Alternative BLM does not provide sufficient analysis, Best Management Practices (BMPs), or mitigation for biological resources in areas of oil and gas development as required by IM 2010-117.

Summary Response:

In response to the comments, BLM revised several sections of the RMP and EIS including adding information on the cumulative impacts of surrounding wilderness areas and National Parks on minerals development, additional information on the complete MLP analysis, and other information, as appropriate.

MLPs have been brought forward from Appendix Y of the Draft RMP and Draft EIS and are fully incorporated into the alternatives and analyzed in the Final EIS.

The BLM maintains compliance with all federal laws and guidance. Reevaluation of federal and BLM policy is outside the scope of this RMP and EIS. The BLM reviewed the RMP and EIS document for consistency with state and federal laws and determined the Proposed RMP and Final EIS is compliant with IM 2010-117 and MLPs.

Mineral Potential and Reasonably Foreseeable Development Scenario for Oil and Gas

Summary Comment #2061:

Commenters noted that the RFD scenario and the RMP and EIS underestimated mineral/oil and gas occurrence and development potential in several areas including the Mowry Shale and the Sub-Absaroka Play and that undiscovered reserves could increase drilling and production beyond the scenarios in the RFD and the analysis in the RMP and EIS. Commenters requested clarification of the role of the RFD in comparing impacts across alternatives in the RMP and EIS, noting that estimates of disturbance and other impacts are for analysis purposes only and exceedence of these analysis assumptions should not require a plan amendment. Commenters also requested that the RMP and EIS clarify that the RFD scenarios are not a cap or limitation on future development. Commenters noted that the RFD did not adequately consider several technologies that could increase development potential including horizontal drilling, carbon dioxide flooding, and other enhanced oil recovery (EOR) techniques. Commenters noted that the surface disturbance estimates in the RFD may need to be adjusted to reflect the larger well pad associated with horizontal drilling. Commenters requested that the RMP and EIS disclose the percent for high potential occurrence in the Planning Area.

Commenters requested that BLM provide inventories and mineral potential information for commercially viable deposits related to rare earth elements and fluvial placer deposits, as well as the acreage for occurrence of sand and gravel.

Summary Response:

The BLM revised text in the Proposed RMP and EIS including clarification of the role of the RFD in the analysis, identification of the percent for high potential occurrence in the Planning Area, clarification of the difference between occurrence and development potential, and other information, as appropriate.

The RFD provides a reasonably foreseeable development scenario for oil and gas resources as well as predicted fluid mineral potential based on staff knowledge, input from industry, and other information. The BLM acknowledges that the RFD is a best estimate of reasonable development based on available information and a current understanding of conditions and technologies (including horizontal drilling and EOR) and that actual development may vary from these estimates.

The Solid Mineral Occurrence and Development Potential Report provided information on mineral materials and other solid minerals. While sand and gravel occurrence acreages were available, acreage for potential occurrence for rare earth minerals, were not available due to a lack of data on such minerals in the Bighorn Basin.

Minerals

Summary Comment #2015:

Commenters questioned the data and methods used by the BLM to conduct the analysis and calculate acreage related to minerals management using GIS and noted potential inconsistencies in data and numbers within the document and compared to other data sources. Commenters raised specific questions and concerns pertaining to: (1) the source and accuracy of data, (2) lack of attribute information and metadata for certain GIS files, (3) the method used to generate mineral constraints, and (4) lack of documentation of methods used to calculate certain values. Some commenters explained that, in using the BLM's own GIS data, they were unable to reproduce the GIS-generated numbers presented in the Draft RMP and Draft EIS. Commenters also cited specific numbers in the document and raised questions about their accuracy and the consistency of their use throughout the document.

Summary Response:

The BLM reviewed GIS data, methods, and mapping products associated with minerals and revised and updated shapefiles, tables, acreages, text, and maps, as appropriate.

Summary Comment #2016:

Commenters requested clarification about how the BLM would manage geophysical exploration in the Planning Area including lessee requirements and site-specific NEPA analysis. Commenters also questioned how BLM management would affect a lessee's ability to obtain valid geophysical data under an approved exploration lease.

Summary Response:

As described in the RMP and EIS, all activities in the Planning Area will be subject to the goals and objectives identified in the RMP. All

individual geophysical operations will be assessed on a case-by-case basis consistent with the terms of the RMP and other applicable federal guidance.

Summary Comment #2017: Commenters questioned the way the BLM portrayed the potential for coal production in the Planning Area, and, citing an outside study, requested the BLM modify the discussion on coal to more accurately reflect the potential for coal production.

Summary Response: The BLM revised the text in Chapters 3 and 4 of the Proposed RMP and Final EIS to more adequately describe the potential for coal production from federal mineral estate in the Planning Area.

Summary Comment #2077: Commenters asked the BLM to identify acreage of withdrawals proposed in ACECs, and modify Visual Resource Management (VRM) Class II boundaries around the Sheep Mountain Anticline ACEC to include areas of bentonite potential. A commenter asked the BLM not to issue new leases in areas where there are few existing leases. Another commenter indicated that Timing Limitation Stipulation (TLS) and Controlled Surface Use (CSU) stipulations are too restrictive where habitats of species overlap. Regarding Alternative D, commenters believed that classifying certain right-of-way avoidance areas would hurt the bentonite industry and that an increase in the areas closed to oil and gas leasing would be inconsistent with goals and policies of county and conservation district land use plans. One commenter asked that the BLM include restrictions on salable mineral development at sage-grouse leks.

Summary Response: The BLM revised the Proposed RMP and Final EIS to include clarification of the process by which ACECs may be withdrawn on a case-by-case basis, adjustment of VRM boundaries as needed, and other revisions, as appropriate.

Summary Comment #2047: Commenters expressed concern that lease stipulations, constraints, and mitigation measures for mineral development are more restrictive than necessary and may not be compliant with Federal Land Policy and Management Act (FLPMA) and the Energy Policy Act of 2005; commenters recommended that stipulations be the least restrictive necessary to adequately protect other resource values. Commenters questioned the need for additional restrictions on oil and gas development in the Planning Area considering the existing restrictions in surrounding wilderness areas and National Parks.

Commenters requested a more detailed description of the reasoning behind increasing restrictions, stipulations, and areas closed to oil and gas leasing in the Planning Area as well as more information regarding impacts to state and local economies from restrictions on minerals development. Commenters requested several modifications in the RMP and EIS including changing VRM Class II areas from a moderate to a major restriction and further describing the impacts from managing big game crucial winter range as No Surface Occupancy

(NSO) Special Recreation Management Area (SRMA) under Alternative B. Commenters noted that closing an area to leasing is effectively a withdrawal and that withdrawals can only be made using specific procedures mandated by FLPMA.

Summary Response:

The BLM revised text in the Proposed RMP and Final EIS to include a description of cumulative impacts on minerals development considering management in surrounding Wilderness and National Parks, clarification of the application of NSO stipulations, and other information, as appropriate.

In accordance with NEPA and other guidance, the BLM provided and analyzed a range of alternatives and management scenarios for minerals development. Chapter 2 provides the rationale and restrictions on oil and gas development in the alternatives. Regarding comments related to closing an area to leasing being considered as a withdrawal, the BLM considers closure to leasing a discretionary action that does not constitute a withdrawal from mineral entry under the mining laws.

The BLM also notes that stipulations are attached prior to lease sale and issuance. Mitigation measures are attached as conditions of approval on site-specific projects. Should stipulations be determined unwarranted, they are subject to exception, modification, and waiver.

Summary Comment #2049:

Commenters requested reference to BLM and other agency policies, guidance, and requirements for minerals development and subsequent reclamation. Commenters requested that the BLM should update certain data to reflect current information including employment data for mining industry and number of Application for Permit to Drill approved in recent years. Commenters also requested the establishment of thresholds related to locatable minerals development. Commenters asked BLM to consider effects of management restrictions, implementing policies, and market conditions and cycles on mineral development. Commenters requested additional analysis on resources from bentonite mining and damage to oil and gas wells if they are shut-in on an annual basis.

Commenters requested modification to minerals management in the alternatives related to Oil and Gas Management Areas (OGMAs) and Rights-of-Way (ROW) corridors in relation to mining. Additionally, commenters requested clarifying language, correction of technical statements, and incorporation of additional information related to minerals in the RMP and EIS. Commenters requested the BLM to base management decisions on sound science, monitoring, and field data.

Summary Response:

The BLM revised the minerals and other appropriate sections in the Proposed RMP and Final EIS to include references to appropriate BLM Handbooks and other guidance, clarify reclamation standards and requirements, update the number of APDs, revise management

actions, clarify language regarding the shut-in of wells, and other information, as appropriate.

Regarding the development of thresholds for locatable minerals, the application of a threshold to locatable mineral development is unreasonable as the 1872 mining law, as amended, allows for mining activities unless withdrawn from appropriation under the mining laws.

Summary Comment #2050: Commenters provided several recommendations related to OGMAs including reconsideration of the number of designated OGMAs, adding language that allows for modification and expansion of OGMAs if development extends beyond the identified OGMA areas, adding certain areas to OGMAs under Alternative C, and modifying management actions associated with OGMAs.

Summary Response: The BLM reviewed the provided comments and revised Alternative D management and other sections in the Proposed RMP and Final EIS including adjustment of OGMA boundaries, addition of language allowing flexibility for expansion of OGMAs in the future if development extends beyond the currently identified OGMAs, and other revisions, as appropriate.

Summary Comment #2051: Commenters indicated that the RMP and EIS did not adequately consider EOR and other technologies such as horizontal-well drilling, and CO₂ sequestration related to EOR. Commenters noted that such technologies could increase oil and gas development beyond what is included in the RMP and EIS. Commenters indicated that the RFD scenario and Proposed RMP and Final EIS should analyze the potential for EOR to increase oil and gas production in the Planning Area. Commenters urged BLM to keep lands open to leasing and development to allow for advances in horizontal drilling and other technologies. Commenters indicated that EOR should be analyzed to allow future project development under Environmental Assessments rather than EISs.

Summary Response: The RFD and the RMP and EIS did include assumptions associated with technology improvements (see RFD page 30) including EOR. The BLM added these technology improvement assumptions to Chapter 4. The BLM also clarified the minerals sections of Chapters 3 and 4 with regard to the potential for EOR techniques to change the potential for oil and gas development in the Bighorn Basin, and included other information, as appropriate.

Summary Comment #2052: Commenters referenced several laws, policies, guidance documents, and case law regarding valid existing rights. Commenters indicated that the BLM does not have the authority to modify stipulations, apply unreasonable mitigation measures, or impose restrictions (such as NSO) on existing leases after a lease has been issued. Commenters also opposed management in alternatives B and D that would allow the BLM to prohibit suspension of existing leases. Commenters noted that a lease can only be modified by the mutual agreement of both

the lessee and the lessor and recommended revisions to reflect this in the RMP and EIS.

Summary Response:

The BLM updated management in the minerals sections in the Proposed RMP and Final EIS including clarification that stipulations on existing leases can only be added with the consent of the lease owner. The BLM included additional information on leasing adjacent to existing leases, clarification that the BLM may apply Conditions of Approval in conformance with Section 6 of the Standard Oil and Gas Lease Terms while recognizing valid existing rights, and other information as appropriate.

NEPA

Summary Comment #2055:

Commenters indicated a preference for the development of an alternative that implements a multiple use approach that would provide for resource extraction while also providing for the conservation for wildlife and biological resources. In addition, commenters requested an analysis of proposed management actions specific to wildlife resources, and, in some cases, requested the development of additional management actions and/or management areas be applied where appropriate. Commenters requested the inclusion of other alternatives including a phased oil and gas development alternative. Commenters also indicated that measurement indicators were missing making it difficult to perform an effects analysis of the alternatives.

Summary Response:

The BLM revised the text of the Proposed RMP and Final EIS based on received commenter input, providing additional information, definitions, details in the text and management actions within Alternative B geared toward conservation measures, reference citations and clearly identified impact indicators. Additionally, Alternative D was updated and contains language that implements a multiple-use approach which balances the needs of resource extraction with wildlife and biological resource conservation needs.

Performing an alternative analysis specific to wildlife resources is not feasible as this action would preclude the BLM from managing public lands for multiple uses and would not meet the purpose and need for the plan revision.

Phased development and phased leasing alternatives were considered, but not carried forward for detailed analysis for the reasons cited in Section 2.3. This does not preclude, however, the consideration of phased leasing or phased development on a site-specific basis.

Note: MLPs, as outlined in the alternatives of the Proposed RMP and Final EIS may include phased leasing.

Summary Comment #2057: Commenters indicated that various maps contained in the Draft RMP and Draft EIS are inaccurate, incomplete, and, in some cases, unable to be reproduced. Commenters also pointed to various inconsistencies associated with maps contained in the Draft RMP and Draft EIS. For instance, acreage inconsistencies were observed in shapefiles associated with Recreation Management Areas, Travel Management, Withdrawals, Geothermal Constraints, ROW Avoidance and Exclusion Areas, and Mineral Constraints. Furthermore, commenters requested an update of the administrative record to include documentation utilized to develop GIS analysis and all metadata utilized to generate maps.

Summary Response: The BLM reviewed GIS data, methods, and mapping products and revised and updated shapefiles, tables, acreages, and maps, as appropriate. The administrative record provides information documenting the GIS analysis process.

Summary Comment #2054: Commenters requested that the BLM incorporate additional information into the text of the RMP/EIS including, but not limited to an explanation of discrepancies between alternatives A and D in acres closed to oil and gas leasing within the Planning Area; providing more information on the effects of different levels of development on biological resources in the Planning Area; and providing specific direction for the completion of rangeland health standards assessments. Comments also requested additional information for the analysis including more current information on jobs associated with Bentonite mining, local research and modeling on the contribution of the oil and gas industry to local economics and air quality modeling to estimate potential impacts of planning decisions on the air quality resources within the Planning Area.

Commenters also requested a more detailed discussion of the purpose, implementation and enforcement of BMPs for resources in the Planning Area and additional information on timeframes and milestones associated with management and BMPs. Commenters expressed concern regarding the need for a greater use of scientific data to characterize historic and current conditions within the Planning Area as well as to substantiate the need for proposed changes in management.

Commenters requested additional information for the RFD including discussing potential increases in production from enhanced recovery techniques, requests for management to better accommodate EOR, and requests for other provisions related to EOR.

Commenters identified a number of technical edits related to the NEPA analysis including requests to use alternative language, correct technical statements and/or terms, define terms, and clarify language.

Summary Response: The BLM has reviewed and revised the text of the Proposed RMP and Final EIS. Based on commenter input, the Proposed RMP and Final EIS

includes revised glossary definitions, additional information, technical edits, clarifications, references, and other revisions, as appropriate.

Paleontological Resources

Summary Comment #2059: Commenters expressed concern regarding the proposed designation of ACECs in the Planning Area based on the protection of specific paleontological fossil locations. Specifically, commenters requested detailed information on how restricting surface disturbance in these areas would help to preserve paleontological resources. Additionally, commenters questioned the necessity of restricted surface disturbance when these areas are exposed to high volumes of natural wind and water erosion. Moreover, commenters questioned why fossil collection is prohibited in these areas and requested the inclusion of scientific citations within the RMP and EIS to provide a better description of the affected environment.

Summary Response: The BLM included additional references where appropriate in the Paleontological Resources section. The BLM considered commenter submitted edits and made technical corrections in the Proposed RMP and Final EIS, as necessary.

Process and Procedure

Summary Comment #2060: Commenters expressed frustration regarding the BLM not fully attending meetings held by the LGCA and noted their beliefs that the BLM's lack of participation and coordination with counties and other stakeholders is not consistent with FLPMA, NEPA, the terms of Memorandums of Understanding (MOUs), and other policies and guidance. Commenters expressed concern regarding the BLM's non-participation in local government public meetings.

Summary Response: The BLM developed the scope, management, and content in the RMP and EIS through a collaborative process that involved numerous public meetings between the BLM cooperating agencies, counties, the public, and other affected parties. The RMP and EIS was prepared consistent with NEPA, FLPMA, the BLM Land Use Planning Handbook, and other applicable guidance and policy.

Readability and Format

Summary Comment #2006: Commenters identified several readability issues and provided suggested format changes regarding the layout and presentation of information in the RMP and EIS. Specifically, commenters noted problems with viewing maps on their computer screens, indicated that the length of the document was excessive, and requested the use of pull out indexes for various large-scale tables and appendices.

Summary Response: The BLM evaluated all submitted requests regarding document readability and format on an individual basis and revised the text, tables, and maps, as appropriate.

Recreation

Summary Comment #2062: Commenters recommended managing additional areas in the Planning Area as SRMAs, while other commenters recommended dropping SRMA management for certain areas or revising management actions governing those areas. Commenters requested that clarifying language be added to the Draft RMP and Draft EIS to describe what types of recreation uses would benefit from specific SRMA designation, as well as more detailed information describing the goal of the SRMA designation.

Additionally, commenters requested clarification or revision of potential impacts to recreation from specific management actions under the various alternatives.

Summary Response: The BLM developed a reasonable range of alternatives for recreation and recreation management areas that were analyzed and considered for the Proposed RMP and Final EIS. Where appropriate, the BLM revised the text in the Proposed RMP and Final EIS to address comments on potential management of recreation and to clarify impacts.

Renewable Energy

Summary Comment #2065: Commenters requested that citations be included for information pertaining to increases in renewable energy development and associated activities in the Planning Area. In addition, commenters recommended that the BLM incorporate wind energy development guidance from the U.S. Fish and Wildlife Service (USFWS) and Wyoming Game and Fish Department (WGFD) and apply these guidelines in the RMP and EIS text.

Summary Response: Citations documenting increases in renewable energy development and associated activities are presented in the *Reasonable Foreseeable Development for Renewable Energy Resources in the Bighorn Basin RMP Planning Area* posted on the project website and referenced throughout the Draft RMP and Draft EIS. The *Summary of Environmental Consequences* table in Chapter 2 further illustrates impacts to and from renewable energy development in the Planning Area. The BLM will continue to consider federal and state guidance on mitigation measures associated with wind development throughout the planning period.

Rights-of-Way and Corridors

Summary Comment #2066: Commenters questioned the overall adequacy of the analysis in the ROW and corridors section and requested additional explanation/rationale to support the proposed ROW corridors and the exclusion and avoidance/mitigation areas under each alternative. Some commenters sought specific information about the proposed ROW programs under each alternative including the width of designated corridors, the requirements for collocation of projects, and the specific management prescriptions for avoidance/mitigation areas. Commenters also expressed concern that the criteria and process for identification of ROW corridors and ROW exclusion and avoidance/mitigation areas were unclear and did not account for some existing ROW projects in the Planning Area or adequately estimate the demand for future ROW projects such as carbon dioxide sequestration. Some commenters requested additional analysis of the impact of ROW management areas on ROW holders and applicants including the ability of an oil and gas lessee to access its lease, and consideration of the regulatory and economic constraints facing utility companies. Commenters also requested definition of terms and clarification of the differences in impacts to the ROW program among alternatives.

Summary Response: In response to comments, the BLM reviewed the ROW sections and provided additional information in the Proposed RMP and EIS, including clarifying resource impacts associated with ROW corridors and exclusion and avoidance areas, clarifying definitions, updating the glossary, and other appropriate revisions.

Summary Comment #2067: Commenters expressed concern regarding discrepancies between information in the Draft RMP and Draft EIS and the GIS data used by the BLM to delineate ROW avoidance and exclusion areas within the Planning Area. Commenters requested that the BLM reconcile the discrepancies or remove the information from the Draft RMP and Draft EIS. Commenters recommended the addition of new information that takes into account the increase in ROW use by future development in the Planning Area such as electrical transmission lines and CO₂ pipelines. Commenters also requested that BLM include a variety of references in the text as well as in the alternatives.

Summary Response: The BLM reviewed GIS data, methods, and mapping products associated with the ROW land use allocations and revised and updated shapefiles, tables, acreages, and maps, as appropriate. In addition, the BLM reviewed and revised the ROW sections in relation to the comments and provided additional information including clarification of existing and new ROWs, clarification of management precedence where ROW corridors overlap ROW exclusion and avoidance/mitigation areas, added language for management actions, and additional reference information, as appropriate.

Greater Sage-Grouse

Summary Comment #2068: Commenters indicated greater sage-grouse information in the Draft RMP and Draft EIS did not provide adequate details for the reader to draw conclusions about impacts among the different alternatives. Commenters raised concerns and requested information regarding: (1) invasive species management and livestock impacts on greater sage-grouse habitat; (2) missing scientific references and/or data to support BLM’s conclusions regarding impacts to greater sage-grouse under each alternative; (3) clarification regarding limiting noise levels around greater sage-grouse leks; and (4) disclosure of economic impacts resulting from land closure to livestock grazing as a protection measure for greater sage-grouse.

Summary Response: The BLM revised management actions and greater sage-grouse related text in the Proposed RMP and Final EIS, including clarification that management of livestock grazing under Alternative A may not improve the quality or quantity of sage-grouse habitat, and clarification regarding consistency with the Wyoming Governor’s Executive Order (EO) “Greater Sage-Grouse Core Area Protection” (EO 2011-5). In addition, BLM clarified language on impacts and included scientific references, as appropriate. (See also the Supplement EIS summary comments and responses in Section 4.2.2)

Summary Comment #2069: Several commenters raised concerns that management and identified Key Habitat Areas in the Draft RMP and Draft EIS may not be compliant with the State of Wyoming’s greater sage-grouse policy including IM WY-2010-012 and EO 2011-5. Commenters questioned BLM’s decision to expand Key Habitat Areas beyond the existing greater sage-grouse Core Area boundaries and requested scientific reasoning for the decision.

Summary Response: The BLM revised management in the alternatives, analysis, and applicable greater sage-grouse text to be consistent with current State of Wyoming policies and guidance on the management of greater sage-grouse and their habitat. As discussed Appendix Q of the Draft RMP and Draft EIS BLM intends to maintain consistency with the Core Areas as identified by the State of Wyoming. The Proposed RMP and Final EIS includes a reasonable range of alternatives for greater sage-grouse management. (See also the Supplement EIS summary comments and responses in Section 4.2.2)

Summary Comment #2071: Commenters indicated that the analysis of impacts to greater sage-grouse in the Draft RMP and Draft EIS could be improved through the inclusion of more descriptive explanations, editorial changes, clarification of terminology, and scientific references. Specifically, commenters questioned or raised concerns pertaining to: (1) impacts on livestock grazing, oil and gas, and other resources resulting from management of greater sage-grouse and their habitat; (2) suggestions that the BLM defer to the Wyoming Governor's EO 2011-5 for BMPs

regarding greater sage-grouse and correctly reference this EO throughout the document; (3) inconsistencies between BLM decisions and guidance provided in EO 2011-5; and (4) expanded detail on the management challenges for greater sage-grouse populations in the Planning Area.

Commenters cited specific research that could be referenced by the BLM to inform their decisions regarding impacts on and from other resources from management of greater sage-grouse. Additionally, commenters requested the BLM fully define terminology, add scientific references, and disclose detailed information pertinent to the planning and management of greater sage-grouse.

Summary Response:

The BLM revised management actions, Chapters 3 and 4, and other greater sage-grouse related text in the Proposed RMP and Final EIS to ensure consistency with EO 2011-5, included additional citations of scientific studies and research to support text, added references (to maps and other sections) where necessary, and made other revisions supplying clarifying language, as appropriate. (See also the Supplement EIS summary comments and responses in Section 4.2.2)

Regarding requests for additional details about sage-grouse nest cover and potential impacts, the BLM notes that greater sage-grouse nest cover amounts change from year to year, and it would be unreasonable to provide this kind and amount of data, annually, given the many variables, besides livestock grazing that affect it. It is reasonable to provide a livestock grazing utilization limit or level that allows for adequate greater sage-grouse nest cover, which is summarized in Appendix W. The BLM added a reference to this appendix in the livestock grazing section.

Socioeconomic Resources

Summary Comment #2046:

Commenters indicated that the analysis does not adequately address potential impacts to local communities and focuses too much on impacts at a regional or statewide level. For instance, commenters expressed concern about the use of the Impact Analysis for Planning Model (IMPLAN) because this model does not address how implementation of the alternatives would affect specific local communities. Additionally, commenters indicated that the analysis does not include historical or qualitative information associated with local communities, which prevents the analysis from accurately estimating the socioeconomic impacts to local communities.

Commenters indicated that the analysis fails to quantify and, thereby, consider the importance of the oil and gas industry to the economic wellbeing of local communities throughout the Planning Area. Commenters expressed concern that an Economic Strategies Workshop was never conducted, which, as a result, renders the analysis inadequate because it does not include the input of the public

as it pertains to desired social and economic conditions. Additionally, commenters indicated that the analysis undervalues the potential output of oil and gas development with respect to job creation and other economic factors.

Summary Response:

The level of impact analysis for individual communities in the Proposed RMP and Final EIS provides as accurate and geographically specific an assessment as available data allow. Additionally, as described in the Proposed RMP and Final EIS appendices, the IMPLAN model uses economic sector information from the four counties (not the entire state of Wyoming) to calculate potential indirect and induced impacts. The Final EIS for the Proposed RMP is at the programmatic level, and subsequent site-specific NEPA analysis and other actions such as APDs will have separate environmental clearance processes that consider impacts on socioeconomics.

In response to comments, the Proposed RMP and Final EIS includes historical information on local communities in the affected environment (Chapter 3). The affected environment section for economic conditions provides detailed information about the contribution of the mining and oil and gas industries to employment, wages, and tax revenues for local as well as state and federal governments.

The description of the affected environment and impacts analysis for socioeconomics utilized the best and most appropriate data and methods. The BLM held an Economic Strategies Workshop for the RMP and EIS in 2008 and used results of the workshop, in combination with input obtained during scoping and cooperator and agency review of draft document versions, to inform and refine the affected environment and impacts analysis for socioeconomics.

Summary Comment #2046_1:

Commenters indicated that the analysis did not consider several potential socioeconomic impacts including those that would result from management of special designations, management actions such as seasonal restrictions, as well as potential oil and gas development in Mowry Shale Formation of the Bighorn Basin. Commenters indicated that the implementation of seasonal restrictions could potentially result in “boom and bust” scenarios. Commenters requested that the RMP and EIS include an analysis of impacts to affected communities that would result from a potential boom and bust scenario.

Summary Response:

The BLM reviewed the socioeconomic analysis in response to the comments and revised text including clarifying potential impacts of an aging population, consideration of differences in local ad valorem production tax credits between BLM provided information in the RMP and EIS and Ecosystem Research Group information, and other information, as appropriate. The alternatives included restrictions

resulting from special designations that were considered in the economic analysis.

The Proposed RMP and Final EIS contains discussion on the seasonal boom and bust cycle by comparison with Alternative C, which would provide exceptions to discretionary seasonal restrictions in OGMA and ROW corridors.

It is not possible to design specific mitigation at the RMP level, because the RMP will not directly authorize any on-the-ground activities. The appropriateness of onsite and offsite mitigation, and the methods to be used, must be tied to a proposal where specific impacts can be predicted. The range of alternatives analyzed in detail provides for development of such mitigation during the analysis of a specific proposal (see management actions 8001, 8004, and 8005).

Summary Comment #2046_2:

Commenters noted that none of the alternatives considered, but eliminated dealt with socioeconomics. Additionally, commenters raised concerns that the *Key Terms and Concepts by Resources* section only discusses socioeconomics in the context of mitigation. Commenters requested the inclusion of socioeconomic factors in the discussion of key concepts including, but not limited to, Livestock Grazing, Mineral Leasing, and Well Withdrawals. Commenters also provided data and recommendations for considering recreation and tourism data in the analysis.

Summary Response:

As noted by commenters, the BLM considered several alternatives that had corresponding connections to socioeconomic resources and scenarios and did not carry them forward as described in Section 2.3 of the Proposed RMP and Final EIS. In addition, the socioeconomic impact analysis considers the economic and social impacts of alternatives in their entirety, including all relevant effects from management actions in other sectors (e.g., livestock, geothermal, oil and gas, etc.). The BLM reviewed the provided data on recreation and tourism in the region and revised the socioeconomic analysis and sections, as appropriate.

Soil

Summary Comment #2045:

Commenters expressed concern regarding the WEPP model used to predict soil erosion rates for the Planning Area. Commenters requested that a more detailed description of the WEPP model parameters be given in the text of the Draft RMP and Draft EIS along with language explaining why those parameters were chosen. Commenters recommended that impacts to soils from certain resources and activities be re-assessed while considering the scientific literature and examples provided. Commenters also recommended identifying priority areas in the Planning Area for soil erosion management in the text.

Summary Response: With respect to issues pertaining to soil loss, Chapter 3, section 3.1.3 identifies the threshold for soil loss in the Planning Area. Currently, there is no data available regarding the number of acres in the Planning Area where soil loss thresholds have been exceeded. The BLM acknowledges the need for additional soils data in the Planning Area and Management Action 1015 requires future soil survey efforts include erosion rates and soil stability parameters.

Appendix V of the Proposed RMP and Final EIS provides details regarding the WEPP parameters; additionally, the BLM added additional references as needed to support statements within the Soils section of the Proposed RMP and Final EIS.

Special Status Species

Summary Comment #2036: Commenters indicated the level of information within the special status species alternatives analysis did not supply adequate details for the reader to draw conclusions about impacts among the different alternatives. Specifically commenters raised concerns and requested information about: (a) detailed protections offered to species from future developments; (b) the size and use of protective buffers; and (c) why the BLM did not include quantifiable data (acres) for comparison of impacts between alternatives.

Summary Response: The BLM developed and analyzed alternatives within the Proposed RMP and Final EIS using the best available information in compliance with federal laws, guidelines, and policies. As necessary, the BLM included additional references and analysis that support decisions concerning special status species management.

The Proposed RMP and Final EIS provides an estimate of potential surface disturbance, sufficient for making a reasoned choice among the alternatives, and employs the assumption that such disturbance would affect vegetation communities proportionally to their current extent. However, the exact location of projects and their effects on various habitat types will not be known until projects are proposed.

Summary Comment #2041: Commenters recommended several changes to the discussion and analysis for the mountain plover. These edits included requests to use alternative language, correct technical statements, and clarify management actions for mountain plover protection. In particular, commenters requested the BLM reevaluate its analysis and alternatives to reflect mountain plover preferred habitat conditions. Commenters also requested the BLM update the Proposed RMP and Final EIS to incorporate the recently released determination from the USFWS removing the mountain plover from consideration of protections under the Endangered Species Act (ESA).

Summary Response: The BLM revised the Proposed RMP and Final EIS to reflect the USFWS ESA determination for the mountain plover. However, despite its

change in status with the USFWS, the mountain plover is a BLM Wyoming special status species and, as such, requires additional consideration and conservation measures.

The BLM acknowledges that mountain plover prefer sparsely vegetated sites; within the Bighorn Basin, the birds inhabit areas with very little vegetation that, consequently, receive little pressure from grazing animals. The Bighorn Basin has an abundance of naturally sparse habitats for mountain plover nesting and the BLM and USFWS do not see the need for, and have not proposed to, create more through application of heavy grazing or other management. Where appropriate, the Proposed RMP and Final EIS have been revised to clarify the focus of habitat management for this species.

Summary Comment #2042:

Commenters raised concerns about the overall adequacy of the special status species analysis and indicated several areas that could benefit from more detailed explanations. Specifically, commenters requested additional information be included within the analysis and raised questions regarding: (a) detailed information on BLM management direction and monitoring actions pertaining to special status species protection and habitat; (b) the accuracy of facts and data presented by the BLM; (c) requests for detailed explanations of BLM's stated methods and assumptions for special status species; and (d) greater protections and safety measures for listed species.

Summary Response:

The BLM incorporated, in coordination with the USFWS and the WGFD, commenter requests for specific revisions and clarifications, technical edits, changes to management actions, and updates to data and mapping as appropriate.

The USFWS and WGFD are the lead authorities responsible for the protection, management, and monitoring of all flora and fauna species within the Planning Area. Both the USFWS and WGFD provided guidance to the BLM, which is reflected in the special status species sections and management actions in the Proposed RMP and Final EIS. In addition, the BLM coordinated with the USFWS and the WGFD in the collection of GIS data and the mapping of special status species.

Travel and Transportation Management

Summary Comment #2034:

Commenters indicated that travel management and travel restrictions would have a negative effect on energy development, grazing, and recreation uses. Commenters requested expansion of the analysis to fully describe the BLM's reasoning behind travel management designations, including references to other resource uses that would be affected by these designations. Commenters also recommended designating certain areas in the Planning Area as Off-Highway Vehicle (OHV) Riding Parks or All-Terrain Vehicle "Open" areas. Additionally, commenters requested that management actions include restrictions

that are more stringent in an effort to protect resources including, but not limited to, wildlife and cultural resources. In addition, commenters highlighted various instances of missing and/or inadequate information.

Summary Response:

The BLM reviewed and revised the RMP and EIS in response to comments including additional references to applicable travel management plans, revision and addition of definitions to the glossary, edits to management actions, and other revisions, as appropriate.

The BLM will address site-specific road closures during subsequent travel management planning. The goal of travel management in the RMP is to identify broad travel management designations (i.e., areas closed, open, or limited for travel).

The BLM must provide a reasonable range of alternatives, and given the resource values associated within suggested open OHV areas, the range of alternatives in the EIS is deemed reasonable and appropriate for consideration.

43 CFR 8342.1, Designation Criteria, includes a basis for considering open OHV areas, and other travel management designations and directs the BLM as follows: “(a) Areas and trails shall be located to minimize damage to soil, watershed, vegetation, air, or other resources of the public lands, and (b) Areas and trails shall be located to minimize harassment of wildlife or significant disruption of wildlife habitats. Special attention will be given to protect endangered or threatened species and their habitat.”

Public sentiment and BLM transportation and planning guidance does not support unlimited off-road, cross-country motorized travel. Generally, unlimited motorized cross-country travel may be warranted in areas where it does not affect other valuable resources, where conflicts with other recreational activities are insignificant, and where a substantial demand for this type of motorized recreational activity has been demonstrated.

Summary Comment #2034_1:

Commenters noted several inconsistencies between travel management acreages in GIS data and those reported in the RMP and EIS. Commenters also identified blank records and other data issues in the GIS data for travel management.

Summary Response:

The BLM reviewed the travel management data and information in the GIS files and the RMP and revised acreages, shapefiles, attributes, and maps, as appropriate.

Vegetation

Summary Comment #2033:

Commenters expressed concern regarding the overall analysis of vegetation in the RMP and EIS. Commenters indicated that the

vegetation information was not adequate and could be improved by using LANDFIRE data instead of GAP vegetation data; replacing incomplete inventories of existing conditions with more complete versions; comparing in greater detail historic and current vegetation conditions; reconciling discrepancies in acreages in the RMP and EIS and between the RMP and EIS and BLM-provided GIS data; and having a more in-depth discussion of the role of fire accompanied by tabular and spatial data. Commenters also recommended that the RMP and EIS provide a more detailed description of why certain events or activities are categorized as having an adverse or beneficial impact to vegetation.

Commenters expressed concern that the RMP and EIS does not provide significant changes in management for invasive species in the Planning Area and requested that the further assessment of invasive species management be initiated. Commenters requested that changes in AMPs be accompanied by a comprehensive monitoring study of the Planning Area based on livestock grazing as well as a comprehensive noxious weed inventory of the Planning Area. Additionally, commenters identified a number of technical edits related to vegetation including requests to use alternative language, correct technical statements and/or terms, define terms, and clarify language. Commenters requested that BLM include a variety of references in the text as well as in the alternatives.

Summary Response:

The BLM reviewed the provided vegetation comments and revised the RMP and EIS including adjustment and clarification of management actions, updates for ESA-listed and sensitive species, and other information, as appropriate.

The BLM will consider using LANDFIRE data in the future as part of keeping the Analysis of the Management Situation current. Neither the BLM nor any participating cooperators made a proposal to implement a comprehensive monitoring study of the vegetation resources, noxious weeds, or sensitive plant species within the Planning Area during the alternative development process. Therefore, under the Proposed RMP, the BLM will continue to manage the vegetation resources at the allotment and watershed level with an emphasis on large contiguous blocks of native plant communities.

The Wyoming North Zone FMP (May 2004) contains a more in depth discussion of the role of fire in each of the Planning Area's five Fire Management Units.

Visual Resources

Summary Comment #2032:

Commenters indicated that the proposed VRM restrictions would significantly reduce oil and gas development potential in the Planning Area. Some commenters stated that the BLM did not have the authority to impose VRM restrictions on state or private lands, as well

as on areas that have existing leases or permits for oil and gas development. In addition, commenters indicated that the determinations of visual inventory classes are unclear and not defined, specifically pertaining to sensitivity levels. Furthermore, commenters questioned the reasoning behind expanding several VRM classes from Alternative A to Alternative D. Commenters indicated that there are several editorial issues associated with the analysis.

Summary Response:

The BLM maintains an inventory of all resources on public lands, which includes maintaining an inventory of visual resources. As part of this RMP revision project, the WFO and CYFO conducted new inventories or updated their existing visual resource inventories. These updated inventories identified changes in sensitivity levels and scenic quality, which changed the Visual Resource Inventory (VRI) classes. Some areas moved from VRI Class II and III to IV, and other areas from VRI Class III and IV to II. The BLM reviewed the manageability of these VRI classes, resulting in the VRM classes analyzed in the Proposed RMP and Final EIS alternatives. The full visual resource inventories are available for public viewing at the CYFO and the WFO, and information on how the BLM conducts inventories is available in Manual 8410-1, Visual Resource Inventory (BLM 1986c).

The Proposed RMP only directs management of public lands and resources administered by the BLM within the Cody and Worland field offices. VRM management classes, therefore, do not apply to any state or private lands. The BLM added this information to the Proposed RMP and Final EIS.

In the case of split estate lands, the application of VRM management class objectives apply to the development of the mineral estate as they would to federal mineral estate on federal surface lands, provided the stipulations do not adversely affect the surface owner's land use or actions. Exceptions to surface development restrictions could be granted if requested or agreed to by the surface owner.

Water

Summary Comment #2031:

Commenters requested that the BLM include additional protective management for water resources. Specific requests included NSO restrictions for areas proximate to drinking water sources, such as aquifers, and the identification of BMPs and monitoring programs to protect and evaluate water quality. Commenters requested justification or clarification concerning several management actions.

Commenters also questioned the BLM's authority to regulate surface water quality, which they noted was under the jurisdiction of WDEQ.

Summary Response:

The BLM revised the text in the Proposed RMP and Final EIS where appropriate to provide additional information and references, and to

clarify the intent of management actions. BLM clarified the intent to require water management plans for new authorizations resulting in produced water. Additionally BLM made changes to Management Action 1029, requiring the development of a groundwater monitoring program in accordance with state requirements.

Appendix L includes a list of standard BMPs for groundwater protection. The inclusion of circumstances under which BMPs would be applied is beyond the scope of this RMP, however, general criteria for application of BMP's to projects is provided in the final document.

While the BLM acknowledges that WDEQ is the authority for water regulation in the State of Wyoming, it is the BLM's responsibility to consult with WDEQ regarding water-related issues during permitting processes that occur on public lands and to follow-up if issues associated with permitted discharges are discovered.

Summary Comment #2031_1:

Commenters indicated that the water section was missing information demonstrating compliance with Wyoming water laws as well as the characterization of specific water resource types such as groundwater and Class I waters. Additionally, commenters indicated that the analysis failed to use the most recent data pertaining to the characterization and classification of specific water resource types. Commenters indicated that the analysis did not provide data or baseline conditions for water resources indicators that would allow for an evaluation of potential impacts including chemical characteristics, physical characteristics, and biological characteristics. Commenters also questioned the determination that no violations of water quality standards would occur under any of the alternatives. Finally, commenters expressed concern that the analysis did not consider the beneficial uses of water produced by development activities including, but not limited to livestock grazing and the creation of riparian zones and wetlands.

Summary Response:

The BLM revised the text in the Proposed RMP and Final EIS based on commenter input to provide definitions, technical corrections, additional text, and clarifications as needed. Specifically, the BLM included additional discussion on the beneficial and adverse effects of produced water discharges. The BLM revised the document where appropriate to include commenter suggested data and reference updates, and conducted additional reviews to ensure consistency with current federal laws and guidance.

BLM RMP's are planning level documents that cannot analyze many site-specific impacts that will affect water quality. While the BLM acknowledges that waters can be described based on their chemical, physical, and biological characteristics, the BLM did not intend these to be the impact indicators used in Chapter 4 of the RMP and EIS and, therefore, did not include baseline information on these characteristics in Chapter 3. Specific water quality indicators

suggested by commenters would likely be addressed during permitting for site-specific actions.

The BLM recognizes that many stream segments do not meet state water quality standards (refer to Chapter 3, Table 3-6). To this end, the BLM revised Chapter 2 and 4 of the final document to state that no additional impacts to surface water quality are anticipated other than the potential for those waters currently impaired to continue to exceed standards for fecal coliform and E. coli. In addition, the BLM revised Chapter 4 to include an expanded discussion of Management Action 1040, which would have a positive impact on water quality due to cooperation with adjacent landowners and implementation of BMPs.

Summary Comment #2031_2:

Commenters expressed concern related to the assumptions and modeling used in the water quality analysis. Commenter questioned the assumption that Coalbed Natural Gas (CBNG) produced water would be of the same quality and quantity as produced water from oil and gas development. Additionally, commenters indicated that the WEPP model utilized in the analysis was inadequate due to underestimations of natural and manmade erosion and runoff rates. Commenters stated that the model did not appear to have been calibrated to represent conditions specific to the Bighorn Basin.

Summary Response:

The BLM revised the text in the Proposed RMP and Final EIS to provide additional text, reference, and clarifications as appropriate. Specifically, the BLM included information on the role of the Wyoming Pollutant Discharge Elimination System in increasing beneficial impacts and reducing adverse impacts, the quality of produced water from CBNG versus conventional oil and gas development, and an expanded discussion on the assumption and limitations of the WEPP model.

The WEPP model is a high level-planning tool; the results presented in the Proposed RMP and Final EIS are not intended to show an accurate projection of total natural and manmade runoff in the Planning Area, but instead to provide a way to evaluate the effects of the alternatives in relation to one another. This type of comparative analysis is appropriate at the RMP level; impacts on runoff will vary based on project type, mitigation and BMPs applied, and other site-specific factors that will be identified at the project level.

Wild and Scenic Rivers

Summary Comment #2018:

Commenters expressed concern regarding the selection of a Preferred Alternative that does not protect and enhance potential Wild and Scenic River (WSRs) resources in the Planning Area. Commenters recommended that the BLM give additional information in the Proposed RMP and Final EIS regarding the basis for the listing of waterways within the Planning Area with special consideration for

consistency of WSR designation between the BLM and agencies with which the BLM shares a boundary.

Summary Response:

The BLM developed and analyzed a reasonable range of alternatives for the Proposed RMP and Final EIS. WSR guidance directs the BLM to analyze suitability for each eligible waterway segment before making a decision on whether or not to recommend an eligible waterway segment to Congress for inclusion in the Wild and Scenic River System. The BLM used the RMP revision as the suitability analysis, which included scoping, public meetings, and intimate planning with the local cooperators and public comments to the Draft RMP and Draft EIS. Appendix F addresses the determination of suitability. In addition, the WFO and CYFO WSR reports are available on the project website.

Wild Horses

Summary Comment #2030:

Commenters presented recommendations on the potential management of wild horses in the Draft RMP and Draft EIS that would both expand and reduce wild horse herds and ranges. Commenters requested the BLM include an option for increasing the appropriate management level for wild horse Herd Management Areas (HMAs). Commenters also requested an option for decreasing the appropriate management level and the AUMs allotted for wild horses or managing wild horses to the lowest allowable appropriate management level. Additionally, commenters suggested the BLM expand HMA boundaries or manage all HMAs and HAs for wild horses, while other commenters suggested the BLM remove wild horses from certain HMAs. Other comments either requested the consideration of additional specific protections for wild horses or questioned the need for specific management actions considered in the Draft RMP and Draft EIS.

Commenters requested that the Proposed RMP and Final EIS include provisions for rangeland health assessments for the HMAs.

Commenters identified a number of technical edits related to wild horses, including requests for BLM to use revised language, correct technical statements, define terms, and clarify language.

Commenters also requested that BLM include a variety of references in the text as well as in the alternatives.

Summary Response:

The Proposed RMP and Final EIS analyzes a full range of alternatives. This range included alternatives that prioritize forage allocation for wild horses, as well as alternatives that prioritize other resources and uses. Some issues (e.g., stocking level for the HMAs and setting appropriate management level) are not RMP level decisions, and would be addressed as applicable in subsequent NEPA or permit renewal processes, or HMA plans.

Section 3.4.10 Wild Horses of the Draft RMP and Draft EIS incorporates by reference previous analysis that determined that managing wild horses in Herd Areas resulted in management issues or conflicts that were most appropriately resolved by the removal of wild horses or the management of horses in smaller HMAs within the original Herd Area boundaries. The BLM reviewed these analyses and determined them to be valid, with the exception of a portion of the McCullough Peaks area. In the case of McCullough Peaks, the BLM considered alternatives that would expand the HMA boundary to address issues and conflicts.

The BLM revised the text in the Proposed RMP and Final EIS based on commenter input to provide additional information, definitions, details, technical edits and citations as deemed necessary.

Wilderness Study Areas

Summary Comment #2019:

Commenters recommended that the acreage for Wilderness Study Areas (WSAs) in the Planning Area be increased to protect, through adaptive management, wilderness characteristics and WSAs. Additionally, commenters expressed concern that citizen proposed WSAs were not included in the proposed alternatives. Commenters requested a description of the reasoning behind recommending WSAs near ongoing operations that may preclude the area from WSA designation.

Summary Response:

The BLM's authority to recommend areas as WSAs under FLPMA section 603 (43 U.S.C. § 1782) has expired and only Congress can make determinations regarding the status of WSAs pending before it. Comments requesting consideration of WSAs have been addressed through identification and analysis of lands with wilderness characteristics.

The BLM conducted a wilderness characteristics inventory of lands in the Planning Area to identify areas with wilderness characteristics. The BLM disclosed the results of that inventory and developed and analyzed a reasonable range of alternatives for managing areas with wilderness characteristics. The inventory forms are available for public review at the WFO and the CYFO and on their respective websites.

Wildlife

Summary Comment #2020:

Commenters raised several questions and concerns regarding wildlife management in the alternatives. Specifically, commenters raised concerns and provided information for BLM's consideration including: (a) recommended constraints on federal mineral estate in Wildlife Management Areas; (b) requests for clarification of management including leasing restrictions in the Absaroka Front; (c) preferences to

allow reasonable access to existing oil and gas well locations even in sensitive wildlife habitat; (d) concerns some alternatives are not in compliance with BLM’s wildlife policy; (e) recommendations for BMPs; (f) recommendations regarding applying seasonal wildlife protections on a case-by-case basis; (g) flexibility in management to effectively manage wildlife through hunting; (h) additional information on wildlife management challenges associated with predation; (i) and requests for revision of wildlife information in the Affected Environment.

Summary Response:

The BLM updated wildlife management in the alternatives and other wildlife-related text in the Proposed RMP and Final EIS, including revisions to the referenced management actions, clarification of terminology, clear identification of areas open and closed to leasing under each alternative, addition of references and citations to support stated information, incorporation of submitted commenter input, and other revisions, as appropriate.

Summary Comment #2022:

Commenters provided several edits for GIS and mapping, as well as other revisions to support the wildlife impacts analysis. Commenters questioned or raised concerns pertaining to: (1) the need for additional maps and revision to big game wildlife species maps; (2) inconsistencies between the BLM and WGFD big game crucial winter range acreages and mapping; (3) factual corrections on area classification; and (4) missing acreage and/or details within the analysis, including summer range acres unavailable for and/or closed to oil and gas development.

Summary Response:

The BLM revised the Proposed RMP and Final EIS in response to comments, as appropriate. The BLM coordinated with WGFD during the preparation of the Draft RMP and Draft EIS and the WGFD concurred with the big game crucial winter range maps as depicted in the Proposed RMP and Final EIS.

Summary Comment #2025:

Commenters raised concerns about completeness of data presented in the wildlife analysis and indicated several areas that could benefit from additional explanations. Specifically, commenters requested additional information be included in the analysis and raised questions regarding: (1) the impacts/effects resulting from wildlife and livestock grazing management, mineral development, and other resource uses; (2) the BLM’s quantification of baseline data; and (3) requests for detailed explanation of BLM’s methods and assumptions for wildlife resources.

Additionally, commenters indicated the Draft RMP and Draft EIS had several deficiencies, specifically in relation to: (a) a clearly stated monitoring and evaluation protocol for the RMP goals and objectives; (b) inconsistencies between objectives for wildlife and special status species; and (c) clear direction regarding public and land manager involvement with the monitoring and evaluation protocol.

Summary Response:

The BLM incorporated commenter requests for specific revisions and clarifications, technical edits, and updates to data as appropriate. Appendix D of the Draft RMP and Draft EIS outlines opportunities for public involvement.

Big game and wildlife population numbers and management are ultimately a WGFD issue. When wildlife population numbers and effects on other resources become an issue, the BLM has several ways to resolve the issue. Examples include habitat enhancement projects to disperse elk use, increased hunter access, and increased harvest negotiated with the WGFD. Additionally, the BLM proposed to help the WGFD manage wildlife populations towards stated objectives by managing identified important habitats (e.g., aspen, willow, mixed conifer and spruce fir communities).

Wilderness Characteristics

Summary Comment #2027:

Commenters expressed concern that based on the guidelines set forth in BLM Manual 6301 the BLM did not properly conduct the lands with wilderness characteristics inventory for the Planning Area.

Commenters requested that the BLM include a more detailed discussion, with references to guidance material, of the reasoning behind the inclusion of each land with wilderness characteristics identified in the inventory. Commenters noted that many proposed lands with wilderness characteristics contained numerous roads and other man-made structures that were not discussed in the text or disclosed on the maps of the RMP and EIS. In addition, commenters recommended the BLM clarify the definition of roads as used in the lands with wilderness characteristics inventory.

Commenters also expressed concern regarding the recent changes in the Department of the Interior's administration of lands with wilderness characteristics and recommended removal of all lands with wilderness characteristics references from the text of the Draft RMP and Draft EIS.

Some commenters requested that BLM institute specific management prescriptions for lands identified as having wilderness characteristics for protection of those characteristics. Commenters expressed concern that the Draft RMP and Draft EIS did not fully address how the proposal of lands with wilderness characteristics would impact resource uses such as ranching and mineral development.

Commenters identified a number of technical edits related to wilderness characteristics including requests to use alternative language, correcting technical statements and/or terms, defining terms, and clarifying language. Commenters also requested the BLM include a variety of references in the text as well as in the alternatives.

Summary Response:

FLPMA, Section 201, requires the BLM to maintain its inventory of wilderness characteristics, which includes augmenting inventory efforts by analyzing additional and new information submitted by the public. BLM's inventory obligation is a continuous one and is not merely an activity that BLM completes during the land use planning process. The intent of an RMP is to set forth the management of areas with inventoried wilderness characteristics, which includes analyzing potential management of areas containing wilderness characteristics for those characteristics.

The BLM is not required to manage lands outside of WSAs or Wilderness Areas for wilderness characteristics. However, the BLM developed a reasonable range of alternatives for lands with wilderness characteristics that were analyzed and considered for the Proposed RMP and Final EIS. This range included alternatives designed to protect wilderness characteristics in these areas, as well as alternatives without such protections. Where specific management actions for the protection of wilderness characteristics were considered, managed lands with wilderness characteristics would still allow for grandfathered uses and would be subject to valid existing rights.

Based on commenter input, the BLM revised the lands with wilderness characteristics sections in the Proposed RMP and Final EIS as appropriate to provide clarifying information, define terminology, and provide references.

The BLM has been updating its inventory of lands with wilderness characteristics consistent with FLPMA, and the discussion in the Proposed RMP and Final EIS is based on information in the updated inventory. As such, the Proposed RMP and Final EIS is consistent with recent policy and guidance (BLM Manuals 6310 and 6320) on lands with wilderness characteristics. For example, while lands with wilderness characteristics continue to be a resource the BLM is required to consider consistent with FLPMA, the BLM concurs that references to the term "Wild Lands" and Secretarial Order 3310 are no longer appropriate and have, therefore, removed them in the Proposed RMP and Final EIS.

4.2.2. Supplement to the Draft RMP and Draft EIS

Similar to that described for the Draft RMP and Draft EIS, the summary comments and responses are presented below, and generally organized by BLM resource program or other appropriate issue categories (e.g., greater sage-grouse) as described in Table A-2. The summary comment numbers below can be used to track the summary comment and response to the individual comments presented in Attachment D.

Air Quality

Summary Comment #3002: Commenters requested BLM provide the rationale for concluding that Alternative E will not exceed the NAAQS or Wyoming Ambient Air Quality Standards.

Commenters questioned why Tables 4-3 and 4-4 only included carbon dioxide emissions, did not include other greenhouse gases, and the years chosen for the carbon dioxide analysis. Commenters suggested “equivalent” be removed in the titles of Tables 4-3 and 4-4 and the footnotes deleted. Commenters requested BLM provide a reference supporting the statement that carbon dioxide from prescribed fires is considered to be counterbalanced by increased productivity of existing larger vegetation and new growth.

Summary Response: The BLM updated the text in the Air Quality sections to provide additional explanation, clarification and/or references; updated the emissions spreadsheets and tables including adding CH₄ and N₂O emissions; and added an Air Resource Management Plan as an appendix to the Proposed RMP.

Areas of Critical Environmental Concern

Summary Comment #3001: Commenters requested the BLM provide clarification on the ACEC designation process, why the ACECs were necessary for conservation of greater sage-grouse, and possible acreage discrepancies between ACEC boundaries overlapping federal mineral estate. Other commenters requested BLM develop other habitat management solutions instead of designating greater sage-grouse ACECs.

Additionally, commenters questioned the scientific facts behind the proposed ACEC designations, if the ACECs met the relevance and importance criteria for designation, and suggested ACEC designation violated the BLM multiple use mandate. Commenters offered support for Alternative D suggesting that the protections in place under the Wyoming Governor’s EO 2011-5 were sufficient to protect greater sage-grouse and its habitat, stating that alternatives E and F were not consistent with the Wyoming Governor’s EO 2011-5. Commenter noted that the two EOs used to inform sage-grouse management efforts had been replaced or are no longer in effect. Other commenters called into question the level of constraints on oil and gas development described in the document due to ACEC designation. Commenters noted that ACEC designation unreasonably encumbered other resource uses and prioritized protection of greater sage-grouse over other resource uses. Commenters also offered that due to the size of the area designated as ACECs, enforcement and management would be burdensome for BLM.

Summary Response: The BLM developed the greater sage-grouse ACECs (under alternatives E and F in the Supplement) to respond to the needs to

address goals, objectives, and conservation measures to conserve greater sage-grouse in response to the potential of its being listed under the ESA, as well as to consider ACEC nominations submitted by the public in response to the 2011 NOI for preparation of EISs and Supplemental EISs to Incorporate Greater Sage-grouse Conservation Measures into Land Use Plans and Land Management Plans (76 FR 77008, December 9, 2011). Additionally, alternatives E and F thoroughly considered the conservation measures identified in the NTT report, as required by the BLM National Greater Sage-Grouse Land Use Planning Strategy (IM 2012-044). The values of concern for both proposed ACECs are sagebrush steppe vegetation communities that provide habitat for special status wildlife species, including areas designated as greater sage-grouse Key Habitat Areas and Priority Habitat Management Areas (PHMAs).

BLM's planning process allows consideration of a range of alternatives that identifies and incorporates appropriate regulatory mechanisms to address these needs to ensure that a balanced management approach was recommended. The Supplement included alternatives that provide a greater and lesser degree of restrictions in various use programs, but would not eliminate or invalidate any valid existing development rights.

BLM's Proposed RMP and Final EIS is consistent with the Wyoming Governor's EO 2011-5 that has been determined sufficient to conserve greater sage-grouse throughout Wyoming.

The BLM provided additional explanation about the ACEC nomination process, updated acreages, and updated text as needed.

Climate Change

Summary Comment #3003: Commenters suggested the BLM did not account for the impacts of livestock grazing on climate change, except for acknowledging that reducing AUMs would reduce methane emissions from cattle. Commenters requested additional analyses be conducted for the Proposed RMP and Final EIS, including impacts of livestock grazing on carbon sequestration and vegetation utilization.

Summary Response: The comments regarding the impacts of livestock grazing on climate change, carbon sequestration, and vegetation utilization are outside the scope of the Supplement. Climate change is addressed as appropriate in the Proposed RMP.

Consultation

Summary Comment #3006: Commenters recommended close coordination with all appropriate state and federal wildlife agencies (e.g., Western Association of Fish and Wildlife Agencies [WAFWA], WGFD) to minimize and mitigate adverse impacts to wildlife species from BLM-authorized activities.

Specifically, commenters recommended working with state agencies to develop planning and habitat management objectives to maintain population objectives and ensure RMP management is flexible enough to respond to changes in state management needs, including coordinating WAFWA recommended dates for big game restrictions and greater sage-grouse management.

Summary Response:

The USFWS and WGFD are cooperating agencies for the RMP and involved in development of the Final EIS. Current and proposed BLM management is designed to help support WGFD population objectives for big game and greater sage-grouse. The management actions related to fish, wildlife, and special status species, included in this RMP, are expected to mitigate impacts to wildlife and are based on recommendations from the appropriate state and federal agencies; the BLM will continue to work with the USFWS and WGFD when implementing the RMP.

Cultural Resources

Summary Comment #3007:

Commenters recommended the BLM not unreasonably constrain oil and gas development since it often leads to discovery and preservation of cultural resources due to Section 106 compliance.

Summary Response:

The BLM developed the Supplement to ensure that a balanced multiple-use management strategy addresses the protection of greater sage-grouse while allowing for utilization of renewable and nonrenewable resources on the public lands.

Cumulative Impacts

Summary Comment #3008:

Commenters indicated that the cumulative impacts analysis did not adequately address the potential impacts of greater sage-grouse management actions on the local economy and resource uses when combined with existing or proposed regulations or plans of other state and federal agencies including the Shoshone Forest Management Plan, the Big Horn River Total Maximum Daily Load Study, and current WGFD and USFWS practices. Commenters also suggested the BLM address the cumulative impacts of Greater sage-grouse management on oil and gas development due to an increased length in permitting.

Commenters suggested cumulative impacts of greater sage-grouse management were understated and requested BLM analyze of the cumulative impacts on livestock grazing from other RMP revisions within Wyoming and Idaho.

Commenters expressed concern that the cumulative impacts analysis did not include information from the USGS baseline study that identifies overlapping direct and indirect impacts on priority greater sage-grouse habitat.

Summary Response:

The BLM thoroughly explained its consideration and analysis of cumulative effects in the Supplement in Section 4.9, including assumptions regarding proposed projects and other reasonably foreseeable future actions. The Supplement considered the present effects of past actions, to the extent that they are relevant, and present and reasonably foreseeable (not highly speculative) federal and non-federal actions, taking into account the relationship between the proposed alternatives and these reasonably foreseeable actions.

The BLM complied fully with the requirements of Council on Environmental Quality (CEQ) regulations (40 CFR 1508.7) and prepared a cumulative impact analysis to the extent possible based on the broad nature and scope of the proposed management options under consideration at the land use planning level.

Additionally, to ensure consistency across the greater sage-grouse's range, BLM's National Operation Center conducted management zone and range-wide cumulative impact analysis, which is included in the Proposed RMP Chapter 7.

Fire and Fuels

Summary Comment #3011-1:

Commenters requested the BLM provide additional explanation and/or information on fire and fuels management, including effectiveness of post-fire stabilization, post-fuels-management for seeded or pre-treatment native plants, management to minimize adverse impacts of fire, if livestock exclosures also prevent wildlife grazing, areas receiving less than 12 inches annual precipitation, impacts attributed to livestock grazing and achieving 65 percent or more of Historical Climax Plant Community.

Commenters expressed concern that management of prescribed fire in ACECs was overly restrictive, indicating fire was an important tool in treating sagebrush, improving forage, controlling invasive species, and preventing catastrophic wildfires. Commenters asserted that impacts on greater sage-grouse from proposed fire management was not inadequately addressed, likely to harm greater sage-grouse in the long term, and indicated the analysis should be revised. Other commenters questioned allowing use of fire and mechanical treatments in ACECs, suggesting they were harmful to greater sage-grouse and their habitat, and indicated that prescriptions the use of fire should be strengthened.

Commenters were concerned over management that closed burned areas to livestock grazing for extended periods to allow vegetation to recover and meet greater sage-grouse habitat objectives. Specific concerns raised include: (1) impacts to livestock grazing, (2) the length of time needed for woody and herbaceous plants to meet the greater sage-grouse habitat objectives, (3) closing entire allotments and/or pastures if they could not be fenced from unburned areas, and (4) lack

of justification for this management. Commenters suggested that livestock grazing could assist in recovery by eliminating competitive plants and that proper livestock grazing management in sensitive areas is effective.

Commenters also submitted recommendations from other RMP amendments for incorporation in the Proposed RMP and Final EIS.

Summary Response:

The management of the greater sage-grouse ACECs under alternatives E and F represent approaches to managing these areas that were not considered in the Draft RMP and Draft EIS. As specific actions come under consideration, the BLM will conduct subsequent NEPA analyses that include site-specific project and implementation-level actions. Site-specific concerns and more detailed environmental descriptions will be addressed when project-level reviews are tied to the analysis in this EIS (40 CFR 1502.20, 40 CFR 1508.28). In addition, as required by NEPA, the public will be offered the opportunity to participate in the NEPA process for any site-specific actions. The BLM would conduct stabilization and rehabilitation consistent with BLM policy and guidance and in accordance with the FMP. There are no restrictions or limitations on stabilization and rehabilitation in specific areas under any of the alternatives.

Implementation of fuels management activities would be designed with consideration of the Required Design Features (RDFs) and BMPs for greater sage-grouse identified in Appendix L. If prescribed fire is to be used for vegetation treatments, the burn plan will clearly indicate how the Conservation Objectives Team (COT) objectives will be addressed and met by its use, and why alternative techniques were not selected. Additionally, a Risk Assessment will be completed for implementation of prescribed fire in relation to the greater sage-grouse goals and objectives.

The BLM drafted a monitoring framework that is included in the Proposed RMP as Appendix Y. The appendix describes the process that the BLM will use to monitor implementation and effectiveness of land use plan decisions. The monitoring framework includes monitoring at various scales specific to greater sage-grouse habitat, consistent indicators to measure and metric descriptions for each of the scales, analysis and reporting methods, and the incorporation of monitoring results into adaptive management. To accomplish effectiveness monitoring, the BLM will analyze the monitoring data to characterize the relationship among disturbance, implementation actions and habitat condition at the appropriate and applicable geographic scale or boundary.

During scoping, individuals and conservation groups submitted management direction recommendations for protection and conservation of greater sage-grouse and their habitat. The BLM reviewed the recommendations considering resource allocation

opportunities and internal sub-regional BLM input to develop the management direction for greater sage-grouse under alternatives E and F. Examples of conservation measures included in the alternatives would include a 3-percent cap on disturbance in priority habitat, RDFs, and ROW exclusion areas in priority habitat.

Greater Sage-Grouse

Summary Comment #3035_1: Commenters expressed concern over the management prescribed under the alternatives the BLM analyzed in the Supplement to meet their conservation goals and objectives for greater sage-grouse. As a result, commenters requested the BLM consider and analyze different alternatives such as a “no grazing” alternative, a “50 percent reduction in grazing” alternative, a BLM Manual 6840 alternative, a “Sage-Grouse Recovery” alternative, and a “sagebrush ecosystem” ACEC. Additionally, comments indicated the No Action Alternative analysis should quantify ongoing conservation efforts to protect greater sage-grouse and their habitat. Some commenters requested the BLM explain why current regulatory mechanisms are or are not effective in the sage-grouse conservation effort.

Commenters questioned the BLM’s rationale for designating the Key Habitat Areas or PHMAs as ACECs indicating there was no justification or supporting data. Other commenters stated preference for Alternative E because of its strong conservation of sage-grouse habitat as an ACEC.

Several commenters requested the BLM’s management actions be consistent with the Wyoming Governor’s EO 2011-5 which has been deemed successful, citing the EO’s measures were supported by the USFWS and BLM’s own policies and guidance and thus should be adopted in the Proposed RMP. Commenters requested the BLM omit the use of Key Areas to stay consistent with EO 2011-5 as well as change or better define specific terms. Additionally, commenters asked BLM to ensure consistency with EO 2013-3.

Other commenters had concerns that the Wyoming Governor’s EO 2011-5 and BLM policies and guidance (IM 2012-019 and the NTT Report) do not uphold BLM’s obligation to prevent degradation of greater sage-grouse habitat or a decline in population, supporting designation of Key Habitat areas over Core Areas and suggesting modifications.

Commenters requested that the BLM make management prescriptions consistent with the NTT Report as specified by IM 2012-044, while others stated the BLM had not analyzed the measures in the NTT Report or they needed to be more protective. Commenters questioned the science behind the NTT conservation measures, stated they were not always appropriate or did not address the immediate threats, was not based on Manual 6840 or the ESA, and that other

conservation measures should be considered and implemented. Additionally, commenters requested the BLM provide their analysis of NTT conservation measures and consider other wildlife protections that would also be beneficial for greater sage-grouse.

Some commenters asked that habitat designations be consistent with the NTT Report. Other commenters called for the BLM to designate priority and general Habitat boundaries as well as other criteria that match the ESA efforts from USFWS. Commenters also requested that the TLS be changed to NSO to better protect greater sage-grouse and their habitat, while others questioned why a TLS was necessary if activities were precluded by NSO depending on the alternative.

Summary Response:

The management of the greater sage-grouse priority habitat ACECs in alternatives E and F represent approaches to managing these areas that were not considered in the Draft RMP and Draft EIS and was derived from recommendations in the NTT report as well as public comments. The BLM considered a reasonable range of alternatives during the greater sage-grouse planning process in full compliance with the NEPA. The CEQ regulations (40 CFR 1502.1) require that the BLM consider reasonable alternatives that would avoid or minimize adverse impacts or enhance the quality of the human environment. While there are many possible alternatives or actions to manage public lands and greater sage-grouse in the Planning Area, the BLM fully considered the management opportunities presented in the Analysis of the Management Situation and the planning issues and criteria developed during the scoping process to determine a reasonable range of alternatives. As a result, two new alternatives were analyzed in detail in the Supplement that best addressed the issues and concerns identified by the affected public. The range of alternatives in the Supplement and Draft EIS represented a full spectrum of options including a no action alternative (current management, Alternative A, Draft EIS).

Nominations for greater sage-grouse-related ACECs were submitted by members of the public in response to the 2011 NOI for preparation of EISs and Supplemental EISs to Incorporate Greater Sage-grouse Conservation Measures into Land Use Plans and Land Management Plans (76 FR 77008, December 9, 2011). The BLM reviewed these nominations and found importance and relevance criteria to be met, warranting consideration in the Bighorn Basin RMP Revision Project. Although these ACEC nominations were submitted in response to the December 2011 NOI, ACEC nominations can be submitted by any individual or organization inside or outside of the BLM at any time during the development of a land use plan. Alternatives E and F each propose the designation of a greater sage-grouse-related ACEC that simultaneously responds to the needs to consider ACEC nominations submitted by the public and to thoroughly consider the conservation measures identified in the NTT report, as referenced in the BLM

National Greater Sage-Grouse Land Use Planning Strategy (IM 2012-044).

The BLM's Proposed RMP was modified to be consistent with the Wyoming Governor's EO 2011-5 that has been determined sufficient to conserve greater sage-grouse throughout Wyoming and WAFWA Management Zones I and II.

The range of alternatives is based upon analysis of public scoping comments as well as information provided in the NTT report, the U.S. Geological Survey's Baseline Environmental Report (BER), the COT report, and state management plans. The alternatives represent different degrees of and approaches to balancing resources and resource use among competing human interests, land uses, and the conservation of natural and cultural resource values, while sustaining and enhancing ecological integrity across the landscape, including plant, wildlife, and fish habitat. For example, alternatives E and F incorporate adjustments to the NTT report (NTT 2011) based on cooperating agency input to provide a balanced level of protection, restoration, enhancement, and use of resources and services to meet ongoing programs and land uses. Anthropogenic surface disturbance would be managed not to exceed 3 percent in ecological sites that support sagebrush within Preliminary Priority Habitat (Figure 2-1, Ecological Sites Supporting Sagebrush in Preliminary Priority Habitat, in Appendix B, Figures).

Greater sage-grouse conservation measures in *A Report on National Greater Sage-grouse Conservation Measures* (NTT 2011) were used to form BLM management direction under alternatives E and F, which is consistent with the direction provided in BLM Washington Office IM 2012-044.

The habitat delineations were created by the BLM and USFWS in collaboration with state fish and wildlife agencies that are responsible for managing and monitoring greater sage-grouse populations. Based on the BER and in cooperation with the WGFD, the BLM created the Preliminary Priority Habitat and Preliminary General Habitat areas (Mainer et al. 2013). For the Supplement to the Bighorn Basin Draft RMP and Draft EIS, the BLM worked with the WGFD and presented the scientific information used to determine the PPH and PGH delineations and findings in the Supplement's Executive Summary. The alternatives analyzed in the Supplement identified two areas considered as priority habitat areas.

The BLM has identified Alternative D as its Proposed RMP, which is consistent with the Wyoming Governor's EO 2011-5. The stipulations (TLS and NSO) in management actions 4116, 4117, and 4118 have been revised accordingly.

Summary Comment #3035_2:

Commenters felt the baseline information used by BLM in the Supplement's analysis was not supported by scientific facts to

conserve greater sage-grouse and suggested different sources be used instead. These sources were provided because of the recent information they could provide for the analysis. Commenters questioned the greater sage-grouse habitat thresholds established by BLM and at what scale they would be applied. Commenters questioned if the new information used in the development of alternatives E and F was used in the development of alternatives A through D, suggesting the newer information should be incorporated in alternatives presented in the Draft RMP and Draft EIS, which would improve those management alternatives.

Commenters also asked the BLM to acknowledge that the State of Wyoming has the sole authority to regulate greater sage-grouse as a game animal asserting BLM uses the terms habitat management or conservation as de facto authorization to manage the species.

Commenters requested a map and data be presented depicting the amount of land changed from sagebrush to agricultural land and that BLM be specific about where RDFs apply as well as provide exception criteria. Some commenters questioned if the management recommendations in the Supplement would measure up to the USFWS Policy for Evaluating Conservation Efforts criteria.

Commenters were concerned that the NTT Report was not the “best available science” to inform sage-grouse management in the Bighorn Basin. Commenters stated the BLM had not considered other more appropriate and effective sources such as those developed by USFWS and the USGS. Other commenters felt differently regarding the NTT report indicating that the NTT conservation measures for greater sage-grouse and their habitat were more appropriate, supportable, and more conservative than EO 2011-5.

Commenters asked the BLM to consider greater sage-grouse population trends suggested by hunting harvest data for projecting populations. Other commenters stated that population information presented in the Supplement is inaccurate, inadequate, unsupported, and questioned the sources used by BLM for their analysis. Commenters also questioned if the impacts to greater sage-grouse populations from oil and gas development were uniform across the planning area and disputed information in the Supplement that attributed population declines to oil and gas development.

Commenters were concerned that the NTT Report was not the “best available science” to inform greater sage-grouse management in the Bighorn Basin. Commenters stated the BLM had not considered other more appropriate and effective sources such as those developed by USFWS and the USGS. Other commenters felt differently regarding the NTT report indicating that the NTT conservation measures for greater sage-grouse and their habitat were more appropriate, supportable, and more conservative than EO 2011-5.

Commenters requested the BLM define occupied lek throughout the document and the process by which leks are deemed occupied or unoccupied asserting leks with no activity for 3 years be considered unoccupied. Commenters requested maps of winter concentration areas be made available as well as the acreage amount of the winter concentration areas.

Summary Response:

Before beginning the Supplement and throughout the planning effort, the BLM considered the availability of data from all sources, adequacy of existing data, data gaps, and the type of data necessary to support informed management decisions at the land-use plan level. The data needed to support broad-scale analysis of the Bighorn Basin Planning Area are substantially different than the data needed to support site-specific analysis of projects. The requisite level of information necessary to make a reasoned choice among the alternatives in an EIS is based on the scope and nature of the proposed decision. The baseline data provided in Chapter 3 and various appendices is sufficient to support, at the general land use planning-level of analysis and the environmental impact analysis (Chapter 4) resulting from management actions presented in the Supplement. The BLM used the most recent and best information available that was relevant to a land-use planning-level analysis including the U.S. Geological Survey's BER (BER; Manier et al. 2013). The U.S. Geological Survey's BER looked at each of the threats to greater sage-grouse identified in the USFWS's "warranted but precluded" finding for the species. For these threats, the report summarized the current scientific understanding, of various impacts to greater sage-grouse populations and habitats. The report also quantitatively measured the location, magnitude, and extent of each threat. These data were used in the planning process to describe threats at other levels, such as the sub-regional boundary and WAFWA Management Zone scale, to facilitate comparison between sub-regions. Additionally, the BLM consulted with, collected, and incorporated data from other agencies and sources, including but not limited to the USFWS and the WGFD. As a result of these actions, the BLM gathered the necessary data essential to make a reasoned choice among the alternatives analyzed in detail in the Supplement and Proposed RMP. Finally, the BLM has made a reasonable effort to collect and analyze all available data.

The WGFD manages wildlife within Wyoming, while the BLM focus is on managing habitat and the BLM will continue to work with the WGFD to meet state wildlife population objectives. While USFWS has responsibility for threatened and endangered species, the BLM manages a significant portion of greater sage-grouse habitat. Thus, although it is the USFWS's responsibility to administer the ESA, management of wildlife habitat is within the BLM's multiple-use mandate and is properly a resource to be managed in their planning decisions.

The BLM has identified Alternative D as its Proposed RMP, which is consistent with the Wyoming Governor's EO 2011-5.

The BLM updated the Chapter 3 greater sage-grouse section with recent trend data and recent information on hunting harvest rates. Definitions for occupied lek and unoccupied leks were added to glossary (from BLM IM 2012-019).

The BLM will continue to follow WGFD recommendations affording protections to occupied leks until they are determined to be unoccupied. Winter concentration areas are addressed in management actions 7186 and 7272 (Proposed RMP). Additionally, greater sage-grouse winter concentration areas were recently mapped by WGFD and BLM personnel and are shown on the special status species wildlife maps in the Proposed RMP.

Summary Comment #3035_3-1: Commenters suggested that the BLM focus on issues other than West Nile virus in regards to threats to greater sage-grouse. Other commenters offered suggestions or alternative methods to improve BMPs/RDFs. Commenters questioned certain BMPs/RDFs because they were too broad and vague, in particular noise shields and siting compressor stations. Commenters cited issues pertaining to these BMPs/RDFs including the different types and shapes of noise shields and engineering concerns when siting compressor stations outside priority habitat as well as proximity to other resources besides greater sage-grouse. Other commenters stated the measures did not address livestock grazing.

Commenters requested that BMPs be updated as more and new information becomes available. Commenters expressed concern that the BMPs/RDFs from the NTT Report were too restrictive and the BLM may not have the legal authority to implement them.

Summary Response:

The BLM modified Appendix L to include language that acknowledges BMPs for greater sage-grouse protections is an evolving field and that the appendix will be supplemented as technology and understanding of greater sage-grouse advance. The RDFs in Appendix L are from BLM's Greater Sage-Grouse NTT. To provide Bureau-wide consistency the recommendations cannot be revised. However, during implementation the site-specific situation shall be considered including effectiveness of the design feature as well as technical and economic feasibility. The BMP and RDF lists are not exhaustive, other methods may also be appropriate.

The BLM may apply Conditions of Approval in conformance with Section 6 of the Standard Oil and Gas Lease terms and conditions while recognizing valid existing rights.

Summary Comment #3035_3-2: Commenters requested clarification on Table 4-9 in the Supplement regarding the acreage in key greater sage-grouse habitat areas. Another commenter asked for clarification on Management Action 71,

specifically why a TLS was need when activities were already precluded by the NSO stipulation.

Summary Response:

The table in question includes acres both proposed and existing ACECs. The BLM complied with the NEPA by including a discussion of measures that may mitigate adverse environmental impacts of the alternatives in the Supplement. Taking certain actions is only one of many potential forms of mitigation. The BLM must include mitigation measures in an EIS pursuant to the NEPA; yet the BLM have full discretion in selecting which mitigation measures are most appropriate, including which forms of mitigation are inappropriate.

Summary Comment #3035_4:

Commenters stated the BLM should be consistent with EO 2011-5 and implement the 5 percent disturbance cap. Other commenters supported the 3 percent disturbance cap but felt that the DDCT calculation is inaccurate and results in a higher surface disturbance number, suggesting modifications to limit disturbance or otherwise strengthen the prescription. Commenters remarked that the 3 percent disturbance cap was inconsistent with the EO 2011-5 and overly restrictive. Some commenters offered supporting information regarding what they thought the density of development and/or disturbance cap should be. Some commenters asked that all management prescriptions be consistent with EO 2011-5 because the EO recognizes existing rights and/or development. Commenters asserted the BLM did not specify the types of activities included in disturbance calculations and others suggested burned areas be included in the calculation.

Summary Response:

The Supplement analyzed conservation measures for greater sage-grouse in alternatives E and F and the consequences of the constraints are evaluated to inform the decision. The BLM's Proposed RMP (Alternative D) in the Final EIS is consistent with EO 2011-5 with the 5 percent disturbance cap. Additionally, the BLM will utilize the most current greater sage-grouse density disturbance process or other state and/or federal agreed upon process for compliance evaluations.

Summary Comment #3035_5:

Commenters expressed concern that the BLM implement the strongest conservation measures possible to support greater sage-grouse conservation and recovery. Commenters felt the BLM did not adequately comply with the NEPA's "hard look" requirement for impacts on greater sage-grouse and should provide a more robust impact analysis. Commenters asked the BLM to withdraw priority habitat from various mining development and to further analyze the effects of energy development on greater sage-grouse habitat. Another commenter suggested BLM consider the limited surface disturbance from locatable mining in their impact analysis.

Other commenters suggested the BLM expand the discussion regarding greater sage-grouse population declines as a result of predation, weather, and other threats including hunting, fences, and

various impacts or relationships (beneficial or adverse) of predators on greater sage-grouse and their habitat.

Commenters either supported or expressed concerns regarding noise BMPs in the RMP. Commenters objected to setting ambient noise level range of 20 to 24 dBA, stating it had not been proven to represent ambient noise levels on multiple-use lands and should be removed. Commenters suggested the BLM implement noise prescriptions consistent with EO 2011-5, while others thought it should be changed consistent the BLM Lander's Field Office measures. Other commenters suggested noise measures be strengthened including recommending BLM anticipate the need to change management to reduce impacts of noise on greater sage-grouse populations.

Summary Response:

Per the requirements of NEPA, the Supplement provided analysis of the effects of each alternative and provides an adequate discussion of the environmental consequences of the presented alternatives. While the BLM has used a consistent method for developing alternatives, the specifics of each sub-region necessitated modification of the range of alternatives to accommodate locality and population differences. Alternatives E and F provide the "hard look". Additionally, the BLM's National Operation Center conducted management zone and range-wide cumulative effects analyses, which is included in the Proposed RMP and Final EIS. As a multiple use agency, the BLM must consider the protection of greater sage-grouse and their habitats as well as the potential for mineral recovery.

Chapter 3 discusses trends and threats to greater sage-grouse and the BLM updated the section with recent information. Predator control was not included as a threat in the USFWS's listing decision for greater sage-grouse. The BLM will continue to work with agencies to address current predation of greater sage-grouse, and BLM-administered lands in the planning area will remain open to predator control under state laws. Additionally, the BLM will continue to work with the WGFD to meet state wildlife population objectives.

The BLM would work with proponents to limit project-related noise where it would be expected to reduce functionality of habitats that support PHMAs and Connectivity Habitat Area populations. Noise restrictions in the Proposed RMP and Final EIS are consistent with the Wyoming Governor's EO 2011-5. As additional research and information emerges, specific new limitations appropriate to the type of projects being considered would be evaluated and appropriate limitations would be implemented where necessary to minimize potential for noise impacts on sage-grouse PHMAs population behavioral cycles. As new research is completed, new specific limitations would be coordinated with the WGFD and partners.

Summary Comment #3035_6: Commenters provided specific recommendations for livestock grazing to protect greater sage-grouse habitat, including routing livestock drives to avoid greater sage-grouse leks, shifting on-off dates to coincide with nesting periods, determining triggers for allotment closures after fires, incorporating specific measures from BLMs National Sage-grouse Habitat Conservation Strategy, and closing riparian areas to livestock grazing. Commenters also requested that allotments in greater sage-grouse priority habitat be managed to meet or exceed Wyoming Standards for Healthy Rangelands while others suggested that meeting the standards does not benefit the greater sage-grouse indicating new standards should be considered. Other commenters recommended BLM implement procedures and actions for allotments in greater sage-grouse priority and general habitat and provided supporting references. Commenters also requested that the livestock grazing management from alternatives E and F be applied under the Preferred Alternative. Commenters continued by suggesting that the BLM coordinate with the BLM Pinedale Office regarding their success in developing effective mitigation measures for greater sage-grouse incorporating livestock management practices.

Several commenters felt supporting retirement of grazing permits would be beneficial to greater sage-grouse, while others felt the opposite. Other commenters asked the BLM to identify who would monitor effects of retiring grazing permits on greater sage-grouse.

Commenters also asked the BLM to acknowledge livestock grazing could have positive effects on sage-grouse habitat and others asked the BLM to provide supporting documentation for these beneficial effects. Commenters asserted that the BLM did not adequately address impacts of livestock grazing on sage-grouse, including threats of West Nile virus from water developments; a lack of adequate mechanisms for use authorizations, allotments assessments, and appropriate livestock grazing levels; and habitat degradation from herbivory.

Summary Response: The BLM considered a reasonable range of alternatives during the greater sage-grouse planning process in full compliance with the NEPA. The range of alternatives in the Supplement and Draft RMP and Draft EIS represented a full spectrum of options to adequately address the impacts. Alternative E reduced grazing and eliminated it from certain areas to resolve resource concerns and is within the range of alternatives analyzed in detail providing the "hard look". The elimination of livestock grazing from all BLM-administered lands in the Planning Area as a method for resolving range, watershed, and wildlife habitat-related planning issues was considered, but eliminated from detailed analysis. This alternative would not meet the purpose and need of the RMP revision. The Supplement contains only planning actions and does not include any implementation

actions. As specific actions that may affect the area come under consideration, the BLM will conduct subsequent NEPA analyses that include site-specific project and implementation-level actions. The site-specific analyses will tier to the plan-level analysis and expand the environmental analysis when more specific information is known. In addition, as required by NEPA, the public will be offered the opportunity to participate in the NEPA process for implementation actions. The BLM considers impacts to sensitive species during site-specific analysis of grazing renewals. The Livestock Grazing Management Response #2017_1 addresses retirement of grazing permits.

The BLM methodology for determining rangeland health is based on the Standards for Healthy Rangelands and Guidelines for Livestock Grazing Management. In addition, the BLM will collaborate with appropriate Federal agencies, and the State of Wyoming as contemplated under the Governor's EO 2013-3, to: 1) develop appropriate conservation objectives; 2) define a framework for evaluating situations where greater sage-grouse conservation objectives are not being achieved on federal land, to determine if a causal relationship exists between improper grazing (by wildlife or wild horses or livestock) and greater sage-grouse conservation objectives; and 3) identify appropriate site-based action to achieve greater sage-grouse conservation objectives within the framework. Please see Appendix C for an overview of the Bighorn Basin Monitoring and Evaluation protocol.

The BLM modified the Chapter 3 Livestock Grazing Management and greater sage-grouse sections, incorporating additional information on current BLM practices for assessing rangeland health and potential adverse and beneficial impacts from livestock grazing with supporting references, respectively.

Summary Comment #3035_7:

Commenters asked the BLM to implement mitigation measures such as water developments using solar power instead of windmills. Commenters also asked the BLM to state that all mitigation measures regarding greater sage-grouse would be evaluated on a case-by-case basis when referring to existing leases. Commenters offered new references or mitigation measures to better protect greater sage-grouse and others supported implementing measures in the COT Report.

Commenters asked the BLM to provide a detailed description of the seed mixtures that would be preferential for use. Commenters asked the BLM to provide specific mitigation and reclamation measures as well and asked if operators would receive credit for previous reclamation projects. Commenters also requested that reclaimed greater sage-grouse habitat not be counted as disturbed habitat. Commenters were opposed to the requirement for restoration versus

reclamation of greater sage-grouse habitat, indicating it was not consistent with BLM regulations and policies.

Commenters requested clarification on how the BLM's Interim Policy on Regional Mitigation Measures would be incorporated in the RMP and asked that a description of the CEQ's mitigation hierarchy also be included. Other commenters cited their own mitigation measures that they requested be used in the RMP. Commenters suggested the BLM should implement a compensatory mitigation program, and work with Avian Power Line Interaction Committee to develop more robust mitigation measures.

Commenters requested that BLM establish a database for monitoring data and make it available to other agencies, industry, and the public. Commenters asked the BLM to provide more detail in regards to the type of monitoring and others suggested monitoring objectives were only applicable to larger scale projects. Commenters also questioned the presentation of the data from WGFD that depicts differences in population between male and female greater sage-grouse and male greater sage-grouse alone. Commenter asked the BLM to collaborate with the WGFD and private landowners to increase the level of information gathered. Commenters expressed concern over not being able to review and comment on Appendix C, *Monitoring and Evaluation*, which does not comply with NEPA requirements and required preparation of another supplemental document. Other commenters requested that BLM implement adaptive management to address future threats to greater sage-grouse.

Summary Response:

The BLM complied with the NEPA by including a discussion of measures that may mitigate adverse environmental impacts of the alternatives in the Supplement. See 40 CFR 1502.14(f), 1502.16(h). Potential forms of mitigation include: (1) avoiding the impact altogether by not taking a certain action or parts of an action; (2) minimizing impacts by limiting the degree or magnitude of the action and its implementation; (3) rectifying the impact by repairing, rehabilitating, or restoring the affected environment; (4) reducing or eliminating the impact over time by preservation and maintenance operations during the life of the action; or (5) compensating for the impact by replacing or providing substitute resources or environments. 40 CFR 1508.20. Taking certain actions, such as compensatory mitigation or a detailed list of preferential seed mixtures, are only some of many potential forms of mitigation. The BLM must include mitigation measures in an EIS pursuant to the NEPA; yet the BLM has full discretion in selecting which mitigation measures are most appropriate, including which forms of mitigation are inappropriate.

The best available information pertinent to the decisions to be made was used in developing the RMP and EIS. The BLM made considerable effort to acquire resource data, which included the NTT, the BER,

state management plans, and COT report. Subsequent site-specific project-level analysis would provide the opportunity to collect and examine site-specific inventory data to determine appropriate application of planning guidance.

BLM's planning regulations, specifically 43 CFR 1610.4-9 require that land use plans establish intervals and standards for monitoring, based on the sensitivity of the resource decisions. Land use plan monitoring is the process of tracking the implementation of land use plan decisions (implementation monitoring) and collecting data/information necessary to evaluate the effectiveness of land use plan decisions (effectiveness monitoring). Appendix C provides an overview of the Bighorn Basin Monitoring and Evaluation protocol. Establishing monitoring protocols will follow BLM program specific policy. As specific actions that may affect the area come under consideration, the BLM will conduct subsequent NEPA analyses that include site-specific project and implementation-level actions. The site-specific analyses will tier to the plan-level analysis and expand the environmental analysis when more specific information is known.

For those impacts that cannot be sufficiently avoided or minimized onsite, the BLM will implement effective measures to offset (or compensate for) such impacts. A mitigation strategy for BLM-administered lands will comply with BLM's Regional Mitigation Manual Section (MS) 1794.

BLM's Wyoming State Office worked with the State of Wyoming and the USFWS to develop a statewide greater sage-grouse adaptive management strategy, which is included in the Proposed RMP as Appendix Y.

The appendix describes the process that the BLM will use to monitor implementation and effectiveness of land use plan decisions. The monitoring framework includes monitoring at various scales specific to greater sage-grouse habitat, consistent indicators to measure and metric descriptions for each of the scales, analysis and reporting methods, and the incorporation of monitoring results into adaptive management. The need for fine and site-scale specific habitat monitoring (see Habitat Assessment Framework) will vary by area depending on existing conditions, habitat variability, threats, and land health. To accomplish effectiveness monitoring, the BLM will analyze the monitoring data to characterize the relationship among disturbance, implementation actions and habitat condition at the appropriate and applicable geographic scale or boundary.

Summary Comment #3035_8: Commenters offered various recommendations from other RMP amendments in Wyoming and surrounding states to aid in the development of the Bighorn Basin RMP.

Summary Response: While the BLM has used a consistent method for developing alternatives, the specifics of each sub-region necessitated

modification of the range of alternatives to accommodate locality and population differences.

In response to the greater sage-grouse management objectives described in the 2006 WAFWA *Greater Sage-grouse Comprehensive Conservation Strategy*, many reports have been prepared for the development of management recommendations, strategies, and regulatory guidelines. The NTT report (NTT 2011), Conservations Objectives Team (COT; USFWS 2013), and the Summary of Science, Activities, Programs and Policies that Influence the Rangeland Conservation of Greater Sage-Grouse (also referred to as the BER; Manier et al. 2013) are the most widely used reports that have been incorporated in the BLM Supplement that addresses the effects of implementing greater sage-grouse conservation measures on public lands. Both documents helped planning teams identify issues within their planning area, determine the context within the management zone, prioritize habitats, and assist in creating a range of alternatives with management actions that can alleviate or mitigate threats to greater sage-grouse at an appropriate level. Both the NTT report and the COT report tier from the WAFWA *Greater Sage-grouse Comprehensive Conservation Strategy* (Stiver et al. 2006). Alternatives E and F are based on the NTT report per direction in IM 2012-044.

Summary Comment #3035_9:

Commenters requested that greater sage-grouse priority habitat be withdrawn from future development and allow existing leases to lapse as they expire. Other commenters expressed opposition to closing the Greater Sage-Grouse Key Habitat Area ACEC (Alternative E) to future leasing. Commenters also stated that impacts to greater sage-grouse from oil and gas development will decrease as new technology for drilling and production is developed and provided supporting information. Commenters also noted the extra truck trips required when using closed loop systems and associated road upgrades could cause additional impacts and suggested fence installation was a better alternative. Commenters asserted that Alternative F's level of constraints on oil and gas leasing was major and not moderate as stated in the Supplement. Commenters requested the BLM clarify how requiring clustering of oil and gas facilities and operations outside priority habitat would work in the event wells are located in priority habitat areas.

Commenters asked the BLM to use specific language to remain compliant with EO-2011-5 regarding TLS. Other commenters felt buffers prescribed by EO-2011-5 were too small to adequately protect greater sage-grouse, suggesting buffers should be increased. Another commenter voiced opposition to OGMAs asserting establishing these areas conflicted with BLM's greater sage-grouse conservation efforts.

Commenters recommended the BLM include management that would provide for flexibility to update management as scientific information

on greater sage-grouse evolves and utilize specific buffers and restrictions based on provided justification.

Summary Response:

The BLM developed the Supplement with involvement from cooperating agencies, including WGFD, Wyoming Governor's office, USFWS, and local agencies/governments to ensure a balanced multiple-use management strategy addresses the protection of greater sage-grouse while allowing for utilization of renewable and nonrenewable resources on the public lands. The BLM's Proposed RMP is consistent with the Wyoming Governor's EO 2011-5, which has been determined sufficient to conserve greater sage-grouse throughout Wyoming. The BMP and RDF lists are not exhaustive, other methods may also be appropriate and Appendix L will be supplemented as technology and understanding of greater sage-grouse advance. During implementation, the site-specific situation shall be considered including effectiveness of the design feature as well as technical and economic feasibility.

Major and moderate oil and gas constraints are defined in the Glossary and are consistent with BLM H-1601-1 — *Land Use Planning Handbook*. Where criteria applied to areas as major constraints those were utilized for analysis. Methods and assumptions for the impact analysis are presented at the beginning of each impact section in Chapter 4, which did consider the impacts of additional siting constraints, including the 3-percent density disturbance restrictions.

Before beginning the Supplement and throughout the planning effort, the BLM considered the availability of data from all sources, adequacy of existing data, data gaps, and the type of data necessary to support informed management decisions at the land-use plan level. The data needed to support broad-scale analysis of the Bighorn Basin planning area are substantially different from the data needed to support site-specific analysis of projects. The information presented in map and table form is sufficient to support the broad scale analyses required for land use planning. As a result of these actions, the BLM gathered the necessary data essential to make a reasoned choice among the alternatives analyzed in detail in the Supplement, and provided an adequate analysis that led to an adequate disclosure of the potential environmental consequences of the alternatives (Chapter 4). A land use planning-level decision is broad in scope and, therefore, does not require an exhaustive gathering and monitoring of baseline data. A more quantified or detailed and specific analysis would be required only if the scope of the decision included implementation actions. As specific actions that may affect the area come under consideration, the BLM will conduct subsequent NEPA analyses that include site-specific project and implementation-level actions. The site-specific analyses will tier to the plan-level analysis and expand the environmental analysis when more specific information is known. In addition, as required by NEPA, the public will be offered the

opportunity to participate in the NEPA process for implementation actions.

The term “administratively unavailable” has been changed to “closed” throughout the document, based on guidance from the BLM Wyoming State Office.

Summary Comment #3035_10: Commenters recommended that greater sage-grouse Core Areas (as identified by Version 3 of Wyoming Governor’s EO 2011-5) located within WSAs be closed to motorized and mechanized vehicle use or at a minimum be limited to existing roads and trails with seasonal closures during breeding and nesting seasons. Commenters identified five WSAs containing these areas including Alkali Creek, Bobcat Draw, Cedar Mountain, Honeycombs, and Medicine Lodge.

Summary Response: The BLM complied with the NEPA by including a discussion of measures that may mitigate adverse environmental impacts of the alternatives in the Supplement. Taking certain actions, such as closing PHMAs to motor vehicle use, is only one of many potential forms of mitigation. The BLM must include mitigation measures in an EIS pursuant to the NEPA; yet the BLM has full discretion in selecting which mitigation measures are most appropriate, including which forms of mitigation are inappropriate. The Proposed RMP and Final EIS is consistent with the Wyoming Governor’s EO 2011-5.

Invasive Species

Summary Comment #3014: Commenters requested the BLM clarify how the BMP requiring power washing of vehicles and equipment would be implemented and questioned if it was reasonable. In addition, commenters requested the BLM clarify that reclamation plans are required for all oil and gas development activities by Onshore Oil and Gas Order No. 1.

Commenters felt the management action restricting activities in greater sage-grouse habitat that facilitate spread of invasive plants was overly broad and could be misinterpreted to apply to any surface-disturbing activity, including oil and gas development activities. Commenters suggested the language should be modified to reflect the BLMs multiple use requirements.

Commenters were concerned over restrictions on the use of herbicides in Key or PHMAs sage-grouse habitats due to a lack of capacity for the BLM to manage invasive plants, suggesting the BLM should implement a pilot program allowing herbicide use where infestations total more than 5 acres in these areas. Another commenter suggested the herbicide “Plateau” could be applied manually in areas not being used by greater sage-grouse and heavily infested with cheatgrass.

Summary Response: The BLM’s FLPMA (Section 103(c)) defines “multiple use” as the management of the public lands and their various resource values so

that they are utilized in the combination that will best meet the present and future needs of the American people. Accordingly, the BLM is responsible for the complicated task of striking a balance among the many competing uses to which public lands can be put. The BLM's multiple-use mandate does not require that all uses be allowed on all areas of the public lands. The purpose of the mandate is to require the BLM to evaluate and choose an appropriate balance of resource uses which involves tradeoffs between competing uses. The Supplement is a targeted amendment specifically addressing goals, objectives, and conservation measures to conserve greater sage-grouse and respond to the potential of its being listed. The Supplement included alternatives that provide a greater and lesser degree of restrictions in various use programs, but would not eliminate or invalidate any valid existing development rights. Construction, stabilization, and reclamation plan(s) address the site-specific soil/site issues to mitigate and the degree of detail required. These details are in addition to other federal regulations.

Land use plan-level analyses are typically broad and qualitative rather than quantitative or focused on site-specific actions (BLM Land Use Planning Handbook H-1601-1, Chapter II, A-B at 11-13 and Chapter IV, B at 29). The Supplement contains only planning actions and does not include any implementation actions. As specific actions that may affect the area come under consideration, the BLM will conduct subsequent NEPA analyses that include site-specific project and implementation-level actions. The site-specific analyses will tier to the plan-level analysis and expand the environmental analysis when more specific information is known. Additionally, as required by NEPA, the public will be offered the opportunity to participate in the NEPA process for implementation actions.

The RDFs in Appendix L are from BLM's Greater Sage-Grouse NTT and cannot be modified in order to provide Bureau-wide consistency. During implementation the site-specific situation shall be considered including effectiveness of the design feature as well as technical and economic feasibility.

Lands and Realty

Summary Comment #3016_1:

Commenters were concerned that public lands would no longer be available for Desert Land Entry applications and stated that the BLM did not provide justification for this action. Commenters suggested that while these entries may be underutilized, they should remain available to the public, and that agricultural development of these lands would not be detrimental to greater sage-grouse.

Summary Response:

The BLM would retain the 1,409 acres open for entry under the Desert Land Act in the Proposed RMP and consider Desert Land Entry applications for unclassified lands on a case-by-case basis consistent

with Desert Land Entry criteria and resource objectives. Only Alternative B proposes to revoke the 1,409 acres of classified Desert Land Entry lands, the other alternatives do not.

Summary Comment #3016_2: Commenters expressed opposition to acquisition of state or private lands for greater sage-grouse habitat management due to lack of adequate funding for managing and/or acquiring public lands. Instead, commenters suggested the BLM acknowledge valid existing rights and work with private landowners to develop appropriate programs for greater sage-grouse management.

Summary Response: The BLM may pursue the acquisition of lands under the FLMPA. Please refer to Appendix M, *Land Disposal and Acquisition* for details on criteria applied by the BLM in identifying lands for acquisition. As stated in the Supplement, the BLM prepared a land use plan revision applied to lands with greater sage-grouse habitat. This effort responds to the USFWS’s March 2010 ‘warranted, but precluded’ ESA listing petition decision. The Supplement focused on areas affected by threats to greater sage-grouse habitat identified by the USFWS in the March 2010 listing decision. The purpose and need provided the appropriate scope to allow the BLM to analyze a reasonable number of alternatives to cover the full spectrum of potential impacts, which includes considering acquiring lands for greater sage-grouse management.

Laws, Regulations, Guidance, Process

Summary Comment #3027_1: Commenters requested clarification on why a Supplement to the Draft RMP and Draft EIS was required. Commenters expressed concern that the Supplement was inconsistent with various laws, regulations, and policies including, but not limited to, FLPMA, the Property Clause of the United States Constitution, the General Mining Law of 1872, the Mining, Minerals and Policy Act, the Energy Policy Act, BLM Manual 6840, and the Wyoming Governor’s EO 2011-5. Commenters felt that alternatives B, E, and F were far too restrictive on resource uses. Commenters also asserted that the Supplement did not meet the requirements of the NEPA process citing incomplete and inadequate analysis. In particular, commenters stated the BLM did not analyze a range of reasonable alternatives that could satisfy the USFWS requirements regarding greater sage-grouse. Commenters were unclear on which alternative was the BLM’s Preferred Alternative, since the release of the Supplement with new alternatives E and F. Commenters also asked that the BLM continue to use the CX as an option when evaluating projects.

Commenters also offered that existing BLM policy is being jettisoned because of IM 2012-044 and the NTT Report, and that these new policies are leading to new regulations that have no explanations and are arbitrary in nature. Other commenters questioned the BLM’s

reliance on the NTT report in developing the Supplement, citing recent information that it was biased and scientifically flawed. In addition, commenters suggested that the BLM use conservation measures worded as mandatory rather than discretionary.

Commenters called into question the BLM's authority to prescribe management actions that could affect existing rights. Commenters also stated that BLM is overstepping its statutory authority and did not comply with CEQ guidelines regarding resource management.

Summary Response:

The analysis in the Supplement, in combination with the analysis included in the Draft EIS, does comply with FLPMA, NEPA and other applicable laws. As stated in the Supplement, the BLM is preparing a land use plan revision and associated EIS for lands with greater sage-grouse habitat, in response to the USFWS's March 2010 'warranted, but precluded' ESA listing petition decision, and that existing regulatory mechanisms in BLM and the Forest Service land use plans was inadequate to protect the species and its habitat. The 15 plan amendments and revisions will focus on areas affected by threats to greater sage-grouse habitat identified by the USFWS in the March 2010 listing decision. The two primary threats to sagebrush habitat are infrastructure from energy development in the eastern portion of the species' range and conversion of sagebrush habitat to annual grasslands due to wildfires in the western portion of the species' range. To address the threats, BLM are considering a range of changes in management of greater sage-grouse habitats to avoid the continued decline of populations and habitats across BLM-administered lands. This purpose and need provides the appropriate scope to allow the BLM to analyze a reasonable number of alternatives to cover the full spectrum of potential impacts. The management of the greater sage-grouse priority habitat ACECs in alternatives E and F represent approaches to managing these areas that were not considered in the Draft RMP and Draft EIS. Valid existing development rights would not be eliminated or invalidated.

The BLM considered a reasonable range of alternatives during the greater sage-grouse planning process in full compliance with the NEPA. The CEQ regulations (40 CFR 1502.1) require that the BLM consider reasonable alternatives that would avoid or minimize adverse impacts or enhance the quality of the human environment. While there are many possible alternatives or actions to manage public lands and greater sage-grouse in the planning area, the range of alternatives in the Supplement and Draft EIS represent a full spectrum of options including a no action alternative (current management, Alternative A in the Draft RMP and Draft EIS).

The BLM disclosed in the Supplement that Alternative D as presented in the Draft RMP and Draft EIS, remained the Agency Preferred Alternative and that the Proposed RMP and Final EIS would contain content from the Draft RMP and Draft EIS and the Supplement. The

BLM's Proposed RMP is consistent with EO 2011-5, as well as EO 2013-3.

A CX would be considered for actions that meet the associated requirements and that extraordinary circumstances do not preclude the use of the CX. If any extraordinary circumstances apply, an EA or EIS must be prepared.

Greater sage-grouse conservation measures in the NTT Report were used to form BLM management direction under alternatives E and F consistent with the direction provided in IM 2012-044 (the BLM must consider all applicable conservation measures developed by the NTT in at least one alternative in the land use planning process). The NTT report used the best current scientific knowledge to guide the BLM planning effort through management considerations to ameliorate threats, focused primarily on priority greater sage-grouse habitats on public lands but was not the sole source of information. In addition, the 2013 COT (COT; USFWS 2013) qualitatively identifies threats/issues that are important for individual populations across the range of greater sage-grouse, regardless of land ownership. The Summary of Science, Activities, Programs and Policies that Influence the Rangeland Conservation of Greater Sage-Grouse (also referred to as the BER; Manier et al. 2013) then provides complimentary quantitative information to support and supplement the conclusions in the COT. Both documents helped planning teams identify issues within their planning area, determine the context within the management zone, prioritize habitats, and assist in creating a range of alternatives with management actions that can alleviate or mitigate threats to greater sage-grouse at an appropriate level. Both the NTT report and the COT report tier from the WAFWA *Greater Sage-grouse Comprehensive Conservation Strategy* (Stiver et al. 2006).

Summary Comment #3027_2: Commenters questioned if the BLM had adequately addressed local plans for counties in the Planning Area and if the impacts associated with the management objectives had been thoroughly analyzed. Commenters also stated that RMP does account for changing technology enough and thus the restrictions on development could be much higher. Commenters requested that EO 2011-5, EO 2013-3, and all individual county Land Use Plans be published in the Proposed RMP and Final EIS.

Summary Response: The BLM considered local plans during alternative development and management actions were developed with the assistance of the cooperating agencies, which included the counties, WGFD, Wyoming Governor's office, and the USFWS. The Reasonable Foreseeable Development addresses oil and gas development potential including updates in technologies.

Summary Comment #3027_3: Commenters requested that additional mitigation measures be considered, such as funding additional studies to better understand

factors affecting greater sage-grouse, industry incentives, mitigation banks, offsite mitigation, etc. Commenters questioned why the BLM did not reference the Avian Power Line Interaction Committee’s new guidance manual.

Summary Response:

The BLM's Proposed RMP is consistent with the Wyoming Governor's EO 2011-5 and EO 2011-5 seeks a cooperative effort to develop incentives for development outside of Core Areas. Additionally, the list of BMPs in Appendix L are not intended to encompass all potentially applicable BMPs. The BLM will examine BMPs, such as those in the Avian Power Line Interaction Committee’s manual for incorporation during implementation of site-specific activities.

Leasable Minerals – Oil and Gas

Summary Comment #3023_1:

Commenters asserted that some of the specific BMPs and/or RDFs included in Appendix L were not feasible or practical and may have unintended consequences. Some of the specific BMPs mentioned included requiring directional drilling wherever possible, remote monitoring, closed loop systems, facility location and placement, power-washing vehicles, and mesh nets over ponds. Commenters offered alternative language for BMPs pertaining to directional drilling or suggested BLM implement measures from other RMPs. Many commenters asserted that BMPs were not consistent with EO 2011-5 and/or BLM IM 2012-019. Several other commenters asked for flexibility in regards to many BMPs and RDFs requirements because each situation is unique.

Commenters questioned management actions and as BMPs and RDFs prescribed by BLM, specifically stating that the management contradicts current BLM regulations and guidance related to oil and gas development as well as violates existing rights. Commenters also asked that the BLM change the language regarding areas “administratively unavailable” to “closed” because it met the definition of a withdrawal. Other commenters asked BLM acknowledge in the RMP the rights of lessees. Commenters requested that BLM honor existing rights indicating proposed stipulations violated those rights. Other commenters added that conservation measures are an attempt by BLM to limit future oil and gas development and are not compliant with FLPMA. Commenters questioned how BLM intends to comply with the existing MOU with the State of Wyoming Oil and Gas Conservation Commission on well spacing based on information in Appendix T. Commenters asked the BLM to consider the effects of constraining development on the local communities and the national interest.

Commenters asked the BLM to clarify which alternative is now the Preferred Alternative and provide evidence for this decision. Other commenters offered that restrictions on oil and gas development

under alternatives E and F violates the BLM's multiple use mandate and are unreasonable. A commenter asked BLM to develop broad management goals and objectives and not waste resources analyzing site-specific impacts from oil and gas development. One commenter offered that BLM misinterpreted the purpose of unitization and Commenters felt that BLM concludes oil and gas development always negatively impacts wildlife and their habitat without providing supporting information. Other commenters indicated development density under Alternative E was supported by scientific information to protect greater sage-grouse while it was not under the other alternatives and that this alternative should be implemented. Commenters also recommended Alternative E buffers apply outside Key Habitat Areas. Some commenters indicated the Wyoming Core Area Strategy should be strengthened by closing these areas to future leasing as recommended in the NTT report. Another commenter suggested compensatory funds could not mitigate the loss of PHMAs.

Commenters suggested that EOR technology could be used to develop unconventional reservoirs in the Planning Area requesting the BLM consider the impacts of alternatives E and F to this type of development. Commenters also requested that lands with favorable EOR potential in developed fields not be included in areas designated as greater sage-grouse priority habitat.

Commenters also asked the BLM to consider a phased development alternative to help limit environmental impacts on sensitive resources or closure of areas to leasing in highly sensitive areas. Alternatively, other commenters opposed phased development because of delays in production and asserted it was not reasonable.

Commenters voiced concern over seasonal road closures noting that the BLM had not justified these closures and they should not be implemented.

Summary Response:

The BLM developed the Supplement to the Bighorn Basin Draft RMP and Draft EIS with involvement from cooperating agencies, including WGFD, Wyoming Governor's office, USFWS, and local agencies/governments to ensure that a balanced multiple-use management strategy to address the protection of greater sage-grouse while allowing for utilization of renewable and nonrenewable resources on the public lands. The BMP and RDF lists are not exhaustive, other methods may also be appropriate and Appendix L will be supplemented as technology and understanding of greater sage-grouse advance. The RDFs in Appendix L are from BLM's Greater Sage-Grouse NTT and cannot be revised in order to provide Bureau-wide consistency. However, during implementation the site-specific situation shall be considered including effectiveness of the design feature as well as technical and economic feasibility. The BLM may apply Conditions of Approval in conformance with Section 6 of the

Standard Oil and Gas Lease terms and conditions while recognizing valid existing rights.

The BLM complied with its multiple-use mandate by evaluating an appropriate balance of resource uses, which involves tradeoffs between competing uses. The Supplement was targeted specifically to address goals, objectives, and conservation measures to conserve greater sage-grouse and to respond to the potential of its being listed (see Section 1.0, Purpose and Need). The Supplement included alternatives that provide a greater and lesser degree of restrictions in various use programs, but would not eliminate or invalidate any valid existing development rights. The BLM developed the Supplement with involvement from the agencies listed above to ensure a balanced multiple-use management strategy addresses the protection of greater sage-grouse while allowing for utilization of renewable and nonrenewable resources on the public lands.

Before beginning the Supplement and throughout the planning effort, the BLM considered the availability of data from all sources, adequacy of existing data, data gaps, and the type of data necessary to support informed management decisions at the land-use plan level. The data needed to support broad-scale analysis of the Bighorn Basin Planning Area are substantially different from the data needed to support site-specific analysis of projects. The requisite level of information necessary to make a reasoned choice among the alternatives in an EIS is based on the scope and nature of the proposed decision. The baseline data provided in Chapter 3 and various appendices is sufficient to support, at the general land use planning-level of analysis and the environmental impact analysis (Chapter 4) resulting from management actions presented in the Supplement.

The BLM used the most recent and best information available that was relevant to a land-use planning-level analysis including the BER (BER; Manier et al. 2013). The BER looked at each of the threats to greater sage-grouse identified in the USFWS's "warranted but precluded" finding for the species. For these threats, the report summarized the current scientific understanding, of various impacts to greater sage-grouse populations and habitats. The report also quantitatively measured the location, magnitude, and extent of each threat. These data were used in the planning process to describe threats at other levels, such as the sub-regional boundary and WAFWA Management Zone scale, to facilitate comparison between sub-regions. Additionally, the BLM consulted with, collected, and incorporated data from other agencies and sources, as noted above. As a result of these actions, the BLM gathered the necessary data essential to make a reasoned choice among the alternatives analyzed in detail in the Supplement and Proposed RMP. Finally, the BLM has made a reasonable effort to collect and analyze all available data.

The Supplement provides an adequate discussion of the environmental consequences, including the cumulative impacts, of the presented alternatives. The Supplement provided sufficiently detailed information to aid in determining whether to proceed with the Preferred Alternative or make a reasoned choice among the other alternatives in a manner such that the public could have an understanding of the environmental consequences associated with the alternatives, in accordance with 40 CFR 1502.1. Land use plan-level analyses are typically broad and qualitative rather than quantitative or focused on site-specific actions (BLM Land Use Planning Handbook H-1601-1, Chapter II, A-B at 11-13 and Chapter IV, B at 29). The Supplement contains only planning actions and does not include any implementation actions. As specific actions that may affect the area come under consideration, the BLM will conduct subsequent NEPA analyses that include site-specific project and implementation-level actions. In addition, as required by NEPA, the public will be offered the opportunity to participate in the NEPA process for implementation actions.

The BLM's Proposed RMP is consistent with the Wyoming Governor's EO 2011-5 that has been determined sufficient to conserve greater sage-grouse throughout Wyoming and WAFWA Management Zones I and II.

The BLM changed the term “administratively unavailable” to “closed” throughout the document, based on guidance from the BLM Wyoming State Office. Additionally, stipulations provided in Alternative D (management actions 4116, 4117, and 4118) were updated in coordination with the State of Wyoming and WGFD consistent with EO 2011-5.

The purpose of unitization is described according to 30 U.S.C. Sec. 181 et seq, which includes “...for the purpose of more properly conserving the natural resources thereof whenever determined by the Secretary of the Interior to be necessary or advisable in the public interest;...”. Further, “...it is the purpose of the parties hereto to conserve natural resources, prevent waste, and secure other benefits obtainable through development and operation of the area subject to this agreement...” The Department has broad discretion in the interpretation of the term “conservation of natural resources” and it may include surface resources such as the greater sage-grouse and associated habitat.

Summary Comment #3023_4:

Commenters asserted that there is very little to no surface disturbance from geophysical exploration and questioned why this type of exploration would be restricted in the Greater Sage-grouse Key Habitat ACEC under Alternative E. Others stated that restricting geophysical exploration is not an objective in BLM IM 2012-044 or the USFWS COT Report, violates existing rights, and that this management should be removed from the RMP. Some commenters said that

geophysical exploration should be encouraged instead of constrained. Commenters asked if the BLM has the authority to prohibit geophysical exploration and stated that this mitigation measure would not affect greater sage-grouse mitigation efforts. Some commenters recommended BLM approve geophysical exploration using CXs.

Summary Response:

Areas open and/or closed to oil and gas leasing are open and/or closed to geophysical exploration unless noted otherwise. Geophysical exploration may be permitted on a case-by-case basis so long as the resource goals and objectives under which the area was closed are not compromised. The BLM will consider CXs for actions that meet the associated requirements and if extraordinary circumstances do not preclude the use of the CX. If any extraordinary circumstances apply, an EA or EIS must be prepared.

Summary Comment #3023_5:

Commenters asserted the economic impacts were not adequately disclosed under alternatives E and F. Commenters asked the BLM to consider economic effects of constraints on oil and gas development and EOR under alternatives E and F. Commenters also emphasized that the socioeconomic impacts would be very detrimental to the local communities in the Bighorn Basin and urged the BLM to reject alternatives E and F.

Summary Response:

The Supplement provides an adequate discussion of the environmental consequences, including the cumulative impacts, of the presented alternatives. The Supplement provided sufficiently detailed information to aid in determining whether to proceed with the Preferred Alternative or make a reasoned choice among the other alternatives in a manner such that the public could have an understanding of the environmental consequences associated with the alternatives, in accordance with 40 CFR 1502.1. Land use plan-level analyses are typically broad and qualitative rather than quantitative or focused on site-specific actions (BLM Land Use Planning Handbook H-1601-1, Chapter II, A-B at 11-13 and Chapter IV, B at 29). The Supplement contains only planning actions and does not include any implementation actions. As specific actions that may affect the area come under consideration, the BLM will conduct subsequent NEPA analyses that include site-specific project and implementation-level actions. In addition, as required by NEPA, the public will be offered the opportunity to participate in the NEPA process for implementation actions.

Summary Comment #3023_6:

Many commenters felt that requiring Master Development Plans rather than using the APD process on all but wildcat wells is inappropriate because of the greater likelihood of periodic drilling in the Bighorn Basin. Other commenters asked that BLM allow infill development within existing fields without a Master Development Plan. Commenters also supported enlarging OGMAs under Alternative D, similar to that under Alternative C.

Commenters had concerns about how BLM would apply leasing screens in areas with MLP areas. Other commenters supported application of MLPS and recommended BLM develop Resource Condition Objectives for each sensitive resource in MLP areas.

Summary Response:

Comments specific to master development plans, OGMAs, and MLPs are outside the scope of the Supplement, which the BLM developed to ensure that a balanced multiple-use management strategy addresses the protection of greater sage-grouse while allowing for utilization of renewable and nonrenewable resources on the public lands. The Proposed RMP and Final EIS addresses these issues and incorporates MLPs within the document.

The BLM has identified Alternative D as its Proposed RMP in the Final EIS, which does not require master development plans in lieu of APD-by-APD processing for all but wildcat wells.

Livestock Grazing Management

Summary Comment #3017_1:

Several commenters requested the BLM add additional language to be consistent with the Wyoming Governor’s EO 2013-3. Other commenters asked the BLM to add language regarding additional agency coordination between BLM and WDEQ. Commenters requested clarification on what actions contribute to surface-disturbing activities including those used in the surface disturbance cap, and whether or not BLM considers livestock grazing a surface-disturbing activity. Commenters requested the BLM update the definition of surface-disturbing activities in the Glossary.

Commenters asserted that the BLM’s alternatives do not comply with BLM IM 2013-184 and requested that the BLM evaluate permanent retirement of AUMs that have been voluntarily waived. Other commenters stated allotment retirement was biased against livestock grazing, inappropriate, and should be removed from the document. Commenters also requested the BLM clarify the management under which allotment retirement would require a NEPA analysis and management categories of custodial, improve, and maintain.

Summary Response:

The BLM incorporated language in the Proposed RMP consistent with the Wyoming Governor’s EO 2013-3 and IM 2013-184, in Management Action 4122 and Goal LR:10-2, respectively. Additionally, the BLM added and/or clarified text as appropriate, including in the *Livestock Grazing Management* section, Appendix P, and definitions in the Glossary.

The Supplement included alternatives that provide a greater and lesser degree of restrictions in various use programs. In the event of retirement of a grazing allotment, the BLM would follow the grazing regulations (CFR 4100 - Grazing Administration) including preparation of an allotment specific document analyzing the potential impacts. All

of Subpart 4160 - Administrative Remedies, including protest and appeals would be applicable. The Proposed RMP does not include this management prescription.

Summary Comment #3017_2: Commenters requested the BLM analyze a no grazing alternative. Other commenters said that livestock forage consumption had increased since the definition of AUM was originally developed, which should be accounted for in the analysis.

Summary Response: Alternative E in the Supplement reduced grazing and eliminated it from certain areas to resolve resource concerns, which is within the range of alternatives analyzed in detail. The elimination of livestock grazing from all BLM-administered lands in the Planning Area as a method for resolving range, watershed, and wildlife habitat-related planning issues was considered, but eliminated from detailed analysis. This alternative would not meet the purpose and need of the RMP revision. Addressing changes in livestock forage consumption is outside the scope of the Supplement and Proposed RMP.

Summary Comment #3017_3: Commenters requested that the impacts to livestock grazing be reassessed asserting that the alternatives analyzed in the Supplement did not adequately assess impacts to livestock grazing, specifically actions that affect AUMs. Commenters also stated that the BLM did not adequately account for effects of livestock grazing on greater sage-grouse habitat. Comments asserted the Supplement incorrectly blamed increased juniper encroachment on livestock grazing. A commenter also asked that natural springs be fenced off to limit impacts from livestock grazing.

Commenters also asserted that the impacts to greater sage-grouse priority habitat were not accurate and stated that livestock grazing can have positive impacts on greater sage-grouse habitat. Other commenters said some allotments did not meet rangeland standards and had a negative impact on greater sage-grouse. Many commenters did not support the closure of priority greater sage-grouse habitat to livestock grazing under alternatives E and/or F, stating this management did not meet BLMs multiple use mandate.

Summary Response: The Supplement included alternatives that provide a greater and lesser degree of restrictions in various use programs including livestock grazing and conservation measures for greater sage-grouse. In accordance with BLM's multiple use mandate the BLM must find the balance among the many competing uses to which public lands can be put. The BLM's multiple-use mandate does not require that all uses be allowed on all areas of the public lands. The Supplement provided sufficiently detailed information to aid in determining whether to proceed with the Preferred Alternative or make a reasoned choice among the other alternatives in a manner such that the public could have an understanding of the environmental

consequences associated with the alternatives, in accordance with 40 CFR 1502.1.

The Supplement contains only planning actions and does not include any implementation actions. As specific actions that may affect the area come under consideration, the BLM will conduct subsequent NEPA analyses that include site-specific project and implementation-level actions. In addition, as required by NEPA, the public will be offered the opportunity to participate in the NEPA process for implementation actions.

The BLM considers impacts to sensitive species during site-specific analysis of grazing renewals. Regarding juniper encroachment, the text in question referenced threats to greater sage-grouse habitat identified in the USFWS COT report and was not specific to the Planning Area. The BLM revised the greater sage-grouse discussion in Chapter 3 to acknowledge livestock grazing can be compatible with, or even beneficial to, greater sage-grouse habitat under certain circumstances.

Summary Comment #3017_4:

Commenters stated that various types of vegetation management, like hand cutting, flash burning, and other treatments for invasive species, would be too difficult to be successful and are burdensome. Other commenters asked the BLM to clarify how vegetation recovery would be determined, details on pretreatment data, and if grazing would be deferred while pretreatment data is collected.

Summary Response:

The BLM will collaborate with appropriate federal agencies, and the State of Wyoming as contemplated under Governor's EO 2013-3, to: (1) develop appropriate conservation objectives; (2) define a framework for evaluating situations where greater sage-grouse conservation objectives are not being achieved on federal land, to determine if a causal relationship exists between proper grazing (by wildlife or wild horses or livestock) and greater sage-grouse conservation objectives; and (3) identify appropriate site-based action to achieve greater sage-grouse conservation objectives within the framework.

The BLM drafted a monitoring framework that is included in the Proposed RMP as Appendix Y. The appendix describes the process that the BLM will use to monitor implementation and effectiveness of land use plan decisions.

Summary Comment #3017_5:

Commenters requested BLM include further detail regarding socioeconomic impacts from restrictions on livestock grazing in the Supplement, including explanations as to why some alternatives would have similar impacts.

Summary Response:

The BLM revised the Chapter 4 Economic section to include additional explanation. The differences that are present between the

alternatives are reflected in the revised analysis and the quantitative data available.

Locatable Minerals

Summary Comment #3020_1:

Commenters requested the BLM provide further rationale for the impacts to mineral development. Additionally, commenters asserted that the cumulative impacts analysis did not adequately address the impacts to the mining industry as a result of mineral withdrawals and surface-use restrictions.

Commenters offered that the RMP does not comply with some mining laws, regulations, the Mining and Mineral Policy Act, and FLPMA, and BLM has an obligation to comply with mining laws and regulations. Commenters also requested that BLM respect existing mining claims. Commenters also requested that validity testing for mining claims be applied uniformly in compliance with the General Mining Law of 1872. Commenters also requested that validity testing not be used to delay mineral development and BLM should state where, when, and how validity examinations will affect authorizations. Some commenters noted that additional validity testing would be burdensome without any identified ecological or economic benefit.

Other commenters requested that EAs be required rather than EISs for mining authorization because they are more economical and yield similar results to an EIS. Commenters offered concerns regarding the RMP's ability to supersede individual mining claims and development. Commenters requested that exploratory drilling for bentonite require a plan of operations level-structure rather than a notice level. Other commenters asserted that management prescribed under Alternative E would increase the surface disturbance footprint from bentonite mining, an industry that already has successful mitigation and reclamation procedures in place. Commenters also offered that conservation measures for greater sage-grouse should be proportionate to the threat from locatable mineral development.

Commenters asserted that BLM did not include locatable mineral development in the socioeconomic analysis. Commenters also requested the BLM analyze the socioeconomic effects of closures and/or restrictions on mining companies under alternatives B, E, and F. Commenters requested additional quantitative data regarding the benefits to greater sage-grouse from restrictions on mining. Commenters requested more analysis on impacts to mining from greater sage-grouse management be presented in alternatives E and F instead of referring the reader to the Draft RMP and Draft EIS.

Summary Response:

The BLM's FLPMA (Section 103(c)) defines "multiple use" as the management of the public lands and their various resource values so that they are utilized in the combination that will best meet the present and future needs of the American people. Accordingly, the

BLM is responsible for the complicated task of striking a balance among the many competing uses to which public lands can be put. The BLM's multiple-use mandate does not require that all uses be allowed on all areas of the public lands. The purpose of the mandate is to require the BLM to evaluate and choose an appropriate balance of resource uses which involves tradeoffs between competing uses. The Supplement is a targeted amendment specifically addressing goals, objectives, and conservation measures to conserve greater sage-grouse and respond to the potential of its being listed and the alternatives provide a greater and lesser degree of restrictions in various use programs, but would not eliminate or invalidate any valid existing development rights. The BLM manages a significant portion of greater sage-grouse habitat and management of wildlife habitat is within the BLM's multiple-use mandate and is properly a resource to be managed in their planning decisions. Further, the BLM developed the Supplement with involvement from cooperating agencies, including WGFD, Wyoming Governor's office, USFWS, and local agencies/governments to ensure that a balanced multiple-use management strategy to address the protection of greater sage-grouse while allowing for utilization of renewable and nonrenewable resources on the public lands.

Regarding validity examinations, as stated in Management Action 68 in the Supplement, minerals exploration would be subjected to a validity examination in Key Habitat Areas under Alternative E. Additionally, the requirements and/or criterion are published and available to the public in BLM Handbook 3890-3, Validity Mineral Reports. The BLM has identified Alternative D as its Proposed RMP in the Final EIS. Alternative D does not designate greater sage-grouse key habitat as an ACEC.

The Supplement provides an adequate discussion of the environmental consequences, including the cumulative impacts, of the presented alternatives. The Supplement provided sufficiently detailed information to aid in determining whether to proceed with the Preferred Alternative or make a reasoned choice among the other alternatives in a manner such that the public could have an understanding of the environmental consequences associated with the alternatives, in accordance with 40 CFR 1502.1. Land use plan-level analyses are typically broad and qualitative rather than quantitative or focused on site-specific actions (BLM Land Use Planning Handbook H-1601-1, Chapter II, A-B at 11-13 and Chapter IV, B at 29). The Supplement contains only planning actions and does not include any implementation actions. As specific actions that may affect the area come under consideration, the BLM will conduct subsequent NEPA analyses that include site-specific project and implementation-level actions. In addition, as required by NEPA, the

public will be offered the opportunity to participate in the NEPA process for implementation actions.

During preparation of the Proposed RMP and Final EIS, the BLM integrated the information and alternatives from the Supplement with the Draft RMP and Draft EIS.

Minerals - General

Summary Comment #3019_1: Commenters asked the BLM to recognize the importance of energy and/or mineral development as well as greater sage-grouse habitat conservation in compliance with FLMPA. Other commenters offered ideas on how to protect greater sage-grouse habitat. Commenters recommended specific language for modifying Record 71 to be consistent with EO 2011-5 and Record 72 to encourage instead of require unitization.

Commenters asked the BLM to add specific language to clarify that existing rights will not be violated by the implementation of management actions related to greater sage-grouse habitat conservation. Some commenters noted that specific management actions were inconsistent with EO 2011-5, which recognizes existing rights and recommended the management actions be removed from the RMP and EIS.

Commenters requested that BLM provide specific language about the right of private landowners regarding mineral development. Commenters also voiced concerns over management actions that could limit or eliminate mineral development on split estate lands. Commenters also urged BLM to work with operators and the state to implement a reasonable monitoring program.

Summary Response: The BLM complied with its multiple-use mandate by evaluating an appropriate balance of resource uses, which involves tradeoffs between competing uses. The Supplement was targeted specifically to address goals, objectives, and conservation measures to conserve greater sage-grouse and to respond to the potential of its being listed (see Section 1.0, Purpose and Need). The Supplement included alternatives that provide a greater and lesser degree of restrictions in various use programs, but would not eliminate or invalidate any valid existing development rights. The BLM developed the Supplement with involvement from cooperating agencies, including the WGFD, Wyoming Governor's office, USFWS, and local agencies/governments to ensure that a balanced multiple-use management strategy to address the protection of greater sage-grouse while allowing for utilization of renewable and nonrenewable resources on the public lands. Management actions 71 and 72 were not modified, however, stipulations provided under Alternative D (management actions 4116, 4117, and 4118) were updated in coordination with the State of Wyoming and WGFD consistent with EO 2011-5.

Paleontological Resources

Summary Comment #3028: Commenters suggested the BLM should not unreasonably restrict oil and gas development since it may lead to the discovery of new paleontological resources.

Summary Response: The BLM developed the Supplement to ensure that a balanced multiple-use management strategy addresses the protection of greater sage-grouse while allowing for utilization of renewable and nonrenewable resources on the public lands.

Recreation

Summary Comment #3030: Commenters asked whether or not special recreation permits required in greater sage-grouse priority habitat areas apply to hunting and trapping.

Summary Response: Special Recreation Permits are authorizations which allow specified recreational uses and are issued as a means to manage visitor use, protect natural and cultural resources, and provide a mechanism to accommodate commercial recreational uses. If the actions described in the comment are subject to a Special Recreation Permit then yes, under alternatives E and F a permit would be required and mitigation may be applied to reduce impacts to greater sage-grouse.

Renewable Energy

Summary Comment #3032: Commenters provided multiple recommendations for renewable energy development to minimize impacts to greater sage-grouse, as well as other birds and raptors. Specific recommendations included installing bird deterrent devices on all guy wires, avoid siting temporary meteorological towers near leks or greater sage-grouse habitat, and siting wind energy development outside key habitat areas at least 5 miles from active leks, and 4 miles from the perimeter of greater sage-grouse winter habitat. Commenters urged the BLM to exclude wind energy development in key habitat areas under the Preferred Alternative. Commenters also suggested excluding development in raptor concentration areas.

Commenters recommended the BLM recognize the value of wind energy to the American public and reconsider how some of the adverse impacts to wind energy are characterized. Commenters noted how wind energy projects can be designed to reduce surface disturbance and construction scheduled to limit disturbances to wildlife and their habitat. Commenters suggested not all viewers consider wind turbines as having a negative effect on the landscape.

Summary Response: The BLM complied with the NEPA by including a discussion of measures that may mitigate adverse environmental impacts of the alternatives in the Supplement. Taking certain actions such as those

suggested by commenters, are only some of many potential forms of mitigation. The BLM must include mitigation measures in an EIS pursuant to the NEPA; yet the BLM has full discretion in selecting which mitigation measures are most appropriate and those that are not. The BLM has reviewed the suggested reports, data, articles, and recommendations to determine if they are substantially different than the information cited in the Supplement. The commenters' additional information was found to provide the findings as already noted in the Supplement, therefore inclusion and consideration would not substantially alter the conclusions or analysis. Therefore, they were not incorporated into the Proposed RMP and Final EIS.

The BLM considers wind to be a valuable energy source however; the purpose of the Supplement is to specifically address the goals, objectives, and measures for conservation of greater sage-grouse and their habitat. All ROW applications, including wind energy will be reviewed on a case-by-case basis, to balance protection of resources with America's wind energy needs.

Rights-of-Way and Corridors

Summary Comment #3033_1: Commenters voiced concerns regarding BMPs and/or RDFs, specifically co-location of transmission lines and use of perch discouragers. Commenters also recommended the BLM obtain additional information on BMPs from the Avian Power Line Interaction Committee (APLIC) and USFWS regarding greater sage-grouse for incorporation in the RMP. Commenters also expressed concern over BMPs that have not been peer reviewed or that may not always be feasible. In general, commenters asked the BLM to be flexible when prescribing measures during implementation.

Commenters rejected the BLM proposed ACEC designation for sage-grouse habitat because it violates access to existing rights, requesting that existing and pending access to ROWs and existing facilities be excluded from ACEC designation. Commenters suggested ROW and corridor management should be consistent with EO 2011-5. Other commenters supported management prescriptions for ROWs and corridors to protect greater sage-grouse habitat under either Alternative E or Alternative F. Commenters also suggested removing ROW avoidance and mitigation areas from OGMAs, separating the analysis for ROW avoidance and mitigation areas to clarify the areas to be avoided or that require mitigation, and that there was a lack of analysis presented of restrictions on ROWs.

Commenters offered new information for BLM to consider regarding the interaction between transmission lines and sage-grouse such as the APLIC studies. Commenters also supplied information disputing the effectiveness of perch discouragers preventing predation of greater sage-grouse, suggesting the BLM employ alternative

measures. Commenters noted there was a lack of information on the effects of tall structures on greater sage-grouse, requesting the BLM work with the industry to better understand decision-related impacts on the species as well as industry. Other commenters requested distribution lines be buried in the greater sage-grouse priority habitat areas and encouraged the use of perch discouragers on above-ground lines.

Summary Response:

The BLM developed the Supplement with involvement from cooperating agencies, including WGFD, Wyoming Governor's office, USFWS, and local agencies/governments to ensure a balanced multiple-use management strategy addresses the protection of greater sage-grouse while allowing for utilization of renewable and nonrenewable resources on the public lands. The BMP and RDF lists are not exhaustive, other methods may also be appropriate and the BLM will review additional BMPs such as those from APLIC documents. In addition, Appendix L will be supplemented as technology and understanding of greater sage-grouse advance. The RDFs in Appendix L are from BLM's Greater Sage-Grouse NTT and cannot be revised in order to provide Bureau-wide consistency. However, during implementation the site-specific situation shall be considered including effectiveness of the design feature as well as technical and economic feasibility. The BLM's Proposed RMP is consistent with EO 2011-5.

The BLM complied with its multiple-use mandate by evaluating an appropriate balance of resource uses, which involves tradeoffs between competing uses. The Supplement was targeted specifically to address goals, objectives, and conservation measures to conserve greater sage-grouse and to respond to the potential of its being listed (see Section 1.0, Purpose and Need). The Supplement included alternatives that provide a greater and lesser degree of restrictions in various use programs, but would not eliminate or invalidate any valid existing development rights.

Before beginning the Supplement and throughout the planning effort, the BLM considered the availability of data from all sources, adequacy of existing data, data gaps, and the type of data necessary to support informed management decisions at the land-use plan level. The data needed to support broad-scale analysis of the Bighorn Basin Planning Area are substantially different from the data needed to support site-specific analysis of projects. The information presented in map and table form is sufficient to support the broad scale analyses required for land use planning. As a result of these actions, the BLM gathered the necessary data essential to make a reasoned choice among the alternatives analyzed in detail in the Supplement, and provided an adequate analysis that led to an adequate disclosure of the potential environmental consequences of the alternatives (Chapter 4). A land use planning-level decision is broad in scope and, therefore, does not

require an exhaustive gathering and monitoring of baseline data. A more quantified or detailed and specific analysis would be required only if the scope of the decision included implementation actions. As specific actions that may affect the area come under consideration, the BLM will conduct subsequent NEPA analyses that include site-specific project and implementation-level actions. The site-specific analyses will tier to the plan-level analysis and expand the environmental analysis when more specific information is known. In addition, as required by NEPA, the public will be offered the opportunity to participate in the NEPA process for implementation actions.

The Supplement provides an adequate discussion of the environmental consequences, including the cumulative impacts, of the presented alternatives. The Supplement provided sufficiently detailed information to aid in determining whether to proceed with the Preferred Alternative or make a reasoned choice among the other alternatives in a manner such that the public could have an understanding of the environmental consequences associated with the alternatives, in accordance with 40 CFR 1502.1. Land use plan-level analyses are typically broad and qualitative rather than quantitative or focused on site-specific actions (BLM Land Use Planning Handbook H-1601-1, Chapter II, A-B at 11-13 and Chapter IV, B at 29). The Supplement contains only planning actions and does not include any implementation actions. As specific actions that may affect the area come under consideration, the BLM will conduct subsequent NEPA analyses that include site-specific project and implementation-level actions. In addition, as required by NEPA, the public will be offered the opportunity to participate in the NEPA process for implementation actions. Finally, the BLM's National Operation Center conducted management zone and range-wide cumulative effects analyses and is included in the Proposed RMP and Final EIS.

Summary Comment #3033_2: Commenters questioned the management to bury multiple pipelines of different operators within greater sage-grouse priority habitat areas and the legal implications.

Commenters do not support limitation on new ROWs corridors within the project area, requesting that BLM identify ROW exclusion and avoidance areas as major constraints for oil and gas development.

Commenters were concerned about management that would require burying transmission lines in greater sage-grouse habitat as realistic because it may not be feasible for several reasons including economics, engineering, and environmental, and violated existing rights. Commenters also stated that ROWs for buried transmission lines would likely be wider than those of above-ground transmission lines, leading to more surface and habitat disturbance during construction as well as maintenance. Commenters also had concerns

about co-locating powerlines within existing ROWs, which conflicts with requirements, policies and guidelines defined by the North American Electric Reliability Corporation and the Federal Regulatory Energy Commission.

Commenters noted that certain existing transmissions lines did not appear on the Supplement’s maps and requested they be included in the current ROW corridor designations.

Summary Response:

Land use plan-level analyses are typically broad and qualitative rather than quantitative or focused on site-specific actions (BLM Land Use Planning Handbook H-1601-1, Chapter II, A-B at 11-13 and Chapter IV, B at 29). The Supplement contains only planning actions and does not include any implementation actions. A more quantified or detailed and specific analysis would be required only if the scope of the decision included implementation actions. As specific actions that may affect the area come under consideration, the BLM will conduct subsequent NEPA analyses that include site-specific project and implementation-level actions. The site-specific analyses will tier to the plan-level analysis and expand the environmental analysis when more specific information is known. In addition, as required by NEPA, the public will be offered the opportunity to participate in the NEPA process for implementation actions.

The ROW and corridors maps have been updated since the release of the Draft RMP and Draft EIS. The maps show designated ROW corridors under each alternative, as proposed in management action 6033. Corridors are the preferred locations for the placement of new ROW. Existing ROWs may or may not be located within these corridors and are not displayed on the maps. Additionally, the BLM revised as requested, Management Action 9 (renumbered as 7186 in the Proposed RMP and Final EIS) as well as Management Action 6033 (number did not change).

Riparian-Wetland

Summary Comment #3034:

Commenters submitted recommendations from other RMP amendments for incorporation in the Proposed RMP and Final EIS for riparian-wetland management. A commenter further suggested adding additional measures such as prohibiting new range improvement projects within 0.5 mile of water and riparian-wetland areas to avoid perching locations for raptors to prevent predation of greater sage-grouse and controlling invasive species.

Commenters indicated the impact analysis for riparian-wetland areas was flawed asserting proper functioning condition was rarely achieved, a minimal standard, and did not respond to fisheries or wildlife habitat needs. In addition, commenters suggested management prescriptions be strengthened to protect those riparian areas that do meet proper functioning condition.

Commenters provided scientific citations supporting livestock grazing impacts on wetland-riparian areas, specifically that grazing affects efforts to maintain proper functioning condition and monitoring should focus on riparian areas, and that BLM should not rely on placing salt blocks in upland areas to draw livestock away from riparian-wetland areas.

Summary Response:

The Supplement only included management actions related to the Key Habitat Areas and PHMAs ACECs. The Draft RMP and Draft EIS included management actions specific to riparian/wetland resources, as does the Proposed RMP and Final EIS.

While the BLM used a consistent method for developing alternatives, the specifics of each sub-region necessitated modification of the range of alternatives to accommodate locality and population differences. In response to the greater sage-grouse management objectives described in the 2006 WAFWA *Greater Sage-grouse Comprehensive Conservation Strategy*, many reports have been prepared for the development of management recommendations, strategies, and regulatory guidelines. The 2011 NTT report, the 2013 Conservations Objectives Team (COT; USFWS 2013), and the 2013 Summary of Science, Activities, Programs and Policies that Influence the Rangeland Conservation of Greater Sage-Grouse (also referred to as BER; Manier et al. 2013) are the most widely used reports that were incorporated in the Supplement to address the effects of implementing greater sage-grouse conservation measures on public lands.

Socioeconomic Resources

Summary Comment #3036_1:

Commenters expressed concern regarding the socioeconomic impacts as a result of ACEC designation on multiple land uses under alternatives E and F, in particular voicing concern that the economic impacts were not accurately portrayed. Commenters also felt that the BLM tried to align alternatives D and F but cannot do so because of the differences in management prescriptions between the alternatives. Commenters requested BLM conduct additional analysis comparing alternatives, update information, incorporate supplied data, and provide supporting information for conclusions. Commenters requested the BLM also address socioeconomic impacts of management to and from land uses including oil and gas development, bentonite mining, livestock grazing, locatable minerals, and EOR development. Other commenters requested that the BLM include economic information and studies on the impacts of hunting, fishing, and the outdoor industry to the local economies in the Bighorn Basin. The commenters added that IMPLAN does not offer the most comprehensive impact analysis and that proposed management was inconsistent with EO 2011-5.

Commenters also pointed out that requiring validity exams in withdrawn or segregated lands could adversely impact small businesses since the ACECs overlap areas with high to moderate locatable mineral potential, which was not addressed, and could put the Proposed RMP at risk of invalidation.

Commenters also requested the BLM conduct further analysis regarding the socioeconomic cumulative impacts to the Bighorn Basin based on restrictions on land uses, in particular, loss of revenue from mineral development and closing public lands to livestock grazing. Other commenters raised issues regarding livestock grazing and how designation of ACECs will affect current and future livestock grazing management. Other commenters asked how the BLM would place an economic value on the social impact of restrictions on livestock grazing.

Commenters also voiced support for management included in the Supplement related to livestock grazing, asserting the value of public lands is often overestimated, not accounted for or could present opportunities for administrative cost savings for BLM.

Summary Response:

The BLM has provided an adequate analysis of potential economic impacts with the RMP; see Chapter 3 and 4, and Appendix Q. The changes suggested by some commenters (e.g., high social impacts in Alt E and F) are driven by the supposition of substantial economic impacts in bentonite, oil/gas, and grazing in Alternatives E and F. The quantitative data provided by BLM do not indicate there would be substantial differences between Alternative E and B, or between Alternative F and D. The differences that are present are reflected in the revised analysis.

The Supplement provides an adequate discussion of the environmental consequences, including the cumulative impacts, of the presented alternatives. As required by 40 CFR 1502.16, the Supplement provides a discussion of the environmental impacts of the alternatives including the proposed action, any adverse environmental effects that cannot be avoided should the alternatives be implemented, the relationship between short-term uses of man's environment and the maintenance and enhancement of long-term productivity, and any irreversible or irretrievable commitments of resources that would be involved in the proposal should it be implemented. The Supplement provided sufficiently detailed information to aid in determining whether to proceed with the Preferred Alternative or make a reasoned choice among the other alternatives in a manner such that the public could have an understanding of the environmental consequences associated with the alternatives, in accordance with 40 CFR 1502.1.

Land use plan-level analyses are typically broad and qualitative rather than quantitative or focused on site-specific actions (BLM Land Use

Planning Handbook H-1601-1, Chapter II, A-B at 11-13 and Chapter IV, B at 29). The EIS contains only planning actions and does not include any implementation actions. A more quantified or detailed and specific analysis would be required only if the scope of the decision included implementation actions. As specific actions that may affect the area come under consideration, the BLM will conduct subsequent NEPA analyses that include site-specific project and implementation-level actions. The site-specific analyses will tier to the plan-level analysis and expand the environmental analysis when more specific information is known. In addition, as required by NEPA, the public will be offered the opportunity to participate in the NEPA process for implementation actions.

Summary Comment #3036_2: Commenters were concerned that the BLM did not adequately reflect the socioeconomic impacts to local communities from limiting land uses such as oil and gas development and livestock grazing. Commenters remarked that revenue from oil and gas activities, mining, employment, property taxes, recreation, etc., could not be replaced from other revenue streams. Commenters requested BLM conduct additional analysis regarding the loss of tax royalties paid by oil and gas companies and associated impacts on the local communities. Commenters recommended the BLM develop and include a monitoring and mitigation plan in the Record of Decision, due to the anticipated socioeconomic impacts, especially smaller communities in the Planning Area.

Summary Response: Land use plan-level analyses are typically broad and qualitative rather than quantitative or focused on site-specific actions (BLM Land Use Planning Handbook H-1601-1, Chapter II, A-B at 11-13 and Chapter IV, B at 29). The Supplement contains only planning actions and does not include any implementation actions. A more quantified or detailed and specific analysis would be required only if the scope of the decision included implementation actions.

As specific actions that may affect the area come under consideration, the BLM will conduct subsequent NEPA analyses that include site-specific project and implementation-level actions. The site-specific analyses will tier to the plan-level analysis and expand the environmental analysis when more specific information is known. In addition, as required by NEPA, the public will be offered the opportunity to participate in the NEPA process for implementation actions.

Special Status Species

Summary Comment #3038: Commenters requested active raptor nests be defined to include nests that have been active within the past seven years and winter roost sites. Commenters also requested the Proposed RMP and Final EIS address golden eagle populations and use in the planning area, as

well as prohibit surface-disturbing activities with 1 mile of golden eagle nests.

Summary Response:

Thank you for your comment. The comment is outside the scope of the Supplement to the Bighorn Basin Draft RMP, a targeted analysis specifically addressing goals, objectives, and conservation measures to conserve greater sage-grouse and to respond to the potential of its being listed. Analysis for raptor protections are in compliance with the United States Fish and Wildlife Service recommend spatial and seasonal buffer zones to avoid or minimize disturbance and the risk of take.

Trails and Travel Management

Summary Comment #3039_1:

Commenters had concerns about seasonally closing roads in greater sage-grouse priority habitats because it could present safety concerns for existing facilities and that eliminating access would violate existing rights. In addition, commenters requested that the BLM allow seasonal access for emergency repairs and maintenance. Commenters stated travel management prescriptions were inconsistent with EO 2011-5 and should be eliminated or modified consistent with the EO.

Commenters discouraged management prohibiting new roads within 1.9 miles from active leks, indicating it could negatively impact utility response, delivery, and maintenance requesting BLM provide for exceptions. Commenters also requested BLM provide citations supporting the buffers required for road construction. Commenters recommended limiting motorized use to existing roads and trails pending travel management planning. Commenters recommended tertiary roads be located further than 0.6 mile from active leks and other important greater sage-grouse habitat. Commenters expressed support for closing unnecessary routes and trails utilizing reclamation practices to benefit wildlife habitat.

Summary Response:

The BLM has identified Alternative D as its Proposed RMP, which is consistent with the Wyoming Governor's EO 2011-5. EO 2011-5 has been determined sufficient to conserve greater sage-grouse throughout Wyoming and WAFWA Management Zones I and II.

Before beginning the Supplement to the Bighorn Basin Draft RMP and Draft EIS and throughout the planning effort, the BLM considered the availability of data from all sources, adequacy of existing data, data gaps, and the type of data necessary to support informed management decisions at the land-use plan level. The data needed to support broad-scale analysis of the Bighorn Basin Planning Area are substantially different from the data needed to support site-specific analysis of projects. The Supplement data and information is presented in map and table form and is sufficient to support the broad scale analyses required for land use planning.

The BLM used the most recent and best information available that was relevant to a land-use planning-level analysis including the BER (BER; Manier et al. 2013). The BER assisted the BLM in summarizing the effect of the planning efforts at a range-wide scale, particularly in the affected environment and cumulative impacts sections. The BER looked at each of the threats to greater sage-grouse identified in the USFWS’s “warranted but precluded” finding for the species. For these threats, the report summarized the current scientific understanding, as of report publication date (June 2013), of various impacts to greater sage-grouse populations and habitats. The report also quantitatively measured the location, magnitude, and extent of each threat. These data were used in the planning process to describe threats at other levels, such as the sub-regional boundary and WAFWA Management Zone scale, to facilitate comparison between sub-regions. The BER provided data and information to show how management under different alternatives may meet specific plans, goals, and objectives.

Summary Comment #3039_2: Commenters voiced concern about BMPs and/or RDFs in Appendix L, in particular those that require heliportable seismic exploration, when seasonal restrictions would suffice and have less impact. Commenters indicated that BLM defer decisions regarding road locations on split estate lands to the private landowner. Other commenters stated that telemetry or remote monitoring alone was not sufficient in all cases and recommended BLM consider operational and economic factors before implementation of this RDF.

Summary Response: The BLM developed the Supplement to the Bighorn Basin Draft RMP and Draft EIS with involvement from cooperating agencies, including WGFD, Wyoming Governor’s office, USFWS, and local agencies/governments to ensure that a balanced multiple-use management strategy addresses the protection of greater sage-grouse while allowing for utilization of renewable and nonrenewable resources on the public lands. The RDFs in Appendix L are from BLM’s Greater Sage-Grouse NTT. To provide Bureau-wide consistency the recommendations cannot be revised. However, during implementation the site-specific situation shall be considered including effectiveness of the design feature as well as technical and economic feasibility. The BLM’s Proposed RMP is consistent with the Wyoming Governor’s EO 2011-5 that has been determined sufficient to conserve greater sage-grouse throughout Wyoming and WAFWA Management Zones I and II.

Vegetation

Summary Comment #3042: Commenters provided justification and scientific data supporting the use of Ecological Site Descriptions instead of Historical Climax Plant Community, for restoration and habitat management. Commenters felt Ecological Site Descriptions provided a better assessment of

change over time and response following disturbance, and standardized data collection and analysis for addressing ecosystem health.

Commenters expressed opposition to language used for managing thatch, indicating it reflected negatively on livestock grazing management. Commenters suggested revisions and/or requested the management not be included in the Proposed RMP and Final EIS. Commenters recommended removing text in the impact analysis, stating it was redundant because the BLM is already required to determine if rangeland health standards are being met. Commenters identified technical edits to BMPs in Appendix L, including requests to use alternative language and corrections to technical terms.

Commenters questioned if vegetation treatments proposed to improve greater sage-grouse habitat were beneficial to the recovery of the species or a threat. Specifically, commenters suggested further evaluation and testing was necessary to substantiate the impacts, whether adverse or beneficial. Commenters further advised prohibiting vegetation treatments with 3 miles of lek sites and including one alternative that targets a 10.2-inch residual summer height during nesting season.

Summary Response:

Vegetation management is conducted using Ecological Site Descriptions developed by the Natural Resources Conservation Service, and the concept of Historic Climax Plant Community is an integral part of the Ecological Site Description in the state and transition model. The BLM revised Management Action 4030 in the Proposed RMP to reference plant community state or phases based on Ecological Site Descriptions.

The Supplement provided analysis of the effects of each alternative as required by NEPA and provides an adequate discussion of the environmental consequences of the presented alternatives. The Supplement contains only planning actions and does not include any implementation actions. As specific actions that may affect the area come under consideration, the BLM will conduct subsequent NEPA analyses that include site-specific project and implementation-level actions. The public will be offered the opportunity to participate in the NEPA process for implementation actions. The BLM considers impacts to sensitive species during site-specific analysis of grazing renewals and Standard 4 of Standards for Healthy Rangelands and Guidelines for Livestock Grazing applies to special status species habitat.

See the Wyoming Governor's EO 2011-5 for clarification on sagebrush treatments and their relation to disturbance. The BLM has identified Alternative D as its Proposed RMP in the Final EIS, which is consistent with EO 2011-5. Further, the BLM will collaborate with appropriate federal agencies, and the State of Wyoming as contemplated under

the Governor’s EO 2013-3, to: 1) develop appropriate conservation objectives; 2) define a framework for evaluating situations where greater sage-grouse conservation objectives are not being achieved on federal land, to determine if a causal relationship exists between improper grazing (by wildlife or wild horses or livestock) and greater sage-grouse conservation objectives; and 3) identify appropriate site-based action to achieve greater sage-grouse conservation objectives within the framework.

The RDFs in Appendix L are from BLM's Greater Sage-Grouse NTT and to provide Bureau-wide consistency the recommendations cannot be revised. During implementation the site-specific situation will be considered on a project specific basis.

Visual Resource Management

Summary Comment #3043: Commenters requested the BLM correct the Alternative F VRM Class II boundary for the Sheep Mountain Anticline ACEC to provide an additional 0.25-mile buffer from the adjacent VRM Class IV area so it includes all the bentonite potential areas depicted in the BLM’s bentonite potential GIS file.

Summary Response: Thank you for your comment. The comment is outside the scope of the Supplement to the Bighorn Basin Draft RMP and Draft EIS, a targeted analysis specifically addressing goals, objectives, and conservation measures to conserve greater sage-grouse and to respond to the potential of its being listed.

All GIS maps, data, and information have been updated for the Proposed RMP and Final EIS.

Water

Summary Comment #3044: Commenters questioned NTT RDFs related to water impoundments and management of produced water, noting the RDFs were duplicative of programs under the jurisdiction of state agencies. Commenters expressed concern that removal or reinjection of produced water would result in loss of habitat and water sources for greater sage-grouse. Commenters asked for clarification on how RDFs will interface with NSO and CSU requirements, where the RDFs apply (in greater sage-grouse priority habitat only or both priority and general habitats), and if there will be a process for granting waivers, exceptions or modifications.

Summary Response: The NTT report (or BER, or COT) is not the sole source of management decisions for the range of alternatives. The NTT was formed as an independent, science-based team to ensure that the best information about how to manage the greater sage-grouse is reviewed, evaluated, and provided to the BLM in the planning process. The group produced a report in December 2011 that identified science-based

management considerations to promote sustainable greater sage-grouse populations. The NTT is staying involved as the BLM work through the strategy to make sure that relevant science is considered, reasonably interpreted, and accurately presented; and that uncertainties and risks are acknowledged and documented.

A baseline environmental report, titled *Summary of Science, Activities, Programs, and Policies That Influence the Rangewide Conservation of Greater Sage-grouse (Centrocercus urophasianus)* (referred to as the BER), was released on June 3, 2013, by the U.S. Geological Survey. The peer-reviewed report summarizes the current scientific understanding about the various impacts to greater sage-grouse populations and habitats and addresses the location, magnitude, and extent of each threat. The BER does not provide management options. The report is being used by the BLM in our efforts to develop regulatory mechanisms and improve our conservation efforts of the greater sage-grouse and its habitat to reduce the potential for listing it under the ESA. The data for this report were gathered from BLM, and other sources and were the "best available" at the range-wide scale at the time collected. The report provides a framework for considering potential implications and management options, and demonstrates a regional context and perspective needed for local planning and decision-making.

In March 2012, the USFWS initiated a collaborative approach to develop range-wide conservation objectives for the greater sage-grouse to inform the 2015 decision about the need to list the species and to inform the collective conservation efforts of the many partners working to conserve the species. In March 2013, this team of State and USFWS representatives, released the COT report based upon the best scientific and commercial data available at the time that identifies key areas for greater sage-grouse conservation, key threats in those areas, and the extent to which they need to be reduced for the species to be conserved. The report serves as guidance to federal land management agencies, State greater sage-grouse teams, and others in focusing efforts to achieve effective conservation for this species.

The range of alternatives is based upon analysis of public scoping comments as well as information provided in the NTT report, the BER, the COT report, and State management plans. The alternatives represent different degrees of and approaches to balancing resources and resource use among competing human interests, land uses, and the conservation of natural and cultural resource values, while sustaining and enhancing ecological integrity across the landscape, including plant, wildlife, and fish habitat. For example, Alternatives E and F incorporates adjustments to the NTT report (NTT 2011) based on cooperating agency input to provide a balanced level of protection, restoration, enhancement, and use of resources and services to meet

ongoing programs and land uses. Anthropogenic surface disturbance would be managed not to exceed 3 percent in ecological sites that support sagebrush within Preliminary Priority Habitat (Figure 2-1, Ecological Sites Supporting Sagebrush in Preliminary Priority Habitat, in Appendix B, Figures).

Greater sage-grouse conservation measures in *A Report on National Greater Sage-grouse Conservation Measures* (NTT 2011) were used to form BLM management direction under alternatives E and F, which is consistent with the direction provided in BLM Washington Office IM 2012-044.

Wild Horses

Summary Comment #3045: Commenters expressed concern that management for greater sage-grouse habitat objectives in HMAs should include managing wild horses at minimum population levels to address impacts on range conditions from wild horses. Further, commenters suggested revising HMA management within Key and Priority habitats to prioritize evaluation of Appropriate Management Levels.

Commenters asked that language in the Supplement acknowledging the impacts of wild ungulates (including wild or feral horses) on the quality and composition of key forage species be incorporated in the *Fish and Wildlife Resources – Wildlife* section of the Proposed RMP and Final EIS.

Summary Response: Management Action 4145 was revised to require inclusion of greater sage-grouse objectives in HMA plan updates. In addition, language was revised to acknowledge that management challenges for big game species include poor habitat conditions, fire management, drought, increased development and urbanization, habitat fragmentation, invasive species, motorized vehicle misuse, disease, hunter access, and the impacts of livestock, wildlife, and ungulate grazing and browsing on the frequency, quality, and composition of key forage species.

Wilderness Characteristics

Summary Comment #3046: Commenters expressed concern over designation of lands with wilderness characteristics indicating the inventory was inadequate and should be updated. Commenters noted that some proposed lands with wilderness characteristics do not have wilderness characteristics because the viewshed requirements are not being met and they contain roads and other man-made structures. Commenters asked for clarification regarding the “scale” of analysis of lands with wilderness characteristics and requested that the BLM only use one scale for the analysis. Commenters felt management that called for restoration of roads and trails in greater sage-grouse priority habitat

would lead to “rewilding” of areas that no longer contain or are not being managed for wilderness characteristics, stating this management did not comply with the BLM’s multiple use mandate.

Commenters requested special management prescriptions for greater sage-grouse PHMAs located within lands with wilderness characteristics and areas recommended in the Citizens’ Wilderness Proposal, to protect greater sage-grouse and wilderness character. Commenters identified 22 lands with wilderness characteristics and 6 Citizens’ Wilderness Proposals that contain greater sage-grouse PHMAs and recommended stipulations for motorized and mechanized vehicle use, VRM, mineral and oil and gas leasing, geophysical exploration, mineral materials disposal, ROWs, and renewable energy. Commenters presented supporting information for implementing the special restrictions to protect greater sage-grouse, citing several technical documents. Commenters also submitted additional information for the BLM to consider about the Citizens’ Wilderness Proposal areas.

Summary Response:

Thank you for your comment. The comment is outside the scope of the Supplement to the Bighorn Basin Draft RMP, a targeted analysis specifically addressing goals, objectives, and conservation measures to conserve greater sage-grouse and to respond to the potential of its being listed.

The BLM has identified Alternative D as the Proposed RMP in the Final EIS, which does not designate Key Habitat Areas or PHMA ACECs, nor does it manage lands to maintain wilderness characteristics; these areas would be managed consistent with management for other resources and resource uses. Alternative D is consistent with the Wyoming Governor's EO 2011-5.

Wildlife

Summary Comment #3049:

Commenters requested that BLM consider multiple published articles and guidance regarding wildlife and greater sage-grouse, noting several relevant articles on greater sage-grouse were not cited.

Commenters identified seven important bird areas for inclusion in the RMP, providing information about the areas and noting that several overlap greater sage-grouse PHMAs, emphasizing the ecological importance of these areas for greater sage-grouse and critical avian habitat.

Commenters were confused by restrictions on locatable minerals due to closure of big game crucial winter range, questioning the BLM’s authority to manage game species and discretion to restrict development in big game habitat.

Commenters suggested the BLM clarify what “closed” meant, recognize WGFD’s responsibility for game management, and support cooperative management where wildlife concerns exist.

Commenters indicated impacts on greater sage-grouse were overstated, asserting recent studies confirmed this assertion, suggesting ROW restrictions were not necessary, and that restrictions and/or mitigation should be specific to greater sage-grouse and based on valid science.

Summary Response:

BLM reviewed the suggested reports/data/articles to determine if they are substantially different from the information cited in the Supplement. The commenters’ additional information was found to provide the general findings as already noted in the Supplement, therefore inclusion and consideration would not substantially alter the conclusions or analysis. Therefore, they were not incorporated into the Proposed RMP and Final EIS.

The BLM acknowledges that WGFD manages wildlife within Wyoming, while the BLM focus is on managing habitat. The BLM will continue to work with the WGFD to meet state wildlife population objectives.

The BLM complied with the NEPA by including a discussion of measures that may mitigate adverse environmental impacts of the alternatives in the RMP and EIS. See 40 CFR 1502.14(f), 1502.16(h). Potential forms of mitigation include: (1) avoiding the impact altogether by not taking a certain action or parts of an action; (2) minimizing impacts by limiting the degree or magnitude of the action and its implementation; (3) rectifying the impact by repairing, rehabilitating, or restoring the affected environment; (4) reducing or eliminating the impact over time by preservation and maintenance operations during the life of the action; or (5) compensating for the impact by replacing or providing substitute resources or environments. (40 CFR 1508.20)

Taking certain actions are only some of many potential forms of mitigation. The BLM must include mitigation measures in an EIS pursuant to the NEPA; yet the BLM has full discretion in selecting which mitigation measures are most appropriate, including which forms of mitigation are inappropriate.

4.3. Non-Substantive Comments

In addition to the substantive comments summarized and responded to above, the BLM received numerous non-substantive comments during the comment period. In accordance with the BLM NEPA Handbook (H-1790-1), a formal response to non-substantive comments is not required; however, the BLM has reviewed and acknowledges all received comments. Non-substantive comments generally included:

- Comments in favor of or against management alternatives and allocations without reasoning that meet the criteria for substantive comments (such as: we disagree with the Preferred Alternative and believe the BLM should select Alternative C);
- Comments that only agreed or disagreed with BLM policy or resource decisions without justification or supporting data that meet the criteria for substantive comments (such as: the BLM needs to better manage oil and gas development in the Planning Area);
- Comments that did not pertain to the Bighorn Basin Planning Area;
- Comments that were outside the scope of analysis for the RMP and EIS (such as comments related to revision and update of laws, policies, and regulations);
- Comments that take took form of vague, open-ended questions or statements that did not meet the criteria for substantive comments; and
- Comments submitted during the comment period for the Supplement that focused on the Draft RMP and Draft EIS rather than the supplement.

5.0 CONCLUSION

The BLM integrated the content of the Supplement into the Draft RMP and Draft EIS, revised the combined document, and prepared the Proposed RMP and Final EIS in response to substantive comments received during both comment periods. The BLM will continue to consider public, agency, and other stakeholder comments through completion of the Bighorn Basin RMP Revision Project, as appropriate.

 COMMENTER RESPONSE INDEX

1.0 INTRODUCTION

The tables presented in Attachments A and B are provided to assist commenters in finding their submitted comments and identifying the associated BLM comment summary and response in the Comment Analysis Report. Table A-1 provides a list of first and last names of commenters, the commenter’s affiliation (if applicable), and the commenter’s comment document number. PDF copies of all received comment documents are located on the BLM website: <http://www.blm.gov/wy/st/en/programs/Planning/rmps/bighorn.html>. Within Attachment B, also located at the above website, Table B-1 includes all individual substantive comments and identifies the BLM summary comment and response number associated with individual comments, organized by comment document number.

To use these tables:

1. Locate your name and associated comment document number in Table A-1.
2. Using the comment document numbers from Table A-1, go to Attachment B on the BLM website address provided above and find your identified individual comment(s), comment text, and BLM summary comment and response numbers in Table B-1.
3. The BLM summary comment/response numbers match those provided in Section 4.2.1 of the Comment Analysis Report.

With this information (comment document number, comment number, and summary comment and response number) commenters can locate a copy of their original comment document on the BLM website, their individual comments in Attachment B, and BLM summary comments and responses in Section 4.2.1 of the Comment Analysis Report.

ATTACHMENT B

Table B-1 includes all individual substantive comments and identifies the BLM summary comment and response number associated with individual comments. The table is organized by comment document number. Please refer to Attachment A, Table A-1 within the Comment Analysis Report for the Bighorn Basin Resource Management Plan Revision Project to locate your name and associated comment document number.

Table B-1. Individual Comments and BLM Response Index

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
10004	10004-1	You do not list all of the existing roads, is it your plan to block off any that are not listed.	2034
10024	10024-5	Comment on Pages 4-60, Figure 4-3: In Figure 4-3, there is no justification for having more Moderate Constraints in Alternative A than in either Alternative A or D. Alternative A should be designed to offer encouragement to further exploration.	2047
10024	10024-6	Recommendation #1: To accommodate and encourage additional exploration along the Absaroka Front, it is strongly recommended that Alternative C be chosen by the BLM. Concurrent with and as a part of this recommendation, there should be a reduction in the 90,000 acres presently classified as Moderate Constraints under Alternative A, Figure Y-4 by reclassifying them as Standard Restrictions. The recommended reduction would eliminate many of the Stipulations presently impeding exploration, and should stimulate oil industry activity in one of the few prospective structural areas remaining in the Bighorn Basin. The acres recommended for reclassification to Standard Restrictions are contained within the following described townships:T44N-R99W through R101W;T47N-R101W through R104W;T45N-R99W through R101W;T48N-R102W through R104W;T46N-R100W through R102W;T49N-R102W through R104W.	2047
10024	10024-7	Comment on Impacts Common to all Alternatives, Page 4-62: To obtain valid geophysical data under approved exploration leases requires that the ends of the lines, which would be stopped against the edges of NGE leases, be extended onto the NGE leases to obtain structural data under all of the approved or issued leases. When conducting seismic work, the tail-end of lines are routinely extended beyond the limits of the acreage being mapped to obtain data under 100% of the leases.	2016
10042	10042-1	Several statements in the RMP Executive Summary are very questionable. For example, on page 5, it states: "Goals are broad statements of desired outcomes that are usually not quantifiable." In business, "Best Management Practices" define goals as providing definable programmatic direction focusing on the desired end result. That is why they are called goals and not some unquantifiable vague ideology. True, objectives provide more precise measurement and steps to achieve the goal. Another example is also on page 5. Allowable uses identify uses that "are allowed, restricted, or excluded on BLM-administered surface lands and federal mineral estate." According to a BLM specialist, this statement means that allowable uses are those uses allowed, restricted, or not allowed. I was also told that this is the BLM definition of "allowable uses." How can an allowable use be not allowed?	2054

**Attachment B – Draft Resource Management Plan and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table B-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
10042	10042-2	Include milestone points in the plan to revisit certain land uses to adjust the process as required for the good of the area and the country. When I questioned one of the BLM specialists, I was told that the BLM's intent is to make specific reviews throughout the life of a particular regulation. This should be clearly communicated to the public together with the associated review criteria to include what triggers these periodic reviews.	2054
10042	10042-3	Some of the assumptions in the RMP are flawed. For example, with respect to the McCullough Peak wild horse range, the executive summary states: "Expansion of the McCullough Peaks HMA under alternatives B and D would result in beneficial impacts to wild horses by adjusting the HMA boundary to more accurately correspond to the range the resident herd uses, rather than continued attempts to recapture and move horses." Does the BLM really think that expanding the area will keep the herd from naturally growing and ultimately overpopulating the new area without further management of the herd size? If this the wildlife management science applied by the BLM in this case, it is terribly wrong.	2054
10042	10042-4	There are no real definable buffer limits when inferring "visual resource" protections. Depending on the topography along some areas along the trails, the exclusion could be more that 15 to 20 miles wide. What purpose is served by these egregiously applied buffers? Preserve the antiquity value of the trail, yes, but not necessarily from horizon to horizon. This concept of visual horizons needs to be re-thought. What purpose will the "preservation of a visual resource" serve other than to close a large portion of the Big Horn Basin from any activity except to serve a few purists while significantly impacting beneficial use of the land for the greater good of the public?	2032
10044	10044-1	It has come to our attention that there is little or no consideration of enhanced oil recovery technologies and the associated development needs in the draft Bighorn Basin RMP.	2051
10047	10047-1	The BLM, to its credit, lists socioeconomic as an analysis portrait, but the Wyoming Business Alliance observes this section doesn't address the advent of new technology and how this has shaped the energy landscape in Wyoming over the last decade---i.e., without new technology there would be no Jonah and Pinedale anti-cline in Sublette County, CBM in Campbell County, natural gas development in Sweetwater County, and the most recent activity regarding the Niobrara Oil play. Because these counties have progressed in terms of direct energy job creation, it should be understood that each of these jobs accounts for 3.65 jobs total--a fact which is important to consider if new energy development were to occur in the Bighorn Basin.	2046
10047	10047-2	In the Alternative C there should be an analysis of technology and how energy development in the future could expand (based on technology) in the Bighorn Basin and why this would be foreclosed in Alternative D, the agency's Preferred Alternative.	2054
10051	10051-1	Public participation in this RMP is very important and many of the people affected will have a lot to learn in order to fully understand, process and compare the alternatives set forth by BLM and provide appropriate, educated comments. Adding this 60 day extension would allow comments to be of greater assistance to BLM when preparing the Final RMP.	2007
10051	10052-1	An additional 90 days would provide better opportunities for a more comprehensive review of the documents by all interested parties. We believe it	2007

**Attachment B – Draft Resource Management Plan and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table B-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
		is imperative that all interested parties have the opportunity to participate in the BHB planning process and we believe this is one of BLM's primary planning goals. Therefore, we urge that you grant a 90-day extension to facilitate review and comment by all interested parties.	
10053	10053-1	The Commissioners of Bighorn, Hot Springs, Park and Washakie Counties would like to formally request that the Bureau of Land Management extend the current public review period for the Draft Bighorn Basin Resource Management Plan and Draft Environmental Statement from 90 days to 120 days	2007
10054	10054-1	The Commissioners of Hot Springs, Park and Washakie Counties would like to formally request that the Bureau of Land Management extend the current public review period for the Draft Bighorn Basin Resource Management Plan and Draft Environmental Statement from 90 days to 120 days.	2007
10055	10055-1	Marathon Oil Company respectfully requests a 90-day extension of the comment public period for the Draft Bighorn Basin RMP/EIS due to the broad public interest in BLM's proposed management of the nearly 6 million acres in the Bighorn Basin.	2007
10056	10056-1	Phoenix Production respectfully requests a 90-day extension of the comment public period for the Draft Bighorn Basin RMP/EIS.	2007
10057	10057-1	The Bighorn Basin Resource Alliance respectfully requests a 90-day extension of the comment public period for the Draft Bighorn Basin RMP/EIS.	2007
10059	10059-1	I would like to request a 60 day extension of the public comment period for the Draft Bighorn Basin RMP/EIS. Due to both the size and complexity of the document, it will be difficult for the general public and other interested stake holders, to digest the document and provide substantive comments before the current 90 day comment period expires on July 20, 2011.	2007
10060	10060-2	Finally, I feel that BLM should institute stricter standards to protect the Yellowstone grizzly bear. In order to keep bears away from unnatural food sources the BLM should implement a food storage order for all BLM lands within occupied grizzly bear habitat. In addition, the BLM should not allow black bear baiting in occupied grizzly habitat. This practice leads to increases in grizzly conflicts by attracting grizzly bears to areas where they are more likely to come into conflict with humans. Protecting grizzly habitat is yet another reason to designate the Absaroka Front Management Area as off-limits to oil and gas leasing. BLM lands along the Absaroka-Beartooth Front provide increasingly important habitat for bears, particularly in the spring and fall. Development of roads and other infrastructure in this area will undoubtedly impact bears' ability to thrive on this landscape. Therefore, I want to emphasize that the BLM should designate the Absaroka Front Management Area as off-limits to future oil and gas leasing, and institute a no-net-gain policy for roads and other forms of development within occupied grizzly habitat along the Absaroka-Beartooth Front (Record #4117).	2039
10060	10060-3	To keep bears away from unnatural food sources, the BLM should implement a food storage order for all BLM lands within occupied grizzly bear habitat. The BLM is proposing that they would require bear-proof food storage for permittees and within developed recreational sites, but this does not go far enough. The vast majority of grizzly-occupied BLM lands fall outside of developed recreational sites and most of the people using these lands are not commercial outfitters or livestock producers. Therefore, it would be most effective if BLM were to require that everybody work to keep bears wild and	2042

Table B-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
		safe through the simple act of food storage.	
10067	10067-1	Grizzlies are a keystone species and their presence is key to the survival of these wild lands. The issue of black bear baiting is one I was not aware of and I would welcome a statement of the reasoning for this	2042
10091	10091-1	May I also point out that according to my own personal research, you may have missed a trail? A significant Native American corridor went from Ten Sleep Pass, through what is now Medicine Lodge State Park and then along the western base of the Big Horns until it went back up the mountains to the Medicine Wheel. Much of this is on what are now BLM public lands.	2010
10091	10091-2	Wyoming is one area of the country that has not experienced the full effect of the recession. Oil and gas jobs will mostly come from outside the region and they were not considered under socioeconomic impacts.	2046
10118	10118-1	The Greater Sage Grouse core areas 2008 designation in the Bear Creek area and in the area north of Hyattville better reflects actual distributions and areas of concern than does the 2010 version.	2069
10118	10118-2	Big game winter range does not include Core areas not designated as such in an area west of the Alkali Road and South of the Red Gulch Road. This area is crucial for wintering elk and mule deer.	2022
10121	10121-1	I would like to see the public discussion of the RMP be extended by at least 3 months so people that live in the Bighorn Basin have time to adequately discuss and comment on the new RMP plan.	2007
10124	10124-1	Wildlife is described based only on perceptions, without qualitative and quantitative data. This is supposed to be a document based on science and facts, not opinion. EXAMPLE: Mule Deer discussion provides no support for the statement (pg. 3-97): (b) because of seasonal dependence on woody plant communities, mule deer are generally declining in numbers due to a decline in habitat quality and quantity. How can you make a statement like this without providing evidence to back it up? No acres, no changes over time are substantiated. Nothing.	2025
10124	10124-2	ECONOMIC WORKSHOPS - these were not conducted throughout this NEPA process-not real economic workshops. This was pointed out to the agency on more than one occasion, but ignored. This is legally challengeable and no doubt will be.	2046
10124	10124-3	+ LIVESTOCK AUMS: Unsubstantiated reductions in animal unit months (AUMs) are called for. There are, however, no numbers, data, or quantitative information to justify such reductions. The document refers to surface disturbances, yet ties nothing to livestock grazing as causing or warranting the restrictions of surface disturbances. There are no direct impacts disclosed under any of the alternatives for management actions that change AUM allocations.	2011
10124	10124-4	TABLE 2 - 5 (RMP/EIS p. 2-160-162) state that management must be consistent with "other resource objectives" but the document does not disclose which resource objectives are being referred to---nor how livestock grazing might be negatively affecting "other resource objective." Just to say it does not make it so!	2011
10128	10128-1	I would like to propose the inclusion of three OHV Riding Parks into the BLM RMP process as described in the attached document. Please let me know how I need to proceed and I will follow up with a list of petitions and names for this project.	2034

**Attachment B – Draft Resource Management Plan and Draft Environmental Impact Statement

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
10128	10128-2	Proposal for a BLM OHV Riding Park located in North Oregon Basin area T52N - R100W and R101W which utilizes the current trails and roads as shown in the Maps proceeding.	2034
10133	10133-1	Recommendations should be made to congress to extend the "Wild and Scenic" designation from the Shoshone National Forest downstream at least to Wyoming Rt. 120. This area is, by my own observation, heavily used habitat for Golden Eagles, Ospreys, and Elk. Numerous Elk cows and calves are frequently seen in the thickets along the river where feed and cover are abundant. Both Mule and White Tailed deer also use the area. I strongly recommend that "No Surface Occupancy" management be employed on the BLM lands abutting the river.	2018
10133	10133-2	I live on that section of land that straddles County Rd. 8VC, also known as Canyon Rd., and Road 8UD running north from it in Clark. My property abuts a BLM plot on the west side. Here too, I would like to see "No Surface Occupancy" management employed for the following reasons. 1) This plot provides the only public BLM access to Little Rocky Creek in the Clark area. 2) The aquifer that lies beneath Little Rocky is severely defined and provides all the drinking water for the Clark community.	2034
10133	10133-2	I live on that section of land that straddles County Rd. 8VC, also known as Canyon Rd., and Road 8UD running north from it in Clark. My property abuts a BLM plot on the west side. Here too, I would like to see "No Surface Occupancy" management employed for the following reasons. 1) This plot provides the only public BLM access to Little Rocky Creek in the Clark area. 2) The aquifer that lies beneath Little Rocky is severely defined and provides all the drinking water for the Clark community.	2031
10135	10135-5	Rock art is damaged by animals rubbing the rock surface. Livestock trails leave a permanent coat of dust on panels. Grazing permits should provide significant buffer zones between sites and livestock.	2004
10139	10139-1	In light of the requests by Cooperating Agencies and the public for an extension of time to submit their comments and in order to provide my office sufficient time to thoroughly review the Draft Bighorn Basin BLM RMP and EIS, I advise that the State supports and requests a 45 day extension of the comment period through August 26, 2011.	2007
10140	10140-1	This letter is in reference to the BLM's draft Resource Management Plan: It is my opinion and request that the 120 extension be granted.	2007
10152	10152-11	In addition, the Clarks Fork River receives Wild and Scenic River protections as it traverses the Shoshone National Forest. Recreationalists enjoy and treasure the BLM portion of this river as well. We feel that managing to protect its Wild and Scenic qualities is justified not only when BLM lands are considered in isolation, but even more so when the river is considered as a whole, such that management would not change across jurisdictional boundaries.	2018
10152	10152-12	Perhaps the most significant addition relative to the special management areas that is found in chapter 2 of the Draft EIS is that unlike in Maps 60 and 62, names are provided for the special recreation management areas, recreation management zones, and extensive recreation management areas. See Draft EIS at 2-13 to -125 (presenting the names of the special recreation management areas). We think this is a valuable addition and these names should also be provided on the maps. The names of these areas provide a great deal of information and "color" regarding these areas that is lacking without the names	2057

**Attachment B – Draft Resource Management Plan and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table B-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
		being provided on the maps. The Badlands Special Recreation Management Area, Absaroka Foothills Area, Tour de Badlands Area, Wild Badlands area, Tatman Mountain Area-these are poignant reminders of why these areas are important and valuable and we ask the BLM to keep these names in mind as it makes its management decisions, and to apply these names on the maps when the Final EIS is released.	
10152	10152-13	However, we admit to some confusion regarding the West Slope Special Recreation Management Area. In Table 4-15 in the Draft EIS it is indicated that under alternative D this area would be 318,385 acres, whereas under alternative B it would be only 126,914 acres. Draft EIS at 4-337. Yet when we look at Maps 60 and 62 it is not apparent that there is such a large differential in the acreage of the West Slope Special Recreation Management Area. In fact, the special recreation management area under alternative B would appear to be larger because under alternative D a fairly large portion of this area-in the southern Bighorns-would be designated an extensive recreation management area.	2057
10152	10152-14	Research has shown that a variety of wildlife taxa are adversely affected by artificial night lighting. And night lighting is very disturbing to recreationists and other public lands users. BLM should strive to minimize the impacts of light pollution	2032
10152	10152-16	The WGFD has developed an important document relative to mitigation of impacts to wildlife in the face of oil and gas development. This document is entitled "Recommendations for Development of Oil and Gas Resources Within Important Wildlife Habitats." It is available at http://gf.state.wv.us/downloads/pdflog.pdf . The Wyoming Game and Fish Department also has developed a similar document with regard to wind energy development: "Wildlife Protection Recommendations for Wind Energy Development in Wyoming." It is available at http://gf.state.wy.us/downloads/pdf/Final%20WGFC%20Approved%20Wind%20Recommendations%2011-17-10.pdf . The BLM should recognize these important guidance documents in the RMP and adopt their provisions as a component of the RMP.	2025
10152	10152-18	We are concerned by alternative D's counterpart provision that would only apply a CSU stipulation or prohibit or restrict surface-disturbing activities or surface occupancy within 0.25 miles of occupied or undetermined sage-grouse leks outside KHAs. Research has shown that this 0.25 mile buffer, widely used by the BLM in coalbed natural gas (CBNG) development areas, has been inadequate in preventing local sage-grouse populations from declining in energy fields. 19 In the Powder River Basin, 98 percent CBNG development within two miles of leks was projected to reduce the average probability of lek persistence from 87 percent to 5percent.20	2036
10152	10152-19	We prefer the TLS in alternative B, which would "avoid surface-disturbing and disruptive activities in greater sage-grouse nesting and early brood-rearing habitat within 3 miles of occupied greater sage-grouse leks ... or in identified nesting and early brood-rearing outside the 3-mile lek buffer. ... from February 1 to July 31." Alternative D instead applies a TLS in suitable sage-grouse habitat within KHAs from March 1 to June 30. We are concerned that the earlier June 30 end date for the TLS in alternative D will fail to protect female grouse that have re-nested after losing their first nest to predators, inclement weather, or other causes. Female grouse that make second or third nest attempts may hatch their	2068

**Attachment B – Draft Resource Management Plan and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table B-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
		eggs as late as early-to-mid-July. Therefore, we believe that a compromise between alternative B and D's TLS dates, such as March 1 - July 15, might be most appropriate to maximize grouse productivity while allowing the maximum possible time for development activities.	
10152	10152-2	The 15-Mile Basin remains largely un-leased for oil and gas development. This presents BLM with an important opportunity to protect a landscape where real protection can still be had. Making this area unavailable for leasing could help link together the three WSAs and provide a large, un-fragmented area for citizens to hunt, explore, and find solitude free of industrial intrusion. This would help protect the wilderness values that dominate in this area, and protect the solitude people seek in this area, as well as its wildlife. Therefore this area should be made unavailable for oil and gas leasing. And because there is an increasing problem with unauthorized roads in this area, this area should be designated as an area where vehicular travel is only authorized on designated routes.	2019
10152	10152-20	Alternative D provides only a half-mile buffer for active golden eagle nests, for example. The USFWS recently published its "Draft Eagle Conservation Plan Guidance" because of its concern over the adverse impact of wind energy development on golden eagles in particular. Given that golden eagle nesting territories can extend over five miles from their nests ² and given the vulnerability of golden eagles to collisions with wind turbines and their sensitivity to anthropogenic disturbances, we believe that a half mile TLS for nesting golden eagles is inadequate.	2071
10152	10152-21	If wind energy development is permitted along the Absaroka-Beartooth Front, BLM should be in a position to strongly regulate it. As currently shown in the Draft EIS, BLM only plans to use the mitigation measures provided in the Record of Decision for Implementation of a Wind Energy Development Program and Associated Land Use Plan Amendments (BLM 2005c) and BLM Instruction Memorandum 2009-43. Draft EIS at 2-110. We ask the BLM to incorporate, at a minimum, wind energy development guidance from the USFWS and the WGFD whenever it permits wind development, particularly along the Absaroka-Beartooth Front, and to make provision for the application of these guidelines in the RMP30	2065
10152	10152-22	However, under both alternatives B and D there would be a communications site designated in T53N R90W, in the Bighorn Front area. Maps 52 and 54. We ask the BLM to reconsider designating this communications site. For one, under either alternative B or alternative D, this communications site would be located in a rights-of-way avoidance and mitigation area, so BLM should start to avoid right now the placement of rights-of-way in this area by not designating this area for a potential communication site. Moreover, under alternative B this communication site would be located immediately adjacent to a rights-of-way exclusion area, so designating this site is an inherent conflict with this management direction. Cell phone towers, which is probably what "communications sites" refers to, are anathema to the important environmental values in the Priority Conservation Areas. Among other things, communication towers kill millions of birds each year. Where BLM does permit communication towers, it should require best management practices such as appropriate lighting that doesn't attract birds (e.g., no solid red lights) and bird diverters that highlight guy wires to reduce bird collision fatalities. 33	2020
10152	10152-23	Under alternatives A, C, and D 5,171 acres would be closed to livestock grazing.	2011

**Attachment B – Draft Resource Management Plan and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table B-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
		Draft EIS at 2-19. This represents less than 0.2 percent of the 3,189,743 BLM surface acres in the Bighorn Basin. Then, under alternative B, 1,988,927 acres would be closed to livestock grazing, or 62 percent of the BLM lands in the Bighorn Basin. This is a radically disproportionate approach to livestock grazing management. The area of closure under alternative B is 385 times the area of closure under any of the other alternatives. And there is nothing in between. This does not represent a reasonable range of alternatives. All we are given to consider is closing almost nothing to grazing or closing well over half of the planning area. That is not a balanced range of alternatives, and therefore defeats informed public and agency involvement and comment on this process, bedrock principles of National Environmental Policy Act (NEPA) law and process. Because of this imbalance, we ask the BLM to develop one or more proposals for grazing management that would close an intermediate portion of the planning area to grazing relative to the options that are currently presented.	
10152	10152-24	Furthermore, in the MLP Evaluation report, the state office said, "[t]o preserve decision space, oil and gas leasing will be deferred in key areas identified [in an accompanying figure] until at a minimum the release of the draft EIS and proposed plan." MLP Evaluation at un-numbered page 30. It is not apparent that this decision has factored into the MLP analysis presented in the Draft EIS and Draft RMP. Will deferral of leasing continue past the release of this Draft EIS? We do not know the answer to that question from what is presented in the draft EIS. The BLM should clarify the timeline over which leasing deferral will continue, and as has been said a number of times at a minimum the lease deferral decision should continue beyond just the release of this draft EIS, and in fact be made permanent in the Priority Conservation Areas.	2014
10152	10152-25	However, on June 23, 2011 the BLM, EPA, and the Forest Service entered into a memorandum of understanding regarding air quality analyses. This memorandum raises the possibility that a more in-depth analysis of air quality issues needs to be prepared for the Bighorn Basin RMP. We ask the BLM to carefully consider this possibility. In particular, it is crucial that visibility in nearby Class I areas-the Teton, Washakie, and North Absaroka Wilderness Areas-be adequately evaluated and protected.	2009_1
10152	10152-5	As shown in Draft EIS Map 7, the level of existing leasing in the Absaroka-Beartooth Front, 15-Mile Basin, and Bighorn Front is generally quite low. That is, by not leasing in these areas in the future, as we request, there would be little impact on oil and gas development in the basin. It is reasonable and practical to not engage in future leasing in these three iconic areas.	2077
10152	10152-6	As we noted above, if our leasing availability approach-which is largely reflected in the provisions of alternative B-were adopted in the RMP only 46.3 percent of the mineral estate in the planning area would be closed to leasing and the remainder would be available for leasing. The fraction of the planning area in the Priority Conservation Areas is even smaller. We note that in the Pinedale RMP the BLM designated 49 percent of the BLM surface estate as unavailable for future leasing. So there is precedent for closing areas to leasing of this magnitude. The Cody and Worland Field Offices would be following in the steps of the Pinedale Field Office if 46.3 percent of these Field Offices was made unavailable for future leasing in the RMP, and they should do so.	2013
10152	10152-7	While there are 137 named fields in the Bighorn Basin, there are only eight major producing oil fields (by volume) and six major producing gas fields. Draft EIS at 3-51. Consequently, we believe the BLM should carefully consider the	2050

**Attachment B – Draft Resource Management Plan and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table B-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
		designated oil and gas management areas that would be established under alternatives C and D and determine whether the number of recognized fields can be scaled back with little or no impact on oil and gas production. The purpose of recognizing these fields is to promote oil and gas production, so if there is little reason to expect much production from many of these fields, they should not be recognized as oil and gas management areas.	
10152	10152-8	Consequently, under the provisions of the Federal Land Policy and Management Act (FLPMA) BLM must give "priority" to the "designation" of these ACECs, a requirement which alternative B clearly meets and which the other alternatives do not.	2068
10152	10152-9	In several maps the Absaroka Front Management Area is recognized. See, e.g., Maps 30 and 68. We strongly support creation and recognition of this management area because it corresponds closely with the Absaroka-Beartooth Front management area specified in our maps in the enclosed CD. As shown in Record # 4080 in the Draft EIS, this area would be recognized under alternatives B, C, and D. Draft EIS at 2-77. After considering the management prescriptions that are presented, we would support protection of the acreages presented for alternative D (130,895 acres of BLM surface estate and 253,159 acres of mineral estate); however, we believe that the management prescriptions presented for alternative B should be applied.	2055
10165	10165-1	In the plan it states: The six mines in the Bighorn Basin employ 132 persons, and another 360 persons are employed at the milling processing facilities at six different mills (one in the Worland area, two near Greybull, and three near Lovell, Wyoming). The stated number of employed people in the bighorn basin from the bentonite industry is a lot more than the number in the plan. My mine alone has four full-time contractors (stripping overburden, hauling bentonite, drilling/blasting and conducting environmental activities) totaling over 60 employees. The number stated in the plan is the number of employees who work "in-house" for the bentonite companies, i.e. not contractors. Please state there is substantially more people employed as contractors from the bentonite industry in the Bighorn basin. My guess is the number of workers in the bentonite industry is 10X more than what the RMP states.	2049
10165	10165-2	Page 3-42 in Management Challenges Approximately 30,000 acres of land has been disturbed in the Bighorn Basin due to bentonite mining, along with approximately 4,000 acres of road and haul-road disturbance (BLM 2008c). The approximate of 4000 acres of road disturbance from bentonite activities cannot be accurate. Assuming 30 linear feet of width per road, this equates to 1100 miles of roads from bentonite activity. Unless the other bentonite mines have substantially more roads than my mine, the 4000 acres of road disturbance stated in the RMP should be reviewed for accuracy.	2015
10165	10165-3	Map 54 Land Resources Rights-of-Way and Corridors Alternative D Why is the area east of the Big Horn River and SE of Lovell mostly classified as Right-of-Way Avoidance/Mitigation Area? This area is a major active bentonite mining region in the Bighorn basin. Won't this designation hurt the bentonite industry when we need to obtain a ROW to access new mining areas in the future?	2077
10165	10165-4	Page 3-169 in Lands with Wilderness Characteristics The BLM performed an inventory of lands in the Planning Area to determine if any BLM-administered lands had wilderness characteristics. Wilderness characteristics are resource values that include naturalness, outstanding opportunities for solitude, and outstanding opportunities for primitive and unconfined recreation. Areas	2028

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
		evaluated for wilderness characteristics generally occur in undeveloped locations of sufficient size (usually at least 5,000 acres) to be practical to manage for these characteristics. Smaller areas are considered if they are contiguous with designated Wilderness or WSAs or are of a manageable size. Map 63 Land Resource. In the Township T55N R93W there is a Wilderness designated area to the east of our patented mining claims which is actively being mined day and night. Based on the Wilderness characteristics listed above in the RMP, this area should not be classified as a WSA because the area is certainly not in solitude with the dozers, scrapers and blasting operating daily nor is it an unconfined recreation area either for the same reason.	
10165	10165-4	Page 3-169 in Lands with Wilderness Characteristics The BLM performed an inventory of lands in the Planning Area to determine if any BLM-administered lands had wilderness characteristics. Wilderness characteristics are resource values that include naturalness, outstanding opportunities for solitude, and outstanding opportunities for primitive and unconfined recreation. Areas evaluated for wilderness characteristics generally occur in undeveloped locations of sufficient size (usually at least 5,000 acres) to be practical to manage for these characteristics. Smaller areas are considered if they are contiguous with designated Wilderness or WSAs or are of a manageable size. Map 63 Land Resource. In the Township T55N R93W there is a Wilderness designated area to the east of our patented mining claims which is actively being mined day and night. Based on the Wilderness characteristics listed above in the RMP, this area should not be classified as a WSA because the area is certainly not in solitude with the dozers, scrapers and blasting operating daily nor is it an unconfined recreation area either for the same reason.	2027
10168	10168-1	The BLM has failed to address the "Big Picture" of the Big Horn Basin. When the 5.6 million acres of the RMP study area (3.1 million BLM surface acres and 4.2 million mineral acres) is referenced, it is not stated that the RMP study area is already surrounded by 9>13 million acres of U.S. Forest Service, Wilderness Areas and National Parks. It is somewhat deceiving to the reader of the document that the surrounding areas already exist and are protected from numerous effects that are being addressed in the Big Horn Basin RMP. The question of why more acreage needs to be restricted or closed needs to be addressed as well and the economic impact to the basin if lands are removed from leasing.	2047
10177	10177-1	the current controlled surface use stipulations are protective of resource values while allowing a prudent method to conduct future exploration to meet the domestic energy demands. We cannot predict exactly where the new accumulations of Oil and Gas will be, but we know we need public lands access to test our exploration concepts with seismic and drilling operations.	2047
10178	10178-3	the agricultural community has become greatly dependent on the surface discharge from oil and gas development. It has become a vital water source for many ranchers and provides perennial fresh-water sources. Additionally, the water creates hundreds of miles of riparian zones and thousands of acres of wetlands. The draft never mentions this.	2031
10178	10178-5	the increased buffer zones around special designation areas are not based on science. New research shows that when grouse are in danger, the grouse move closer to oil and gas development and any human activity to get away from their predators. Due to this fact, buffer zones are inadequate.	2071
10178	10178-6	The BLM needs to look at more locally available data in regards to our economic	2046

*Bighorn Basin Proposed RMP and Final EIS
Comment Analysis Report*

**Attachment B – Draft Resource Management Plan and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table B-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
		viability (for instance the research done by Bighorn Basin Resource Alliance). This data clearly shows how important oil and gas is to our communities and in 2,000 pages the BLM doesn't clearly represent how important it is. For instance, all four of the counties in the Bighorn Basin received 54 percent of their property taxes directly from oil and gas development. By including this information, it will inform citizens of the current economics.	
10178	10178-7	The BLM fails to include reasonably foreseeable development in the next 20 years. Horizontal and directional drilling is happening in neighboring communities. I heard a presentation by the Bighorn Basin Resource Alliance (quoting the USGS statistics), showing that an additional 3 trillion barrels of oil equivalent are yet to be produced in the Basin through enhanced oil recovery techniques that are happening near Riverton and Casper (Sand Draw). Why weren't these considered in the BLM's RFD? This section is extremely incomplete and needs to be recompleted before the record of decision is issued.	2061
10181	10181-1	Include in all RMP alternatives measurable (i.e. quantifiable) standards for livestock grazing including maximum upland and riparian utilization of 30% on any herbaceous graminoids; maximum bank or wetland trampling annually not to exceed 10% of hydric and mesic soils areas; maximum use of woody browse by all sources not to exceed 15% of new leader growth annually. Such obvious requirements, based on current range science, have not been included	2011
10181	10181-10	We provide in C_Grazing Capacity Info Proposed Outline, a scientifically and legally defensible methodology for determining capability and suitability of BLM lands for livestock grazing. We request the BLM incorporate this process into the RMP as well as the EIS alternatives.	2011
10181	10181-11	Frequently, the DEIS uses such terminology as "maintain or improve" but this is often inappropriate in most of the contexts it is used. For instance, an objective for riparian areas may say maintain or improve riparian condition but this is inappropriate as areas below objective must be improved not merely maintained. Similarly, for special status species by definition maintaining habitat is insufficient because by their very definition special status species are declining.	2054
10181	10181-12	2-12: The document states that the BLM will "include the use of best management practices to preserve the air, soil, cave and karst, and water resources" but the BLM fails to provide exactly what these BMP's actually are, when they will be required, how their effectiveness will be monitored and even more importantly research regarding their effectiveness.	2054
10181	10181-13	2-20: We see that all alternatives contain nearly identical acres of WSAs despite the submission of citizens proposed WSAs which appear to have been ignored.	2019
10181	10181-14	2-42: As an example of the deficiencies in the proposed RMP one merely has to look at the 2nd "management action" where the lack of a timeframe for this to be required by renders it worthless. 1003 is similar in that it fails to provide any timeframe for implementation and takes up space with such worthless actions as "and work cooperatively to encourage industry and other permittees to adopt measures to reduce emissions".	2054
10181	10181-15	2-44: "use BMPs to reduce runoff, soil erosion and sediment yield and to retain water on the landscape". Again, this is worthless from an implementation perspective. What these BMPs are, when and how they will be required, or even how effective they are is not provided for within the RMP direction. In	2054

**Attachment B – Draft Resource Management Plan and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table B-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
		other words, these various "actions" in the proposed RMP completely lack the level of detail necessary for implementation and enforcement.	
10181	10181-16	2-47: 1026 provides an extremely general "protect watershed resources through the application of watershed conservation practices and BMPs". This is again completely worthless from an implementation standpoint because it fails to provide any specificity as to what these practices are, when they will be required, how their effectiveness will be monitored or other such critical details.	2054
10181	10181-17	2-48: Not only do springs need to be fenced but the responsibility for fence maintenance must be placed on the permittees since there would be no reason to fence Springs and reservoirs if it were not for their permitted livestock. The proposed RMP contains no requirements to meet fisheries habitat needs. The habitat needs for trout and other aquatic species are well researched and need to be required by the RMP.	2025
10181	10181-18	2-58: There needs to be clear requirements for re-analyzing the appropriateness of leasing expired or expiring leases.	2013
10181	10181-19	2-59: Goal FM2 states "restore natural fire regimes and frequencies to the landscape and utilize fire in vegetation treatments to accomplish DPC objectives". The document provides no analysis or research on what "natural fire regimes" are for the different land areas within the assessment area. This is, of course, a critical issue because without understanding the current science regarding what natural fire regimes are the BLM has no way to manage to achieve those. In addition, DPC objectives are not laid out in any fashion that would allow for their implementation. Additionally, this section is entirely lacking direction regarding cheatgrass and other invasives. For instance areas with the potential for cheatgrass should have no prescribed fire allowed.	2008
10181	10181-2	In addition to analyzing current management, suitable alternatives to analyze would include eliminating livestock grazing from all sensitive areas such as Wilderness, ACEC, cultural resources, and important wildlife habitat; reducing grazing from the 99.9% of the resource area to 40% of the resource area; and a no grazing alternative along with reduced utilization rates for uplands and riparian areas.	2055
10181	10181-20	4030 does not require any monitoring and given the history of an almost complete lack of data collection over last 25 years by the BLM such a requirement is critical. This item requires a "substantial shift in both the timing and level of production" in order to trigger the undefined "actions". What is substantial? So what is this shift in "timing" that has to be there in addition to a substantial change in productivity? The combination of these 2 leads to the result that even the vague direction in this section will never be triggered.	2054
10181	10181-21	2-68: This section only requires the management of repairing areas to meet PFC despite the fact that PFC is only the minimal physical functioning required to withstand twenty-year flood events and is well below the habitat needs for fish and wildlife. Therefore such an objective is inappropriate. This section does not define what "priority riparian wetland areas" are nor what the "desired future conditions" for these are. Without this being done in the RMP itself, the result will be a meaningless objective.	2033
10181	10181-22	2-72: Again, this section conflates "conserve, recover and maintain". The requirements for species recovery such as ESA or BLM listed sensitive species needs to apply all such species habitats. "Maintaining" is not appropriate for the management of these species because by definition they are in decline.	2042

**Attachment B – Draft Resource Management Plan and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table B-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
10181	10181-23	4076 needs to include public access into the upper Owl Creek drainage as a condition for reassurance of grazing permits. This section provides no requirements to restrict livestock utilization rates within winter range or crucial winter range which is a critical consideration.	2011
10181	10181-24	2-80: Again, the RMP wrongly states that it is appropriate to merely "maintain" habitat for special status species. This is completely inappropriate and does not comply with the sensitive species manual.	2042
10181	10181-25	4099 seeks to "maintain" instead of improve conditions in undefined "crucial seasonal greater sage grouse habitats". Without defining these habitats the direction is not implementable.	2042
10181	10181-27	6281 fails to include the Interested Public as required in the regulations. This section lacks a wide range of obvious requirements such as utilization rates, seasons of use issues, riparian impacts such as alteration, etc.	2054
10181	10181-29	2-221: the BLM somehow concludes that no violations of water quality standards would occur under any of the alternatives. This is unsupported by the research or experience. We have collected water quality data throughout BLM lands in Wyoming for over half a decade and we have never collected a single sample that met state water quality standards in any allotment where livestock were present. Exceedance of the E. coli standard generally ranges from 10 to 30 times the state standard.	2031
10181	10181-30	3-29: The document discusses the sensitive nature of the soil throughout most of the planning area but fails to discuss any of the research regarding the impacts of livestock grazing on sensitive soils. We provide a number of papers as attachments including the famous paired watershed study done by the BLM in the 1970s on similar soils to those found within the planning area. Despite the fact that most of the planning area contains the sensitive soils there are insufficient requirements and limitations in the proposed RMP to address these issues.	2045
10181	10181-31	3-33: this section lists various impaired water bodies due to degraded watershed conditions yet the RMP fails to provide any requirements or limitations to deal with this issue.	2031
10181	10181-32	3-80: Despite the admission of the failure of current invasive species management the proposed RMP provides no further significant management requirements or limitations to deal with this issue.	2033
10181	10181-33	3-81: This section discusses the impact of soil loss but fails to provide any information regarding how many acres within the planning area have already crossed this threshold as well as those areas mirroring the threshold, which of course would be clear management priorities.	2045
10181	10181-34	3-87: Again, this section clearly indicates current efforts regarding invasive species is woefully inadequate yet the proposed RMP continues virtually the same actions as are in place now. Clearly, the effectiveness of current actions must be reviewed and further actions taken. The document mentions that approximately 10% of the basin has been inventoried for cheatgrass infestations and have documented 57,000 acres.	2033
10181	10181-35	3-98: The outcome of the Working Group has no bearing upon the legal responsibilities of the BLM regarding wildlife management. The document needs to map big horn sheep habitat throughout the planning area and overlay domestic sheep allotments or trailing that occur within 10 miles of these habitats and then implement specific requirements and limitations regarding	2022

**Attachment B – Draft Resource Management Plan and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table B-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
		domestic sheep permitting to allow for recovery of big horn sheep. Again, this section provides details regarding "management challenges" but the RMP provides no limitations or requirements to address these issues.	
10181	10181-36	3-102: the BLM admits declining habitat conditions for reptiles and amphibians and that their populations are "generally on a downward trend" but again the proposed RMP fails to implement requirements or limitations to address these issues.	2025
10181	10181-37	3-107: This section likewise discusses various "management challenges" to various sensitive species but the proposed RMP fails to implement specific requirements or limitations to deal with these issues. In the sage grouse section we see a concern for "fragmentation and degradation" but again the RMP fails to implement specific requirements or limitations to deal with this issue. The nongame amphibians section has a similar list of "management challenges" but fails to deal with them.	2042
10181	10181-38	3-178: the BLM is required to conduct rangeland health assessments on all allotments over a 10 year schedule. In the 15 years since the implementation of Rangeland Reform, these 2 field offices have only conducted standards assessments on 40% of the allotments, instead of 150%. The RMP needs to provide specific direction for the completion of standards assessments on the remaining 60% of allotments as well as a schedule and resource allocation to complete 100% in 10 years.	2054
10181	10181-39	4-32: The BLM states that "special designations, such as ACECs , would restrict surface disturbing activities and resource uses that may adversely impact water quality and quantity", but as we've discussed previously proposed RMP allows livestock grazing regardless of its impacts to the resources for which the ACEC was designated. So the above statement is misleading at best. Carefully review the proposed RMP and see how such "resource uses that may adversely impact water quality" are restricted within ACECs.	2054
10181	10181-4	The EIS should disclose the type, location, and number of the various "range improvements" (fencing, water developments, water pipelines, access roads, and so forth) that currently exist on the public lands that will be managed under the direction of the RMP revision. What cumulative impacts have these "improvements" had on vegetation, wildlife habitat, water quality, riparian areas, soils, and habitat fragmentation? What changes/impacts to upland vegetation, water quality, habitat values, and other resources near these developments have occurred as a result of these "improvements?" Have these management activities been successful at accomplishing the goals for which they were implemented? These questions must be answered.	2005
10181	10181-40	4-108: The BLM correctly states that livestock "contribute to the introduction and spread of invasive species" but again the RMP fails to implement requirements and limitations to deal with this issue.	2054
10181	10181-41	4-228: the proposed RMP fails to implement the "long-term management to promote desirable plant communities" or the "annual management of the standing crop to provide cover for the greater sage grouse". Despite the fact that the cover requirements for sage grouse are well researched the proposed RMP fails to implement any requirements or limitations that would provide the "standing crop to provide cover for the greater sage grouse". Likewise the document says "monitoring is important to ensure grazing intensity and duration does not remove required herbaceous cover and litter important for maintaining greater sage grouse habitats. Not only does the proposed RMP not	2042

Individual Comments and Index to Summary Comments and Summary Responses**

Table B-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
		require any monitoring it does not require any herbaceous cover.	
10181	10181-42	the BLM falsely states that "more beneficial impacts to greater sage grouse" would occur by allowing livestock grazing. This ignores the vast body of sage grouse research including the BLM's own literature reviews regarding the impacts of livestock grazing on sage grouse which we provide as attachments.	2042
10181	10181-5	Additionally, the EIS should document how domestic grazing activities on allotments has affected habitat for threatened, endangered, and sensitive species in the project area. How has vegetation changed as a result of a century of livestock grazing?	2011
10181	10181-6	BLM should address how it will handle the buy-out of grazing permits by conservation and other organizations, and should identify how it will retire such permits through the planning process. BLM should work with permittees to identify those who are interested in retiring their permits or being relocated to prevent resource damage or other impacts such as disease transmission from domestic sheep to bighorn sheep.	2011
10181	10181-7	Those areas that are to continue being grazed by livestock must be stocked and managed in accordance with the condition of the land and its vegetation. This needs to be done not just in an alternative the BLM well knows it will never choose. In areas to be grazed by livestock, the amount of forage produced must be determined and allocations of forage to watershed protection (50%), wildlife (25%) and livestock (25%) be made as recommended by Holechek et al (1998)1. Field data collection will be necessary to accomplish this.	2076
10181	10181-8	The BLM cannot just assume that an AUM is 800 lbs of forage consumption per month. The RMP/EIS must analyze the current and potentially available forage to satisfy the forage consumption by the number of livestock it currently permits or proposes to permit. It cannot assume that the forage capacity determined 20-40 years ago is applicable today	2074
10181	10181-9	The current RMP authorizes a certain number of AUMs. However, that is based on an AUM equivalent to 800 lbs of forage per month. The most current information, reviewed above shows that number to be 1368 lbs/month per AUM. Therefore, if sufficient forage were available to satisfy all needs, the numbers of livestock grazed should be reduced to account for the increases in weight and correct the erroneous assumption that 800 lbs/month is an accurate consumption figure. Using the ratio between the current RMP's forage amount per AUM divided by the correct figure above, gives a needed reduction in permitted numbers and/or seasons of use of 42% to account for the RMP's understated forage consumption, without accounting for wildlife, plant and watershed needs	2074
10186	10186-1	The BLM fails to look at the big picture of Big Horn Basin land management. Although the planning area contains 4.2 million mineral acres and 3.1 million surface acres (5.6 million acres of RMP study area) is included, the BLM doesn't explain that the Basin is already surrounded by 91.3 million acres of U.S. Forest Service, Wilderness Areas and National Parks. These areas are already being protected to the highest degree and none or little leasing has taken place. Why do more acres need to be closed to leasing?	2014
10189	10189-12	Because a reduced regulatory climate enhances true multiple use, which is the BLM's original mandate, the text should be amended to include a fifth alternative - Alternative E-which is a compilation of the least-restrictive elements of both Alternative A and Alternative C.	2055

Individual Comments and Index to Summary Comments and Summary Responses**

Table B-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
10189	10189-5	Although Secretarial Order 3310 has been rescinded, the Areas of Wildland Designation have not been removed from the maps and text of the draft RMP. This is unacceptable, as the draft document is now in violation of Department of the Interior policy. Our fears of the decision being reversed at some future, more convenient time are reinforced by the retention of the maps and text, which include these proto-wilderness study areas. The several areas designated as Wildlands must be removed from the text of the draft document, and from every map and table in the draft document, before the review process can continue	2027
10189	10189-6	At present, there are almost 1.5 million acres of oil and gas leases within the Bighorn Basin, yet the Agency Preferred Alternative (D) calls for less than 570,000 acres of Oil & Gas Management Areas. I am unclear how the Bureau can consider planning for less exploration, development, and production than it has already leased land for	2050
10194	10194-1	The BLM does not fully support the reason WHY a new resource management plan is needed, other than "the plans must be revised every 20 years".	2054
10194	10194-2	The current 'buffer zones' are not reasonable, in any scenario, as no real science was used to develop these 'buffer zones'. For instance, new science shows that when sage grouse are in danger they move closer to human activity (i.e. ranching and oil and gas development) This fact makes 'buffer zones' useless. Buffer zones also take out a huge chunk of land that could very well be used for 'multiple use'.	2071
10194	10194-3	Alternative D, the preferred alternative, lists 85% more 'standard' restrictions as 'moderate' for oil and gas companies. This slows down the ability of producers to do their job and decreases our ability to produce domestic energy for our country. Yet the BLM fails to ever explain (with science) the reason those restrictions have increased so drastically.	2047
10194	10194-4	The BLM doesn't fully explain how important oil and gas is to our Basin especially in Hot Springs where over 70% of our property tax revenue comes directly from oil and gas.	2046
10194	10194-5	The BLM also lists much more acres (nearly double) for Big Game Crucial Winter Range than the Wyoming Game and Fish. Why is that?	2022
10197	10197-1	With the exception of government enterprises, mining (oil and gas) is the strongest sector of income in Hot Springs County. Data provided by BIGHORN BASIN RESOURCE ALLIANCE ECONOMIC REVENUE REPORT depicts that importance of oil and gas exploration, development and production. The BLM doesn't provide enough detail, such as this report, to help guide the public to the best decision. For this reason, the report is incomplete. Moreover, the IMPLAN regional modeling doesn't fit our needs as well as local modeling and research would, throwing off the analysis	2054
10197	10197-2	The Draft RMP doesn't properly explain how the Bighorn Basin and the communities benefit from oil and gas production and instead, tries to discriminate against oil and gas.	2046
10197	10197-3	Alternative D increases 85 percent of "standard" regulations to "moderate" and doesn't explain why	2047
10197	10197-5	with Enhanced Oil Recovery, both of which the BLM left out of their analysis and alternatives. The BLM should prepare a more detailed and factual document to present to the public. This potential should be considered in the Reasonable Foreseeable Development.	2051

**Attachment B – Draft Resource Management Plan and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table B-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
10200	10200-1	The Draft BB RMP currently includes disclosure of specific ambient air quality monitoring data that are used to characterize the existing environment, and a quantitative emissions inventory estimate, but lacks any air quality modeling to estimate potential impacts of planning decisions on the air quality resource.	2054
10202	10202-1	The RMP designates large areas of surface estate as “moderate” constraints for oil and gas leasing. Why is it necessary to increase from the “standard” regulations when there has never been a sight of a lack of regulation in the basin?	2054
10202	10202-4	The BLM has also overlooked or neglected to consider and include reasonably foreseeable development in the next 20 years. Horizontal and directional drilling is happening in neighboring communities. A presentation by the Bighorn Basing Resource Alliance (quoting USGS statistics) showed that an additional 3 trillion barrels of oil equivalent are yet to be produced in the Basing through enhanced oil recovery techniques that are already occurring near Riverton and Casper. Why weren’t these facts considered in the BLM RFD? This section’s is extremely incomplete and lacking. It needs to be recompleted before the ROD is issued	2054
10203	10203-1	Because my office and the Board of Land Commissioners are charged with managing the trust assets for the short- and long-term return to the beneficiaries, our paramount concern revolves around the adequacy of the plan in terms of its provisions related to enhanced oil recovery. Given the potential for CO2 flood and enhanced oil recovery opportunities within developed fields, all of which contain state minerals, it would appear that the document must be altered to better accommodate and facilitate enhanced oil recovery. There are approximately 21,862.43 acres of trust mineral estate that lie within the potential Bighorn Basin CO2 Residual Oil Zone (ROZ) site boundaries	2054
10203	10203-2	In view of the above projections, OSLI requests that the BLM include the following provisions specifically related to enhanced oil recovery:1) The reasonably foreseeable development scenario for oil and gas will not be a threshold for analysis; acreage will be the only analysis point to compare alternatives as long as such disturbance occurs in oil and gas management areas (see 2 below).2) The existing oil and gas management areas must be expanded to include the entire ROZ area. In other words, all federal surface and minerals within ROZs will be oil and gas management areas plus 28,000 acres (over Alternative C). In addition, while not part of the BLM’s allocation under the RMP, the State of Wyoming and trust beneficiaries will benefit by virtue of enlarged boundaries and the production that accrues from the expanded areas.3) The description of the oil and gas management areas will be modified in a way that will not trigger re-analysis as long as development remains within existing spacing levels; similar to the Pinedale RMP, a ROZ may expand if development within it remains within the spacing limits of the existing field.4) The definition of right of way corridor will be modified to state that as long as the new pipeline is built adjacent to existing lines, the new pipeline will be considered “in the corridor” regardless of the actual width.5) CO2 sequestration will be an allowed use for purposes of the RMP in all properties used for enhanced oil recovery.6) A comprehensive description of enhanced oil recovery is incorporated in the document, including a state enhanced oil recovery production projection. OSLI would strongly encourage the BLM to work in partnership with the State to establish a state-wide CO2 network to produce and deliver CO2 across Wyoming and if necessary, amend other existing	2054

Individual Comments and Index to Summary Comments and Summary Responses**

Table B-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
		Resource Management Plans to facilitate enhanced oil recovery throughout Wyoming	
10205	10205-1	BLM has attempted to characterize bentonite mining over the last 60 or so years. Its analysis is out-of-date/low on employment, pg. 3-41. Wyo-Ben would estimate direct milling and mining employment from bentonite in the Bighorn Basin at well over 600, and perhaps as many as 700. BLM should conduct a more thorough investigation on employment, as these numbers directly-affect socioeconomic impacts discussed later in the RMP.	2054
10205	10205-10	On pg 4-266, on Alternative A (and by reference Alternative D), BLM states that dust and vibration from mineral development activities can cause degradation to rock art. Wyo-Ben has inquired previously about the body of evidence or studies to indicate the challenges with rock art degradation from dust and vibration. BLM has failed to produce this data. Since no scientific reference exists in the proposed RMP, we must assume there is no technical data to support BLM's position, and ask that this language be removed.	2055
10205	10205-11	On page 4-274 the RMP states, "Rock art and other prehistoric and historic sites and districts are managed for scientific, public and sociocultural use, and research and preservation study and use. Known important cultural sites are protected from surface-disturbing activities. For resources where setting is important to the site's integrity, the site's foreground is to be avoided with buffers that may be up to 3 miles wide." BLM has given no scientific or legal justification for limiting activities with their arbitrary three mile buffers, BLM does not have authority to limit non-discretionary activities such as locatable minerals for virtual or intangible reasons	2054
10205	10205-2	On pg. 3-42 describing "management challenges," BLM assigns disturbance of 30,000 acres to bentonite mining in the Bighorn Basin. Most of the acreage is on private lands, with inference of an impact to the federal estate. BLM should clarify the acreage by differentiating the private from federal land.	2055
10205	10205-3	Wyo-Ben supports the preservation of cultural resources. On page 3-122 the RMP states, "Cultural resources are any prehistoric or historic district, site, building, structure, or object considered important to a culture, subculture, or community/or scientific, traditional, religious, or other purposes. Cultural resources include archeological resources, historic architectural and engineering resources, traditional resources Traditional resources can include archeological resources, structures, topographic features, habitats, plants, wildlife, and minerals that Native Americans or other groups consider essential to the preservation of traditional culture. ... The definition of traditional resources is being expanded to topographic features and structures. Our bentonite mining operation exists in topographic features located in the Frontier, Mowry-Shale and Thermopolis Shale formations. The RMP does not specifically-mention any topographic feature or place, yet plans to regulate activities with these features. The RMP should specify BLM's intent and effect on other uses.	2054
10205	10205-4	On pg. 3-126,127, the RMP mentions several trails including unnamed trails but provides no details on location or management. Failure to disclose the locations eliminates the possibility of a predictable regulatory landscape. Other multiple use and development costs that could be avoided will be uselessly spent on areas with a high potential for conflict	2054
10205	10205-5	On page 3-133, the RMP states, "As shown in Map 37. approximately 50 percent of the Planning Area is classified as Class 4 or 5 geologic formations, indicating a	2057

**Attachment B – Draft Resource Management Plan and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table B-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
		"High" or "Very High" potential for vertebrate or scientifically important paleontological resources." In reviewing Map 37, the PFYC 4 has been merged into PFYC 3. We cannot identify the 50 percent that Class 4 and 5 encompass. Also from Map 37, over 80% of the area is considered PFYC 3 or greater requiring an on the ground survey for any ground disturbing activity.	
10205	10205-6	On pg 3-133, BLM states that outcrops of Mowry and Thcrmpolis Shale produce the fossil bones of marine reptiles, yet no citation for this claim exists	2055
10205	10205-7	In Table 3-34, BLM elaborates that the Frontier and Cody Shales also produce marine reptiles. These formations are the commercially-viable bentonite-producing formations. Of the hundreds of thousands of tons mined here, Wyo-Ben is unaware of any scientifically-important find of marine reptiles in the bentonite-bearing geologic units in the Bighorn Basin. This erroneously conveys the impression that expensive surveys are a reasonable, proactive conservation tool for subsurface-disturbing activity such as bentonite mining. BLM should correct this error or provide scientific proof otherwise	2054
10205	10205-8	Page 2-84 (Table 2-5) regarding sage grouse, Alternative D, unlike alternative A, does not distinguish between discretionary and non-discretionary activity when stating sage grouse protection stipulations within Key Habitat areas.	2071
10205	10205-9	On pg. 4-43, BLM mentions the Endangered Species Act without commenting on the 1872 Mining Law. We recognize these laws may conflict, but compliance is required on both counts. There can be no assumption of one law trumping the other.	2054
10208	10208-1	The plan reports approximately 3.2 million acres of public lands in the planning area. Current BLM Wilderness Study Areas total 140,924 acres, or 4.4%, of the public lands in the basin. The plan reports that a total of 960,000 acres of federal mineral estate had been leased through June 1998. The release of this planning document (Scoping Report in March 2009) could have easily incorporated the acreages from the expanded leasing that occurred during the final months of the Bush Administration to come up with a more accurate acreage value. Information I was able to attain from the BLM's oil and gas leasing website indicated an additional 45,636.31 acres of oil and gas leasing in Big Horn, Hot Springs, Park, and Washakie Counties occurred with the August 1998 auction and an additional 32,951.49 acres in these four counties leased during the October 1998 auction. This April 2011 document could have easily shown the leasing acreage to be well over 1 million acres instead of the 960,000 figure. All told, additional oil and gas leasing from August 1998 through August 2011 has added 141,455.64 acres to the basin's leasing total; 531 more acres leased in this 3 year period alone than the total acreage contained in all of the basin's WSAs. The total acreage to-date of oil and gas leases in the planning area is now approximately 1,101,500 acres. The plan reports a total of 4,219,790 acres of federal mineral estate in the planning area. The current leased amount would therefore be 26.1% of the total federal mineral estate in the basin.	2013
10208	10208-2	BLM may have used language on the Travel Management Maps that may unnecessarily alarm certain readers. The stop-light red notation for areas closed to motorized vehicle use is simply labeled as "closed." This could give the impression that these lands are completely closed to all entry. This label should clearly denote these areas are "closed to motorized vehicle use." Travel into these areas by foot or on horseback is certainly not curtailed.	2054

**Attachment B – Draft Resource Management Plan and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table B-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
10211	10211-1	We believe that livestock grazing has shown itself to be a sustainable use of the resource. The DEIS discusses the in Appendix W that livestock grazing is to be considered a surface disturbing activity. I feel this is stretching the concept of a surface disturbing activity to almost beyond the breaking point. All of the areas encompassed by the RMP have had grazing activity on them for thousands of years. The plant species have all evolved with grazing and a sizable body of evidence exists to document the importance grazing is to these species. To then move those activities into the realm of a surface disturbance similar in nature to road building or mining is not logical and I believe such categorization of this activity should be taken out of the final document.	2011
10211	10211-2	Furthermore I strongly disagree with the designations of lands with wilderness characteristics. The DEIS has identified 56 areas totaling 571,000 acres. However, within these acres there are approximately 600 miles of road; over 400 reservoirs; close to 300 miles of fences. In addition there are over 150 range improvements; 17 water wells and 10 miles of water pipelines. All of these argue against wilderness characteristic. Designation of areas as wilderness or lands with wilderness characteristics has significant economic impacts on ranching operations. These additional costs contribute to further difficulties in maintaining a viable ranching unit. Efforts should be made by the BLM to reduce the economic burdens on the ranching community.	2027
10211	10211-3	The RMP/DEIS establishes some 1.8 million acres for sage grouse protection in the management area. The document is not clear on what the BLM anticipates towards grazing in sage grouse areas. Grazing could be adversely impacted depending on the restrictions put in place to protect sage grouse.	2071
10214	10214-2	Oil and gas stipulations should incorporate wording to prohibit surface-disturbing activities within ¼ mile of or within riparian/wetland areas as shown in alternative B (record #4037).	2033
10214	10214-4	Oil and gas leasing on Federal lands is critical to both the Nation and to the local economy. It also has the potential to significantly impact and degrade the Big Horn Basin. To better plan for and manage these leases the BLM needs to consider spacing requirements for all new leases. The spacing requirements should be made on a watershed/geographic basis and include a minimum 2-mile buffer from all identified sage grouse leks and nesting areas. Geographic areas for well/facility spacing should be mapped (delineated) and include classifications such as “heavy industrial” (5-acre or less pad/facility spacing); “industrial” (40-acre pad/facility spacing); “light industrial” (160-acre pad/facility spacing) as an example.	2049
10214	10214-5	Best management practices should be required and not just recommended as a lease stipulation on all new leases. In particular, all evaporation ponds, skim pits, and reserve pits need to be netted, at a minimum, to prevent accidental mortality of migratory birds. In conjunction with required netting the BLM needs to implement comprehensive monitoring of existing oil production facilities. Monitoring needs to be intensive enough to insure that netting is adequately maintained, and that all spilled oil is promptly cleaned up and the site remediated to prevent entrapment or contamination of birds and other wildlife.	2025
10214	10214-6	Noxious weeds have deleterious impacts to riparian systems, wildlife habitat and livestock grazing. Consequently, the RMP needs more emphasis/resources applied to their management. Emerging problems such as the invasion of riparian areas by Russian knapweed should be met aggressively and on a	2012

**Attachment B – Draft Resource Management Plan and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table B-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
		priority basis while the problem can still be realistically addressed. The BLM must work cooperatively with State and county organizations to establish priorities for control and to establish monitoring standards to establish successful treatment strategies. A permit condition for all surface-disturbing activities such as leasable mineral, locatable mineral and salable mineral development/extraction and their related facilities such as right-of ways and access roads should include annual physical inspections for and treatment of noxious weeds by the permit holder. Permit holders should be required to submit an annual report of noxious weed monitoring/treatment activities as a condition of permit approval.	
10214	10214-7	Mining impacts water quality, recreation, wildlife habitat, and livestock grazing. Cumulative impacts that have and will result from bentonite mining need to be evaluated. By doing this effective measures can be put into place to keep the industry from having unnecessary/undue degradation on the environment. In situ leach mining operations require test wells to detect any leakage or contamination of groundwater outside the aquifer mining zone. In addition, suitable bonding is required to assure remediation of groundwater contamination that may result from in situ mining operations. Concurrent reclamation should, generally, be required of all open-pit mining operations.	2049
10214	10214-8	The BLM should, however, give additional attention to route management. Although the legal use of off highway vehicles on designated roads and trails is a popular and valid use of public lands, it is extremely important to protect our wildlife, scenic and cultural values. These resources provide the basis of our recreation industry and play a critical role in providing quality of life benefits for those of us that have chosen to make the Big Horn Basin our home. Due to the importance of these resources, motorized vehicle use on most of the BLM lands covered by the RMP should be classified as limited to designated roads and trails with seasonal closures on the majority of sage grouse nesting areas and big game crucial winter range. To accomplish this it will be necessary for the BLM to work with state, county and local organizations to identify areas, roads and trails to promote appropriate motorized use. The effective implementation of any travel management plan(s) will require vigorous enforcement against unauthorized use.	2034
10215	10215-1	To the extent that Alternative D deviates from Alternative A, changes should be based on mandatory statutory and regulatory changes or identified failure to meet the multiple use mandates for BLM land management. WSGA finds that several proposed changes fail to meet these criteria. The increased emphasis on “conservation of physical, biological, and heritage and visual resources”; designation of numerous types of priority management areas (SMAs, MAs, ACECs, SRMAs, ERMAs); these all represent further erosion of the fundamental multiple use concept which Congress has determined should guide BLM resource management.	2055
10215	10215-11	Records 4092-4111 Greater Sage Grouse: The USFWS has accepted the Wyoming Governor’s Executive Order and the concept of core areas as an appropriate methodology to address the needs of the greater sage grouse. WSGA urges BLM to reference and adopt this strategy as its management guidance.	2071
10215	10215-12	Record 4115: This section should specify that, if the gray wolf is delisted in Wyoming, BLM will undertake no conservation or management actions to protect the wolf or its habitat unless requested to do so by the WY G&F.	2042

**Attachment B – Draft Resource Management Plan and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table B-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
10215	10215-14	Record 6283: The language under alternative D is very unclear. WSGA suggests using language from alternative A or otherwise clarifying the intent.	2011
10215	10215-2	While WSGA concurs that “BLM is required to inventory lands to determine whether they possess wilderness characteristics”, this inventory under FLIPMA carries no greater weight than the inventories for grazing suitability, minerals etc. There is no requirement that these lands be managed primarily for their wilderness characteristics. In light of the congressional prohibition of the use of funds for the identification of LWCs and designation of Wild Lands, WSGA assumes that all references to LWCs, Wild lands, Secretarial order 3310 and corresponding BLM Manuals will be removed from any final RMP.	2027
10215	10215-5	WSGA respectfully suggest the use of more current and more directly applicable USDA NASS data on pages 3-176/177. Using recently released 2010 data, Wyoming accounted for 2.2% of the U.S. inventory of beef cows, giving us a ranking of 15th. For 2010 Wyoming had 6.7% of the total number of breeding sheep, a ranking of 3rd, and ranked 3rd in wool production.	2011
10215	10215-6	Record 1037: WSGA notes that Alternatives A-C include references to maintaining natural flow regimes “in compliance with Wyoming water laws”. Alternative D fails to include this language. We hope that this was an oversight that will be corrected.	2031
10215	10215-8	Record # 4077: If the purpose of this restriction is to mitigate negative impacts of livestock on elk parturition, such actions should only be considered on a case-by-case basis if formally requested by the WY G&F, the agency with management authority over elk. If the purpose is to reduce the risk of brucellosis transmission to cattle, WSGA recommends that the following language be substituted: “BLM would consider implementation, on a case by case basis, of management actions jointly recommended by wildlife managers, grazing permittees and animal health officials that would control the transmission of brucellosis.”	2025
10216	10216-10	On page 2-39, we comment that “Livestock Grazing Management” should not be included in the “Resource Topic” for the Surface-disturbing/surface disturbance “Term or Concept”.	2011
10216	10216-11	On page 3-116, we comment that the Final RMP should convey to the public ALL of the reasons the BLM used when they made the decisions over 30 years ago to remove all “wild” horses from Foster Gulch, North Shoshone, Zimmerman Springs, Alkali Spring Creek, and Sand Draw Herd areas. For example, we are aware that a significant reason for removing all “wild” horses from the Foster Gulch Herd area was an insistence from the Wyoming Game and Fish Department that a new fence on the south side of this Herd area which would have been required to keep these horses inside the Herd area would have been very detrimental to seasonal migrations of mule deer. The BLM and public agreed with that reason and those horses were removed. It is also our understanding that there were legitimate reasons that were considered much more significant than the “competition for forage with livestock” shown on page 3-116 & 7 as justification for the BLM decisions to remove all horses from the Zimmerman Springs and Sand Draw areas. Please convey ALL of these justifications to the public.	2030
10216	10216-12	We also comment that the Final RMP should include the viable option of a complete removal or management for a 100% non-reproducing herd of “wild” horses in the Fifteen Mile HMA. The horse program within the BLM is in a state	2030

**Attachment B – Draft Resource Management Plan and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table B-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
		of desperate financial and administrative condition. The BLM needs to prioritize the number of HMAs their budget and staff can properly manage in compliance with the 1971 Wild Horse and Burro Act. The Fifteen Mile HMA certainly qualifies as an HMA that could be returned to a priority for wildlife, recreation, and livestock multiple uses. The health of the lands and natural resources could then recover it would save the BLM a lot of time and the public’s money. The WSGB has been on-the-ground in a number of rangeland areas in the Fifteen Mile HMA. It is our opinion that a number of sizable polygons in this HMA do NOT meet one or more of the Wyoming Rangeland Health Standards due to impacts to natural resources from year-long “wild” horse use. We are of an understanding that a significant reason for the amount of nonuse by livestock permittees who hold grazing rights in the Fifteen Mile HMA is directly related to the adverse rangeland health and water quantity/quality issues created by the “Wild” horses in this area. We comment that a new assessment of the Wyoming Health Standards should be conducted in the Fifteen Mile HMA with the participation of rangeland scientist from outside the employ of the BLM.	
10216	10216-13	On page 3-179, we comment that the paper by Holechek, 1988, should not be the basis for the narrative on the subject of “suitability” because his paper only applies, if at all, the New Mexico rangelands, not to cool season grasslands in Wyoming. We can find NO science based, peer reviewed published literature or research that supports the concept of distance to water and suitability of rangelands for livestock grazing in cool season ecosystems and we request that this concept be removed from the Final RMP	2011
10216	10216-14	On page D-1, the narrative under 1.0 speaks to a requirement that cooperative agencies need to be involved in the continued monitoring of the implementation of the entire RMP. But the narrative under 4.0, MONITORING WORKING GROUP conveys an intent to develop a “Monitoring Working Group” to develop an overall monitoring plan related to livestock grazing issues. This section states that guidance and direction to monitor implementation of the entire RMP will be provided by Appendix C. Appendix C deals with livestock grazing monitoring and evaluation protocols. It is our comment that monitoring the implementation of the entire RMP is a MUCH different task than monitoring of livestock grazing influences on federal rangelands. Please provide a much clearer statement in the Final RMP as to how the BLM intends to monitor the implantation of the entire RMP as a separate process from monitoring the impacts, if any, of livestock grazing.	2011
10216	10216-15	In Appendix C, under 2.0, DATA COLLECTION, why are the permittees not included in the list of those with whom the BLM intends to cooperate in the collection, analyzing, and report monitoring data? Why are the permittees not specifically included in those involved in the determination of causes and effects, predictive modeling, and condition and trend from the results of the monitoring program ?We propose that the Final RMP clearly convey an intent by the BLM to use the “Joint/Cooperative Monitoring Program” , JCM as supported by, and authorized by the National Memorandum of Understanding between the National Public Lands Council and National BLM Director for all monitoring programs in the RMP area. If the RMP Team does not have a copy of this MOU, please contact the Director of BLM or BLM Chief of Range for that information.	2054
10216	10216-16	We do not see in this Draft AMP a Table that shows the current Preference level of livestock AUM’s held by your permittees. Appendix P only shows the level of	2011

**Attachment B – Draft Resource Management Plan and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table B-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
		“active AUMs”. Please include a Table in the Final RMP that conveys the Preference level, active use level, and suspended use levels of livestock AUMs for each permit and lease in the RMP area.	
10216	10216-17	In the Final RMP, please convey an additional level of detail with respect to the policies and specific management actions or changes to current management that will be used by the BLM to guide livestock grazing activities in identified sage grouse seasonal habitats. We also request that the Final RMP convey in the ROD a commitment to identify and map all seasonal grouse habitats on federal lands within a specific time frame. Neither the permittees nor BLM can expect to be effective with respect to the conservation of grouse without that knowledge. The information in the draft RMP is not specific enough to be able to evaluate the potential impacts of the grouse subject sections on either current or future livestock	2011
10216	10216-18	In Appendix W, in the fifth paragraph on page W-1, a narrative conveys that watershed and vegetation management “objectives” would not be met if utilization levels consistently exceed the levels in Table W-1. We specifically request that the Final RMP offer peer reviewed, science based support for this statement. We can find no statements in the draft RMP that convey what are the specific measurable “objectives” with respect to watershed and vegetation management that would not be met if the use levels in Table W-1 are exceeded. We can find Goals, but no objectives. Objectives are by definition, measurable, (see Glossary at pg. 24 and Appendix N at N-8). If the RMP contains site specific objectives that the BLM feels will react in a trend to the use levels in W-1, please guide us to those so we can evaluate and provide a comment with respect to whether or not the restrictive utilizations in Table W-1 could accomplish what the RMP conveys.	2033
10216	10216-19	We also comment that we have read Appendix N, Wyoming Standards For Rangeland Health, and we can find no direct relationship between the utilization levels in W-1 and whether or not an allotment would either pass or fail these “Standards” or help fix a flunked standard. We have reviewed considerable published and peer reviewed range science literature on the subject of the influence of utilization on the trend of resource values. In cool season ecosystems, with the exception of situations of consistent, year after year grazing during the growing season at use levels of either “too much” often defined as 70% or more, or “too little” often defined as 10% or less, we can find nothing to support that utilization by livestock in a rotation system at levels that are going to be required by Table W-1 will have ANY measurable effect on trends of resource parameters. We can find NO published literature to support that use levels required by Table W-1 will have a measurable effect on either rangeland health parameters according to the Rangeland Science profession or the Wyoming Rangeland Health Standards. It is also the experience of the WSGB that in situations where an allotment has flunked one or more of the Wyoming Standards, and the BLM has applied utilization standards as an “effective action” as required by CFR 4100 Part 4180, we can find no documentation from the BLM to support that the utilization prescription actually brought the allotment back into compliance with the Wyoming Standard.	2011
10216	10216-20	We comment that the Final RMP should contain a statement that management of utilization levels for the expressed purpose of helping bring an allotment back into compliance with one or more Wyoming Standards or to assist in achieving one or more site specific resource objectives jointly develop between the BLM	2076

**Attachment B – Draft Resource Management Plan and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table B-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
		and permittee, will ONLY be applied when it has been determined from data collected from a science-based, joint cooperative monitoring program with the permittee(s) that active management of utilization is a required and necessary “effective action” under CFR 4100 part 4180.	
10216	10216-21	In Appendix V, WEPP Technical Support Document, we comment that the parameters used as input to the WEPP model to simulate conditions in the Planning area are much too generic to adequately represent the very wide variety of actual on-the-ground situations. For example, at each proposed rangeland improvement, the variability in gradients, aspects, soil types, bare ground percentages, and rock cover, in the Big Horn Basin can and will be dramatically different. We request that the entire section of the RMP with respect to the predicted results from the WEPP model be removed because the reliability of predicted results of soil erosion from this model in as conveyed in Table V-1 can not be estimated with any degree of precision due to the inflexible inputs to the model. The results convey an amount of soil erosion from human caused activity that is unreliable and misleading to the public. We VERY much disagree with the statement in this Appendix that conveys that the model estimated that with no disturbance there would only be trace amounts of annual runoff. It is common knowledge that the Bighorn Basin is and always has been before man arrived, a very highly erosive environment.	2011
10216	10216-22	We agree with the definition of “utilization” in the Glossary and request that the narratives in entire RMP related to this subject recognize and apply this definition where appropriate.	2011
10216	10216-4	We also request that the Final RMP/ROD specifically exclude livestock management activities conducted by the permittees to accomplish the terms and conditions on their permit as required by the BLM from the additional proposed off-road restrictions. This is another example of an adverse impact on permittees.	2011
10216	10216-6	We do not support the addition of any new Areas of Critical Environmental Concern, (ACEC), and request the removal of existing ACECs until such time as it has been determined through a public process that there are any areas in the Worland or Cody Field offices of the BLM that qualify under the definition of that concept as stated in the Federal Land Planning and Management Act, FLPMA. The definition of an ACEC in the FLPMA clearly conveys that an area of federal lands can only be proposed for ACEC status if that action by the BLM, “is required to protect and prevent IRREPARABLE (our emphasis) damage to important historic, cultural, or scenic values.” (quote from the FLPMA definition)The key word from this Congressional definition is “IRREPARABLE” and we have not read in this draft RMP any support for current or proposed ACECs as a requirement to prevent “IRREPARABLE” damage to federal lands. If the Final RMP/ROD includes ANY ACECs, we request that these documents clearly convey what will be done by the BLM with respect to action items that preclude “irreparable damage” to these ACECs.	2001
10216	10216-7	On page 2-33, in the last sentence on this page, please convey what and specifically where are the “new resource uses” that will be mitigated to minimize or avoid conflict with livestock grazing?	2011
10216	10216-8	On page 2-35, we comment in total opposition to the seasonal restriction on livestock grazing in elk parturition areas. To date, neither the WSGB nor the public have been provided any justification for the concern that livestock grazing has ANY adverse effect of elk calving success ratios. We request that the	2011

**Attachment B – Draft Resource Management Plan and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table B-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
		Final RMP/ROD remove this unfounded bias.	
10216	10216-9	On page 2-35, we also comment that the seasonal restrictions from February 1 to July 31 should not apply to livestock or rangeland management practices. The Executive Order from the Wyoming Governor with respect to Sage Grouse specifically conveyed that normal livestock and rangeland management practices we considered “de minimus” by that Order and we understand that the State BLM has adopted that Order for federal BLM lands in Wyoming.	2011
10217	10217-1	I believe the wild horses of the two HMAs in the Bighorn Basin deserve protection and preservation. I note that these horses, and most especially the McCullough Peaks horses, are attracting more and more recreational viewers to the HMAs each year. I further note that recreational use in general (hikers, horseback riders, ORVs, fossil hunters, sight-seers, hunters, and photographers) in both the McCullough Peaks area and the Fifteen Mile Basin has risen significantly in recent years. I contend that the final RMP should respond to the public’s interest in these recreational opportunities by managing both areas as Special Recreation Management Areas (SRMAs).	2062
10217	10217-2	For the McCullough Peaks area, I suggest the establishment of the SRMA of 160,860 acres, as put forth in Alternative B. The SRMA should be managed for both motorized and non-motorized recreational use with No Surface Occupancy restrictions on future oil and gas leasing within this area. Any currently held leases which may be “grandfathered in” should be strictly held to the BLM’s highest “Gold Book” standards, with NSO’s stipulated wherever possible. The SRMA should be managed as a ROW avoidance and/ or mitigation area, and surface disturbing activities should be limited to development of recreation related facilities or activities which will enhance wildlife habitat. Since the McCullough Peaks area currently offers a world-class viewshed, it should be protected by designating the entire SRMA as Visual Resource Management Class II. Future developments of renewable energy resources (wind, solar, geothermal) should be disallowed. Motorized vehicle use should be limited to designated roads within the SRMA.	2062
10217	10217-3	As to the McCullough Peaks HMA, I believe that the western boundary should extend to the Shoshone River. In past years I have personally observed wild horses coming down to the Shoshone River to drink. The river presents a natural barrier for horses crossing from BLM land onto private lands across the river. This is part of the wild horse historic range and the river obviously provides a perennial water source for the western side of the McCullough Peaks wild horse range. Water is a limited commodity within the HMA.	2030
10217	10217-4	I also suggest that the RMP be written so as to allow for the possibility of putting in crossing areas for wild horses and other wildlife to move from the McCullough Peaks area to BLM lands on the east side of Highway 32. Underpasses near Dry Creek and Coon Creek come to mind. These safe crossing areas would allow wild horses to access that area which lies east of Highway 32, which is also a part of their historic range. I believe that the BLM refers to this area as Foster Gulch.	2030
10217	10217-5	The RMP should also provide a mechanism which will trigger a reevaluation of the Herd Management Level (HML) for both the McCullough Peaks and the Fifteen Mile HMAs. I would suggest that a fresh assessment of the HMLs is appropriate as soon as is practical, and another assessment should be programmed for twenty years hence.	2030

**Attachment B – Draft Resource Management Plan and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table B-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
10217	10217-7	I firmly believe that a restriction should be imposed upon approaching closer than 100 yards from wild horses. This restriction protects both the human observers (recreationists, photographers, hikers, etc.) and the horses. It should be specified that designated wild horses managers are exempt from this restriction, so that the PZP field darting, necessary gathers, and the like may be continued as management practices.	2030
10217	10217-8	I recommend designating the Fifteen Mile Basin area as a Special Recreation Management Area (SRMA). By doing so, it would help to protect this area from activities which would degrade its outstanding recreational values, and paleontological resources. It would also serve to create a physical connection between the Bobcat Draw Badlands, Red Butte, and Sheep Mountain Wilderness Study Areas. The SRMA should be managed with limitations to motorized vehicle use on designated roads and trails only. NSO should apply to oil and gas leasing. ROWs should be avoided and or mitigated. Surface disturbance should be limited to establishing recreational facilities of enhancing wildlife/ wild horse habitat. It should be given a VRM class I or Class II rating (most restrictive as possible), and renewable energy sources should not be developed. Additional water development projects should be planned for this area.	2062
10218	10218-1	In the BLM RMP, a fair amount of discussion pertained to the protection of the Paleocene-Eocene Thermal Maximum (PETM) stratigraphic zone. In particular, a number of Areas of Critical Environmental Concern (ACEC) were proposed based on the protection of this geologic horizon as the outcrop snakes around the basin. These ACECs include the Clark’s Fork Basin/Polecat Bench West Paleontological Area, McCullough Peaks South Paleontological Area and Foster Gulch Paleontological Area. The PETM horizon does not need any protection. Paleocene and Eocene sediments in the Bighorn Basin are composed of claystones, mudstones, siltstones, sandstones and occasional coals. Almost all geoscience field studies of intervals composed of claystones, mudstones, siltstone, coal and thin sandstones are dependent on fresh exposures along road cuts. Without fresh exposures, there is little to study on the surface. Almost all geoscience field trips that focus on these types of rocks take their participants to road cuts or mining highwalls. Studies of the PETM would benefit from oil and gas development that would provide fresh exposures. The PETM is not a depleting resource like Native American artifacts on the surface. The PETM horizon continues into the subsurface. If some of the PETM is removed by oil and gas surface development, there is more PETM immediately below what was removed. The BLM RMP does not say how restricting surface disturbance on the PETM will specifically help the study of it. It seems rather obvious that surface disturbance will provide critical exposure to these soft sediments for better study.	2034
10218	10218-2	In the BLM RMP, a fair amount of discussion pertained to the protection of botanical and vertebrate fossils. In particular, a number of Areas of Critical Environmental Concern (ACEC) were proposed based on the protection of these fossils. These ACECs include the Clark’s Fork Basin/Polecat Bench West Paleontological Area, McCullough Peaks South Paleontological Area and Foster Gulch Paleontological Area. The sediments and areas that contain these fossils do not need any protection. These fossils are exposed to erosion and degradation every day. They slowly fall apart and dissolve. The particles that remain are then washed down the drainages and rivers. The government does	2034

**Attachment B – Draft Resource Management Plan and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table B-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
		not allow private/commercial collection of the vertebrate fossils, thus what value might exist with these fossils is lost since they just erode. Compared to how much erodes away, very little is collected for academic studies. Erosion of the rocks that contain these fossils has been occurring for millions of years. It is not a depleting resource like Native American artifacts that only occur on the surface. The beds that contain the fossils continue into the subsurface and continue across the basin. There is an almost unlimited supply of new fossils below the surface. If some of the fossils are removed by oil and gas surface development, there are more fossils immediately below what was removed. Surface disturbance by oil and gas development would provide fresh exposures in these sediments to better study and potentially find additional fossils. The value of botanical and vertebrate fossils potentially disturbed by oil and gas development in the Bighorn Basin is miniscule compared to the value of oil and gas that could come from that same area.	
10218	10218-3	My experience with oil and gas exploration from a long career is that new geologic ideas and new technology results in the economic development of oil and gas resources in areas that were previously thought to be non-commercial. The BLM and the USGS may believe an area has low potential for commercial oil and gas, but that same area may be a tremendous oil and gas resource for the nation in the future. We have seen that repeatedly across the nation in new plays like the Bakken, Eagle Ford, Barnett, Marcellus, Fayetteville, Bone Springs and Haynesville shales. Do not shut down an area to future oil and gas development because today you perceive it to have low potential.	2051
10219	10219-4	3.6.6 Lands with Wilderness Characteristics. Many existing roads, livestock reservoirs, and fences were not considered, to be able to consider this an area with wilderness characteristics. When is a road not a road? Reminds me of "it depends on what the definition of "is" is." Roads are roads. Reservoirs that are on the BLM's own listing of BLM allotments were not included.	2027
10220	10220-1	Surface disturbance should be limited to mechanical activities, and be consistent with other RMPs, therefore the Big Horn Basin RMP should use, Information Bulletin WY-2007-029, Guidance for Use of Standard Surface Use Definitions. New definition: Updated 5/26/2009Surface-Disturbing Activities: These are Public Land resource uses/activities that disturb the endemic vegetation, surface geologic features, and/or surface/near surface soil resources beyond ambient site conditions. Examples of surface-disturbing activities include: construction of well pads and roads, pits and reservoirs, pipelines and power lines, and most types of vegetation treatments (e.g., prescribed fire, etc.). NOTE: Some resource uses, commodity production and other actions that remove vegetative growth, geologic materials, or soils (e.g., livestock grazing, wildlife browsing, timber harvesting, sand and gravel pits, etc.) are allowed, and in some instances formally authorized, on the Public Lands. When utilized as a land use restriction (e.g., No Surface Disturbing Activities), this phrase prohibits all resource use or activity, except those uses and activities that are specifically authorized, likely to disturb the endemic vegetation, surface geologic features, and surface/near surface soils. Original definition: Grass Creek Planning Area 1998Surface-Disturbing Activities (or Surface Disturbance): The physical disturbance and movement or removal of land surface and vegetation. These activities range from the very minimal to the maximum types of surface disturbance associated with such things as off-road vehicle travel or use of mechanized, rubber-tired, or tracked equipment and vehicles; some	2054

Individual Comments and Index to Summary Comments and Summary Responses**

Table B-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
		timber cutting and forest silvicultural practices; excavation and development activities associated with use of heavy equipment for road, pipeline, power line and other types of construction; blasting; trip pit and underground mining and related activities, including ancillary facility construction; oil and gas well drilling and field construction or development and related activities; range improvement project construction; and recreation site construction	
10220	10220-12	6045 Snowmobiling is not a surface disturbing activity and should not be limited to roads and trails.	2034
10220	10220-13	Recreation is too specific for this large document it is difficult to comment because it is unclear to where the described areas are. The names and locations are confusing for this large resource area. There is no clear description of the land locations and therefore it is difficult to identify the impacts of the alternatives.	2062
10220	10220-14	6000 Lands With Wilderness Characteristics/Wild Lands uses incomplete inventories to classify wilderness characteristics and should be removed from this document, furthermore funding has been removed for wildlands, so they should be removed.	2027
10220	10220-15	Goal LR10.1 Remove “consistent with multiple-use needs” replace with “for.” Livestock grazing should be managed for sustained yield. Monitoring and mitigation can coordinate livestock grazing with other resource objectives. A resource (livestock grazing) has its own goals and actions that are designed to manage that resource (livestock grazing), stating that a resource (livestock grazing) will be used to meet other objectives is not management of the resource (livestock grazing), it is a management action of another resource that should not be in another resources (livestock grazing) actions.	2011
10220	10220-17	6268 Replace “stakeholder” with “interested public.” Interested public is cited in CFR 4100.0-5. Stakeholder is not defined in the federal regulations.	2011
10220	10220-18	6268 Remove “and meet other multiple use objectives.” Each resource should stand on its own merits rather than one resource stating that it will give. This is unfair multiple use and could cause economic loss to permittees and local economies. A resource (livestock grazing) has its own goals and actions that are designed to manage that resource (livestock grazing), stating that a resource (livestock grazing) will be used to meet other objectives is not management of the resource (livestock grazing), it is a management action of another resource that should not be in another resources (livestock grazing) actions	2011
10220	10220-19	6276 Remove “to support other resource objectives and” replace with “to.”	2011
10220	10220-2	1000 PR: 3 remove the word significant. Significant cannot be measured.	2009_1
10220	10220-22	The BLM failed to consider new technologies that can manipulate plants communities and water develop that could prevent no net loss of AUMs. Appendix P should include Preference AUMs	2011
10220	10220-23	Utilization Levels in Appendix W Table W-1 are new levels and are incorporating precipitation zone with season of use to classify levels of utilization. These changes in utilization levels were not compared and analyzed for environmental impacts regarding AUMs or economic impacts. “35% or less utilization of current standing crop during growing season” conflicts with the definition of utilization. Current year’s forage production cannot be determined during the growing season, therefore 35% cannot be determined. Extensive wildlife use cannot be analyzed or described in quantitative terms as stated in Footnote 1 of Appendix W.	2074

Individual Comments and Index to Summary Comments and Summary Responses**

Table B-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
10220	10220-4	1039 PR: 4.3, 4.4 there is no definition to "casual factors."	2031
10220	10220-7	4132 Remove "through upland management" since impact is marginalized	2042
10220	10220-8	GOAL BR: 11 Remove "thriving" descriptive personal interpretation.	2030
10230	10230-1	Along the south side of Gypsum Creek Road are north-facing cliffs composed of dark shale. (See Map 2). These cliffs have been used extensively for motorcycle hill-climbing. One of my concerns is that your Preferred Alternative designates this area as "Limited to Existing Roads and Trails." This is not practical in a historical play area. There are trails everywhere. Further, anyone who does not make it to the top of the hill must necessarily leave the existing trail, at least for a short distance. The cliffs should also be designated "Open." There are areas along the ATV Trail between the Bentonite Hills and the cliffs that have historically been used as play areas. One such area is depicted on Map 3. These areas have no surface water, no vegetation, and support no wildlife. Being composed primarily of bentonite, the soil (such as it is) swells with every rain. It then shrinks and crumbles as it dries, erasing recent ATV tracks and trails. This land is ideally suited for Play Areas - and little else. As appropriate, non-vegetated areas along the ATV Trail should be designated as "Open" areas.	2034
10248	10248-1	. The plan is a 20 year plan yet the BLM fails to include reasonably foreseeable development which addresses horizontal and directional drilling.	2061
10248	10248-2	By decreasing lands available for grazing by 27% you are negatively effecting the ranching industry, ranch employment and all jobs supporting the ranching industry including federal employment, which will decrease property tax, sales tax, and retail wholesale spending resulting in an economic hardship. The BLM has not shown how these decreases will better the LWCS by not allowing grazing.	2027
10248	10248-3	There is a discrepancy in the Big Game Winter Range area identified by the BLM and also by the WGFD. BLM Big Game Crucial Range covers nearly twice the area as WGFD Big Game Crucial Habitat, nearly 649,246 acres. This discrepancy is unacceptable and unjustified. The BLM must reevaluate these areas in the Draft RMP and limit the designation of such areas to those necessary for the maintenance of populations at object levels.	2022
10248	10248-4	An example is Legend Rock Petroglyph site. All alternatives states that a three mile buffer zone will be used around all cultural sites. When you follow the trail to view the petroglyphs you are facing a cliff face on one side so there is less than 100 yards of visual resource. If you turn around you face a small hill which also limits your view. A three mile buffer is unnecessary in this instance.	2004
10248	10248-5	NO WHERE in the plan do you address what roads can, mayor will be closed or your sound reasoning of why.	2034
10248	10248-7	The BLM did not conduct a study of special designations and other management areas and the economic impact on stakeholders and locals governments from the associated constraints and restrictions.	2046
10261	10261-1	EPA believes that the Draft EIS contains insufficient information to evaluate and disclose potential impacts to air quality and air quality related values. A thorough analysis of air quality is essential because of the proximity of the proposed development and its associated projected emissions to five federal Class I areas (North Absaroka, Washakie, Fitzpatrick and Bridger Wilderness Areas, and Yellowstone National Park) and four sensitive Class II areas (Bighorn Canyon National Recreation Area, Bighorn National Forest, Teton Wilderness Area, and Cloud Peak Wilderness Area). More specifically, these sensitive areas	2009

**Attachment B – Draft Resource Management Plan and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table B-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
		are located either within, directly adjacent to, or within 35 miles of the RMP planning area. Without an air quality impact analysis to confirm otherwise. EPA must assume that the predicted cumulative emissions from the estimated 1,534 new oil gas and coalbed methane wells identified for the preferred alternative are potentially substantial.	
10261	10261-10	The Draft EIS provides no explanation of or justification for BLM's selection of a preferred alternative that does not protect and enhance Wild and Scenic River resources. The EPA recommends that the Final EIS describe the basis for BLM's decision with regard to listing of waterways within the planning area.	2018
10261	10261-11	The Draft EIS estimates 920 acres of short term disturbance and 139 acres of long-term disturbance to wetlands and riparian areas. The Draft EIS further explains that due to requirements to avoid surface disturbing activities within 500 feet of water, actual direct impacts to wetlands would be less than this estimate. The EPA recommends that the Final EIS display the reduced disturbance achieved in order to provide a more accurate estimate of potential disturbance that considers the avoidance requirement. Doing so will more clearly identify where concerns exist, and enable focus on sensitive areas for protection.	2033
10261	10261-12	It does not appear that the Draft EIS addresses the jurisdictional status of wetlands in the planning area. We recommend that a preliminary assessment of wetland jurisdiction be included in the Final EIS. Having this information readily available will be of use to BLM in future project planning by enabling focus of management practices on areas where sensitive resources are most at risk of being impacted. We further recommend that the RMP/EIS explain that jurisdiction will be determined in future project specific EISs. Further, because a current National Wetlands Inventory is not available for the full planning area, we suggest that the BLM prepare an inventory of aquatic resources, characteristics, functions and overall ecological health. Having such an inventory will provide greater wetland and riparian area protection in the Bighorn Basin by providing information that can be used by BLM when authorizing surface disturbance or planning mitigation for unavoidable impacts to wetlands. Because preparation of an inventory may take time, we recommend that the Final EIS explain how BLM plans to undertake an aquatic resource inventory in the future, and offer our assistance in designing such an inventory.	2033
10261	10261-13	Additionally, we are interested in the Draft EIS's reference to potential carbon sequestration research and projects in Alternatives C and D; however, we were not able to find any detail on these efforts in the Alternative descriptions in the Draft EIS. We recommend that BLM consider additional mitigation measures that could reduce greenhouse gas emissions from RMP activities, for example methods to limit fugitive emissions of methane from oil and gas operations or to reduce combustion emissions.	2003
10261	10261-14	We recommend that the discussion of potential greenhouse gas emissions associated with other activities (e.g., motorized vehicle use as was included in the emissions inventory prepared for the Lander RMP) be quantified if possible, or else qualitatively compared as a total impact associated with each alternative, to allow for a more clear comparison among alternatives.	2003
10261	10261-15	We also urge that BLM provide additional detail to Alternative D of this management action to make clear how the BLM will address water bodies not meeting state water quality standards. We believe this can be accomplished by identifying the best management practices and discussion how they will be	2031

**Attachment B – Draft Resource Management Plan and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table B-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
		prioritized and implemented to address causal factors related to the impairment of water quality.	
10261	10261-16	The Draft EIS identifies mitigation measures associated with Alternative D to address some potential impacts to surface water quality, including requiring a 1/4 mile water resource buffer for placement of salt, mineral or forage supplements. Given that the Draft EIS acknowledges that livestock may increase loading of fecal bacteria. EPA suggests that the Final EIS clearly discuss how this buffer will be adequate to protect water quality in the planning area, or whether additional mitigation measures are needed (e.g. larger buffer, timing). Finally and because Alternative B provides for a 1/2 mile buffer, we recommend that the Final EIS explain whether any additional benefits would be gained from this wider buffer size.	2031
10261	10261-17	Draft EIS, Table 3.3, Applicable NAAQS and Representative Concentration. Please note that the sulfur dioxide method measured by the WARMS network is not directly comparable to the SO2 NAAQS. The WARMS method is a filter-cartridge based method used to sample sulfate aerosols, typically used in for visibility-related comparisons. An equivalent reference method analyzer meeting the requirements of 40 CFR Part 50. Appendix A should be used to compare against the NAAQS. We recommend contacting the Wyoming DEQ for appropriate SO2 monitoring data.	2009
10261	10261-18	Draft EIS. Section 4.1.1, Air Quality and Appendix U. Technical Support Document for Air Quality. The EPA is confused by the discussion on page 4-6 of the Draft EIS, which lists "fire management (including prescribed fire)" as among the activities for which emissions have been quantified. but later states "emissions from any prescribed fire activities conducted on BLM land within the Planning Area have not been estimated in this analysis" Based on Appendix U, it appears to us that prescribed fire emissions have been included in the emissions inventory, and we recommend that the Final EIS clarify this point.	2009_1
10261	10261-19	In addition to the commitment to manage prescribed burns to comply with Wyoming DEQ Air Quality District smoke-management rules and regulations already included as Management Action 1001, we recommend that the Final EIS include: (1) discussion of appropriate smoke monitoring techniques and mitigation (including meteorological conditions favorable for mitigated prescribed fire smoke and alternatives to prescribed fire such as mechanical fuel reduction methods); (2) requirements for the incorporation of the Interagency Prescribed Fire Planning and Implementation Procedures Guide (July 2008) into site-specific burn plans that would be designed for each prescribed burn conducted under this GMP; and (3) commitment to public notification of pending burns.	2009_1
10261	10261-2	Our understanding is that BLM has not completed a cumulative air quality impact analysis for the 6,133 oil and gas wells that have already been drilled on BLM administered mineral estate. We also understand that BLM has not completed such an analysis for the 4,544 existing active wells within the planning area or for the 1,534 planned wells. In short, the EPA believes that the "level of concern" that would warrant modeling under Management Action 1005 (contained in the Draft RMP) has already been reached.	2009_1
10261	10261-20	We recommend that the Final EIS specify that the 20 acre NSO will apply to all wetlands regardless of jurisdiction, in accordance with Executive Order 11990. In addition, we recommend that BLM consider whether any high value wetland areas smaller than 20 acres would also warrant protection through a SO	2033

**Attachment B – Draft Resource Management Plan and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table B-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
		stipulation. Factors to consider include but are not limited to: the jurisdictional waters of the U.S.; agency responsibilities under Executive Orders 11990 and 11988; the needs of species of concern; and potential impacts to aquatic communities.	
10261	10261-21	We recommend that this plan include the following key elements:1. A statement that: "The activity in the basin has already reached a level of concern regarding cumulative adverse air quality impacts. This concern is based on the level of current emissions (1100 tons per year NOx) and the proximity (between 1 and 50 miles) of proposed leasing areas to five federal Class I areas, including Yellowstone National Park, North Absaroka, Washakie, Fitzpatrick, and Bridger Wilderness Area." 2. A discussion of the current air quality status of Class I areas in the project area, based on existing monitoring data and any other available information.3. A statement that: "basin wide modeling to characterize the air quality of Class I areas will occur as soon as possible, subject to funding and staffing levels."4. A statement that: "The modeling would be either (1) a project-specific model (e.g., Calpuff) or (2) another planned modeling effort decided upon in consultation with EPA and DEQ.5. A description of activities that BLM may authorized before Class I area Characterization is completed (e.g., A requirement for Applications for Permit to Drill or field development proposals to include an emissions inventory until such time as the Class I modeling and characterization is completed).6. A statement that: "A statement that "based upon the findings of the Class I Characterization, and as provided for by law and consistent with lease rights and obligations, BLM will ensure implementation of reasonable mitigation and control measures and design features through appropriate mechanisms including lease stipulations and conditions of approval, notices to lessee, and permit terms and conditions."7. A statement that "BLM would consider applying mitigation measures to oil and gas projects developed under this RMP in the event that a future air quality impact analysis determines there are adverse impacts to Class I areas."8. Inclusion of a list of mitigation measures that BLM could apply in the event future air quality modeling shows there to be an adverse impact to Class I.9. Inclusion of the Oil and Gas mitigation table currently in the Lander Air Plan, revised as appropriate to apply to the Bighorn Basin RMP.	2009_1
10261	10261-22	The EPA recommends that the BLM develop lease stipulations for protection of sensitive drinking water resources during this RMP revision, which presents a key opportunity for avoidance and mitigation of potential significant impacts. Based upon our knowledge of the planning area, including the presence of sensitive groundwater and surface water resources designated by the State of Wyoming, we provide the following recommendations for inclusion in the Final EIS: Groundwater recharge areas: Consider No Leasing in a recharge area with a 1000 foot wide buffer zone on both sides of all perennial streams for a distance of one mile upstream of the recharge area or to the point where the stream becomes intermittent. Sole Source Aquifers: Consider No Leasing. Source Water Protection Areas and Well Head Protection Areas: Consider No Leasing in Groundwater Zones 1-3. Consider No Leasing in Surface Water Zones 1-2. If leasing occurs, impose No Surface Occupancy lease stipulations in Groundwater Zones 1-3 and Surface Water Zones 1-2. Impose Controlled Surface Use Stipulations in Surface Water Zone 3 including but not limited to: Closed loop drilling systems. Line surface impoundment ponds (evaporation ponds or drilling pits) with synthetic liners and subsequently decommissioned by removing all contaminants and liner and reclaiming the area with natural	2031

**Attachment B – Draft Resource Management Plan and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table B-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
		<p>vegetation. Identify private wells and set stipulations to be protective (e.g., no occupancy within immediate area, collect baseline data on groundwater, etc.); In cases already permitted but not drilled, impose Conditions of Approval for APDs including but not limited to the Controlled Surface Use Stipulations listed above. For areas with unconfined shallow groundwater, because the shallower the depth to water the more sensitive an aquifer is to contamination: Consider No Surface Occupancy; Prohibit use of evaporation ponds in proximity to shallow aquifers; Review the geology of shallow aquifers to determine well construction requirements, which may include cementing to surface and drilling with a fresh water mud system. To accurately identify sensitive aquifer systems, we recommend using the Wyoming Ground Water Vulnerability Assessment Handbook. General recommendations for standard lease stipulations/best management practices: A general well design requirement to set surface casing and cement to a specific formation or depth if there are aquifers at depth that need protection; Surface casing needs to be below the lowermost USDW and set into a confining (e.g. shale) layer; A requirement for an intermediate string of casing and cement may be appropriate in the event of encountering very deep aquifers; Specify in the RMP that future oil and gas projects will need a Water Resource Management Plan to address water consumption and produced water disposal including identifying water recycling opportunities.</p>	
10261	10261-3	<p>For the reasons stated above. EPA prefers that the Final EIS include a quantitative analysis that utilizes air quality modeling of the potential impacts of activities authorized under the Bighorn Basin RMP. Nonetheless, we agree that air quality impacts can be adequately evaluated and disclosed provided that BLM pursues one of the following approaches: 1) Conduct basin-wide dispersion modeling based on the emissions inventory and include this information in the Final EIS; or 2) Utilize representative photochemical grid modeling planned for another project (e.g. Powder River Basin Coal Review) with the appropriate modeling domain for the Bighorn Basin to determine the contribution of the RMP activities and include this information in the Final EIS; or 3) Modify Management Action 1005 in the Final EIS to include an air resources management plan. The air resources management plan should be included in the Final EIS and as described in Attachment 2 contain additional detail clarifying how and when modeling will be performed and mitigation potentially implemented.</p>	2009
10261	10261-4	<p>Incomplete Disclosure of Groundwater Characteristics and Potential Impacts The characterization of groundwater in the Draft EIS does not include important and up-to-date information necessary to protect groundwater water resources. The Draft EIS acknowledges that the planning area includes sensitive drinking water resources, but does not contain a complete and up-to-date evaluation of these resources, including recharge areas and source water protection zones designated by the State of Wyoming. The Draft EIS references the Wyoming Water Development Commission's (Commission's) 2003 Wind/Bighorn River Basin Plan for the ground water analysis. The Commission is currently updating the 2003 report and intends to circulate the revised report for public comment later this summer. Additional data that is included in the 2011 revision includes identification of the major aquifers in the basin, their three dimensional extent and the physical and chemical characteristics of their groundwater; estimates of the quantity of water in the aquifers and aquifer recharge rates; and descriptions of the aquifer recharge areas. In addition, EPA recommends BLM consider the Wyoming Ground Water Vulnerability Assessment Handbook</p>	2031

Table B-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
		(SDVC Report 98-01, 1998) which includes maps of aquifer sensitivity and identifies shallow groundwater aquifers that are susceptible to contamination. Analysis of this updated information in the Final EIS will maximize the ability of the BLM to determine where leasing stipulations are needed to protect current and future drinking water resources. The EPA recommends that BLM use this updated information in the Final EIS to identify water budget projections related to activities considered on BLM land, since water shortages were identified in the Draft EIS as a potential concern. In the event that updated groundwater hydrology and quality information is unavailable, we recommend that the Final EIS explain that the groundwater resources are not fully defined and identify the potential future requirements applicable to operators for gathering information on water quality and depth of useable groundwater and subsequently to comply with protective requirements as appropriate.	
10261	10261-5	The Draft EIS provides insufficient information regarding mitigation measures that could be employed to protect groundwater resources.	2031
10261	10261-6	According to the Draft EIS, one of the key ways BLM intends to address these potential impacts is to establish best management practices (BMPs). However, the Draft EIS does not provide the specificity needed to assess the adequacy of the BMPs. EPA suggests that BLM provide this specificity by including additional information in the Final EIS on the types of BMPs the BLM plans to implement including the circumstances under which the BMPs would be applied. Specifically, EPA recommends the Final EIS include: 1) A list of BMPs that may be required to protect groundwater resources. EPA recommends BLM consider the groundwater BMPs that were developed for the Pinedale Anticline oil and gas field in response to monitored groundwater contamination. 2) Identification of the circumstances under which the BMPs would be applied (e.g. wetlands, shallow water aquifers, proximity of water wells.) 3) Identification of how BMPs would be monitored and enforced.	2031
10261	10261-7	We recommend that the BLM develop lease stipulations for sensitive resources to ensure that the potentially significant impacts are avoided as much as possible. Our specific recommendations for stipulations to avoid and protect sensitive drinking water resources are attached (See Attachment 3). EPA developed these recommendations based on the Wyoming's Source Water Assessment and Protection Guidance (October 2000) and in consideration of BLM's Instructional Memorandum UT 2010-055 Protection of Groundwater Associated with Oil and Gas Leasing, Exploration, and Development.	2031
10261	10261-8	The Draft EIS contains insufficient information to evaluate the adequacy of BLM's planned groundwater monitoring program. The Draft EIS indicates the BLM plans to require groundwater monitoring "in areas of concentrated oil and gas development where groundwater has been determined to be of 'High' and 'Moderately High' priority by Wyoming DEQ" (Management Action 1028, Draft EIS page 2-47). However, neither the location of the development relative to the WDEQ priority areas nor the level of monitoring to be expected of oil and gas lease holders is disclosed. EPA believes this information is necessary to evaluate the adequacy of the proposed monitoring program and therefore requests that it be included in the Final EIS/RMP. An essential component of future project-level monitoring is baseline and long-term monitoring for private wells and clearly defining how the water supply will be replaced in the event that it is impacted. Monitoring is important to assure mitigation measures are adequate and that groundwater resources are being fully protected. In the	2031

**Attachment B – Draft Resource Management Plan and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table B-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
		absence of modeling to determine the distance from the project at which impacts may occur we recommend that monitoring occur in private wells within one mile of the project area (the BLM Pinedale Anticline project and the U.S. Forest Service Eagle Prospect project area examples of where similar monitoring programs have been established). Groundwater baseline monitoring may also be necessary to identify the depths of aquifers that are used or could be used in the future for drinking water, referred to as Underground Sources of Drinking Water (USDWs). Aquifers are presumed to be USDWs unless they have been specifically exempted or if they have been shown to fall outside the definition of USDW (e.g. over 10,000 mgf TDS). We further recommend that the Final EIS/RMP include a commitment that future project-level NEPA analyses for oil and gas development will contain a specific comprehensive monitoring plan and program to track groundwater impacts as drilling and production operations occur.	
10262	10262-13	Relevance and importance criteria used in the analysis of Areas of Critical Environmental Concern (ACEC) is generic and does not include data sets to confirm or deny the four noted importance criteria and the five relevance criteria.	2001
10262	10262-7	Protective measures for fish include intensively manage intermittent streams on a case-by-case basis. Intensive management measures for fish, or their need, are not disclosed and thus could unnecessarily hamper local governments and stakeholders.	2002
10262	10262-89	Throughout the RMP/EIS, there are many terms and practices regarding fish resources that are not defined or described. The issues have been highlighted where clarification is needed, including questions that will assist in better identifying where such information is lacking.	2002
10262	10262-200	Please justify only including carbon dioxide emissions in Tables 4-3 and 4-4, particularly when they are titled “Carbon Dioxide Equivalent Emissions” implying inclusion of other greenhouse gases.	2003
10262	10262-2	Cultural site and historic trail buffers are excessive. Alternative D buffers for cultural sites, national, and other historic trails would restrict or constrain resources uses on BLM that have yet to be identified. The BLM does not identify intact segments of historic trails nor do they identify cultural sites where the scene and setting is intact. The three mile buffer on cultural sites and the two, three, and five mile buffers (depending upon resource) of the historic trails shall be reduced and the BLM must identify exactly where the scene and the setting is intact in the Bighorn Basin to effectively analyze the economic impacts of these actions. If the BLM cannot produce intact segments of historic trails or properly identifying the cultural sites where the scene and setting is intact then the buffers for both resources will be eliminated.	2004
10262	10262-275	In the description of the affected environment, Table 3-19 on page 3-65 should be re-titled. It displays fire regime groups not the fire regime condition classification system.	2008
10262	10262-276	The bottom of page 3-65 needs references to support the rationale for not allowing fires to burn in cheatgrass invaded sage-grouse habitats. The assumption is that cheatgrass will expand and damage sage-grouse habitat. This is a statement of fact that needs to be supported by scientific evidence. We do not necessarily disagree, but some explanation or reference should be provided.	2008
10262	10262-277	On page 3-67, the sentence stating “Upslope from the basin bottom, fuel types	2008

**Attachment B – Draft Resource Management Plan and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table B-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
		and fire regimes are similar to those found in the physiographic areas, and nearly all wildfires and prescribed fires occur in these areas” needs to be corrected. The use of “physiographic” in this sentence is awkward and confusing.	
10262	10262-278	The fire and fuels analysis could benefit from a better explanation or quantification of fuels conditions. Right now there is only a cursory discussion of the existing condition of fuels. Of the lands that are classed in FRCC 2 and 3, what vegetation types that are most changed? Table 3-21 identifies acres of fires burned. It would be helpful to know the cover types these wildfires occurred.	2008
10262	10262-279	In Section 3.2.2 (prescribed fires), there is no quantification. Please include the acreage of fuel treatments per year by cover type.	2008
10262	10262-280	No analysis methods are identified in the environmental consequences, only assumptions and definitions are given. What are the indicators? How are alternatives being compared? Without this discussion, much of the following analyses are meaningless. It seems much of the subsequent analysis is based on speculation because it is difficult to predict fire behavior, weather, etc. While this is understandable, there should probably be a discussion here about the nature of the unpredictability of variables and outcome.	2008
10262	10262-281	Several issues are identified as potentially “adversely impacting wildfire management” but there is no indication to the context or intensity. Are these impacts significant? Why or why not? If these can’t be quantified they at least have to be explained in more detail to explain more about significance. This needs to be addressed throughout the majority of the fire and fuels section.	2008
10262	10262-282	Under the discussion in the last paragraph of page 4-90 in Section 4.3.1.3, quantitative figures are finally given. Unfortunately, the context and intensity is not adequately discussed. It appears here that the analysis is using acres of treatment as an indicator. What do these numbers mean? Are they significant? Are they discountable? How does this help someone make a decision on the best alternative? Please frame this discussion with better interpretation of the differences and how this would help the decision maker decide on an alternative. This needs to occur wherever numbers are presented.	2008
10262	10262-86	The fire and fuels analysis could benefit from a better explanation or quantification of fuels conditions. In its current form, there is only a cursory discussion of the existing condition of fuels	2008
10262	10262-1	The Wyoming Department of Environmental Quality (WDEQ) is not given a seat at the table in the monitoring of air quality in the Bighorn Basin. Air quality and state-of-the-art monitoring is important to the LGCA. It is fundamental that the WDEQ is given primacy in monitoring of air quality in the Planning Area.	2009
10262	10262-180	Page 3-5 states that air quality monitoring sites in the Bighorn Basin and relevant sties nearby are listed in Table 3-1. Please include a map of the air quality monitoring sites listed in Table 3-1.	2009
10262	10262-181	The North Absaroka is described as one of two air quality monitors located in the planning area. The location provided in Table 3-1 places the site outside of the planning area. Please clarify this discrepancy.	2009
10262	10262-182	The process for identifying relevant air quality monitoring sites is not described in the RMP/EIS. Please include the criteria used in selecting relevant sites.	2009
10262	10262-183	Along with descriptions of the site selection process, please include an expanded description of the relevant sites, particularly the differences in	2009

**Attachment B – Draft Resource Management Plan and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table B-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
		climate and topography from locations in the planning area.	
10262	10262-184	Please include justification for not including air quality monitoring sites located to the southwest. For example, the Boulder monitoring station (NO ₂ , O ₃ , and PM ₁₀) is located approximately 70 miles from the planning area, and the Bridger Wilderness IMPROVE monitor is located approximately 58 miles from the planning area. Both are a shorter linear distance than Thunder Basin SPM and IMPROVE sites (100 miles).	2009
10262	10262-185	Following expanded description of the process used to identify relevant air quality monitoring sites, please provide justification of their ability to accurately characterize the air quality in the Planning Area. If this justification cannot be provided, or is deemed insufficient by the cooperating agencies, then additional air quality monitoring stations should be established.	2009
10262	10262-186	Additional air quality monitoring sites distributed throughout the basin should be established to accurately represent the air quality in the Planning Area.	2009
10262	10262-187	Table 3-3 presents applicable standards for criteria pollutants and current representative concentrations for the Planning Area. Beginning with page 3-8, the Trends section does not address all sources presented in Table 3-3. Please provide justification for selection of presented data.	2009
10262	10262-188	Page 3-13 states that a WARMS monitoring site is currently operating northwest of Worland. Please present any relevant data from the Worland WARMS monitoring site, even though the three years of data required for determining compliance have not been collected. Observed concentrations of ozone at a site within the planning area would provide information that is more relevant than data from a site significantly removed from the planning area.	2009
10262	10262-189	Figure 3-5 on page 3-14 does not include the NAQQS standard for ozone, which deviates from previous figures. Please show the 75ppb standard in Figure 3-5 in order to clearly represent the standard as compared to ozone concentrations at the Thunder Basin SPM Site.	2009
10262	10262-199	Please include measurements from the Worland monitor established in 2010.	2009
10262	10262-114	There are no impacts disclosed for management actions relating to wildlife habitat, special status species, special designations, etc., although it states that “when rangelands are not meeting resource objectives, the BLM implements changes in grazing management”.	2011
10262	10262-115	There are also several areas in the management action Table 2-5 (RMP/EIS pg. 2-160-162) that state management must be consistent with “other resource objectives”, but does not disclose which resources or objectives. The other resource management actions could have significant impacts to livestock grazing, but are not disclosed in the RMP/EIS.	2011
10262	10262-15	Counter to existing BLM RMPs in Wyoming, the RMP/EIS discloses in the glossary that grazing is a “surface disturbing activities.” Livestock grazing should not be considered a surface disturbing activity due to the onerous/nebulous requirements that such a designation would carry.	2011
10262	10262-177	The LGCA is concerned that these other resource management actions could have significant impacts to livestock grazing but are not disclosed in the RMP/EIS. The County and Conservation District Land Use Plans are clear in that they are opposed to any reductions in grazing, particularly if they are not backed up by scientific data including monitoring of vegetation resources, trend analyses, etc.	2011

Individual Comments and Index to Summary Comments and Summary Responses**

Table B-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
10262	10262-298	This section presents that in 2007, "...the WFO estimated that approximately 57,000 acres in the field office were infested with nonnative annual bromes." This inventory is stated to only cover 10% of the Bighorn Basin so, "actual infested acreage might vary." We argue that this acreage could be substantially higher. The 57,000-acre figure is contradictory to table 3-22 in the RMP/EIS, which presents acres for non-native annual bromes at 37,505 for BLM surface estate and 46,875 for BLM mineral estate. [Figure 11 Spatial comparison of BLM's 'BighornBasin_GapVegetation' and 'WFO_Invasive_NonNative' GIS layers] The discrepancy seems to lay in the GIS data provided by the BLM. A GIS layer entitled 'WFO_Invasive_NonNative' totals 57,413 acres, which approximates the 57,000 acres presented in section 3.4.4. The issue seems to be that not all of the shapes in the 'WFO_Invasive_NonNative' GIS layer were incorporated into the 'BighornBasin_GapVegetation' GIS layer. Figure 11 below presents a comparison of the BLM's 'BighornBasin_GapVegetation' and 'WFO_Invasive_NonNative' GIS layers. Notice how only some of the shapes from 'WFO_Invasive_NonNative' were captured by the 'BighornBasin_GapVegetation' layer. The LGCA requests that this issue be explained and corrected, and a complete vegetation and noxious weed inventory be completed for the basin.	2012
10262	10262-299	Cooperative Management in Invasive Species and Pest Control In this section it is stated, "The goal is to contain and reduce densities of known invasive species populations." This sentence needs to be introduced to state that only very small portions of the Bighorn Basin have been inventoried for weeds and the sentence in question needs to be added to account for newly identified populations.	2012
10262	10262-88	Within the Invasive Species and Pest Management section there is nearly nonexistent disclosure of relevant field-verified data. The most glaring deficiency within this subject area is that only 10% of the Worland Field Office has been inventoried for invasive nonnative annual bromes. Clearly an EIS cannot accurately analyze the impact of invasive species when only 10% of the Worland Field Office has been inventoried. Prior to finalization, the BLM must conduct a new, expanded inventory and reanalyze impacts.	2012
10262	10262-268	Also, following any updates to the oil and gas development potential in the Planning Area the BLM shall reevaluate the indirect impacts from ROW management actions.	2013
10262	10262-53	Withdrawals: Alternative A GIS files contain blank records in the GIS attribute tables. Acres do not match those in the RMP.	2013
10262	10262-229	The BLM reviewed proposals for three areas nominated for MLP reviews: Absaroka-Beartooth Front, Fifteen Mile, and Bighorn Front. After review, the BLM stated none of the areas met the criteria necessary for MLP analysis; however, they did identify resources of concern within those areas. They also stated additional MLP areas may be identified and analyzed at the BLM's discretion at any time.	2014
10262	10262-230	The LGCA is concerned that future lease sales and therefore exploration and production may be slowed significantly if MLPs are required in other sections of the Planning Area, or if the BLM identifies additional resources of concern in the three MLPs analyzed to date.	2014
10262	10262-242	The LGCA requests an addition to that list: the additional challenges resulting from NEPA processes that may be necessary if the IM 2010-117 is implemented prior to the letting of leases in the Planning Area, as discussed above. It is	2014

**Attachment B – Draft Resource Management Plan and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table B-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
		thought that the execution of a MLP will detrimentally impact oil and gas exploration and development and could ultimately force oil and gas companies to spend their exploration budgets elsewhere.	
10262	10262-265	The LGCA is concerned that future lease sales and therefore exploration and production may be slowed significantly if MLPs are required in other sections of the Planning Area, or if the BLM identifies additional resources of concern in the three MLPs analyzed to date. Further, if either of those issues arises in the future and the BLM requires a MLP to be conducted, it is possible oil and gas companies will become discouraged and will not pursue leasing in the Planning Area. Please reevaluate these consequences before accepting Instruction Memo 2010-117 as permanent direction.	2014
10262	10262-143	The Alternative D GIS shapefile for Mineral Constraints does not include the standard constraint restriction category.	2015
10262	10262-144	The shapes on Map 20 closely, but not exactly, matched the resulting analysis performed by the LGCA for the standard constraints. The acreage reported in the RMP Table 2-5, record number 2024, of approximately 257, 000 acres did not match the resulting GIS acres of approximately 200,000.	2015
10262	10262-145	An issue with the definition query given to the LGCA by Mr. Hiner has arisen during the GIS data review and acreage analysis. The definition query provided by Mr. Hiner is Fed_Min = All, Oil-Gas, Oil-Gas-Coal, and Oil-Gas-Sand-Gravel. The Alternative D Mineral Constraints GIS shapefile was cut to the Federal Mineral Ownership GIS file to disclose acres of constraints only on BLM administered minerals for oil and gas development. The red outlines and blue highlights on the following map [Figure 2] are the federal mineral ownerships for the BLM. The green polygons are the Alternative D Mineral Constraints that were cut to the Federal Mineral Ownership according to Mr. Hiner. The map shows that the polygons are not coincidental and boundaries do not align. The Alternative D Mineral Constraints migrate in and out of the “Other” mineral ownership category in the Federal Mineral Ownership layer. The “Other” category was not included in Mr. Hiner’s query for federal mineral ownership in relation to mineral constraints. The conclusion drawn is that the LGCA received an inaccurate Federal Mineral Ownership layer or that the layer has been edited in such a way that the edits are unbeknownst to anyone other than the BLM. Due to this issue, the LGCA will be unable to accurately verify any analysis related to federal mineral ownership or reporting of related acreages in the RMP.	2015
10262	10262-146	After review of the BLM-provided GIS data for Withdrawals, the LGCA has been unable to reproduce the acreage reported in Table 2-2 in the RMP. Several factors contribute to the irreproducible acreages reported in the RMP. The GIS attribute tables for both Alternative A and D GIS data are missing information. There are blank records in the attribute table. The selection process for identifying the lands carried forward as Withdrawals was not documented in the GIS data. Trial and error reviews of query selections and a review with Mr. Hiner, failed to resolve the issue of the selection process. The blank records contribute significantly to the difficulty of identifying the selection process and reconciling mismatching acreages. To date, Mr. Hiner at the BLM has not been able to resolve the Withdrawals issues. The LGCA will continue to seek resolution of these issues. The following screen shot [Figure 3] documents the missing attribute data in Alternative A Withdrawals. The highlighted column is the Withdrawal classifications.	2015

**Attachment B – Draft Resource Management Plan and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table B-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
10262	10262-154	Upon review of the constraints on leasing for geothermal development, the LGCA was unable to match the acreages of “open to geothermal leasing” and “administratively unavailable to geothermal leasing” for Alternative D. A dissolve process based on constraint designations was performed in an attempt to correct for any overlapping polygon or duplication of acres. This process failed to produce matching acreages between the GIS data and RMP Table 2-2.	2015
10262	10262-155	It appears that the geothermal leasing constraints still contain overlapping designations. Controlled Surface Use (CSU) designations overlap into areas with Timing Limited Stipulations (TLS), resulting in double counting of acreages.	2015
10262	10262-156	The GIS data presents 387,699 acres as unavailable to geothermal leasing, contradicting the 324,737 acres reported in RMP Table 2-2.	2015
10262	10262-157	Given the overlapping polygons for CSU and TLS stipulations, matching acres open to geothermal leasing between the RMP and GIS will be impossible without removing the overlapping constraints.	2015
10262	10262-158	It appears that in the BLM GIS data, CSU polygons were simply drawn on top of existing TLS polygons. By cutting the CSU polygon into the larger TLS polygons, the data would not show overlapping polygons and double counting of acreages.	2015
10262	10262-163	Review of the new Alternative A Withdrawals file has revealed blank records as well. This is not a solution to the problem of missing attribute data.	2015
10262	10262-164	The LGCA should have received the final GIS product which contains GIS documentation of the acreages presented in the RMP. It is the LGCA’s contention that the BLM should have sent the final product of ICF’s completed analyses of GIS data that yielded the numbers produced in the RMP. These files would have included the appropriate metadata describing how the files were produced from the original BLM files supplied to ICF. These files are required as part of the administrative record.	2015
10262	10262-165	Final analysis GIS files or specific definition queries had to be produced to accurately report RMP analysis acreages. If ICF performed the GIS analysis, then they must have final analysis files or definition queries.	2015
10262	10262-166	The updated file contains missing data in the attribute table. Caleb’s email discussed how to complete the GIS attribute table based on Table 3-40 in the RMP and how to clip the Withdrawals to the Federal mineral ownership layer. This should have been done by the BLM.	2015
10262	10262-167	The LGCA pointed out a 42-acre parcel of Withdrawals for Alternative A and D located on private surface and private subsurface. This should not have been included in the Withdrawals for either alternative. Forty-two acres does not seem significant on a 4.2 million acre Federal mineral ownership scale. When the bentonite industries current operations are only 1,200 acres (4% of their operations), 42 acres becomes more significant.	2015
10262	10262-245	Yet, the calculated percentages for each classification category (high, medium, and low) are not disclosed in the RMP/EIS. A review of Figure 40 (Potential for occurrence of oil and gas within the Bighorn Basin Planning Area) presented in the RDF shows that approximately 92 percent of the Planning Area is depicted as having high potential for oil and gas occurrence.	2015
10262	10262-257	On Page 3-42 under Management Challenges it is disclosed that “Approximately 30,000 acres of land has been disturbed in the Bighorn Basin due to bentonite mining, along with approximately 4,000 acres of road and haul-road disturbance (BLM 2008c).” These disturbance acres are in conflict with calculations provided	2015

**Attachment B – Draft Resource Management Plan and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table B-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
		by representatives from the bentonite industry (Scott pers. comm.). Please review for accuracy the 4,000 acres of reported road and haul-road disturbance in the RMP/EIS.	
10262	10262-52	Mineral Constraints: Alternative D Mineral Constraints is missing all records for the “Standard Constraints.”	2015
10262	10262-56	Geothermal Constraints: GIS files contain overlapping polygons resulting in conflicting management in those areas and double counting of acres in GIS.	2015
10262	10262-217	The RMP/EIS (pg. 3-43) states “Coal production in the Planning Area is generally not considered economically feasible due to the relative thinness of the coal beds, thickness of the overburden, and low quality of the coal.” Yet there is a record of historical mining activity in the Planning Area and the USGS named eight important coal fields within the Bighorn Basin (USDI 2009b). Please remove or modify the statement in the RMP/EIS in order to accurately portray the affected environment.	2017
10262	10262-252	The RMP/EIS (pg. 3-43) states “Coal production in the Planning Area is generally not considered economically feasible due to the relative thinness of the coalbeds, thickness of the overburden, and low quality of the coal.” However, there is a record of historical mining activity in the Planning Area and the USGS has named eight important coal fields within the Bighorn Basin (USDI 2009b). Therefore, the BLM shall remove or modify the statement in the RMP/EIS in order to accurately portray the affected environment.	2017
10262	10262-93	Predators, including gray wolves and grizzly bears, have adverse impacts to big game in the Bighorn Basin. The RMP/EIS states that management challenges to big game include (RMP/EIS pg. 3-98): habitat conditions, fire management, drought, increased development and urbanization, habitat fragmentation, motorized vehicle misuse, disease, hunter access, and the impacts of livestock grazing management on the frequency, quality, and composition of key forage species. Note that predators and predation are not listed as a management challenge for big game. The BLM must acknowledge, account for, and analyze the predation of big game species in the RMP/EIS.	2020
10262	10262-28	Descriptions of wildlife species and habitats are based on perceptions, not qualitative and quantitative data.	2025
10262	10262-91	if woody plant communities for pronghorn, mule deer, or moose have indeed declined, the Affected Environment should identify the key variables and provide quantifiable data to show baseline conditions compared against historic conditions (which are also not disclosed in the RMP/EIS) that would support such a contention. Under CEQ 1502.22 Incomplete or Unavailable Information, the BLM has a duty to provide relevant information unless it is proven to be unattainable or the agency would incur exorbitant costs to obtain the information. Neither of which are the case in this circumstance.	2025
10262	10262-92	Recognizing the mandate outlined in CEQ 1502.22, the LGCA requires that the BLM qualify and quantify the aforementioned management challenges for big game species prior to any management decision(s) that alter or minimize allotment management plans or allotments, road-use designations, oil and gas activities, or additional multiple-use activities. At present, the BLM could choose to alter grazing allotments, road designations, hunting units, etc. as a rationale for improving big game habitat based on exceedingly inadequate and incomplete information. The effects of such could have detrimental social, economic, and political impacts.	2025

Individual Comments and Index to Summary Comments and Summary Responses**

Table B-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
10262	10262-109	When reviewed by the LGCA, skepticism arose about the wilderness characteristics, or lack thereof, contained within the areas. Given the vast local knowledge of the areas by LGCA members, there was skepticism of the designations based on roads and structures known to be present.	2027
10262	10262-11	The BLM did not identify structures within the LWCs that detract from wilderness characteristics. Using the BLM’s own GIS data the LGCA identified 634 miles of roads, of which 518 miles are two track, 442 reservoirs, 296 miles of fence, 569,273 acres of active allotments, 154 range improvements, 10 miles of water pipeline, 17 water wells, eight oil fields, 68 miles of oil and gas pipeline, eight active oil and gas wells, 59 plugged and abandoned oil and gas wells, and 248,315 acres (43%) have oil and gas leases. Since the release of the preceding, the LGCA conducted a local stakeholder review. Likely, these totals will be increased based on the incorporation of stakeholder review data. The BLM is required to identify structures based on their own guidance in BLM Manual 6301 and summarize and analyze the cumulative effects of structures on wilderness characteristics. Clearly, the BLM did not do so. The LWC inventory must be entirely revised using LGCA input and data.	2027
10262	10262-110	The BLM ignored their data and other readily available data sources for structures when designating LWCs.	2027
10262	10262-111	The LGCA/ERG LWC Inventory found that almost 20% of the 3.2 million acres of BLM lands in the Bighorn Basin were erroneously identified as having wilderness characteristics. In the 3.2 million acres, the BLM has identified 56 LWC areas comprising a total of 571,000 acres. Within 571,000 acres there are 634 miles of roads, of which 518 miles are two-track, 442 reservoirs, 296 miles of fence, 569,273 acres of active allotments, 154 range improvements, 10 miles of water pipeline, 17 water wells, eight oil fields, 68 miles of oil and gas pipeline, eight active oil and gas wells, and 59 plugged and abandoned oil and gas wells (248,315 acres (43%) have oil and gas leases).	2027
10262	10262-112	the LGCA has requested the BLM to initiate a new inventory process and postpone indefinitely the management of LWCs until a comprehensive and objective inventory is completed.	2027
10262	10262-48	Improper or incomplete inventory of LWCs as is illustrated in Appendix A. Note that the LWC inventory and maps have been presented during public meetings. There are numerous specific references to incorrect information provided by the BLM in Appendix A.	2027
10262	10262-49	The BLM LWC Inventory is flawed. The BLM did not include any GIS data for structures detracting from wilderness characteristics in inventory forms or on maps. Refer to Appendix A for more detail on this issue.	2027
10262	10262-59	Nevertheless, the BLM-preferred alternative in the RMP/EIS includes LWCs that potentially reduce or eliminate significant acreage available for oil and gas leasing even though the BLM LWC inventory included lands that contain significant development including roads, pipelines, oil and gas wells (active and abandoned), reservoirs, fences, and grazing improvements. The LGCA LWC Inventory found that almost 20% of the 3.2 million acres of BLM lands in the Bighorn Basin were erroneously identified as having wilderness characteristics.	2027
10262	10262-100	Should any expansion of wild horses occur, which is not mandated by the WFRHBA and thus unnecessary, this expansion must result in no reduction in livestock AUMs.	2030
10262	10262-102	Currently wild horses in the Planning Area are within the mandated appropriate	2030

**Attachment B – Draft Resource Management Plan and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table B-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
		management level (AML) range established in the Consent Decree. Yet, the LGCA's stated position is that wild horse populations should be further reduced to a total head that is at or near the minimum AML.	
10262	10262-98	The Affected Environment discussion of wild horses states that population growth is expected at a 15% annual rate. But, in Environmental Consequences - Methods and Assumptions, it is stated that the number of wild horses would increase by 18% annually.	2030
10262	10262-99	As a nonnative species that unduly affects grazing permittees, the LGCA firmly asserts that the BLM should manage wild horses in the Planning Area only to the extent that the minimum requirements of the Wild Free-Roaming Horses and Burros Act (WFRHBA) are met.	2030
10262	10262-207	With the exception of the WEPP model, "assumptions and methods" section only includes assumptions, not methods.	2031
10262	10262-208	No actual water quality data is presented in Chapter 3. Although it is not expected that the RMP/EIS document the quality of surface water in all drainages throughout the Big Horn Basin, more data should be provided in the RMP to document baseline water quality.	2031
10262	10262-209	Indicators for water according to the Final AMS are chemical, physical, and biological characteristics (Page 2-19 of the AMS). No data are presented to provide a baseline for these indicators.	2031
10262	10262-78	First, the AMS listed three indicators for water: (1) chemical characteristics, (2) physical characteristics and (3) biological characteristics. Yet none of the indicators is mentioned in the RMP/EIS and no baseline information regarding the indicators is provided in Chapter 3 of the RMP/EIS.	2031
10262	10262-79	in order for there to be adverse impacts to water resources, there must be demonstrated negative impacts as measured by indicators. Without the presence of baseline data pertaining to chemical, physical, and biological characteristics, it cannot be demonstrated that adverse or positive impacts would occur as a result of any alternative action.	2031
10262	10262-105	Specifically unclear is the sensitivity levels in the inventory	2032
10262	10262-106	Why are several VRM classes were expanded from Alternative A to Alternative D (e.g. Sheep Mountain Anticline).	2032
10262	10262-25	It is unclear how Visual Inventory Classes and Visual Resource Management (VRM) classes were determined. Specifically, it is not clear how sensitivity levels were designated in the Inventory	2032
10262	10262-26	it is not stated why some VRM classes were expanded from Alternative A to Alternative D	2032
10262	10262-16	Acreage discrepancies are present within the RMP/EIS (e.g. vegetation resources).	2033
10262	10262-24	Vegetation inventories are deficient, particularly invasive species inventories.	2033
10262	10262-284	It is stated that Wyoming Gap data are suitable for RMP/EIS level planning. The LGCA argues that these data are not sufficient and other available vegetative datasets were not investigated or analyzed. Gap only provides cover type, and does not provide size/height or percent cover. LANDFIRE offers a nationally standardized and comprehensive dataset of vegetation cover types, canopy cover, canopy height, fuels, and fire regimes. The Bighorn Basin is covered by LANDFIRE version 1.1.0 that portrays the basin for 2008. Version 1.1.0 was released in early 2011. Besides presenting more current information than Gap	2033

**Attachment B – Draft Resource Management Plan and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table B-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
		data, the LANDFIRE data offers increased detail of the Planning Area’s vegetative components.	
10262	10262-285	Statewide Gap data was modified for the Worland Field Office during the planning process, but this modification was not identified in the Biological Resources section. The LGCA has compared statewide Gap data to the layer presented in the RMP/EIS revision, and the two datasets are inconsistent. The Cody Field Office matches the statewide Gap layer, but not in the Worland Field Office. It is misleading for the BLM to state that the Wyoming Gap Analysis data were used, when, in fact, it is a modified dataset. We request a discussion of the data used to update Gap, as well as an accuracy assessment of the modified data.	2033
10262	10262-286	The RMP/EIS mentions increases in bark beetle activity but provides no numbers to support this statement. The USFS, since 1994, has maintained an Aerial Detection Survey providing spatial data of insect damage by year. These aerial surveys extend past the USFS boundary to the lower tree line, thus covering a majority of the forested areas in the Bighorn Basin Planning Area. These data could have been incorporated to better illustrate the insect activity in the basin.	2033
10262	10262-287	The description of the existing conditions of forested communities is completely inadequate. Each of the three forest community descriptions are nearly identical and portray the communities in very broad and vague metrics. For example, the RMP/EIS states that lodgepole pine "stand ages are between 1 and 150 years." Not only is this statement vague, but it is contradictory to the best available science. The biophysical setting description for the Rocky Mountain Lodgepole Pine Forest presents fire return intervals of 100 to 200 years.	2033
10262	10262-288	The LGCA requests a breakdown of acres by early-, mid-, and late-successional stages, percent cover, and departure from historic fire regimes. The discussion of historic fire regimes is inadequate and no quantification of departure was provided. Table 4 below is an example of how LANDFIRE data can be used to quickly analyze forest conditions. LANDFIRE does not provide size (diameter breast height (DBH)) classes, but does provide canopy height, which can be used as a surrogate for age classes. A brief review of forest ages within the Planning Area shows that there are minuscule amount of early-seral forests when compared to mid- and late-seral stands.	2033
10262	10262-289	Similar to the Forest Communities section, this section has a lack of citing literature and no presentation of quality and quantity of the woodland communities located within the Planning Area.	2033
10262	10262-290	The LGCA requests that the BLM further address the decline in the forest products infrastructure in the Bighorn Basin and present the potential of new technologies to revive production at closed mill operations while providing forest health treatment opportunities. There is significant potential to use dead and dying forest products, combined with green woody material, for a myriad of uses. The economics of such activities improves with contribution from appropriated fuel reduction funding sources. Long term landscape scale contracts, such as stewardship contracting, can provide small business flexibility to meet changing market conditions and supply stability to obtain financing to make important capital investments	2033
10262	10262-291	This section speaks to the recent insect outbreak and provides no quantification. The USFS Rocky Mountain Region, in cooperation with the Wyoming State Forestry Division, conducts annual flights mapping insect	2033

Individual Comments and Index to Summary Comments and Summary Responses**

Table B-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
		damage (USDA 2008). These data are readily available online and cover a majority of the forested portions of the Planning Area. The LGCA requests that the BLM incorporate these data into the Forest Communities section of the RMP/EIS. [Table 5 Aerial Detection Survey Data for the Bighorn Basin 2008]	
10262	10262-292	The RMP/EIS states that shrublands represent approximately 2,690,284 acres of BLM administered land. Using BLM supplied Gap data and surface ownership GIS layers, the LGCA cannot recreate this number. BLM GIS files display 2,662,057 acres of shrublands. The LGCA requests that the BLM explain this discrepancy. The source of this inconsistency could be generated by the designations of shrublands and barren types. RMP/EIS Table 3-22 presents barren lands as 43,114 acres, and BLM-provided GIS files present 71,314 acres. This 28,000-acre discrepancy can be traced to a single Gap polygon located southwest of Burlington, which is attributed as Basin exposed rock/soil type in the Description field in the BLM Gap data, but is displayed as 'Shrubland-Sagebrush' on Map 29 of the RMP/EIS.	2033
10262	10262-293	Additionally, the BLM-supplied Gap data had three blank records, totaling 1,340 acres. These areas are classified as forests/woodlands and riparian/wetlands on Map 29. We request justification for these assignments.	2033
10262	10262-294	Table 6 presents successional classes for the Inter-Mountain Basins Big Sagebrush Shrubland - Wyoming Big Sagebrush biophysical setting. This analysis shows that there is a buildup of late-seral stands of sagebrush, uncharacteristic of historic plant communities (USDA and USDI 2010). [Table 6 Successional Classes in the Inter-Mountain Basins Big Sagebrush Shrubland - Wyoming Big Sagebrush Biophysical Setting (USDA and USDI 2010)] Reference conditions for the Wyoming Big Sagebrush type show a historical presence of 15% and 5% in Class A and B respectively (Barret et al. 2010). This distribution of early- and mid-seral stands was driven by the mean fire return interval of 54 years for the Wyoming Big Sagebrush type (Barret et al. 2010). The departure from historic conditions provided in Table 6 can be further examined by analyzing the fire regime condition classes (FRCC) in these shrubland habitats. Landscapes determined to fall within the category of FRCC 1 contain vegetation, fuels, and disturbances characteristic of the natural regime; FRCC 2 landscapes are those that are moderately departed from the natural regime (34-66% departure); and FRCC 3 landscapes reflect vegetation, fuels, and disturbances that are uncharacteristic of the natural regime (67-100% departure) (USDA 2007). Table 7, below, presents the FRCC of the major shrubland existing vegetation types. [Table 7 Fire Regime Condition Class by Existing Vegetation Type (USDA and USDI 2010)] The buildup in late-seral sagebrush stands, presented in Table 6, can be explained by the increase in FRCC 2 presented in Table 7. The major driver of this increase can be attributed to missing one or more burn cycles, or an increase in non-native vegetation. [Table 8 Fire Regime Condition Classes by Fire Regime Groups (USDA and USDI 2010)] Resource Condition The Resource Condition section presents differing descriptions of fire's role in the sagebrush/grassland communities. It is discussed that lack of fire has led to an increase in juniper and a loss of age class and structural diversity, and it is stated that areas experiencing multiple wildfires have been converted to cheatgrass monocultures. There needs to be a more in-depth discussion of the role of fire, which should be accompanied with tabular and spatial data.	2033
10262	10262-295	Riparian/Wetland Communities Existing conditions and acres are lacking.	2033
10262	10262-296	It is stated that, "Based on PFC assessments, many riparian/wetland areas in the	2033

Individual Comments and Index to Summary Comments and Summary Responses**

Table B-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
		planning area have improved over the last 15 to 20 years in response to implemented changes in grazing and other management actions." Table 3-23 presents a current PFC inventory for wetlands. Data to show the PFC ratings from 15-20 years ago are not presented. If the BLM cannot show two inventories with an improvement, the LGCA asks that the above-mentioned sentence be removed or rewritten.	
10262	10262-297	In the Management Challenges section it is stated that, "Allotments can fail standard #2 for many reasons. If failure to meet the standard is attributable to existing livestock grazing management or utilization level, then the BLM must make management changes to correct the issue." It is the assertion of the LGCA that the BLM have a minimum of two data points with a temporal range showing a downward trend before any grazing management decisions are made.	2033
10262	10262-301	Many of the vegetation goals and objectives deal with the desired plant community without adequate discussion of ecological sites or a breakdown of the existing conditions across the basin. The LGCA requests that a full description of ecological sites and the methods used to calculate percent similarity to historic climax plant community are provided.	2033
10262	10262-302	The figures presented in Record #4031, in Table 2-5, under the Alternative A column, need to specify if they are goals for percent composition by weight or by cover.	2033
10262	10262-303	Table 4-8 in this section does not present totals by alternative. Upon migrating these data into Excel and calculating totals by alternative, it was noted that very few of the totals matched the acreages provided in RMP/EIS Table 2-2. The LGCA requests that this table be reworked, with totals added, to match Table 2-2.	2033
10262	10262-306	The adverse and beneficial impacts need to be better explained. The RMP/EIS states that grazing and fire could be adverse or beneficial, and no reasoning or explanation is provided. Neither the role of fire in these vegetative systems nor a discussion of the benefits of proper grazing are presented.	2033
10262	10262-307	The RMP/EIS states, "Current trends in plant succession and vegetation health would continue." This does not account for the recent drought or the anticipated effects of climate change. The LGCA encourages the BLM to add a discussion with recent climatic and vegetative trends.	2033
10262	10262-308	The RMP/EIS states that disturbed shrublands will regain "pre-disturbance structure and density for more than 20 years." This statement is grossly underestimated, not referenced, and is in direct contradiction to the RMP/EIS. On page 3-87 the RMP/EIS states, "Many reclamation efforts performed 20 or more years ago still do not have shrubs established..." There is a wealth of research available concerning this issue. The LGCA requests that the following be incorporated into the RMP/EIS: removal of the 20-year figure, citation of literature, and reanalysis of the environmental consequences. Following intense fire or other disturbances that completely remove canopy cover, herbaceous species will dominate the ecological site, and recovery to 20% big sagebrush canopy cover may take 40 years (Young and Evans 1989) or longer (West and Yorks 2002). Canopy cover is defined as the percentage of ground covered by a vertical projection of the outermost perimeter of the natural spread of foliage of plants, including small openings within the canopy (Butler et al. 1997). Evidence of long-term stable grass communities for sagebrush sites in Wyoming are illustrated by models developed for the LANDFIRE project (USDA and USDI	2033

**Attachment B – Draft Resource Management Plan and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table B-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
		2010). Model R2SBWY is designed for a Wyoming big sagebrush semi-desert site and it estimates that it will take 20 years for natural succession after a fire for shrubs to achieve 10% cover. Model ROSBDW (Low sagebrush shrubland) estimates that following fire it will take 20 years for shrubs to have greater than 5% cover (USDA et al. 2011). Watts and Wambolt (1996) estimated that it will take approximately 30 years for big sagebrush cover to reach 13.5% in southwestern Montana after fire. In Montana, Eichhorn and Watts (1984) did not find seedling recruitment in a former Wyoming big sagebrush /bluebunch wheatgrass site 14 years post-fire. Similarly, Wambolt and Payne (1986) found less than 2% canopy cover of Wyoming big sagebrush 18 years post-fire (Watts and Wambolt 1996). Blaisdell et al. (1982) noted the effective use of prescribed fire could reduce cover for 25 to 50 years.	
10262	10262-309	The RMP/EIS states, "Grassland and shrubland communities would be maintained with a mix of species composition, cover, and age classes." The RMP/EIS does not disclose these data. The LGCA requests that the RMP/EIS present a table outlining the current cover type, cover, and age classes. LANDFIRE data suggest that the current conditions across the Bighorn Basin are not well distributed, but are instead dominated by late-seral stands of shrubs (USDA and USDI 2010).	2033
10262	10262-310	The LGCA appreciates the discussion of the benefits of grazing and fire to rangeland resources. This section presents the same discussion on reestablishing grassland and shrubland communities, stating that they "... would not reestablish to pre-disturbance structure and density for more than 20 years." The LGCA requests that this section be reworked to account for all relevant scientific research on this matter.	2033
10262	10262-311	The riparian/wetland resource section loosely describes the implications of management actions on this resource. This environmental consequences section lacks the quantity and distribution information needed to adequately portray the anticipated effects on this resource. As it presently stands, this environmental consequences section is inadequate for readers or decision makers to quantify effects or to compare alternatives.	2033
10262	10262-312	This section states, "In addition, efforts at conserving species, such [as] the Ute ladies-tresses (a wetland species), can directly benefit riparian condition." Section 3.4.7 of the RMP states that Ute ladies-tresses could occur, but are not known to occur within the Planning Area. It is unclear how management actions can focus on conserving species that are not known to occur in the Bighorn Basin. The LGCA requests that this section be reworked and updated to contain acres affected by alternative.	2033
10262	10262-314	1. Prior to any proposed modification of AMPs or elimination of livestock grazing allotments in the Planning Area as a protective measure for vegetation protection, the BLM will design and implement a comprehensive monitoring study based on state-of-the-art methods that evaluates vegetation cover type, percent cover, age/size classes, structure, habitat quality and quantity, and the effects of livestock grazing in the Planning Area. At the conclusion of the study, the BLM will coordinate with livestock grazing permittees and local governments in the Bighorn Basin preceding any proposed modification of AMPs or elimination of livestock grazing allotments in the Planning Area. If disagreements arise, they shall be settled through a conflict resolution and mediation process.	2033
10262	10262-315	2. Prior to any proposed modification of AMPs, elimination of livestock grazing	2033

**Attachment B – Draft Resource Management Plan and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table B-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
		allotments, or adjustments to fire use plans in the Planning Area as a protective measure for vegetation protection, the BLM will design and implement a comprehensive noxious weed inventory. A complete awareness of the noxious weeds in the Bighorn Basin is necessary for proper management of the vegetative, and wildlife habitats, in the Bighorn Basin.	
10262	10262-316	3. The vegetation discussions will be updated by reviewing available science and incorporating the research, complete with citations, in the Final RMP/EIS. The vegetation discussions, as they stand now, do not offer the reader a full understanding of the resources, existing conditions, or how they differ from historic conditions. Prior to any project level NEPA analyses, the BLM shall update the vegetation dataset for the Bighorn Basin. This dataset will include vegetative components (vegetation cover type, percent cover, age/size classes, and structure), ecological site, fuels, and fire regime information. New LANDFIRE data that provides the aforementioned data requirements is available and is more detailed than GAP data, which is currently employed by the BLM.	2033
10262	10262-317	4. The BLM shall provide baseline data when disclosing sensitive plants, especially when sensitive plants are rationale for management actions. The BLM shall use the Wyoming Natural Diversity Database (WYNDD) GIS data for plant Species of Concern as baseline occurrence/presence data, but not as proof of absence. The BLM shall conduct a full inventory, providing field verified occurrences of sensitive plants to substantiate any future management actions.	2033
10262	10262-318	Overall, the vegetation discussion in the RMP/EIS is significantly flawed; there is insufficient data, incomplete inventories of existing conditions, generic effects analyses, and discrepancies in acreages both within the RMP/EIS and between the RMP/EIS and BLM provided GIS data. Throughout the RMP/EIS, there is a lack of best available science and citations are very scarce. The lacking disclosure of existing conditions adds to the confusion of how management will work to attain desired conditions. The effects analysis provided by the RMP/EIS is inadequate and filled with vague descriptions of how management action might or might not affect resources in a positive or negative manner.	2033
10262	10262-319	Before the RMP/EIS is finalized, the vegetation section must be substantially improved. The Affected Environment must compare historic and current vegetation conditions and habitat quality and quantity. The connection must be made from historic vegetation conditions to existing conditions, facilitating connections between desired conditions and management actions. Until a thorough vegetation NEPA analysis is constructed, the LGCA cannot support any management actions taken by the BLM for the protection of vegetation resources in the Bighorn Basin.	2033
10262	10262-87	The vegetation sections of the Draft Bighorn Basin RMP/EIS are consistently incomplete, contradictory, and unclear. An Affected Environment chapter should comprehensively disclose resources, spatially and tabularly, describe historic vegetative processes and conditions, and then make the case for management affecting current conditions. With this foundation set, the Environmental Consequences section can clearly describe how management will direct resources towards desired conditions. This is not the case with the Bighorn RMP/EIS. The LGCA feels very strongly that the RMP/EIS vegetation section is inadequate as a basis for making management decisions with far-reaching, both spatial and temporal, ramifications.	2033
10262	10262-107	Of particular concern in the RMP/EIS is the change in travel restrictions that would limit motorized use from the current management standard of “existing	2034

**Attachment B – Draft Resource Management Plan and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table B-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
		roads and trails” to the proposed “designated roads and trails,” which will have a significant adverse impact on energy development, grazing, and recreation uses by stifling access. While the issues that precipitate restrictions in renewable energy development, general rights-of-ways, or travel management are covered under the relevant resource sections, the LGCA requests that more information be included in the Land Resources section that cross-references the rationale for proposed change. With expanded descriptions of decisions which affect land resources, a fuller understanding can be reached concerning the variations between alternatives and, ultimately, the future actions undertaken in the Planning Area.	
10262	10262-132	Under Alternative A, Travel Management GIS data document 1,052 acres of “open to motorized use.” This figure does not match the 1,320 acres reported in Table 2-2 of the RMP.	2034
10262	10262-133	There is a second Alternative A Travel Management GIS file that the LGCA received from Mr. Caleb Hiner, BLM RMP Project Lead, named Travel Management A1. Based on cursory review it appears to be associated with Wild and Scenic Rivers designations. This data should have been incorporated into the Travel Management Alternative A file.	2034
10262	10262-134	Travel Management A1 reports 56,661 acres of “closed to motorized use.” This figure is inaccurate because acres were not recalculated when creating this file. The actual addition of “area closed to motorized use” under Travel Management Alternative A1 is 2,379 acres.	2034
10262	10262-135	The Travel Management GIS data documents 2,332,505 acres “limited to existing roads and trails” which does not match the reported 2,332,355 acres in the RMP.	2034
10262	10262-136	The TravelMngt column contains one blank record of 4,468 acres.	2034
10262	10262-137	The Alt_D column matches the “closed to motorized use” restriction for all records except one, where the “closed” designation in the TravelMngt column was not transferred to Alt_D column.	2034
10262	10262-138	There are four blank records in the Alt_D column totaling 13,908 acres with no direction as to their relevance in Alternative D Travel Management decisions.	2034
10262	10262-139	The total acreage of “closed” records in the TravelMngt column is 61,001 acres and the total of “closed” records in the Alt_D column is 53,396 acres. Neither description of closure matches the reported acres of “closed to motorized use” reported in Table 2-2 in the RMP of 60,681 acres.	2034
10262	10262-140	GIS data for areas where motorized use is “limited to designated roads and trails” covers 1,057,318 acres which does not match the 1,055,257 acres reported in Table 2-2 of the RMP.	2034
10262	10262-141	There is one blank record in the Alt_D column for the “designated roads and trails” designation that contains a designation under the TravelMngt column. When removing the blank record, the total is reduced to 1,054,942 acres, which still does not match the RMP reported acres.	2034
10262	10262-142	Seasonal restrictions on travel management are only briefly discussed in the Travel Management section of Chapter 3 and acres of changes to seasonal restrictions are not reported in Tables 2-2 or 2-5 in the RMP. A list of the areas in which the seasonal restrictions will apply is the only detail reported.	2034
10262	10262-159	Travel Management GIS data conflicts with RMP reported acreages. There are two GIS files for Travel Management Alternative A, an Alternative A file and an	2034

**Attachment B – Draft Resource Management Plan and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table B-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
		A1 file. Mr. Sanford posed the question as to whether or not A1 was incorporated into A. Mr. Hiner did not know if it was incorporated or why A1 was created. A1 appears to be travel restrictions associated with the Wild and Scenic Rivers exclusively based on an on screen review of polygon shapes.	
10262	10262-160	Some tables are missing attributes in the Travel Management Alternative D file which was acknowledged by Mr. Hiner to be a mistake. He noted that if the "seasonal" acres are added into the "designated" category, the acres should match for the category of "limited to designated" roads and trails. This solution is not a solution to the matter of the "closed to motorized use" GIS acres not matching the RMP acres and is involved in the missing attribute data problem.	2034
10262	10262-161	The LGCA tried the solutions posed by Mr. Hiner on June 9, 2011, adding seasonal designation into "limited to designated" designation. This solution did not correct the acreage differences between the GIS and RMP Table 2-2.	2034
10262	10262-51	Travel Management: Blank records in the GIS attribute table for Alternative D. RMP vs. GIS acres do not match.	2034
10262	10262-300	This affected environment section lacks the quantity and distribution information needed to adequately portray the existing condition for these species. Each of the 11 species is first discussed in a table and second in a short paragraph that describes general accounts of physiology, growth requirements, associated species, and occasionally a general locality of presence. The Wyoming Natural Diversity Database contains 252 presence locations for special status plants in the Bighorn Basin, this dataset could have been used to portray a generalized distribution of these species. As it presently stands, this affected environment section is inadequate for readers or decision makers to quantify effects described in Section 4.	2042
10262	10262-304	The RMP states, "No current forest or woodland inventory or age and species classifications are available for the Planning Area." The LGCA argues that there are data sources readily available that would portray the current forest conditions. LANDFIRE data and the national inventory system called Forest Inventory and Analysis were not investigated.	2042
10262	10262-305	In this section it is stated that, "Aspens generally are declining due to advancement of ecological conditions and succession. The advancement of ecological conditions also leads to encroachment of evergreen species into aspen stands; for example, shade-tolerant conifers invade and eventually shade out aspen stands, contributing to their decline." The LGCA argues that this statement is incorrect and not tied to best available science. Aspen are in decline due to lack of fire, which would equate to a degradation of ecological condition (Bradley et al. 1992). The LGCA requests that this section be rewritten to take into account best available science and to fully describe the ecological dynamics and fire regimes of these communities.	2042
10262	10262-10	Designation of LWCs could potentially erase \$1.9 billion of total potential output (gross present value) and 434 jobs annually during the drilling and completion process.	2046
10262	10262-118	The BLM failed to conduct the required economics workshop, which allows the public to "identify desired economic and social conditions" and to "collaborate with BLM staff members to identify opportunities to advance local economies and social goals through planning and policy decisions." This failure has led to a disconnect between the concerns of the communities of the Planning Area and the BLMs socio-economic analysis.	2046

**Attachment B – Draft Resource Management Plan and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table B-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
10262	10262-119	The impact analysis does not satisfy Table D-3 of Appendix D. In particular, the impact analysis does not describe or quantify impacts to particular communities (the geographic dispersion of impacts).	2046
10262	10262-127	Economically, an underestimate at such a scale would have impacts that ripple throughout and beyond the Bighorn Basin. At minimum, the oil and gas development sections of the RMP/EIS must be updated to reflect true potential	2046
10262	10262-20	The BLM did not conduct a public Economic Strategies Workshop, which allows the public to “identify desired economic and social conditions” and to “collaborate with BLM staff members to identify opportunities to advance local economies and social goals through planning and policy decisions.”	2046
10262	10262-6	Beneficial economic impacts from Mowry Shale extraction would bring thousands of jobs and billions of dollars in revenue to the Bighorn Basin.	2046
10262	10262-210	Further, it is requested that additional mitigation measures be implemented for project-specific impacts when necessary, rather than an increase in stipulated restrictions across a larger area.	2047
10262	10262-227	Loss of leasing opportunities, closure to exploration, or NSO restrictions would effectively end future exploration of this possible significant shale gas and oil resource play.	2047
10262	10262-211	2007 - Any management decision implemented through the guidance outlined in record #2007 must be based on sound science and monitoring/field data at the project level. In addition, when considering drilling densities, please consider the projected timeline for each project activity.	2049
10262	10262-213	The RMP/EIS (pg. 3-40) discloses “Disturbed areas must be reclaimed after exploration and mining activities are completed.” Please clarify this statement by adding that comprehensive reclamation plans are required for all project-level activities that exceed casual use and result in surface disturbance.	2049
10262	10262-214	Additionally, include guidance from the BLM Solid Minerals Reclamation Handbook and state that reclamation plans will fulfill federal, state, county, and other local agencies requirements.	2049
10262	10262-216	It is stated in the RMP/EIS (pg. 3-42) that: Critical thresholds relevant to continued development of locatable minerals in the Planning Area have not been specifically determined under the existing management scenario. However, using the Geographic Information System (GIS), the BLM might be better able to determine threshold levels of disturbance in relation to locatable mineral (primarily bentonite) mining, and be better able to make future decisions because of these capabilities. The LGCA requests that if future thresholds are considered, that they are made available for review and discussion.	2049
10262	10262-222	In order to qualitatively understand how restrictions in the RMP/EIS would affect future development, and by using Alternative 4 as an example, the LGCA conducted a risk analysis for the total area of the USGS Mowry Shale/Muddy Frontier Sandstone AUs that do not directly correlate to the RMP/EIS mineral constraints.	2049
10262	10262-232	In order to accurately characterize oil and gas activity in the Planning Area, the LGCA requests that data and trends be provided for the following comments: The RMP/EIS states (pg. 3-47) “There are 82 operators actively exploring for or producing oil and gas resources in the Planning Area.” Please disclose the number of operators actively holding leases that are not conducting active	2049

**Attachment B – Draft Resource Management Plan and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table B-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
		operations in the Planning Area.	
10262	10262-233	The RMP/EIS discloses (pg. 3-48) "At the close of 2008, there were 4,544 active oil and gas wells in the Planning Area (BLM 2009c)." Provide the start date of operations for all active wells in the Planning Area in order to determine an increase or decrease in activity	2049
10262	10262-234	The RMP/EIS states (pg. 3-48) "There has been an overall upward trend in the number of APDs approved on federal oil and gas leases in the Planning Area since 2002, particularly after passage of the National Energy Policy of 2001 and the Energy Policy Act of 2005. However, starting in 2008 there was a decrease in APD submissions, which was primarily driven by market conditions for oil and natural gas." Provide data by year for these trends in order to portray how changes in policy and market conditions have affected oil and gas activity in the Planning Area.	2049
10262	10262-235	The above statement acknowledges that there are cycles when it comes to oil and gas production, yet the RMP/EIS completely dismisses the fact that there could be an upward trend in production during the 20-year planning period. Characterizing the affected environment to be in a constant decline or static state limits the impact analysis and prevents successful planning and management.	2049
10262	10262-253	In regards to interim and final reclamation, the BLM shall include guidance in the RMP/EIS from the Solid Minerals Reclamation Handbook H-3042-1 and state that reclamation plans will fulfill federal, state, county, and other local agencies requirements.	2049
10262	10262-256	The RMP/EIS states (pg. 3-41) "The six mines in the Bighorn Basin employ 132 persons, and another 360 persons are employed at the milling processing facilities at six different mills (one in the Worland area, two near Greybull, and three near Lovell, Wyoming)." The stated number of employees in the Bighorn Basin provided from the bentonite industry is higher than the number disclosed in the Plan. For example, Bentonite Performance Minerals, LLC has four full-time contractors (stripping overburden, hauling bentonite, drilling/blasting and conducting environmental activities) totaling over 60 employees (Scott pers. comm.). The number stated in the Plan is the number of employees who work "in-house" for the bentonite companies, i.e. not contractors. Please include the number of people employed as contractors for the bentonite industry in the RMP/EIS.	2049
10262	10262-260	Moreover, it is requested that BLM modify the description of Alternative C in Record # 2029 (Table 2-5) as follows: Delineate Oil and Gas Management Areas (Map 21) (592,983 acres) around intensively-developed existing fields and existing fields with potential for EOR, using a buffer zone of up to 2 miles from the outer boundary of the existing field and incorporating all Federal surface and minerals within the boundaries of ROZ Potential Sites. Within these areas, manage primarily for oil and gas exploration and development (including EOR) and carbon sequestration; consider all other surface uses secondary. The oil and gas management areas would be allowed to be developed at the well spacing and surface densities (for all surface disturbing activities) of the existing fields.	2049
10262	10262-267	It is also requested that the BLM modify Record # 6033 in Table 2-5 (p. 2-111) as follows: Designate ROW corridors as shown on Map 53. No limit will be placed on the width of these corridors as long as new linear facilities are constructed adjacent to existing linear facilities recognizing the need for adequate separation for operating system integrity, safety (construction and operations),	2049

**Attachment B – Draft Resource Management Plan and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table B-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
		appropriate federal, state and local statutes, regulations and policies, and land use constraints. Where BLM determines that a linear facility should be moved away from an adjacent utility to avoid a resource conflict, the new linear facility will still be considered to be within the RMP corridor.	
10262	10262-240	The LGCA agree with WEORI's position that large reserves of oil will be realized with the implementation of CO2 EOR in the Planning Area, and as such, the need for additional infrastructure. In agreement with the State of Wyoming, the LGCA request that the BLM fully evaluate the potential for significant EOR development in the Final EIS to facilitate and expedite EOR.	2051
10262	10262-241	It is anticipated that the Final RMP/EIS will provide sufficient analysis and candid public disclosure to allow EOR development to proceed using EAs, rather than lengthy EISs with significant Plan Amendments. Accordingly, the LGCA supports the proceeding statement provided by the State	2051
10262	10262-247	The LGCA believes this to be a flawed premise considering the probable advances in technology over the 20-year life of the plan; technological advances are a reasonable assumption that should have been used in forming the baseline unconstrained projection in the RMP/EIS.	2051
10262	10262-258	The LGCA agree with WEORI's position that large reserves of oil may be realized with the implementation of CO2 EOR in the Planning Area, and as such, the need for additional infrastructure, including additional wells, may have been greatly underestimated in the RMP/EIS. The LGCA agrees that this is a significant oversight and also encourages the BLM to develop a management plan that encourages and facilitates delivery, utilization, and sequestration of CO2 in the Planning Area related to EOR operations. Thus, please update and include information pertaining to EOR implementation, including the effects of ROW constraints on CO2 delivery, and incorporate those revised projections in the RMP/EIS.	2051
10262	10262-3	There is no treatment or consideration of enhanced oil recovery potential in the Bighorn Basin. New drilling techniques and the use of CO2 could significantly change the potential of the Basin to develop energy resources.	2051
10262	10262-81	The RMP/EIS should thoroughly address the likely increase in demand over the 20-year planning period and the increase in development that recent advances in technology will yield.	2051
10262	10262-83	Yet, recent oil and gas discoveries and comparisons of past assessments indicate that there needs to be an accounting of advances in technology.	2051
10262	10262-128	Realistically, the RMP/EIS should be entirely revised and impacts from increased development should be analyzed across all affected resources.	2054
10262	10262-31	In total, the key findings and issues identified lead the LGCA to firmly assert that the RMP/EIS is inadequate in its current form. Of great concern to the LGCA is the overwhelming lack of both historic and current condition quantitative data in the RMP/EIS. A common theme commented on by the LGCA throughout the revision process has been, and continues to be, that the BLM is proposing management actions with associated constraints and restrictions on domestic livestock grazing, oil and gas development, and the travel management infrastructure without demonstrating cause and/or need. If the BLM can substantiate management challenges via data collection and analysis, then the LGCA, stakeholders, and the general public will have an opportunity to evaluate the accuracy of findings and results. Should field data and corroborating research validate the need for an alteration of uses to protect the natural	2054

Individual Comments and Index to Summary Comments and Summary Responses**

Table B-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
		environment, the LGCA and stakeholders are willing to collaborate with the BLM to identify adaptive management strategies that are in the interest of all parties and Planning Area resources. Unfortunately, the BLM has largely ignored numerous requests by the LGCA, following review of previous iterations of the RMP/EIS and Analysis of the Management Situation (AMS), to increase the amount and use quantitative data and scientific literature in BLM-produced documents.	
10262	10262-32	Accordingly, the LGCA reached out to the BLM to strengthen the definition of stakeholder in the RMP/EIS. Presently, the definition of stakeholder in the RMP/EIS (Glossary-37) is as follows: An individual or group (such as local government) with a "stake" or interest in the success of delivering or maintaining the viability of a business's products and services. Stakeholders influence programs, products, and services (BLM 2009a). On August 19, 2011, Caleb Hiner (Bighorn Basin RMP/EIS Project Lead) corresponded with the LGCA and propositioned the inclusion of a second definition of stakeholder in the RMP/EIS. The addition, which will become part of the current definition, reads as follows: Federal, state, or local governments and agencies, or other entities where a Memorandum of Understanding, Cooperative Agreement, Interagency Agreement, or other such agreement has been executed with the BLM, or an applicant for a BLM authorization or permit.	2054
10262	10262-33	The LGCA supports the revised definition of stakeholder and finds that the BLM shall update the RMP/EIS with the new definition. Stakeholder is used throughout this comment document. Its use and meaning is compatible with Mr. Hiner's proposed revision with one exception. Record #6268, commensurate with Goals/Objectives LR:10.1 and LR:10.3, in the RMP/EIS (2-160) states the following: In cooperation, consultation, and coordination with permittees/lessees, cooperators, and other stakeholders, develop and implement appropriate livestock grazing management actions to enhance rangeland health, improve forage for livestock, and meet other multiple use objectives by using the Wyoming Guidelines for Livestock Grazing Management, other appropriate BMPs (see Appendices L and W), and development of appropriate range improvements. The LGCA strongly urges the BLM to delete the word "stakeholder" from this Record #6268 and add the words "interested public." Interested public is an established term used in the livestock grazing portions of the Code of Federal Regulations (CFR) and this RMP must be consistent with existing regulations. CFR 4100.0-5 includes a specific definition for interested publics. It is important to cite these regulations in the RMP: CFR 4100.0-5 Interested public means an individual, group, or organization that has:(1)(i) Submitted a written request to BLM to be provided an opportunity to be involved in the decision making process as to a specific allotment, and(ii) Followed up that request by submitting written comment as to management of a specific allotment, or otherwise participating in the decision making process as to a specific allotment, if BLM has provided them an opportunity for comment or other participation; or(2) Submitted written comments to the authorized officer regarding the management of livestock grazing on a specific allotment. Even though there is a definition of stakeholders in the glossary, stakeholders are not included in the grazing portion of the regulations and cannot be used in this RMP. The definition of stakeholders in the glossary can include anyone holding U.S. citizenship. The CFR regulations cited above require U.S. citizens to actively request involvement before being consulted on grazing management decisions and allotment management plans (AMP).	2054

Individual Comments and Index to Summary Comments and Summary Responses**

Table B-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
10262	10262-67	It is our contention that the RMP/EIS in its present iteration is incomplete in numerous capacities. Chapter 3 - Affected Environment describes the current condition in such general terms it leaves the LGCA questioning the existing state of the natural environment. Is it above average with minor problems or below average condition with significant issues? The stated problem with Chapter 3 is that it lacks critical scientific substantiation through data and research. This is true for both current and historic conditions.	2054
10262	10262-70	A concurrent dilemma with having insufficient methods is that Chapter 4 does not divulge measurement indicators. Both methods and measurement indicators are indispensable in an EIS. Measurement indicators define the variable(s) most likely to impact, negatively or positively, a resource upon plan implementation. Sans methods and measurement indicators, an EIS is ineffectual.	2054
10262	10262-72	The RMP/EIS does not adequately describe the environment of the area. Baseline and historical condition descriptions are not found within the RMP/EIS.	2054
10262	10262-19	Measurement indicators are missing for all resources, making it infeasible to conduct an effects analysis.	2055
10262	10262-47	In reviewing the RMP/EIS, as well as maps and data disseminated by the BLM during the RMP revision process, it is clear that there are several issues with data and information presented as fact by the BLM. The hierarchy of federal requirements, as existing in statutes, rules and regulations, case law, and agency handbooks and manuals was reviewed and, in fact, corroborates that the BLM inaccurately used and presented data and information. It is for this reason that the LGCA asserts that the BLM must recognize and correct factual errors as required by the Data Quality Act (DQA) of 2000.	2055
10262	10262-57	It is for the highlighted examples of data quality issues in the RMP/EIS provided above that the LGCA asserts that the BLM must recognize and correct factual errors as required by the DQA. The DQA was enacted by Congress to ensure that federal agencies disseminate and use accurate information. The BLM, in preparing the RMP/EIS, failed to abide by the provisions of the DQA.	2055
10262	10262-58	LGCA members believe that the BLM has ignored in the RMP/EIS numerous stated policies and goals included in the Big Horn, Hot Springs, Park, and Washakie Land Use Plans and Meeteetse, Cody, Hot Springs, Powell-Clarks Fork, Shoshone, South Big Horn, and Washakie County Conservation District Land Use Plans. In not addressing inconsistencies between the RMP/EIS and County and Conservation District Land Use Plans, the BLM is in violation of CEQ Section 1506.2 - Elimination of Duplication with State and Local Procedures. The counties and conservation districts have consistently stated that they favor continued multiple use and disfavor reducing access to public lands for a variety of purposes.	2055
10262	10262-60	Implementation of multiple uses through a combination of elements selected from Alternative A, B, C, and D, which would work to strike an appropriate balance between traditional and non-traditional resource uses and recreational use/conservation, is the goal of the LGCA. Alternative B and D, in particular, restrict certain multiple uses (e.g. resource extraction, grazing, and travel management designations) across much of the Planning Area, which is contradictory to the stated goals of the BLM, as well as the policies set forth in the county and conservation district land use plans.	2055
10262	10262-71	The previously identified issues regarding lack of data and analysis to support	2055

Individual Comments and Index to Summary Comments and Summary Responses**

Table B-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
		management actions in the RMP/EIS, which are based on lack of baseline or historical conditions, violate CEQ Section 1502.15 Affected Environment	
10262	10262-74	Information missing from the RMP/EIS is extensive and varying in degrees of absence (from wholesale nondisclosure of historic, baseline, and existing conditions and quantitative effects analysis to repeatedly not referencing with citation(s) what is portrayed as statement of fact). CEQ regulations speak directly to the inclusion or exclusion of “incomplete or unavailable information” in Section 1502.22	2055
10262	10262-75	Because cost to obtain a significant majority of the missing information in the RMP/EIS would not be exorbitant, Part A of CEQ 1502.22 is relevant. By violating CEQ1502.22, the BLM produced a NEPA document out of compliance and ineffectual in guiding management action in the Planning Area. As such, the LGCA is gravely concerned that management actions in the future will unduly restrict or prohibit multiple uses in the Planning Area for the next 20 years.	2055
10262	10262-130	Inconsistencies were found in GIS shapefiles related to the Recreation Management Areas (RMA), Travel Management, Withdrawals, Geothermal Constraints, Rights-of-Way (ROW) Avoidance and Exclusion Areas, and Mineral Constraints.	2057
10262	10262-131	When differences are in the hundreds and thousands of acres, these differences reflect mistakes and demonstrate that the results of the RMP/EIS cannot be duplicated.	2057
10262	10262-17	Historic and current condition data for the Planning Area are undisclosed and necessary for proper analysis of the alternatives.	2057
10262	10262-171	The analysis processes, shapes, and acreages contained within the RMP GIS data should be complete, accurate, and highly reproducible. They are not.	2057
10262	10262-172	The definition queries for selection processes should have been thoroughly tracked in GIS or in a text document. They were not.	2057
10262	10262-173	At least one of the two options for documenting GIS analysis should be included in the project’s administrative record.	2057
10262	10262-50	It is not possible to recreate maps and information based on information provided in the RMP/EIS. Therefore, the BLM must better describe and disclose methodologies and correct GIS data issues.	2057
10262	10262-62	It is disconcerting to see significant inconsistencies and inaccuracies in GIS data in an RMP/EIS that will guide management on 5.6 million acres for 20 years. The Bighorn Basin RMP will have major impacts to the local communities and stakeholders in the Bighorn Basin. Inaccuracies in the RMP/EIS need to be acknowledged and fixed prior to the release of the Final RMP/EIS.	2057
10262	10262-63	The analysis processes, shapes, and acreages contained within the RMP/EIS GIS data should be complete, accurate, and highly reproducible. The DQA (Public Law 106-554, Â§515) requires Federal agencies to ensure that influential information, such as that used in the preparation of resource management plans, be characterized by reproducibility and transparency. The RMP/EIS GIS data does not meet these requirements.	2057
10262	10262-64	A number of issues were resolved, but many major data issues remain unresolved. Coordination by ERG’s highly skilled GIS staff should not be required to use data to recreate acreages and analysis. The definition queries for selection processes should have been thoroughly tracked in GIS, or at the least in a text document. Again, this did not occur.	2057

**Attachment B – Draft Resource Management Plan and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table B-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
10262	10262-65	GIS data sets and methodologies should be in the administrative record for the RMP/EIS. GIS files that match the acreages in the RMP/EIS also need to be included in the administrative record. The files that the BLM supplied to ERG do not match information in the RMP/EIS. Proper documentation of GIS methodologies is required to recreate analyses and acreages reported in the RMP/EIS.	2057
10262	10262-66	Two options to document GIS analysis and definition query processes when conducting GIS analysis surrounding public land use policies and projects are as follows: A complete library of the original GIS data sets with completed geometry and attribute information is required. The library would be supplemented by a text document clearly outlining the definition queries and selection processes documented in order to recreate the analysis processes performed by ICF International (BLM contractor working on the RMP/EIS) to arrive at the acreages and conclusions reported in the RMP/EIS. Metadata for all GIS files should be complete according to the Federal Geographic Data Committee (FGDC) guidelines. A more common and simplistic approach is to set the definition queries or selection process, run the analysis processes, and export them into new, final analysis GIS files and disseminate those to the public or cooperating agencies. All appropriate metadata needs to be completed under the FGDC metadata guidelines for all original and final analysis files. At least one of the two options for documenting GIS analysis should be included in the project’s administrative record.	2057
10262	10262-8	Geographic Information Systems (GIS) files provided to the LGCA include blank attribute table records, overlapping polygons of disparate management actions, and datasets that cannot be used to reproduce numbers in the RMP/EIS.	2057
10262	10262-36	Regrettably, in the seven meetings held by the LGCA (attended by 360 individuals (meeting sign-in sheets available upon request)), beginning May 24th in Thermopolis and ending June 1st in Cody, at only one meeting (Worland May 25th) did one BLM employee (Caleb Hiner, Bighorn Basin RMP/EIS Project Lead) attend. Only recently has it come to the LGCA’s attention that BLM employees were instructed by the BLM Regional Director Eddie Bateson to not attend any of the meetings sponsored by the LGCA (pers. comm. Shockley Siggins). By intentionally not attending the cooperating agency public meetings on the Draft RMP/EIS review, the BLM has breached much of the inclusive guidance in the manuals and regulations (e.g. Federal Land Policy and Management Act (FLPMA), NEPA, CEQ, BLM Planning Handbook, Final Land Use Planning Rule in the Federal Register (Vol. 70, No. 55), and the BLM Contractor’s Public Participation Plan).	2060
10262	10262-37	The signed Cooperating Agency MOUs state under the “responsibilities of the BLM” (5) that: “the BLM will utilize the (County or Conservation District name) input and proposals to the maximum extent possible consistent with legal requirements and its responsibility as lead agency.” By intentionally ignoring the seven public meetings (Thermopolis, May 24th, 58 attendees; Ten Sleep, May 25th, 41 attendees; Worland, May 25th 32 attendees; Greybull 78 attendees; Powell May 31st, 51 attendees; Meeteetse, June 1st, 26 attendees; and Cody, June 1st, 74 attendees) sponsored by the LGCA to review the RMP/EIS, the BLM violated the intent if not the letter of the MOUs. Section 6 of the MOU states: parties will cooperate in the development and review (emphasis ours) of any operating guidelines or agreements between (County or Conservation District name) or BLM and other entities involved in the EIS for Bighorn Basin RMP	2060

**Attachment B – Draft Resource Management Plan and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table B-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
		effort which might affect the environmental analysis and writing of the EIS. BLM and (County or Conservation District name) agree to meet on issues concerning the EIS at the request of either party.	
10262	10262-38	By deliberately neglecting public concerns discussed at the local government sponsored meetings, the BLM violated the coordination, cooperation, consultation, and collaboration requirements.	2060
10262	10262-39	It would have been in the best interest of the agency and the public if the BLM would have attended, as the meetings were highly objective, informative, and civil. The 360 attendees of the LGCA meetings had and have valid interests and concerns unlikely captured in the BLM content and comment analysis. The fundamental planning concerns by interested attendees were dismissed by the BLM and clearly articulated by the Regional Director’s decision to forbid BLM from observing and listening to stakeholders in local meetings. The fact that the BLM sponsored meetings were round tables, without the benefit of presentations or available forums to publically comment, made the BLM meetings unnecessarily confusing. One participant in the Worland meeting, while waiting for BLM personnel to finish a non-stakeholder discussion, left a note which read “this is confusing.”	2060
10262	10262-126	In addition to the expressed concern the LGCA has with the primacy given to wildlife species and habitat protection (e.g. CSU, NSO, and TLS constraints and LWC and ACEC designations) is the apparent understated oil and gas development potential presented in both the RMP/EIS and RFD. Marathon Oil has stated that in their professional opinion the RFD is understated by a factor of 25 to 50. Using a conservative estimate that the RFD is understated by a factor of 10, well potential in the Mowry Shale currently under lease would increase exponentially. In the entire Mowry Shale formation, both leased and non-leased, the well potential would increase even more.	2061
10262	10262-215	If there are known commercially viable minerals associated with rare earth elements in the Planning Area, please provide an inventory per FLPMA Sec. 201. An evaluation of economically viable quantities should include fluvial placer deposits.	2061
10262	10262-218	it is thought that a review of the regional geology provides opportunities for discovering new oil and gas reserves along the western boundary of the basin that were not adequately evaluated or had understated potential (i.e. low to no potential) in the Bighorn Basin RFD.	2061
10262	10262-219	In at least 16 Bighorn Phosphoria fields, stratigraphic variation contributes greatly to the structure of the Phosphoria trap and is essential in at least three fields (Cottonwood Creek, Manderson, and Water Creek) (Stone 1967). Considering this stratigraphic variation and that one petroleum system in the basin is sourced from the Phosphoria Formation, it is probable that there are opportunities for discovering new reserves in this formation (USDI 2008a).	2061
10262	10262-220	Further, one of the understated areas that may have potential for new discoveries is the Mowry Fractured Shale as defined by the USGS (USDI 2008b).	2061
10262	10262-221	The USGS evaluated the Mowry Fractured Shale play in their recent assessment of undiscovered oil and gas resources of the Bighorn Basin (USDI 2008b). The Mowry Fractured Shale was included in the Cretaceous-Tertiary Composite Total Petroleum System Muddy-Frontier Sandstone and Mowry Fractured Shale Continuous Gas assessment unit (AU) and was also evaluated separately as the Mowry Fractured Shale Oil AU. The extents of the two assessment units are	2061

**Attachment B – Draft Resource Management Plan and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table B-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
		shown in Figure 5. Estimated undiscovered continuous oil and gas reserves were five million barrels of oil in the Mowry Fractured Shale AU and 348 billion cubic feet of gas in the Muddy-Frontier-Mowry AU. It is interesting to note that the Crosby 25-2, Crosby 25-3, and the Ainsworth 13-35 wells discussed above were drilled outside both AU boundaries, therefore indicating Mowry production throughout the basin cannot be overlooked.	
10262	10262-223	In further support of the RMP/EIS being understated, according to Marathon Oil Company (Marathon Oil Company 2010): Table 4 of the RFD (the U.S. Geological Survey's Undiscovered Reserve Estimates) understates the probability of significant discoveries in these resource plays.	2061
10262	10262-224	Upon there being a successful discovery of these gas plays, the recovery for each could easily be between 25 to 50 times the projected mean amounts. For planning purposes, it would be best to include the potential of each of these plays, since a successful discovery would generate activity and a significant positive economic impact on the affected county(ies) and the state.	2061
10262	10262-225	Another area that may have been overlooked in the RMP/EIS is the Sub-Absaroka play. The Sub-Absaroka play was evaluated by the USGS in their 1995 national assessment of oil and gas resources (Fox and Dolton 1995) but it was not included in their more recent 2008 assessment of undiscovered oil and gas potential for the Bighorn Basin. It was also not included in the 2009 draft BLM's Bighorn Basin RFD analysis.	2061
10262	10262-226	According to the 1995 USGS assessment, the Sub-Absaroka is a "demonstrated" oil play located along the western side of the basin beneath Eocene-age volcanic rocks. That study stated that the potential for significant new field discoveries was considered to be "good." Oil was predicted to be trapped in Laramide-age anticlines and domes, similar to producing structures successfully developed elsewhere in the basin. In the 2009 RFD, this area is considered to have low or no potential.	2061
10262	10262-228	The oil and gas potential within the Bighorn Basin Planning Area is shown in Figure 40 of the Bighorn Basin RFD. A similar projection for oil and gas potential in the western portion of the planning area was forecast in the Shoshone National Forest (Shoshone) RFD (Figure 9 of (USDA 2011)). Those two potential projections were overlain and discrepancies were observed. As shown in Map 1[BLM RFD Compared to Shoshone National Forest RFD], there are several areas where the Shoshone RFD projects a high potential for the occurrence of oil and gas and the Bighorn Basin RFD projects a very low to low potential. There are also areas where the Shoshone RFD projects moderate potential and the Bighorn Basin RFD projects very low potential. The BLM should reevaluate the discrepancies observed on overlapping areas of the Shoshone and BLM RFD and incorporate this information into the RMP/EIS if determined necessary.	2061
10262	10262-236	Table 3-16 in the RMP/EIS lists the projections of the amount of oil, gas and natural gas liquid resources in the Planning Area. The list does not include an estimate of the Sub-Absaroka play.	2061
10262	10262-238	Since the Bighorn Basin shares many geologic characteristics with these basins, it is thought that a number of stratigraphic and structural plays remain to be found in the under-explored central and far west portions of the Bighorn Basin (Herrod 2010a). As such, the future drilling activity may be much greater than that predicted in the RFD.	2061
10262	10262-239	Also, the methods used to calculate surface disturbance from projected new-	2061

**Attachment B – Draft Resource Management Plan and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table B-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
		well counts in the RFD are insufficiently described and the LGCA supports the following comment provided by the State of Wyoming: the BLM is not as clear on how impacts are treated and how disturbance is calculated from these well counts. It is my understanding that disturbance and impacts projected using the RFD well counts is also provided solely for the purposes of comparing impacts between alternatives and that it is not BLM's intention that any of the estimates of disturbance or impacts provided in the RMP or EIS represent "analysis thresholds" for determining what actions may require a plan amendment. The relationship between disturbance estimates and impacts and what constitutes an analysis threshold is not clear in the Draft RMP and DEIS and BLM needs to provide a clear statement that exceeding the estimates of disturbance or impacts in the EIS will not result in the need for an RMP amendment. For instance, in Appendix T of the draft RMP/EIS BLM calculates short- and long-term surface disturbance from leasable oil and gas for each of the alternatives. Short-term disturbance during the 20-year projection period ranges from 1,527 (Alternative B) to 3,771 acres (Alternative C) on public lands. The projection for fee and state surface is 1,533 acres for all alternatives. BLM needs to clarify in the Final RMP and EIS that these estimates are provided for analysis purposes only to demonstrate the difference between alternatives and that disturbance or impacts beyond the analysis assumptions does not require a plan amendment.	
10262	10262-246	This suggests that the impact analysis is based on an RFD that does not take into account the potential for high oil and gas occurrence and the known geologic and engineering assumptions associated with the Bighorn Basin. Please disclose the percent for high potential occurrence in the Planning Area in the RMP/EIS.	2061
10262	10262-250	The RMP/EIS (pg. 4-77) states "However, because sand and gravel are the principal salable minerals found in commercial quantities in the Planning Area, wherever possible, this analysis describes specific impacts to the disposal of sand and gravel. Acreages of occurrence potential of other mineral materials were not available at the time of analysis." There is a discrepancy between this statement and what has been included in the findings (ex. limestone occurrence potential) of the Bighorn Basin Solid Mineral Occurrence and Development Potential Report. Please disclose occurrence potential acreages when possible in order to ensure that the impacts analysis for salable minerals materials is correct.	2061
10262	10262-254	If there are known commercially viable minerals associated with rare earth elements in the Planning Area, please provide an inventory per FLPMA Sec. 201.	2061
10262	10262-261	The RMP/EIS understates unconventional oil and gas potential in the Mowry Shale and the Muddy Frontier Sandstone/Mowry Shale, and therefore, the potential reserves are not accurately depicted in the baseline development projections in the RMP/EIS. The BLM should include additional discussion in the RMP/EIS to accurately reflect unconventional oil and gas potential in the Mowry Shale and the Muddy Frontier Sandstone/Mowry Shale.	2061
10262	10262-262	The correlation between RFD surface disturbance estimates and what constitutes an impacts analysis threshold is not clear in the Draft RMP and DEIS. The BLM needs to provide a clear statement that exceeding the projected new-well counts and estimates of disturbance or impacts in the EIS will not result in the need for a Plan Amendment.	2061
10262	10262-263	Given the concern that the projected new-well numbers disclosed in the RMP/EIS could be perceived as a limit, the LGCA requests the following addition	2061

**Attachment B – Draft Resource Management Plan and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table B-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
		provided from the Wyoming Rawlins Field Office RMP Record of Decision: “The number of wells projected in the RFD scenario for oil and gas does not limit or cap the number of wells that can be drilled, nor the amount of surface disturbance that will be allowed during the period covered by the Proposed RMP/Final EIS. This clarification reaffirms that the RFD is intended for analysis purposes only. Individual implementation level project proposals will be subject to site-specific NEPA analysis to ensure conformance with the Approved RMP.”	
10262	10262-264	Given the importance of the baseline unconstrained projection for oil and gas in the Planning Area, the BLM should reevaluate the discrepancies observed on overlapping areas of the Shoshone and BLM RFD.	2061
10262	10262-271	It is of great importance to the LGCA that the aforementioned mitigations be implemented, because only an accurate prediction of likely energy development and exploration will lead to proper and effective management and planning. It is also essential that the impacts to mineral resources be analyzed thoroughly and accurately, especially since the disclosed impacts for many other resource areas are coupled with these results.	2061
10262	10262-4	Mineral potential in the Bighorn Basin is significantly underestimated in the RFD scenarios.	2061
10262	10262-5	Mowry Shale energy potential is not evaluated in the RMP/EIS.	2061
10262	10262-82	The RMP/EIS states under Section 4.2.5 Leasable Minerals - Oil and Gas (pg. 4-55) the following: The potential for oil and gas occurrence in the Planning Area ranges from high to low, depending on location, as documented in the Reasonable Foreseeable Development Scenario (RFD). The RFD for oil and gas in the Planning Area analyzed the potential for anticipated drilling activity over the next 20 years. Lands in the Planning Area are classified as having moderate to no potential for development of oil and gas resources, depending on location and based on projected drilling densities (BLM 2009u). Drilling in existing fields accounts for a large proportion of the growth, with a lesser share attributed to additional new discoveries in both conventional and unconventional reservoirs. However, it is documented in Figure 40 of the Draft Bighorn Basin RFD, and cited in the RMP/EIS, that 92 percent of the Planning Area is classified as high occurrence potential for oil and gas (USDI 2009a). While it is appropriate to use past drilling densities in part to establish a baseline for development potential, it is incorrect to disregard the high occurrence potential throughout the Planning Area.	2061
10262	10262-84	The RMP/EIS posits that management direction for oil and gas leasing be based on past drilling densities disclosed in the RFD and, in doing so, may significantly underestimate the development potential of recoverable oil and gas resources within the Bighorn Basin. Therefore, the impacts to oil and gas resources are most likely miscalculated, which in turn leads to insufficient analysis from many other resources listed in the RMP/EIS.	2061
10262	10262-149	The Alternative A and D GIS data supplied by the BLM for RMAs are incomplete. Shapes and records for Worland Caves Special Recreation Management Area (SRMA), Beck Lake Extensive Recreation Management Area (ERMA), and Newton Lake Ridge ERMA are missing from the Alternative A GIS data, but are listed in Table 4-15.	2062
10262	10262-150	The Bighorn Basin ERMA is accounted for in Alternative D but not in Alternative A, which is a misrepresentation of current management.	2062
10262	10262-151	The SRMA portion of the South Bighorn’s RMA, listed in Alternative D Table 4-15	2062

**Attachment B – Draft Resource Management Plan and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table B-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
		as containing 14,668 acres, is missing from the Alternative D RMAs GIS files.	
10262	10262-152	Maps 59-62 of the RMP do not display all SRMAs, ERMAs, and RMZs located on BLM lands in the Bighorn Basin. They only display selected RMAs, misrepresenting the on-the-ground management to the public. That may be due to the missing data in the RMA GIS Files.	2062
10262	10262-153	The Canyons RMZ is reported, in Table 4-15, as containing 141,793 acres. The GIS data reports the Canyons RMZ as containing 127,268 acres.	2062
10262	10262-162	The RMAs for both Alternative A and D are missing records and shapes for multiple RMA designations. Mr. Hiner acknowledged that in fact the files are incomplete and is attempting to track them down. He offered a solution as to how the LGCA can create the shapes and records. This is not the LGCA's responsibility. These shapes and records should have been completed before they were disclosed in the RMP and the RMP was released.	2062
10262	10262-55	Recreation Management Areas (RMAs): Both Alternative A and D GIS files do not show a complete data set of all RMAs included in the RMP.	2062
10262	10262-22	Rights-of-way (ROW) avoidance/mitigation areas are immense (941,778 acres - 2,717,617 acres), economically irresponsible, and not proven to be necessary or effective in protecting resources.	2066
10262	10262-147	The LGCA discovered that the BLM Rights-of-Way (ROW) GIS files for both Alternative A and D contained overlapping polygons resulting in a double counting of acreages. Also, the attribute table had multiple miss-spellings for both ROW categories.	2067
10262	10262-148	The ROW Avoidance Areas acreage for Alternative A reported in the RMP Table 2-2 is 941,778. The acres in GIS are 973,467. The ROW Avoidance Areas for Alternative D in Table 2-2 is 2,512,202 and the GIS acres are 2,536,211. These differences cannot be rectified with the GIS data supplied by the BLM.	2067
10262	10262-54	Rights-of-Way Avoidance and Exclusion: GIS file contained overlapping areas resulting in conflicting management in the same areas. This also results in incorrect acres.	2067
10262	10262-95	The discussion of greater sage-grouse in the RMP/EIS Affected Environment is deficient, rendering impossible proper analysis of impacts disclosed in Environmental Consequences. First, management challenges are not isolated, but amalgamated.	2071
10262	10262-96	Again, as with big game, the RMP/EIS does not include predation as a management challenge facing greater sage-grouse. Certainly predation is one of many factors affecting greater sage-grouse in the Bighorn Basin.	2071
10262	10262-97	Finally, as it pertains to greater sage-grouse, guidance in Executive Order 2011-5, issued by Wyoming Governor Matthew Mead on June 2, 2011, which recognizes only Core Areas, not arbitrary Key Areas constructed by the BLM, and provides adaptive management principles for the species, shall be implemented by the BLM.	2071
10262	10262-113	according to the RMP/EIS, the direct impacts to livestock grazing result from management actions that change AUM allocations or restrict livestock grazing. Yet, the only disclosure of impacts is for surface disturbing activities and closures. There are no direct impacts disclosed under any of the alternatives for management actions that change AUM allocations	2074
10262	10262-14	Reductions in animal unit months (AUMs) are a result of management actions that change AUM allocations or restrict livestock grazing. Yet, the only	2074

**Attachment B – Draft Resource Management Plan and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table B-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
		disclosure of impacts is for surface disturbing activities and closures. There are no direct impacts disclosed under any of the alternatives for management actions that change AUM allocations.	
10262	10262-174	potential impacts on grazing that are not explicit in the RMP. The RMP states that the current AUMs of 305,887 will only be reduced by 1-2% over the life of the Plan. However, according to the Plan, direct impacts to livestock grazing will result from management actions that change AUM allocations or restrict livestock grazing. Yet, the only disclosure of impacts is for surface disturbing activities and closures.	2074
10262	10262-175	There are no direct impacts disclosed under any of the alternatives for management actions that change AUM allocations. There are also several areas in the management action Table 2-5 (RMP/EIS pg. 2-160 - 162) that state management must be consistent with “other resource objectives,” but does not disclose which resources or objectives.	2074
10262	10262-122	the following mitigation/corrective action was devised by the LGCA for wildlife and grazing: Prior to any proposed modification of an AMP or elimination of livestock grazing allotments in the Planning Area as a protective measure for greater sage-grouse and/or other wildlife species, the BLM must design and implement a comprehensive monitoring study based on state-of-the-art methods that evaluates species population density and viability, habitat quality and quantity, and the effects of livestock grazing in the Planning Area. At the conclusion of the study the BLM will coordinate with livestock grazing permittees and local governments in the Bighorn Basin preceding any proposed modification of AMPs or elimination of livestock grazing allotments in the Planning Area. If disagreements arise, they shall be settled through a conflict resolution and mediation process.	2076
10262	10262-243	Therefore, the boundaries of the Alternative D VRM Class II encompassing the Sheep Mountain Anticline ACEC should be modified to provide an additional ¼-mile buffer of the adjacent Alternative D VRM Class IV to more fully encompass the bentonite potential areas depicted in the BLM-developed bentonite potential GIS file.	2077
10262	10262-244	The RMP/EIS (pg.4-51) states “Under Alternative D, withdrawals are pursued on the second-fewest acres of ACECs, after Alternative C, but the alternative includes the most acreage that can be withdrawn in ACECs on a case-by-case basis for resource protection.” Yet it is unclear if the aforementioned ACEC acres are included in the already disclosed areas or if they would be additive. Please clarify this statement and identify proposed ACECs that would be withdrawn on a case-by-case basis.	2077
10262	10262-251	The RMP/EIS (pg. 4-75 to 4-76) states “As a result of specific stipulations for ferruginous hawks, lands where greater sage-grouse and raptor habitats overlap could be subject to development restrictions for most of the year (9 months).” Without population data on raptors, coupled with the fact that golden eagle and osprey “appear to be increasing throughout the Planning Area,” the TLS and CSU restrictions are too restrictive (see Wildlife Corrective Actions).	2077
10262	10262-255	Correct the boundaries of the Alternative D VRM Class II for the Sheep Mountain Anticline ACEC to provide a ¼-mile buffer of the adjacent VRM Class IV to fully encompass the bentonite potential areas depicted in the BLM-developed bentonite potential GIS file.	2077
10262	10262-61	With respect to projections of oil and gas development in the RMP/EIS, the	2077

Individual Comments and Index to Summary Comments and Summary Responses**

Table B-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
		LGCA believes that the BLM significantly underestimated the potential for recent and upcoming technologies to develop existing resources. This position is backed up by letters and comments from those in the industry (see Mineral Resource discussion and comments). The number of acres administratively unavailable to oil and gas leasing increases from approximately 155,000 under current conditions (Alternative A) to over 290,000 acres under the BLM-preferred alternative (Alternative D). This is not consistent with the goals and policies of any of the county and conservation district land use plans.	
10262	10262-190	Names of Class I and Class II areas in or near the Planning Area are presented on page 3-19. Please provide a map of the Class I and Class II areas in or near the planning area.	2009_1
10262	10262-191	The RMP/EIS asserts that visibility conditions are excellent at the North Absaroka site, and standard visual range values are presented. Please provide the metric, in standard visual range or otherwise, for designating the visibility conditions as excellent.	2009_1
10262	10262-192	The USFS and NPS have established Level of Concerns for total deposition of nitrogen and sulfur compounds in Class I Wilderness Areas. These Level of Concerns are 1.5 kilograms per hectare per year of total nitrogen deposition and 5.0 kilograms per hectare per year of total sulfur deposition. Please include the USFS/NPS Level of Concern guidelines on the graphs in this section.	2009_1
10262	10262-193	The air quality environmental consequences section describes the expected impacts of each alternative using a qualitative analysis. In order to accurately determine impacts to air quality, comprehensive monitoring should be performed by the WDEQ. Limited monitoring data and inaccurate qualitative methods may result in decisions that negatively affect the Planning Area and management of its resources.	2009_1
10262	10262-194	If estimates for activity data change (for example, if the reasonably foreseeable development projections are updated), impact analysis should be revised.	2009_1
10262	10262-195	A method on page 4-6 states that “only emissions from permitted activities that would occur on federal lands within the Planning Area” are included in the analysis. Please provide a reference that, while only emissions from permitted activities that would occur on federal land within the planning area are included, the cumulative effects of activities occurring off federal land and outside of the planning area will be considered and incorporated into the appropriate planning documents and project-specific assessments.	2009_1
10262	10262-196	Please justify the exclusion of fugitive VOC and prescribed fire emissions from the analysis.	2009_1
10262	10262-197	Please justify the exclusion of activities related to the management of cultural resources, paleontology, recreation, and fish and wildlife.	2009_1
10262	10262-198	Please correlate the annual emissions summary presented in Table 4-2 to the applicable national and state primary air quality standards presented in Table 3-3. Quantitative air quality monitoring, by the WDEQ, using an expanded array of monitoring sites, is necessary to provide an accurate characterization of air quality impacts during the life of the Plan.	2009_1
10262	10262-178	On Page 2-12, the RMP/EIS states that Certain management actions specify conformance with Wyoming DEQ regulations (e.g., smoke management rules for prescribed burns and meeting water quality standards), or specify enforcement and remediation actions. Please include a statement that these nondiscretionary laws and regulations are presented in Table 2-5.	2009_2

**Attachment B – Draft Resource Management Plan and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table B-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
10262	10262-179	Within Table 2-5 Detailed Alternatives, Record 1000 states that Goal PR:1 is to “Minimize the impact of management actions in the Planning Area on air quality by complying with all applicable air quality laws rules, and regulations.” Please expand Goal PR:1 and its associated management actions to include basic descriptions of all applicable air quality laws, rules, and regulations, as well as how compliance will be achieved. Management actions that are currently presented only specify compliance with Wyoming DEQ Air Quality District smoke-management rules and regulations.	2009_2
10262 part2a	10262 part2a-10	Record #4055 - Alternative A uses the terms “intensively managed intermittent streams” on a “case by case” basis. Without defining “intensively” or the “case by case basis” decision criteria, any action might be proposed on an intermittent stream. The impact to intermittent streams and other uses could be substantial. Alternative B does define which streams might be chosen, but chooses to use the term “intensively manage” without specifics. Could this mean an exclusion of cattle or no stream crossings or other uses? Alternative C uses the same language as Alternative A. Alternative D references no surface occupancy within ¼ mile of a Class 1 or 2 fisheries and a 500-foot fisheries buffer elsewhere. Does this mean any intermittent stream contributing to a fishery could be deemed subject to a ¼ mile or 500-foot buffer? Would intermittent streams contributing to a class 1 or 2 fishery be subject to a ¼ mile avoidance of surface disturbing activities? Is the use of the term “avoid” meant as a guideline subject to interpretation as to how it would be applied or is it a NSO restriction similar to Alternative A? We propose that this language not be applied to Record #4055, but rather only to Record #4056.	2002
10262 part2a	10262 part2a-11	Record #4058 - Alternative A forms the basis for comparison of alternatives. Several commonly used techniques are listed including vegetation manipulation and planting, installing sediment and erosion control structures, fencing, and acquiring, developing, and maintaining water sources. However, there is little evidence in the document to support either the need for nor the benefit of the techniques listed. Alternative B indicates that there are implied management practices, but none are specifically listed. What management practices would be implemented in addition to those listed in Alternative A? Are there additional practices proposed in addition to “acquiring, developing, and maintaining land and water sources?” There are no references or assessments to determine where or if such acquisitions are necessary, nor beneficial for native fish or fish species of concern.	2002
10262 part2a	10262 part2a-12	Record #4059 - Alternative A is unclear as to whether existing reservoirs will be encouraged to have minimum pool depths. Please clarify as to whether the Bighorn Basin RMP encourages the establishment of minimum pool depths. Both Alternative B and D reference the term “managing existing reservoirs.” What is meant by “managing existing reservoirs,” as well as “encouraging minimum pools?”	2002
10262 part2a	10262 part2a-13	Record #4060 - Alternative B proposes to retrofit or design new culverts to “allow fish passage, both upstream and downstream.” Is this alternative proposing to retrofit or design new culverts that allow for fish species of all size classes to have passage? Will fish have passage at all potential streamflows (including bankfull)? Will fish passage be provided on ephemeral or intermittent streams? In most cases, culverts are not capable of passing all species and size classes of fish at any flow level. Bridges spanning bankfull width or fords would be required for such wide-ranging passage requirements. Bridges or fords are	2002

**Attachment B – Draft Resource Management Plan and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table B-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
		not mentioned in this alternative. Alternative C proposes to design culverts and crossings to current standards. What are current standards? What fish species and size classes are provided passage with the current standards? Why are such current standards not listed in Alternative A? Alternative D proposes to use Alternative B practices on a priority basis. What are the priorities? How extensive are the practices expected to be applied?	
10262 part2a	10262 part2a-14	"Campgrounds are not developed under Alternative B, resulting in less adverse impacts due to recreation access than Alternatives A and C." Does this statement apply only to land within ¼ mile or 500 feet of a stream or will no more campgrounds be built in the Bighorn Basin? Also, why would not well located and designed campgrounds be less impactful than dispersed camping that could occur on streambanks?	2002
10262 part2a	10262 part2a-15	Resources Paragraph four, page 4-163 of the Bighorn Basin RMP/EIS states that: Alternative B maintains natural flow regimes in streams supporting fish, providing the greatest beneficial impacts to water quantity compared to the other alternatives. Fencing of wetlands and riparian areas reduces potential bank degradation and sedimentation from other activities and resources uses, resulting in greater indirect beneficial impacts to fish than Alternative A. This paragraph implies that Alternative B maintains natural flow regimes. However, there are existing alterations due to water and diversion projects and acknowledgement that oil and gas development may provide produced water surface discharge, thereby changing natural flow regimes. Due to this, please clarify the term natural flow regimes.	2002
10262 part2a	10262 part2a-1	Within the Invasive Species and Pest Management section there is nearly nonexistent disclosure of relevant field-verified data. The most glaring deficient within this subject area is that only 10% of the Worland Field Office (WFO) has been inventoried for invasive nonnative annual bromes. Clearly an EIS cannot accurately analyze the impact of invasive species when only 10% of the WFO has been inventoried. Prior to finalization the BLM must conduct a new, expanded inventory and reanalyze impacts.	2012
10262 part2a	10262 part2a-2	In section 2.5 Alternatives Summary it states that the section describes only the key elements of the alternatives (those with the greatest potential to affect resources). This table should include invasive weeds and cheatgrass since this resource has the greatest potential to affect resources if not managed properly. Please include acres of invasive weeds and cheatgrass by alternative.	2012
10262 part2a	10262 part2a-3	The Affected Environment section for Invasive Species and Pest Management is inadequate and contradictory. Acreages are not consistent as explained below, there is no information provided on the species types and acres infested by species, nor is there a location map. Noxious weeds were identified as an issue early in the planning process, however they are given minimal treatment and there have been no indicators identified to compare the difference in alternatives.	2012
10262 part2a	10262 part2a-4	This section states that in 2007 "...the WFO estimated that approximately 57,000 acres in the field office were infested with nonnative annual bromes." This inventory is stated to only cover 10% of the Bighorn Basin so, "actual infested acreage might vary." We argue that the inventory is far too minimal and must be conducted at a much greater scale.	2012
10262 part2a	10262 part2a-5	The Environmental Consequences section does not disclose what the indicators are for measuring impacts. This section has very detailed information on surface disturbing activities, is it to be assumed that every acre of surface disturbing	2012

**Attachment B – Draft Resource Management Plan and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table B-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
		activity is going to be infested with weeds? Please identify what indicators were used to compare alternatives and provide a table that displays the differences between alternatives so that the impacts can be understood.	
10262 part2a	10262 part2a-6	There are no methods detailed on how environmental consequences of invasive species were analyzed. There is no quantitative information provided to assess impacts.	2012
10262 part2a	10262 part2a-107	Predators, including gray wolves and grizzly bears, have adverse impacts to big game in the Bighorn Basin. Note that predators and predation are not listed as a management challenge for big game. The BLM must acknowledge, account for, and analyze the predation of big game species in the RMP/EIS.	2020
10262 part2a	10262 part2a-128	METHOD/ASSUMPTION: Forest management actions replicating natural historical disturbance regimes and managing wildlife habitats instead of, or in addition to, managing forest products are anticipated to benefit wildlife habitats. COMMENT: Describe how forest management actions differentiate from managing forest products. The RMP/EIS frames the latter management regime as less ideal than the former.	2020
10262 part2a	10262 part2a-16	However, the Wildlife sections of the Draft Bighorn Basin RMP/EIS are consistently incomplete, contradictory, and unclear. An Affected Environment chapter should comprehensively disclose wildlife habitat needs and available habitat for all species analyzed in the EIS Planning Area. Additionally, when management challenges are noted for individual species (e.g. greater sage-grouse) or groups of species (big game), such challenges should be disclosed quantitatively with data and research. Rather than doing so, the Affected Environment chapter provides little to no historic, baseline, and/or current data on wildlife species, habitat availability and quality, and substantiation via data and research to document that the management challenges are in fact real and accurate as described.	2020
10262 part2a	10262 part2a-26	BR:6.1 “ In minimizing, avoiding, and mitigating environmental risks to fish and wildlife, all decisions and management actions must be substantiated with field-verified data and best science. The BLM is required, according to case law, to take a hard look at best science before implementation of management actions.	2020
10262 part2a	10262 part2a-31	4063 - Define as appropriate, casual use, and vegetation manipulation.	2021
10262 part2a	10262 part2a-100	What the RMP/EIS does not bring to the discussion is how the overpopulation of elk has negatively affected BLM permittees. As affected parties, the LGCA asks that the RMP/EIS qualify and quantify how the increase in elk has: Complicated grazing for BLM permittees; Compromised the economic viability of permittees; Disrupted attaining utilization standards	2025
10262 part2a	10262 part2a-103	Suggesting that elk have possibly fared better sans reference by footnote to the scientific and other sources relied upon for conclusions in the statement is an issue the BLM must correct before the publication of the Final RMP/EIS (see Wildlife Mitigations - Grazing, Travel Management, and Mining and Energy Development).	2025
10262 part2a	10262 part2a-104	To begin and end the Affected Environment discussion of moose, the RMP/EIS determines that moose are both distributed in low densities and below WGFD-objective numbers. In determining such statements, the LGCA is perplexed why the BLM does not provide causation for such, nor how the Agency proposes to improve moose prospects in the Planning Area. The Affect Environment should provide a setting for disclosing effects to moose from project activities in the	2025

**Attachment B – Draft Resource Management Plan and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table B-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
		Environmental Consequences. A cursory summary of moose needs and population numbers is contextually insufficient, which requires the LGCA to request additional information for moose so that in the future, if resource uses are restricted under the auspices of protecting moose they can be fairly assessed and justified (see Wildlife Mitigations - Grazing, Travel Management, and Mining and Energy Development).	
10262 part2a	10262 part2a-105	Without question domestic sheep and goat interactions with bighorn sheep lead to population decreases in the species. Information disclosing such is readily available and at least one comprehensive review has been created with a five-plus page reference list of scientific research pertaining to disease-related conflicts between domestic sheep and goats and bighorn sheep (Schommer and Woolever 2008). It is the obligation of the BLM, in asserting the conflict between domestic sheep and goats and bighorn sheep, to provide basis for such statements. Yet, the RMP/EIS goes further in stating (pg. 3-97): Bighorn sheep populations in the Planning Area have increased due to the establishment of native core areas in occupied bighorn sheep habitat and because of habitat augmentation and improvement through burning and livestock permit changes. Does the preceding suggest that the elimination of domestic sheep and goat allotments in bighorn sheep habitat in the Bighorn Basin has increased population numbers? Presently, there are no domestic sheep or goat allotments in bighorn sheep designated habitat. In suggesting that “livestock permit changes” have facilitated an increase in bighorn sheep, please provide historic grazing allotment and bighorn sheep population data. Correlation between the reduction of domestic allotments and increases in bighorn sheep should be evident.	2025
10262 part2a	10262 part2a-106	The assertion is made that habitat augmentation is the other factor allowing for an increase in bighorn sheep. What does habitat augmentation entail? A definition of this term is requested by the LGCA. The literature does show a positive response to bighorns from prescribed burning (Bentz and Woodard 1988; Bleich et al. 2008; Dibb and Quinn 2008; Smith et al. 1999). Brown et al (2010) found that bighorn sheep exhibited increased vigilance around cattle and thus spent extra energy being alert rather than feeding, which could be interpreted to negatively impact sheep. Ganskopp and Vavra (1987), however, indicate that the overlap where bighorn sheep and cattle occur on the same site was only about 20% due to bighorn sheep's affinity for steep slopes. If the RMP/EIS is going to conclude that cattle use is incompatible with bighorn sheep, data on the distribution of steep versus gentle land and amount of land where cattle can physically interact with bighorn sheep is needed (see Wildlife Mitigations - Grazing, Travel Management, and Mining and Energy Development).	2025
10262 part2a	10262 part2a-108	The statement that habitat conditions, fire management, drought, increased development and urbanization, habitat fragmentation, motorized vehicle misuse, disease, hunter access, and the impacts of livestock grazing management on the frequency, quality, and composition of key forage species may be to varying degrees true. However, the preceding paragraphs, as well as the inadequate Affected Environment summaries of individual species, provide an egregious lack of data and research to support such conclusions. For instance, if woody plant communities for pronghorn, mule deer, or moose have indeed declined, the Affected Environment should identify the key variables and provide quantifiable data to show baseline conditions, compared against	2025

**Attachment B – Draft Resource Management Plan and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table B-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
		historic conditions, which support that contention and are comparable to historic conditions, which are also not disclosed in the RMP/EIS. Under CEQ 1502.22, the BLM has a duty to provide relevant information unless it is proven to be unattainable or the agency would incur exorbitant costs to obtain the information. Neither of those are the case in this circumstance.	
10262 part2a	10262 part2a-109	According to the RMP/EIS furbearing animals in the Planning Area have decline due to drought conditions (pg. 3-99): Beaver, mink, and muskrat populations have likely declined across much of the Planning Area due to drought conditions. Water volumes have decreased in many riparian systems from a loss of water storage capability and from a lack of precipitation. The distribution of mink and muskrat populations has shrunk due to a loss of water in some riparian systems. Beaver depend on aspen, willow, and cottonwood trees to build and maintain their dams and lodges. Conifer trees have invaded many riparian areas adjacent to streams due to drying of these sites from a drop in the water table. Conifers take up available water and space, both surface and subsurface, choking out aspen, willow, and cottonwood communities. The conclusion regarding the effect of conifer encroachment on the water table and riparian vegetation may in fact be accurate. Yet, the RMP/EIS fails to make that case with its lack of current and historic comparative data. A comparison could be made between present and past conditions through means as simple as aerial photos. It would seem that the BLM has conducted field surveys of riparian areas for decades. Why is that data not presented? Further, provide a temporal scale of drought conditions that has brought about this change in riparian corridors. Recognizing the mandate outlined in CEQ 1502.22, the LGCA requests that the BLM quantify the change in riparian vegetation structure that has presumably facilitated a decline in furbearing animals (see Wildlife Mitigations - Grazing, Travel Management, and Mining and Energy Development).	2025
10262 part2a	10262 part2a-120	Generally, the effects of alternatives upon individual species (e.g. elk) or species groups (e.g. special status species) are intuitive and comparative, rather than data- and science-based. For instance, note the conclusion under Alternative B regarding wildlife species (in particular big game) (p. 4-168): Under Alternative B, restricting motorized vehicle use and surface-disturbing activities in the Absaroka Front Management Area provides the greatest beneficial impacts to wildlife species, especially big game. The preceding may be true, but the conclusion for beneficial impacts to wildlife species, especially big game, for Alternative B is not supported by cited research, data on existing conditions, or identification of what variables affecting big game (e.g. hunting season security, habitat effectiveness, etc.) would be impacted beneficially.	2025
10262 part2a	10262 part2a-124	METHOD/ASSUMPTION: For each alternative, changes to vegetation types, either in quantity, quality, or increased fragmentation, are compared to baseline conditions. Adverse and beneficial impacts to vegetation types (i.e., wildlife habitats) are assumed to have a corresponding adverse or beneficial impact on wildlife species. COMMENT: Describe and disclose vegetation type quantity, quality, and baseline conditions. ☐ At what scale, temporally and spatially, and to what degree and how will adverse and beneficial impacts to wildlife habitats have equal and corresponding adverse/beneficial impacts to wildlife?	2025
10262 part2a	10262 part2a-125	METHOD/ASSUMPTION: Disturbance impacts to wildlife are evaluated by comparison to current management practices in the Planning Area; increased	2025

Individual Comments and Index to Summary Comments and Summary Responses**

Table B-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
		protection in time or space are beneficial, whereas reduced protection result in adverse impacts. COMMENT: Elaborate and provide measurable indicators for the statement increased protection in time or space is beneficial.	
10262 part2a	10262 part2a-126	METHOD/ASSUMPTION: Habitat fragmentation adversely affects wildlife. COMMENT: Describe if habitat fragmentation adversely affects all wildlife species equally, regardless the scale/type of fragmentation.	2025
10262 part2a	10262 part2a-127	METHOD/ASSUMPTION: Prescribed fire, where historical fire regimes occurred, is a tool used to manage vegetative communities and can result in short-term adverse impacts with long-term beneficial impacts to wildlife, certain wildlife habitats, and in some cases to forage productivity and availability. Explain if prescribed fire only causes short-term adverse impacts with long-term beneficial impacts to wildlife? Is this true for all wildlife species?	2025
10262 part2a	10262 part2a-129	METHOD/ASSUMPTION: Management actions aimed at benefiting specific wildlife species can have adverse or beneficial impacts to other wildlife species. COMMENT: Provide substantive examples in Chapters 3 and 4 and refer back to this assumption.	2025
10262 part2a	10262 part2a-130	METHOD/ASSUMPTION: Surface disturbance generally causes adverse impacts to wildlife habitats. Lesser amounts of surface disturbance in wildlife habitats have a corresponding lesser adverse impact to wildlife compared to more surface disturbance. The extent of adverse impacts due to surface disturbance depends on the precipitation zone. COMMENT: Mitigations are available to limit adverse surface disturbance effects to wildlife habitats. This assumption should include a statement in that regard. The extent of adverse impacts from surface disturbance does not depend solely on the precipitation zone. Include in this assumption all factors that affect the extent of adverse impacts from surface disturbance.	2025
10262 part2a	10262 part2a-131	METHOD/ASSUMPTION: Prohibiting surface disturbance or occupancy is more restrictive and provides more protection for wildlife than avoiding surface disturbance or occupancy. COMMENT: Mitigations are available to limit adverse surface disturbance effects to wildlife species and habitats. This assumption should include a statement in that regard. Prohibition of surface occupancy is not the only method of avoiding disturbance.	2025
10262 part2a	10262 part2a-132	METHOD/ASSUMPTION: The more surface disturbance that occurs on steep slopes or on highly erosive soils, the greater the potential for adverse impacts to wildlife habitats. Adverse impacts from surface disturbance also increase in areas that receive less precipitation. COMMENT: Mitigations are available to limit adverse surface disturbance effects to wildlife species and habitats on steep slopes or on highly erosive soils. This assumption should include a statement in that regard. The extent of adverse impacts from surface disturbance does not depend solely on the precipitation zone. Include in this assumption all factors that affect the extent of adverse impacts from surface disturbance.	2025
10262 part2a	10262 part2a-133	METHOD/ASSUMPTION: The higher the road density and the frequency of use in the Planning Area, the greater the potential to degrade adjacent wildlife habitat quality in the Planning Area. COMMENT: Define adjacent quantitatively.	2025
10262 part2a	10262 part2a-134	METHOD/ASSUMPTION: The BLM utilizes the best available information, management and conservation plans, and other research and related directives, as appropriate, to guide wildlife habitat management on BLM-administered lands. COMMENT: The LGCA agrees completely with this method/assumption.	2025

**Attachment B – Draft Resource Management Plan and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table B-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
		However, the RMP/EIS does not incorporate at an adequate level the mentioned methods. Additional information is needed throughout the RMP/EIS to substantiate BLM findings as they relate to wildlife.	
10262 part2a	10262 part2a-135	METHOD/ASSUMPTION: The quality and quantity of seasonal ranges and migration corridors are generally considered to be the limiting factors on big game populations in the Planning Area. The ability of these areas to support populations is a factor in determining population levels. COMMENT: Provide historic and current vegetation data that validate the claim that quality and quantity of seasonal ranges and migration corridors are generally considered to be the limiting factors on big game populations in the Planning Area.	2025
10262 part2a	10262 part2a-136	METHOD/ASSUMPTION: Wildlife habitats being protected are generally in desired natural condition and those being managed are being managed toward a more desirable condition. COMMENT: Define qualitatively and quantitatively generally in desired natural condition.	2025
10262 part2a	10262 part2a-137	As noted in comments for Chapter 3 “ Big Game, the LGCA ardently disagrees that the challenges facing big game were properly described. While it may be true that the BLM does identify the aforementioned challenges, the RMP/EIS fails to disclose, both qualitatively and quantitatively, poor habitat conditions, habitat fragmentation, disease, increased development and urbanization, hunter access, and impacts to key forage species from livestock and wild horse grazing. ¶ For proper analysis in Chapter 4, the variables must be segregated and measurement indicators constructed for each variable so that effects can be properly analyzed. Merely identifying challenges is inadequate. As the RMP/EIS is currently written, the LGCA cannot find a means of understanding and evaluating current big game challenges, how they differ from historic conditions, or how if any of the alternatives will work to make conditions better or worse for big game.	2025
10262 part2a	10262 part2a-138	the LGCA can find no science-based rationale to support the RMP/EIS conclusion that big game behavior or populations may be altered in the long term at some level of development given that winter disturbance is precluded in all alternatives by a TLS or a NSO (Alternative C).	2025
10262 part2a	10262 part2a-141	Unlike the Bighorn RMP, most management agencies in the west do not spatially allocate elk parturition areas. So, a logical question is whether those (few) elk populations in which calving areas were protected performed better than other populations? The LGCA sincerely doubts that the BLM will find any strong data-based correlation. Data from most western states indicated elk populations increased substantially in the 1990s through the early 2000s. While biologists from the state wildlife management agencies do not necessarily agree upon the reasons for the increase, the only variable common across the west that might best explain those increases is milder-than-normal winter weather. As wolves have re-colonized the west, elk and other big game behavior seems to no longer follow predictable patterns, including well-published seasonal use preferences. One thing biologists, ranchers, and hunters all agree upon is that elk and other big game do not react as they have for the past century. If wolves are pushing elk and other big game into unusual areas at different times of the year, how will allocating elk and other big game parturition areas provide improved protection to cows and calves if wolves do not allow animals to use the areas for extended periods? Consequently, the inference that parturition areas are somehow at risk in Alternative A is without scientific merit. More importantly, even if there is a relationship between calf survival and TLSs in	2025

**Attachment B – Draft Resource Management Plan and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table B-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
		parturition areas (that has not been disclosed in the RMP/EIS), the TLSs in Alternative A preclude disturbance during the late spring on parturition areas. Thus, the RMP/EIS has no basis for inferring that ungulate parturition will be affected by Alternative A.	
10262 part2a	10262 part2a-142	Given that elk herds have been substantially above WGFD population goals for many years, it is difficult to conclude that existing levels of motorized disturbance (as allowed in Alternative A) has had any demonstrated effect on elk populations. There is research connecting winter disturbance to impacts on elk populations (Toweill and Thomas 2002), but no citations were proffered in Chapter 3 or in the aforementioned RMP/EIS discussion. It is suggested that the BLM add the relevant scientific references and conclude something to the effect that although the current high elk populations show no obvious adverse effects from road-related disturbance, the literature does suggest that negative effects from road use in the winter are possible.	2025
10262 part2a	10262 part2a-143	Additionally, no research suggesting vehicle disturbance in elk parturition areas has any documented effect on elk calving success or calf survival. We suggest that unless the BLM offers some pertinent research that the BLM should remove the conclusion that unrestricted roads may affect elk parturition.	2025
10262 part2a	10262 part2a-25	BR:6 - Please define environmental risks and associated impacts and describe how they are measured temporally and spatially.	2025
10262 part2a	10262 part2a-42	4074 - Define appropriate wildlife needs.	2025
10262 part2a	10262 part2a-44	4077 - Alternative A, B, and D "There is no scientific research that suggests that livestock grazing affects parturition areas during the birthing season. Further, the parturition area concept is archaic due to predatory expansion. The LGCA does not support livestock grazing restrictions in parturition areas. Alternative C "The LGCA supports livestock grazing in parturition areas.	2025
10262 part2a	10262 part2a-45	If Record #4077 was developed to address potential brucellosis impacts, the LGCA recommends the following language, "BLM would consider implementation, on a case by case basis, management actions jointly recommended by wildlife managers, grazing permittees, and animal health officials that would control the transmission of brucellosis."	2025
10262 part2a	10262 part2a-50	4083 - The LGCA strongly disagrees with Alternative B restrictions. Alternative A and D - Define case-by-case basis.	2025
10262 part2a	10262 part2a-51	4084 - The LGCA disagrees with any parturition habitat designations. However, if Record #4084 was developed to address potential brucellosis impacts, I recommend the following language, "BLM would consider implementation, on a case by case basis, management actions jointly recommended by wildlife managers, grazing permittees, and animal health officials that would control the transmission of brucellosis."	2025
10262 part2a	10262 part2a-92	The discussion in the RMP/EIS on habitat fragmentation is overly simplified and explicitly claims that (pg. 3-70): a contiguous 100,000-acre block of sagebrush habitat is considered fragmented when a major highway is constructed within the habitat, thereby bisecting the block. If, in this example, the highway bisects the 100,000-acre block in half, the result of this fragmentation is two 50,000-acre blocks of sagebrush habitat bisected by a highway. In making such a statement, the RMP/EIS fails to provide a single reference that the construction of a major highway through a 100,000 acre block will result in two separate parcels of wildlife habitat. Additionally, the RMP/EIS could have cited many	2025

**Attachment B – Draft Resource Management Plan and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table B-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
		pieces of literature that cogently discuss the effects of fragmentation on wildlife (Dobkin 1994; Faaborg et al. 1993). Instead, the RMP/EIS has not one citation regarding fragmentation.	
10262 part2a	10262 part2a-93	The RMP/EIS needs to quantify the degree to which the preceding statement is true (what percentage of wildlife populations in the Planning Area are supported by private land). While it is true that wildlife is affected by management of these non-BLM-administered lands, the inverse is also true that habitat on private lands is affected by BLM actions. Interestingly, while the RMP/EIS discloses that when large working ranches are convert(ed) to subdivisions to smaller ranchettes wildlife suffer habitat fragmentation and loss of habitat, the RMP/EIS makes no attempt to quantify how BLM actions affect the economic viability of working ranches. The BLM must disclose all connected actions of how changes in grazing management plans affect the viability of working ranches (Map 2).	2025
10262 part2a	10262 part2a-95	The tone of the pronghorn discussion is typified by sweeping generalizations, identification of problems without supporting data, and viability characteristics in the Planning Area without supporting data. An example of such is found on pg. 3-96 of the RMP/EIS: Population projections for pronghorn generally have been below objectives for several years, except where herds have access to large areas of irrigated fields. This is partly due to adverse effects on the quality of the shrub component of their pronghorn habitat in many ranges. Habitat condition of many of the Wyoming big sagebrush communities associated with pronghorn winter ranges is declining due to poor productivity, plant recruitment, old age, and cheatgrass invasion that has out-competed native herbaceous and sagebrush species. Declines in habitat quality also have affected the reproduction and survival rates for pronghorn. Lower reproduction and lower recruitment of young into populations has inhibited the ability of herd populations to recover from declining numbers. The statement that pronghorn have done well “where herds have access to large areas of irrigated fields” lacks supporting data derived from field-verified surveys and monitoring. For how long has this been occurring? Since the conversion of native land to farmland? In the last 10, 20, or 30 years?	2025
10262 part2a	10262 part2a-96	Further, the RMP/EIS must disclose where, how many acres, and to what degree pronghorn populations are thriving as a result of irrigated private lands. It is also necessary to describe if this phenomenon is exclusive to the Planning Area or occurring throughout the West and why it is occurring. The statement that the “(h)abitat condition of many of the Wyoming big sagebrush communities associated with pronghorn winter ranges is declining due to poor productivity, plant recruitment, old age, and cheatgrass invasion that has out-competed sagebrush species” needs to be substantiated with data gathered in a scientifically-accepted manner to support the conclusion. Specific data needed, both historic and existing, include: How many acres of sagebrush have been lost to dry and irrigated farming? Of lands still in sagebrush, how has the coverage and age class distribution of sagebrush changed due to fire suppression?	2025
10262 part2a	10262 part2a-98	The BLM, in their discussion of mule deer in the RMP/EIS, states the following (pg. 3-97): (b)ecause of seasonal dependence on woody plant communities, mule deer are generally declining in numbers due to a decline in habitat quality and quantity. It is unclear how the BLM can make a statement such as the preceding without providing evidence? Not only does the statement need supporting data and scientific literature, but an explanation that this is the only	2025

**Attachment B – Draft Resource Management Plan and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table B-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
		variable negatively affecting mule deer. Data requested for inclusion in the final RMP/EIS include: How many acres of sagebrush have been lost to dry and irrigated farming? Of lands still in sagebrush, how has the coverage and age class distribution of sagebrush changed due to fire suppression?	
10262 part2a	10262 part2a-99	it is unclear how the RMP/EIS can conclude with certainty that mule deer are generally declining in numbers due to a decline in habitat quality and quantity, particularly without providing any data on habitat conditions (see Wildlife Mitigations – Grazing, Travel Management, and Mining and Energy Development).	2025
10262 part2a	10262 part2a-119	While it is appreciated that the BLM is in compliance with the Consent Decree, the LGCA’s stated position is that wild horse populations should be further reduced to a total head that is at or near the minimum AML.	2030
10262 part2a	10262 part2a-82	4124 - Alternative B - The LGCA does not support 1- and 2-mile TLS restrictions to protect raptors. There is no available science/research to suggest such a buffer is necessary. Alternative D - The LGCA does not support a 1-mile buffer around ferruginous hawk nests. Recognized science does not support such a restrictive buffer as well. The BLM must provide and take a “hard look” at scientific research before implementing such an extensive buffer zone.	2036
10262 part2a	10262 part2a-116	On May 11, 2011, the USFWS determined that the mountain plover does not warrant listing as a threatened or endangered species throughout all or a significant portion of its range. The RMP/EIS was compiled prior to the determination and states (pg. 3-113): The mountain plover inhabits shortgrass prairies and shrub-steppe habitats, both for breeding and wintering. This species prefers areas with little vegetative cover for nesting, particularly prairie dog towns. The species is now included on the BLM sensitive species list and is a proposed threatened species under the ESA.	2041
10262 part2a	10262 part2a-117	In describing the vegetative nesting cover required, the dependency of mountain plovers on disturbance including prairie dogs and grazing (Beauvais and Smith 2003; Dechant et al. 2002b; Knopf and Wunder 2006; Manning and White 2001) is understated in the document. As a disturbance-dependent species, the RMP/EIS should acknowledge that mountain plover co-evolved with heavy grazing by large bison and prairie dog populations. The RMP/EIS should propose to promote heavy grazing regimes and to maintain or enhance prairie dog populations, in areas identified as appropriate, to encourage mountain plover sustainability (see Wildlife Mitigations - Grazing, Travel Management, and Mining and Energy Development).	2041
10262 part2a	10262 part2a-83	4125 - The BLM has failed to recognize that the mountain plover co-evolved with grazing ungulates. Mountain plovers are dependent on over-grazed environments. Acknowledgment of such is requested by the LGCA and programs should be implemented that incorporate grazing methods to promote mountain plover.	2041
10262 part2a	10262 part2a-118	Where a position is taken is in the fact that the BLM fails to sufficiently describe white- and black-tailed prairie dog life history in the Bighorn Basin. Due to this failing, the LGCA declares that the BLM must revise the white- and black-tailed prairie dog section with the following information and data: Current habitat condition and population density; Historic habitat condition and population density; National distribution; Plague and predation and its effects on white- and black-tailed prairie dog; Relationship to obligate species (e.g. burrowing owls and black-footed ferrets); Distribution and connectivity of prairie dog towns in the Bighorn Basin; Relationship with grazing (positive and negative) To	2042

**Attachment B – Draft Resource Management Plan and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table B-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
		address the white- and black-tailed prairie dog issue, the LGCA has developed a mitigation that instructs the BLM on how to proceed going forward in consideration of these two species met (see White- and Black-tailed Prairie Dog Mitigation - Grazing).	
10262 part2a	10262 part2a-121	Again, the conclusion may be true, but no supporting data showing existing conditions, desired conditions, measurement indicators, or site-specific actions to be taken are disclosed in 2.5 - Alternatives Summary, 2.6 - Detailed Descriptions of Alternatives by Resource, and/or Chapter 3 - Affected Environment.	2042
10262 part2a	10262 part2a-122	As with big game and greater sage-grouse, there is no discussion of predation and predators.	2042
10262 part2a	10262 part2a-57	BR:7.3 - Define “environmental hazards, risks, and impacts.” Management should be compatible with multiple uses and stakeholder interests.	2042
10262 part2a	10262 part2a-58	BR:7.4 - The LGCA fully supports “providing multiple use management.” Define “sufficient undisturbed” and “minimally disturbed” habitats.	2042
10262 part2a	10262 part2a-77	4114 - Describe and define activities that will “promote the maintenance and improvement of habitat quantity and quality.”	2042
10262 part2a	10262 part2a-9	3. The BLM will change the definition of surface-disturbing activity to remove disturbance of endemic vegetation. Surface-disturbing activities should only include uses that remove non-renewable resources such as top soil, sand and gravel etc. This definition implies that use of herbivory is a surface disturbing activity. Ecosystems evolved with herbivory use which is a renewable resource and its use should not be considered surface-disturbing activities. Surface Disturbing Activities: These are Public Land resource uses/activities that disturb remove the endemic vegetation, surface geologic features, and/or surface/near surface soil resources beyond ambient site conditions. Examples of surface-disturbing activities include: construction of well pads and roads, pits and reservoirs, pipelines and power lines. and most types of vegetation treatments (e.g., prescribed fire, etc.). NOTE: Some resource uses, commodity production and other actions that remove vegetative growth, geologic materials, or soils (e.g., livestock grazing, wildlife browsing, timber harvesting, sand and gravel pits, etc.) are allowed, and in some instances formally authorized, on the Public Lands. When utilized as a land use restriction (e.g., No Surface Disturbing Activities), this phrase prohibits all resource use or activity, except those uses and activities that are specifically authorized, likely to disturb the endemic vegetation, surface geologic features, and surface/near surface soils.	2054
10262 part2a	10262 part2a-115	Additionally, as it pertains to greater sage-grouse, guidance in Executive Order 2011-5, issued by Wyoming Governor Matthew Mead on June 2, 2011, which recognizes only Core Areas and provides adaptive management principles for the species, shall be implemented by the BLM. Unequivocally, the LGCA supports Executive Order 2011-5. It is the firm opinion of the LGCA that the BLM will adopt Executive Order 2011-5 as management guidance for greater sage-grouse in the Bighorn Basin.	2069
10262 part2a	10262 part2a-74	4107 - The LGCA does not support BLM-designated Key Areas. Guidance in Executive Order 2011-5, issued by Wyoming Governor Matthew Mead on June 2, 2011, which recognizes only Core Areas, shall be implemented by the BLM.	2069
10262 part2a	10262 part2a-79	4120 - Alternative A - The lek buffer should be extended to 0.6 mile. Alternative D - The LGCA does not support BLM-designated Key Areas. Guidance in Executive Order 2011-5, issued by Wyoming Governor Matthew Mead on June	2069

**Attachment B – Draft Resource Management Plan and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table B-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
		2, 2011, which recognizes only Core Areas, shall be implemented by the BLM.	
10262 part2a	10262 part2a-80	4121 - Alternative D - The LGCA does not support BLM-designated Key Areas. Guidance in Executive Order 2011-5, issued by Wyoming Governor Matthew Mead on June 2, 2011, which recognizes only Core Areas, shall be implemented by the BLM.	2069
10262 part2a	10262 part2a-81	4123 - Alternative B - The LGCA does not support BLM-designated Key Areas. Guidance in Executive Order 2011-5, issued by Wyoming Governor Matthew Mead on June 2, 2011, which recognizes only Core Areas, shall be implemented by the BLM. Further, the LGCA does not support restrictions of motorized access. Alternative C and D - The LGCA does not support BLM-designated Key Areas. Guidance in Executive Order 2011-5, issued by Wyoming Governor Matthew Mead on June 2, 2011, which recognizes only Core Areas, shall be implemented by the BLM.	2069
10262 part2a	10262 part2a-113	The discussion of greater sage-grouse in the RMP/EIS Affected Environment is deficient, rendering impossible proper analysis of impacts disclosed in Environmental Consequences. Again, as with big game, the RMP/EIS does not include predation as a management challenge facing greater sage-grouse. Certainly predation is one of many factors affecting greater sage-grouse in the Bighorn Basin. In the opinion of the LGCA it is disingenuous of the BLM to not include predation in the list of stressors affecting greater sage-grouse. The contention of the LGCA is that failing to segregate the variables and identify data-based quantifiable outputs makes it unattainable to quantitatively identify effects.	2071
10262 part2a	10262 part2a-114	Also, please disclose that greater sage-grouse co-evolved with intensive and extensive grazing from bison and that greater sage-grouse populations were high during the 1950s and 1960s, a period when domestic livestock were grazed at much higher stocking levels and under less-restrictive (season-long) grazing systems than those applied in the Planning Area today. Thus, attributing declines in greater sage-grouse to grazing is disingenuous. Failing to disclose the ecological relationship between greater sage-grouse and natural disturbance processes (bison grazing) severely biases the analysis for assessing effects on greater sage-grouse from grazing (see Wildlife Mitigations - Core and Key Areas, Grazing, Travel Management, and Mining and Energy Development).	2071
10262 part2a	10262 part2a-68	4096 - Define restore and the effects to multiple uses and permittees	2071
10262 part2a	10262 part2a-69	4098 - Define "manage." Describe in detail the method used in determining "ecological site descriptions."	2071
10262 part2a	10262 part2a-70	4101 - Disclose those areas with less than 5% sagebrush cover that will be restored. What temporal scale is being used to determine historic levels?	2071
10262 part2a	10262 part2a-75	4109 - Disclose where strategic locations are in the Bighorn Basin. How are strategic locations determined?	2071
10262	10262-18	Resource management challenges identified by the BLM are subjective and overly qualitative. Consequently, groundless management challenges may lead to unnecessary constraints that adversely impact local governments, stakeholders, and multiple uses.	2054
10262	10262-69	To be factual and accurate, the RMP/EIS should title the sections Assumptions and remove Methods. The term method suggests that it is a standard operating procedure carried out numerous times previously in the biological, physical, and social sciences for deriving an endpoint. As such, the method has	2054

**Attachment B – Draft Resource Management Plan and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table B-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
		been published, tested by researchers and scientists, and substantiated as a best method. In the case of the RMP/EIS, the endpoint should be an effects conclusion. Yet, the supposed methods in the RMP/EIS are not clear, referenced, or appreciably used to make effects determinations.	
10263	10263-37	With respect to Carter Mountain ACEC, management proposed under Alternative D is confusing, inconsistent and unnecessary. On one hand, surface disturbing activities would be allowed provided they can be mitigated under Record 7054 while the area would be administratively unavailable to oil and gas leasing under Record 7058. Given the fact that surface activities would be allowed provided the alpine tundra can be protected and mitigated, there is no justification for withdrawing the area from mineral leasing	2001
10263	10263-19	The DEIS improperly reflects a single reference point, monitoring Yellowstone National Park Carbon Monoxide (CO) levels, during 2005. (Ref. Chapter 3, Table 3-3). It is incongruous that Yellowstone National Park was chosen to monitor CO emissions for the Bighorn Basin because conditions couldn't be more dissimilar	2009
10263	10263-20	Additional questions that arise from the use of Yellowstone National Park for this data point: What time of year did this monitoring occur? Was it during winter time when automobile exhaust is nearly non-existent? Was it during the summer months when the Park has an estimated 3 million visitors and their associated transportations visit the park? Future air standards, alternatives, or future applications of monitoring must be based on actual science that includes statistically relevant, quantitative data obtained within the planning area itself	2009
10263	10263-1	Page ES-1, 1.2.2 Purpose, et al., the DEIS indicates in that valid existing rights will be recognized. Comment: We are concerned that no explanation of what constitutes valid existing lease rights and how they relate to new land use decisions has been provided. We recommend that BLM clearly state in the Final EIS that the new restrictions proposed in the Preferred Alternative will not apply to lands already under oil and gas lease. Moreover, it must be made clear that BLM has no authority to impose these new restrictions through Conditions of Approval (COA) on applications for permit to drill (APD) if they would abrogate the valid existing lease rights. These principles are particularly important given the fact that discussions about new protections for national historic trails and expansion of Areas of Critical Environmental Concern (ACEC) could very much impose significant limitations on existing leases that were not anticipated at the time the leases were acquired from the federal government in good faith. Such qualifiers are consistent with current rules and policies of the BLM and must be clearly disclosed in the planning documents. An acceptable example of appropriate language is included in the Rawlins RMP adopted in 2008, page 20.	2013
10263	10263-2	Page 4, Chapter 4, Assumptions Common to All Analyses - An oil and gas lease grants the lessee the "right and privilege to drill for, mine, extract, remove and dispose of all oil and gas deposits" in the leased lands, subject to the terms and conditions incorporated in the lease (BLM Form 3100-11, Lease for Oil and Gas). Because the Secretary of the Interior has the authority and responsibility to protect the environment within federal oil and gas leases, the BLM imposes restrictions on the lease terms. Comment: We recommend clarification of this language to recognize the fact that lease stipulations are only subject to change prior to lease issuance. Once a lease has been issued, stipulations may not be legally modified absent voluntary agreement by the lessee. Therefore, in accordance with 43 CFR 3101 and federal court case law, we recommend that BLM clearly disclose its limited authority to add conditions of approval to a	2013

**Attachment B – Draft Resource Management Plan and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table B-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
		drilling permit, i.e., conditions must remain consistent with the terms of the issued lease.	
10263	10263-3	The DEIS ignores BLM policy that states "the least restrictive stipulation that effectively accomplished the resource objectives or uses for a given alternative should be used." Therefore, it is necessary to demonstrate that less restrictive measures were considered but found insufficient to protect the resources identified. A statement that there are conflicting resource values or uses does not justify the application of restrictions. Discussion of the specific requirements of a resource to be safeguarded, along with a discussion of the perceived conflicts between it and oil and gas activities must be provided. Clearly, an examination of less restrictive measures must be a fundamental element of a balanced analysis and documented accordingly in the draft EIS.	2013
10263	10263-38	Page 2-54, Record 2014, "On lands with an NSO restriction, allow only casual use geophysical exploration." Comment: Acknowledging the fact that geophysical operations have very low to zero impacts on the environment, in August 2007 the Department of Interior included in its NEPA Manual a categorical exclusion (CX) for geophysical operations that do not involve road construction. All such geophysical activities are categorized as "casual use." This distinction should be clarified in the FEIS and provision should be made to grant CXs in these circumstances.	2013
10263	10263-15	Record #4082 allows BLM to apply discretionary seasonal wildlife protections on a case-by-case basis. As discussed above, some maintenance and operation of developed projects must not be subject to seasonal wildlife protections under any circumstances. The term case-by-case basis is used throughout the DEIS pertaining to the application of additional conditions or restrictions. As previously explained, under some circumstances (e.g. certain areas or certain activities) the application of conditions or limitations is not appropriate (e.g. Record #4082). As such, we recommend BLM specifically identify areas where BLM will be able to apply seasonal wildlife protections on a case-by-case basis, and limit the use of case-by-case determinations to areas where application of protections is warranted and appropriate	2020
10263	10263-12	A comparison of big game crucial winter range and parturition habitat identified in the RMP to WGFD Big Game CHPAs reveals that the BLM's habitat areas are much more expansive throughout the Project Area, especially along the eastern, western (including the Absaroka Front Management Area), and southern boundaries of the Project Area. We understand the value of protecting crucial wildlife habitat. However, in light of this discrepancy it is difficult to justify the extent of big game crucial winter range and parturition habitat under all alternatives in the BHB RMP. As such, we suggest BLM re-evaluate the designation of big game crucial winter range and parturition habitat locations, and reduce the size of these areas such that they are consistent with WGFD Big Game CHPA's. A map and narrative description of WGFD Habitat Priority Areas in the Cody Region is available on-line at: http://gf.state.wy.us/habitat/PriorityAreas/Cody/index.asp	2022
10263	10263-31	All references to Wild Lands must be removed from the planning documents in view of Congress's 2011 Continuing Resolution which prohibited BLM from moving forward with designations of any Wild Lands	2027
10263	10263-26	BLM fails to recognize the beneficial impact of produced water discharges in stabilizing ephemeral and intermittent stream channels through creation of riparian zones, thus reducing natural erosion. Good examples of this	2031

**Attachment B – Draft Resource Management Plan and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table B-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
		phenomenon are very evident in the Cottonwood, Gooseberry, Kirby Creek, and Dry Creek drainages. We believe BLM has overemphasized the potential erosion problems in ephemeral drainages caused by produced water. BLM has omitted the fact that, in most instances, the presence of produced water has actually stabilized stream banks on ephemeral and intermittent waters by creating and enhancing riparian zones and wetlands. Surface water discharges create thousands of acres of wetlands in the Bighorn Basin. These wetlands and riparian zones provide tremendous benefits to wildlife and waterfowl in the arid interior of the Basin.	
10263	10263-27	The WEPP model estimate that with no disturbance there would only be trace amounts of runoff, seems to disregard the amount of natural runoff experienced in the interior of the basin during snow melt or precipitation events. The badland topography and the clay content of soils in the Bighorn Basin can result in significant amounts of natural runoff and erosion from areas like McCullough Peaks, 15 Mile and other badland areas of the basin, which have very minimal human disturbance.	2031
10263	10263-28	Chapter 4, Part 4.1.4.3, Page 4-30 “Water management plans for surface discharges of produced water would include reclamation strategies, mitigation, and monitoring to track changes in receiving channels and to minimize adverse impacts to watershed health.” COMMENT: Does this statement mean that the BLM intends to start requiring Water Management Plans for WPDES discharges in the Bighorn Basin? If so, would this requirement be for existing surface discharges, or only for proposed new surface discharges?	2031
10263	10263-29	Chapter 4, Part 4.1.4.3 Page 4-31 “Adverse impacts on surface water quality from the introduction of these components of produced water would be minimized, but not eliminated, under all alternatives by following standard practices, BMPs, and guidelines for surface disturbing activities. The properties of produced water can vary depending on the location of the producing well and the oil and gas formation, which will influence the application of BMPs and other measures intended to safeguard water quality.” COMMENT: How does the BLM plan to minimize impacts on surface water quality from components of produced water? As previously stated the Wyoming DEQ permits WPDES discharges and promulgates and enforces water quality standards. It is not the duty, nor the legal authority of the BLM to set water quality standards or to issue WPDES permits	2031
10263	10263-30	Chapter 4, Part 4.1.4.3 Page 4-32 “Stormwater Discharge Plans to reduce impacts; restoring healthy plant communities and vegetative cover after surface disturbance in a timely fashion; conforming BLM actions to Wyoming DEQ water quality standards, enforcement, and remediation; and participating in the development and implementation of local watershed management plans and/or total maximum daily loads (TMDLs) with interested stakeholders and the Wyoming DEQ.” COMMENT: What is meant by “conforming BLM actions to Wyoming DEQ water quality standards, enforcement, and remediation?” As previously stated the Wyoming DEQ permits WPDES discharges and promulgates and enforces water quality standards.	2031
10263	10263-36	Page 3-139, Types of Intrusions The DEIS points out, “Visual intrusions on BLM-administered lands in the Planning Area include oil and gas fields, bentonite mining, the network of roads and highways, powerlines and various facilities needed to support mineral development, recreation, range improvements, and other facilities and infrastructure. Overall, development in the Planning Area	2032

**Attachment B – Draft Resource Management Plan and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table B-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
		has left a small footprint and has not substantially changed the visual character of the area.” Page 2-103, Records 5052Comment: Despite the “small footprint” left by the variety of development activities that have occurred within the planning area, BLM proposes to substantially revise its Visual Resource Management (VRM) categories to be excessively restrictive under Alternatives B and D. However, none of these proposed management changes are warranted as evidenced by BLM’s analysis summary noted above.	
10263	10263-13	Based on the USFWS’s recent findings and determination regarding the mountain plover, the stipulations and protections imposed for the mountain plover under the Management Action #4125 and the Chapman Bench ACEC is no longer warranted or scientifically justified. The USFWS has determined that the mountain plover is not threatened or endangered, has widespread habitats, has adapted to many human activities, and likely will not be impacted by human land use changes in the foreseeable future. The common occurrence of mountain plover in existing oil fields indicates that this species has adapted well to oil field conditions. As a result, special management and protection of the mountain plover under Alternative D (implement conservation measures and manage for the retention and success of mountain plover), Alternative C (apply TLS to protect mountain plover habitat), Alternative B (implement conservation measures and manage Chapman Bench ACEC to protect mountain plover), and Alternative A (implement conservation measures for mountain plover) is not justified. Therefore, we advocate the elimination of special management and protection for the mountain plover as currently proposed under Management Action #4125 and the Chapman Bench ACEC.	2041
10263	10263-14	By definition the sensitive species designation includes species that could easily become endangered or extinct in the state (BLM Manual 6840). Criteria for designating sensitive species include species: under status review, numbers are declining so rapidly that Federal listing may be necessary, populations are small or widely dispersed, or that inhabit ecological refugia or other specialized or unique habitats (BLM Manual 6840). The mountain plover does not meet any of these criteria. As such, it is essential for BLM to remove the mountain plover from the sensitive species list and eliminate protections afforded to the mountain plover in the BHB RMP based on its status as a sensitive species.	2041
10263	10263-23	Chapter 4, Part 4.1.3.1, Page 4-14 Both the Disturbed WEPP and WEPP Road modules are limited to four soil textures (clay loam, silt loam, sandy loam, and loam). The WEPP analysis used a loam soil texture for all erosion predictions. COMMENT: Is loam soil the best soil texture to use for WEPPP modeling in the Bighorn Basin (BHB). Since most soils in the interior of the BHB contain a lot of clay (bentonite), should clay loam be used for modeling purposes rather than a loam soil?	2045
10263	10263-24	It is unclear whether the WEPP model, which is used to predict erosion rates and runoffs, is calibrated to account for installation and implementation of Best Management Practices required by the Wyoming DEQ under the Stormwater Construction Permitting Program, which essentially requires no discharge of pollutants (including soil) from the construction site.	2045
10263	10263-34	The Impact Analysis for Planning Model (IMPLAN) is a model using regional analysis. However, the Bighorn Basin would be better analyzed using a more geographic specific approach. For example, in Table X-1, IMPLAN identifies regional oil and gas well numbers including coalbed natural gas. There has been very limited exploration and marketable sales from coalbed natural gas	2046

**Attachment B – Draft Resource Management Plan and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table B-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
		development in the Bighorn Basin. It appears the model may be using the entire state of Wyoming for a regional model. It is precisely because of the use of data like this that has no bearing on oil and gas development in the Bighorn Basin and makes the reported information and findings flawed.	
10263	10263-5	Alternative C exempts OGMAs from discretionary wildlife seasonal stipulations, including big game and sage grouse stipulations. However, under Alternative D, OGMAs are only exempt from discretionary big game seasonal stipulations. Other wildlife stipulations (i.e. non-big game stipulations), such as sage grouse stipulations will still apply within OGMAs. As a result, under Alternative D, OGMAs located within Key Habitat Areas (KHA) will still be subject to KHA stipulations for sage grouse protection and other non-big game stipulations, which may be very limiting on existing oil and gas units. This is inconsistent with BLM's intent to manage OGMAs primarily for exploration and development of oil and gas resources	2050
10263	10263-6	BLM defines OGMAs as areas containing existing fields that are already disturbed by development. EO 2011- 5 states that "areas already disturbed or approved for development within Core Population Areas prior to August 1, 2008 are not subject to new sage-grouse stipulations with the exception existing operations may not initiate activities resulting in new surface occupancy within 0.6 mile perimeter of a sage-grouse lek (EO 2011-5, Attachment B, paragraph 11)." EO 2011-5 further states that "[i]t is assumed that activities existing in Core Population Areas prior to August 1, 2008 will not be managed under Core Population Area stipulations. Examples of existing activities include oil and gas, mining, agriculture" and other uses that were in place prior to the development of the Core Population Areas. Provided these activities are within a defined project boundary (such as a recognized federal oil and gas unit, drilling and spacing unit, etc.) they should be allowed to continue within the existing boundary, even if the use exceeds recommended stipulations recognizing that all applicable federal actions shall continue (EO 2011-5, pg. 2, Item 2). As such, existing fields within the BHB Plan Area (including those within KHAs) that were disturbed or approved for development prior to August 1, 2008, must not be subject to sage grouse stipulations if BLM desires to achieve consistency with EO 2011-5. Application of KHA sage grouse stipulations to pre-2008 fields conflicts with EO 2011-5.	2050
10263	10263-11	Based on the statistics quoted above, there are 136,433 more acres administratively unavailable for oil and gas leasing under Alternative D than Alternative A (i.e. under current management). However, no discussion or justification has been provided in the DEIS for this discrepancy. Increasing the acreage administratively unavailable will decrease management flexibility in the Plan Area.	2054
10263	10263-16	BLM cites the West Tavaputs Plateau Natural Gas Full Field Development Plan Draft EIS (2008), Glossary for the definition of disruptive activity in the BHB Draft RMP. However, disruptive activity is not defined in this document.	2054
10263	10263-32	For nearly a century, oil and gas has a favorable history of responsible environmental operations that have been well-managed by both industry and the BLM - something in which the oil and gas community takes pride. Despite these efforts, the four alternatives for the RMP could result in moderate to drastic changes socially and economically. The Bighorn Basin Resource Alliance (BHBRA), an affiliate of the Natural Resource Growth Coalition (NRGC), as part of this coalition compiled detailed information to assist with determining the	2054

**Attachment B – Draft Resource Management Plan and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table B-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
		best alternative. The information produced by the BHBRA is contained in the Bighorn Basin Resource Alliance Economic Revenue Report (BHBRA-ERR) and comes mostly from the Wyoming Department of Revenue, the Wyoming Department of Employment and the U. S. Bureau of Labor Statistics. This report can be accessed here: Bighorn Basin Resource Alliance Economic Revenue Report. By way of this letter, we formally incorporate the report in our comments by reference, and further request that the BLM review the report as part of the comments analysis process	
10263	10263-33	The quality of life for all citizens in the Bighorn Basin is enhanced by employment opportunities, many of which are found from public land use. The Coalbed Natural Gas Alliance (NRGC’s predecessor) hired Moore Information in November of 2008 to better understand how Wyoming viewed oil and gas development. 400 registered Wyoming voters were sampled with a 95 percent confidence interval and a plus or minus 5 percent confidence ratio. Please click here to access the CBNGA poll. By way of this letter, we formally incorporate the poll results in our comments by reference, and further request that the BLM review the poll results as part of the comments analysis process.	2054
10263	10263-35	Alternative D is not much of an improvement in that it proposes to limit surface disturbing activities within either three or five miles of cultural sites. The DEIS provides no information to justify the need for the excessive management proposed, especially since the BLM’s proposal greatly exceeds the ¼ mile buffers required by federal law.	2054
10263	10263-25	It appears reclamation plans will be required under Alternative D for surface disturbing activities associated with minerals development. Will this require submission and approval of a reclamation plan, prior to APD approval? If so, we question the need for a reclamation plan for all oil and gas wells. Moreover, if a reclamation plan is necessary in certain areas with highly erosive soils and limited reclamation potential; it is necessary for BLM to have consistent standards and a formal review period with a mandatory approval/rejection timeline.	2060
10263	10263-4	The RFD also fails to contemplate and plan for the utilization of Enhanced Oil Recovery (EOR) via CO2 injection that is anticipated to occur in existing oil fields within the BHB. The use of EOR/CO2 injection is expected to occur in existing oil fields within the BHB over the next several years as some fields initiate tertiary recovery. Consequently, oil production in existing fields within the BHB is also anticipated to increase due to the efficiency of EOR. EOR is, and will be an important element of oil production in the BHB and should be properly accounted for in the BHB RMP.	2061
10263	10263-10	EO 2011-5“ For activities outside of Core Population Areas, no more than a ¼ mile NSO standard and a 2-mile seasonal buffer should be applied to occupied leks. Additionally, incentives to enable development of all types outside Core Population Areas should be established, including stipulation waivers, even if it results in reduced numbers of sage grouse outside of Core Population Areas (EO 2011-5, pg. 3, Item 7). As such, EO 2011-5 merely establishes a maximum NSO standard and seasonal buffer for occupied leks that may be applied outside of Core Areas. It does not mandate the application of any stipulations outside of Core Areas. Alternative D “ BLM applies much more restrictive stipulations outside of Key Habitat Areas, including: CSU within ¼ mile of leks, TLS within ¼ mile of leks March 1 to May 15, and TLS in connectivity habitat or within 2-miles of any lek in nesting/early brood rearing habitat (Table 2-5, pg. 2-84, 2-85).	2069

Individual Comments and Index to Summary Comments and Summary Responses**

Table B-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
10263	10263-7	KHAs designated by BLM are inconsistent with the State of Wyoming’s Core Areas. If the intent of BLM is to obtain and maintain consistency between KHAs and the State of Wyoming’s Core Areas, then why are KHAs identified in this RMP different than Core Areas provided for in Wyoming EO 2011-5, Attachment A (Sage-Grouse Core Breeding Areas Version 3)? Figure Q-1 of the RMP clearly illustrates the discrepancies between Sage-Grouse Core Breeding Areas Version 3 and KHAs.	2069
10263	10263-8	there are 71,241 more acres of KHA (1,857,485) than acres of Core Areas (1,786,244) located within the total planning area. What are the justification and scientific reasoning for expanding KHAs and changing KHA boundaries from Core Area boundaries?	2069
10263	10263-9	sage grouse stipulations Under Alternative D are not consistent with stipulations provided for under EO 2011-5: Core Areas/Key Habitat Areas - Seasonal Use: Leks. Under EO 2011-5 - Activity will be allowed from July 1 to March 14 (i.e. not be allowed from March 15 to June 30) outside of the 0.6 mile perimeter of a lek in Core Population Areas where breeding, nesting and early brood-rearing habitat is present (EO 2011-5, pg. 9, Item 3). Alternative D - BLM extends this seasonal use restriction by two weeks, placing TLS on surface disturbing activities on nesting/early brood rearing habitat from March 1 to June 30 (Table 2-5, pg. 2-84).	2071
10263	10263-18	Finally, as also recognized by the AQ MOU, the CEQ regulations implementing NEPA do not require agencies to develop information that is not reasonably available; see 40 C.F.R. Å§ 1502.22. Rather, when faced with a situation where there is incomplete information, the agency is only required to inform the public of the unavailability of these data and explain why it would not be practical to develop such data as part of the planning process. Given the lack of emissions data or other information regarding air quality in the Planning Area, we recommend that BLM provide the public with the reasons it would not be appropriate to develop an air quality model at this time.	2009_1
10263	10263-21	There are no scientific data compendiums in the form of graphs, tables, or otherwise within the proposed RMP/EIS to quantify or substantiate any data regarding HAPs in the planning area. The air pollution emissions listed therein are regulated by the WDEQ for oil and gas operators within the planning area.	2009_1
10263	10263-22	The air quality analysis implied in Alternatives B and D requires quantitative air quality modeling. However, the RMP used methods and assumptions regarding impacts for all alternatives using a qualitative emission comparison approach for this assessment (Appendix U, page 9).	2009_1
10264	10264-1	Page 2-29, 2-34, Table 2-5, Page 2-73, etc. Throughout this document, BLM refers to Class I and Class 2 trout fisheries for added protection. We support these proposals for added protection, but need to clarify our trout ranking system. A class number ranking is no longer used by the WGFD and is sometime confused with a numbering system used by the WDEQ. Our department ranks streams using a color system. Blue and Red ribbon streams are those that produce the highest quality trout fishery based upon biomass. These blue and red ribbon trout waters are considered of National and Regional importance, respectively. We suggest changing all references to Class I fisheries to blue and all class 2 fisheries to red ribbon trout fisheries.	2002
10264	10264-20	Page 3-90In paragraph 2, the reference to focused management on "Snake River Cutthroat" should be deleted. Our management of Snake River Cutthroat	2002

**Attachment B – Draft Resource Management Plan and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table B-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
		in BLM waters is very limited in the Cody Region.	
10264	10264-21	Page 3-92(top of page) "The effects of drought can be quickly reversed in streams with a return to more normal weather patterns, but higher flows will not remedy the continued siltation of reservoirs." We recommend changing the sentence to read "The effects of drought can be quickly reversed in streams with a return to more normal weather patterns, however higher stream flows may improve stream pool habitat but will not remedy the continued siltation of reservoirs."	2002
10264	10264-26	Page 4-159In the first bullet near the end of the sentence, we recommend adding the words "deep pools" after the word streamflows.	2002
10264	10264-27	Page 4-164Under Special Designations, reference is made to benefits to water quality by restricting surface-disturbing activities and pesticide applications for the Spanish Point Karst. We would like clarification as to the broad use of the word pesticide in this case. If pesticide application is to mean restricting the use of piscicides on streams with similar stream features, this action could greatly reduce our ability to remove non-native fish species for Yellowstone Cutthroat restoration. We suggest this be clarified by adding the words "(excluding fish piscicides) after the word "application" in the first sentence.	2002
10264	10264-4	Page 2-68, Record # 4036In alternative D we recommend changing "fishery" to "aquatic".	2002
10264	10264-17	Page 2-162, Record # 6281Appendix WĀ is an important component of the livestock grazing section of the RMP. We suggest adding the following language to this management action: "Grazing plans should use the utilization levels specified in Appendix W.	2011
10264	10264-29	Appx P Appendix P seems to show that no allotments failed Standards P and Guidelines (no "N" in the "Progress" column). This is not our understanding.	2011
10264	10264-5	Spatial habitat designations such as crucial ranges, migration routes, raptor nests, and sage grouse winter concentration areas are periodically reviewed and, if necessary, modified in response to changing wildlife use patterns or better data becoming available. We recommend that the RMP describe that management actions relating to areas within these designations will apply to modifications to crucial habitat designations made after the Final EIS.	2020
10264	10264-6	Page 2-76, Record # 4076, 4077If Record # 4077, Alternative D, was developed to address disruptive activities resulting from grazing in delineated elk parturition habitat, we are unaware of data that supports these restrictions. Therefore, we would not support restricting cattle grazing in parturition areas based on the premise of disturbance. However, if Record # 4077 was developed to address potential brucellosis impacts, we recommend the following language, "BLM would consider implementation, on a case by case basis, management actions jointly recommended by wildlife managers, grazing permittees, and animal health officials that would control the transmission of brucellosis."	2020
10264	10264-8	Page 2-77, Record # 4080We remain committed to our recommendation for the Absaroka Front Management Area, provided to BLM as agreed upon under the previous Governor's Administration. Our recommendation differs from Alternative 0 in having the following constraints on federal mineral estate: 149,335 acres unavailable for leasing, 65,366 acres NSO, 40,703 acres CSU, and 0 acres TLS) (see attached map).	2020
10264	10264-9	Page 2-79, Record # 4087Any seasonal closures should take into account that	2020

**Attachment B – Draft Resource Management Plan and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table B-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
		many big game hunting seasons extend beyond November 15. Some road closures could limit access and not allow for adequate harvest. The RMP should allow for this flexibility to effectively manage wildlife through harvest.	
10264	10264-2	Page 2-56, Record # 2024 Under the Leasable Oil and Gas - Map 20 shows three small polygons on the divide between Rose Creek and Rawhide (T48, R103, sec. 3,4,10 & 11) that are classified as producing O/G fields. To the best of our knowledge, there are no active, producing wells in that area. Also, the area is identified as leasable with only standard constraints, yet it is very important crucial elk winter range, borders the proposed Absaroka Front Management Area, and is adjacent to the Carter Mtn ACEC. We recommend that these areas be changed to leasable with major constraints, due to their importance to wintering wildlife.	2022
10264	10264-7	Page 2-77, Record # 4079 Under alternative 0 - Map 21 (2 mile buffers) is referenced as the oil and gas management areas being exempt from discretionary big game seasonal stipulations. This is a map reference error, and should reference Map 22.	2022
10264	10264-22	Page 3-99 Skunks are not classified as furbearing wildlife in Wyoming, they are predatory.	2025
10264	10264-23	Page 3-100 Quail and ptarmigan have not been documented in the planning area.	2025
10264	10264-3	We request that at least an NSO constraint be placed on the Medicine Lodge and Renner WHMA to protect wintering big game. Both of these WHMAs were acquired with federal funds for the purpose of providing habitat for wintering big game.	2025
10264	10264-14	Page 2-92, Record # 4144, 4145 Why are there two upper limits for each HMA when the objective (100) is the same?	2030
10264	10264-15	Page 2-114, Record # 6045 The Medicine Lodge WHMA closure is June 30, not July 1.	2034
10264	10264-28	Page 4-214 Under Methods and Assumptions, second bullet, we have concerns with the statement that Production water from CBNG activities will have negligible influence on surface water quantity and quality. It very much depends on the amount of salts and other minerals that may be harmful to fish contained in the production water and where this effluent production water is released. If it is released in high quality habitat for special status fish species it could be very detrimental. We suggest a rewording of this bullet to read the following: "Production water from CBNG drilling that is low in salts and other chemicals that may be detrimental to aquatic life forms is assumed to have negligible influence on surface water quantity and quality in the Bighorn River and the Clarks Fork of the Yellowstone River watershed due to the low likelihood that CBNG activities would occur at high levels in the Bighorn Basin. However, if CBNG activities are located near important habitat for special status fish species, it can be assumed there will be adverse impacts."	2042
10264	10264-16	6128, 6138, 6150, and other similar MAs The management actions related to Worland's RMZs are stated in a way that surface-disturbing activities will not be allowed if they are related to wildlife habitat or recreational facilities. This wording should be changed to be consistent with Cody's RMZs, which allows for surface disturbing activities related to wildlife habitat or recreational facilities.	2062
10264	10264-13	Page 2-86, Record # 4122 We recommend re-writing this alternative to clarify its intent to the following, "Limit new noise levels, as measured at the perimeter of	2068

**Attachment B – Draft Resource Management Plan and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table B-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
		a lek, to 10 dBA above ambient noise ...from 6 PM to 8 AM.	
10264	10264-10	Page 2-82, Record # 4103: If this action is meant to protect springs and riparian areas in greater sage-grouse habitats it should also apply to activities that may alter or disturb those areas, beyond mining and mineral development. If this action is to address impacts of mining, other important habitats (e.g. winter, breeding, and nesting) should also be included along with springs and riparian habitat.	2071
10264	10264-11	Page 2-84, Record # 4120Although BLM's sage-grouse Key Habitat Areas provide more extensive protections, we recommend the BLM use sagegrouse Core Areas (version 3) as defined by the Governor's Sage-grouse Implementation Team. BLM's Instruction Memorandum No WY-2010- 012 stated that "WY BLM Sagegrouse Key Habitat Areas correspond to the State of Wyoming's Core Population Areas (Core Areas)." BLM personnel at the local, regional and state levels have had input on those Core Areas. Version 3 of the Core Areas was completed in 2010 and should have been included in this analysis.	2071
10264	10264-12	Page 2-84, Record # 4120"Undetermined leks" should not be provided the same protections as Occupied leks. As a result of the most recent Sage Grouse Executive Order, only Occupied leks should be stipulated. Therefore, Undetermined leks should receive priority to be accurately delineated and placed on the WGFD lek database, as necessary.	2071
10264	10264-25	Page 4-84Salable Minerals, Alternative D, Resources - Alternative D should include sage-grouse leks as sites that receive TLS or other restrictions from surface-disturbing activities.	2077
10262 2b	10262 2b-1	The conclusion that such designations would result in beneficial impacts to big game is purely speculative. The RMP/EIS has not sufficiently identified the research connection between human disturbance and elk, has not provided any baseline data on existing levels of human disturbance related to roads or road density, and has not identified any future disturbance levels that might be expected under Alternative A. It is recognized that anticipating levels of future disturbance from oil and gas is speculative, however, the RMP/EIS should have provided some range of possible disturbance levels in miles of road per square mile, pads per square mile, or other measurement indicators that would provide units for comparing effects by alternative.	2020
10262 2b	10262 2b-10	As written, the conclusions are purely speculative. The RMP/EIS has not identified any research connection between livestock grazing in parturition areas and adverse impacts to elk or any research connection between wind energy developments and adverse effects to elk. In fact, the papers cited in the RMP/EIS (Frisina 1992 and Anderson and Scherzinger 1975) only describe beneficial effects from grazing livestock on elk summer range, including parturition periods. Thus, the RMP/EIS provides no reason why "avoiding livestock grazing in elk parturition habitat" would be beneficial. The RMP/EIS conclusion that "avoid(ing) wind-energy projects in big game crucial winter range and parturition habitat under Alternative D would minimize the potential for disturbance and displacement" is without any supporting data, scientific citations linking wind energy projects with declining elk populations, or anticipated levels of disturbance that might accompany wind-energy projects (see Wildlife Mitigations - Grazing, Travel Management, and Mining and Energy Development).	2025
10262 2b	10262 2b-	METHOD/ASSUMPTION: Impacts to special status wildlife species are based primarily on potential impacts to habitats managed by the BLM. COMMENT:	2039

**Attachment B – Draft Resource Management Plan and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table B-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
	12	Within the Planning Area, sagebrush and grassland obligate species use habitat on 730,321 acres of private and state land. The importance of private and state land must be considered, as well as how BLM management actions	
10262 2b	10262 2b-13	METHOD/ASSUMPTION: Precise quantitative estimates of impacts generally are not possible because the exact locations of future actions are unknown, population data for special status wildlife species are often lacking other environmental variables, or habitat types affected by surface-disturbing activities cannot be predicted. COMMENT: Oil and gas production and livestock grazing activities are common across BLM and other federal agency lands. At the least, the BLM must provide a comparative analysis using other similar projects to assess predicted effects. Prior to the development of the EIS/RMP, the BLM had an obligation to conduct comprehensive population surveys. In doing so, the accumulation of “other environmental variables” should have occurred. It is impossible, without population data and other environmental variables, to analyze Planning Area management actions undertaken by the BLM.	2039
10262 2b	10262 2b-14	METHOD/ASSUMPTION: Prohibiting all surface-disturbing and disruptive activities in greater sage-grouse seasonal habitats is more beneficial to greater sage-grouse than avoiding these activities, as avoidance provides discretion for each proposed activity and applies mitigations, where prohibition precludes all activity. COMMENT: The BLM must define qualitatively and quantitatively what “all surface-disturbing and disruptive activities” entail. Asserting that there are no mitigations available that are as effective as prohibiting activities is biasing.	2042
10262 2b	10262 2b-15	METHOD/ASSUMPTION: Within historical fire regimes, prescribed fire is used to manage vegetative communities and can result in short-term adverse impacts with long-term beneficial impacts to wildlife, certain desirable wildlife habitats, and in some cases to forage productivity and availability. COMMENT: Explain if prescribed fire only causes short-term adverse impacts with long-term beneficial impacts to wildlife? Is this true for all wildlife species?	2042
10262 2b	10262 2b-16	METHOD/ASSUMPTION: Measures to protect one species generally result in long-term benefits to other species in that habitat. COMMENT: Much greater detail is needed for this assumption. For instance, measures to protect a species that uses overgrazed or bare areas (e.g. mountain plover) would have detrimental effects to greater sage-grouse.	2042
10262 2b	10262 2b-17	METHOD/ASSUMPTION: Short- and long-term surface disturbance are assumed to occur in vegetation types in proportion to the availability of these vegetation types in the Planning Area. Impact acreage for vegetation types are not absolute, but serve as a relative comparison among alternatives. COMMENT: Clarify. As written, the assumption is unclear.	2042
10262 2b	10262 2b-18	METHOD/ASSUMPTION: Because of the migratory nature and relative mobility of some special status wildlife species (e.g., waterfowl, neotropical migrants, and raptors), these species are affected by actions on non BLM-administered land more so than other species. In the case of migratory species, impacts to winter and migration habitats could adversely impact the viability of some species. Winter and migration habitats are assumed to be at least as important to long-term viability of these species as breeding and nesting habitats. COMMENT: The assumption ignores the migratory nature of big game species that are significantly affected by actions on non-BLM land. Further, actions on BLM land can affect private land, thus displacing or disturbing wildlife.	2042

**Attachment B – Draft Resource Management Plan and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table B-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
10262 2b	10262 2b-2	According to BLM GIS data, black-footed ferret essential habitat occurs on 35,323 acres, representing only 0.6% of the Planning Area. The RMP/EIS provides no data on suitable habitat (occupied white-tailed and black-tailed prairie dog towns). Upon request, the LGCA received a BLM GIS data file for black-tailed prairie dogs that discloses 72,636 acres of suitable habitat. Significantly greater, the Wyoming Natural Diversity Database (WNDD) suggests there is approximately 200,000 acres of occupied prairie dog towns Basin-wide (Map 3). This may represent 3%-4% of the Bighorn Basin (depending upon how individual prairie dog towns were buffered by the WNDD) and compares with a range-wide occurrence of ~2% (Miller et al. 1994).	2042
10262 2b	10262 2b-20	The findings of Holloran et al. (2010) are pertinent to the aforementioned conclusion if future oil and gas activities were to be conducted in a conventional manner. The oil and gas industry, however, has endorsed measures, including directional drilling and seasonal constraints, in cooperation with the BLM that make future drilling activity anything but conventional. Thus, we argue that the conclusion that surface disturbance in sagebrush habitats under Alternative A is anticipated to result in adverse impacts to greater sage-grouse in the short and long term, be reevaluated to include state-of-the-art measures currently applied.	2071
10262 2b	10262 2b-21	The ¼ mile protective measure is no longer state-of-the-art and is obviously, based on the latest research (Holloran et al. 2010), insufficient to protect greater sage-grouse and avoid the risk of federal listing. In our estimation, limiting the standard to an archaic ¼ mile lek buffer makes Alternative A unfairly un-selectable. The LGCA recommends modifying Alternative A to extend the CSU stipulation to 0.6 miles to recognize the state-of-the-art mitigation	2071
10262 2b	10262 2b-22	No data on the amount of invasive weeds by species, spatial distribution, or infestation intensity is provided in the Affected Environment. The aforementioned discussion makes no reference to measures applied during oil and gas exploration, vegetation manipulation, or grazing to minimize the spread of invasive weeds. Without a more rigorous evaluation of the effectiveness of those measures, or lack thereof, we find no basis for concluding that continued expansion and spread of invasive species under Alternative A would result in adverse impacts to greater sage-grouse and sagebrush habitats.	2068
10262 2b	10262 2b-23	No data is provided in the Affected Environment on the availability of nest cover at any scale (e.g. by grazing allotment, Basin-wide, etc.). No scientific references are provided that correlate declines in greater sage-grouse specifically to limited nesting cover, without segregating that variable from other possible variables (weather, changes in sagebrush coverage, distribution of sagebrush size classes, invasive weeds, and oil and gas disturbance). Thus, the conclusion that management of livestock grazing under Alternative A may not improve the quality or quantity of habitats for greater sage-grouse, but should maintain current habitats is speculative and sans supporting data.	2068
10262 2b	10262 2b-24	Research (Connelly et al. 2000; Gregg et al. 1994; Wallestad and Pyrah 1974) does show a positive correlation between greater sage-grouse nest success and nest cover. If the RMP/EIS is going to suggest, as it does, that changes in grazing may or may not improve greater sage-grouse nest success, the conclusion must be based on Basin-wide allotment-by-allotment data that summarizes nest cover in a statistically meaningful manner that isolates the effects of limited nest cover from other variables. If data concludes that modifications to grazing in some allotments are warranted to recover greater sage-grouse, the BLM	2071

**Attachment B – Draft Resource Management Plan and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table B-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
		should engage stakeholders and permittees with a proposed solution. Making conclusions regarding the effects of grazing on greater sage-grouse without data, however, is improper. Management decisions based not on data but perceptions could have significant negative economic impacts on permittees and stakeholders. The LGCA strongly objects to Basin-wide modifications to grazing under the auspices of greater sage-grouse recovery that are not allotment-specific or based on field data and scientifically-sound analyses (see Wildlife Mitigations“ Core and Key Areas, Grazing, Travel Management, and Mining and Energy Development).	
10262 2b	10262 2b-25	We challenge the conclusion that measures to protect greater sage-grouse as discussed under Game Birds (Greater Sage-grouse) would benefit all sagebrush and shrubland species. Brewer’s sparrows, sage sparrows, and sage thrashers clearly prefer large tracts of late seral big sagebrush (Buseck et al. 2004; Hansley and Beauvais 2004a; Hansley and Beauvais 2004b; Wiens and Rotenberry 1981). Greater sage-grouse prefer a mosaic of young and old sagebrush interspersed with open grassy areas (Connelly et al. 2000; Connelly et al. 2004; Rowland 2004). Thus, the biological requirements for species in the sagebrush and shrubland species differ by species.	2042
10262 2b	10262 2b-26	it is unclear how the BLM concludes that current conditions are limiting to greater sage-grouse or if future conditions will be better or worse. Thus, the RMP/EIS conclusion (pg.4-181) that species that utilize or depend on sagebrush habitats (will) benefit from management actions for greater sage-grouse may or may not be accurate and reflect current conditions in the Planning Area.	2042
10262 2b	10262 2b-27	The conclusion that direction in Alternative A provided by Standards for Healthy Rangelands and Guidelines for Livestock Grazing Management for the Public Lands Administered by the BLM in the State of Wyoming, may not create the vegetation heterogeneity needed for neotropical migrants is speculative. The RMP/EIS needs to determine whether grazing management does or not meet the needs of Neotropical migrants. If, grazing as currently conducted does not provide the needs for some species (e.g. heavily-grazed lands needed by mountain plovers), then the alternatives should be modified to meet those biological needs.	2042
10262 2b	10262 2b-28	The relationship between sagebrush-associated species and grassland-associated species needs to be segregated. First, the wildlife effects discussion needs to acknowledge that according to BLM biophysical setting data, most grasslands are the result of disturbance that removed sagebrush (fire, mechanical, herbicides, etc). Similarly, most sagebrush-dominated areas are the result of an absence of disturbance (e.g. long-term fire suppression). Secondly, the effects analysis needs to acknowledge that actions that benefit/favor sagebrush obligates (e.g. sage sparrows) will be detrimental to grassland obligates (Baird’s sparrows) and contrariwise. Lastly, the degree to which alternatives provide for both sagebrush- and grassland-associated species must be based on comprehensive data that discloses the current mix of sagebrush and grasslands and changes in that mix that will occur by alternative. Referring simply to greater sage-grouse measures (Section 4.4.9 Special Status Species - Wildlife and Standards for Healthy Rangelands) or domestic livestock grazing measures (Guidelines for Livestock Grazing Management for the Public Lands Administered by the BLM in the State of Wyoming) does not answer the fundamental questions of how Alternative A will affect sagebrush- and grassland-associated species in terms of how the Planning Area will be managed	2039

**Attachment B – Draft Resource Management Plan and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table B-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
		in either sagebrush or grassland coverage (see Wildlife Mitigations - Grazing, Travel Management, and Mining and Energy Development).	
10262 2b	10262 2b-29	Where there is agreement with the preceding narrative is that appropriate grazing intensity and duration maintains suitable greater sage-grouse habitat (WGFD and BLM 2007). The following should be addressed under Alternative B: Greater sage-grouse co-evolved with bison and are therefore, generally tolerant of or benefit from livestock grazing; Some allotment-specific problems with limited nesting cover may exist, but issues can be resolved at the allotment-scale regardless of alternative selected; Removing 1.1 million acres of livestock is based on a perception that grazing is a major problem for greater sage-grouse, but that opinion is generally not validated by research. Removing livestock on 1.1 million acres will have greater negative effects on greater sage-grouse from increased fire severities, resulting in a loss of big sagebrush to a greater degree than any minor site-specific benefits from improved nesting cover. Elimination of 1.1 million acres of grazing allotments will have significant adverse impacts on permittees in the Planning Area. The BLM has an obligation to disclose the economic effects of removing 1.1 million acres of grazing.	2068
10262 2b	10262 2b-3	No analysis is found in the RMP/EIS that demonstrates that sustaining black-footed ferrets on 0.6% habitat is sufficient to recover black-footed ferrets to non-listed status. Nor, can we find any objectives for prairie dog towns that are needed to sustain black-footed ferrets, even though the WNDD data suggests prairie dog towns are reasonably abundant. Consequently, concluding that “adverse impacts from BLM actions to prairie dog populations are not anticipated under Alternative A” may be technically true, but it is not clear if Alternative A meets the ESA in terms of providing sufficient habitat over time.	2042
10262 2b	10262 2b-30	Mountain plovers require intensively grazed areas, either from domestic livestock, wild ungulates, or prairie dogs (Beauvais and Smith 2003; Dechant et al. 2002b; Knopf and Wunder 2006; Manning and White 2001). Removing 1.98 million acres of grazing allotments will drastically inhibit the ability of the BLM to provide suitable habitat for mountain plover. Consequently, concluding that “Alternative B may result in adverse effect to mountain plover(s)” is a gross inaccuracy.	2041
10262 2b	10262 2b-31	Furthermore, the conclusion that “managing areas to create preferred habitat for the mountain plover, would likely provide a net benefit for this species” lacks the essential discussion of “how” that activity would occur. Given that mountain plovers require intensively-grazed areas, how will non-disclosed management activities benefit mountain plovers when Alternative B removes grazing on 1.98 million acres? Will BLM crews be out mowing areas to create mountain plover habitat? Without some specific details on what those plover management actions will entail, the conclusion is baseless (see Wildlife Mitigations “ Grazing, Travel Management, and Mining and Energy Development).	2041
10262 2b	10262 2b-32	As stated in comments for the effects of Alternative A, no data is provided in the Affected Environment on the availability of nest cover at any scale (e.g. grazing allotment, landscape, Basin-wide). No scientific references are provided that correlate declines in greater sage-grouse specifically to limited nest cover, without segregating that variable from other possible variables (weather, changes in sagebrush coverage, distribution of sagebrush size classes, invasive weeds, oil and gas disturbance). Thus, the conclusion that there may be more beneficial impacts to greater sage-grouse (from Alternative D), is speculative	2068

Individual Comments and Index to Summary Comments and Summary Responses**

Table B-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
		(see Wildlife Mitigations " Core and Key Areas, Grazing, Travel Management, and Mining and Energy Development).	
10262 2b	10262 2b-33	Based on previous comments regarding the effects of Alternative A, there is no data on existing acres of sagebrush age class distribution. While Alternative D infers there will be less acres lost to minerals extraction, there is no quantitative comparison of existing acres of habitat compared to acres remaining under Alternative A. It is understood there is uncertainty involved with minerals extraction, yet a general comparison is necessary to validate the conclusion advanced by the BLM.	2036
10262 2b	10262 2b-6	The RMP/EIS makes no disclosure of the amount of summer range acres withdrawn from oil and gas development, nor does it identify any benefits to summering ungulates on that winter range from withdrawal.	2022
10262 2b	10262 2b-42	Energy extraction activities can compromise hunting season security by adding roads that can reduce security or by creating a high level of noise and human disturbance during the hunting season that makes existing security areas unusable to elk. Generally, leasing with CSU would fully mitigate impacts on security. If, however, security areas overlap with crucial winter range, the combined seasonal restrictions (e.g. fall through late spring) might not leave a sufficiently reasonable operating season for energy extraction. In that situation, special security areas, not to exceed 30% of the AFMA (Edge et al. 1988), should be designated NSO..	2025
10262 2b	10262 2b-43	Bighorn sheep do not exhibit the same sensitivity to human disturbance that elk do (Papouchis et al. 2001). Bighorn sheep will routinely occupy habitat along freeways and other areas of high disturbance. Because of areas of de facto NSO (see previous paragraph) that comprise sheep habitat, it is unlikely that disturbance from energy extraction would have measurable effects upon sheep populations; therefore, no mitigation measures are necessary.	2025
10262 2b	10262 2b-44	Mitigation measures needed to protect wintering moose are assumed to be the same as for elk (e.g. minimizing the footprint of physical disturbance, aggressively controlling invasive weeds, and restricting activity during critical use periods). As important, prior to any constraints being placed on grazing, oil and gas development projects, or travel management designations in the AFMA, the constraints must be substantiated with monitoring data, research, and close coordination and cooperation with stakeholders	2025
10262 2b	10262 2b-45	Disturbance associated with roads probably outweighs all other threats. CSUs have the potential to fully mitigate impacts upon grizzly bears; however, determinations regarding the level of energy extraction activity allowed, number of roads to be temporarily constructed, and season of use allowed for drilling need to be carefully crafted to fit the needs of locally-studied bear populations. In areas with an absence of reliable data, NSOs may be warranted. Prior to any constraints being placed on grazing, oil and gas development projects, or travel management designations in the AFMA, the constraints must be substantiated with monitoring data, research, and close coordination and cooperation with stakeholders.	2025
10262 2b	10262 2b-5	The Affected Environment did not demonstrate with either data or scientific literature how making Carter Mountain and Little Mountain expansion unavailable to oil and gas leasing and withdrawn from locatable mineral entry would benefit big game. It is disclosed that the ACECs include 246,064 acres of crucial winter range. Those areas, however, are already protected from wintertime ungulate disturbance by a TLS. The RMP/EIS infers there will be a	2025

**Attachment B – Draft Resource Management Plan and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table B-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
		temporary loss of habitat from surface-disturbing activities, but no estimate of acreage lost is provided. Low to moderate intensity oil and gas development has a relatively tiny footprint (pad surfaces, access roads, pumping stations, etc). High intensity oil and gas developments (e.g. Jonah or Pinedale Anticline) have larger footprints. However, the percentage of habitat temporarily lost is still in the single digits. For the RMP/EIS to conclude that withdrawing lands from oil and gas will benefit big game, some estimate of lands temporarily lost as habitat to pads, roads, and pumping stations should be provided and a science-based assessment of the significance of that loss to wintering ungulates should be made.	
10262 2b	10262 2b-7	The LGCA strongly disagrees with the removal of domestic sheep grazing from crucial pronghorn winter range. In the RMP/EIS, the BLM fails to disclose, with peer-reviewed scientific studies or BLM field data, that cattle grazing has adverse effects on wintering pronghorn.	2025
10262 2b	10262 2b-8	Additionally, the conclusion that eliminating livestock grazing on crucial winter range for elk (Table 4-9) to increase forage availability, reduce forage competition, and prevent possible displacement of these wildlife populations (Scolvin et al. 1968; Coe et al. 2004; Stewart et al. 2002) has not been demonstrated as fact. Two critical variables discussed in two of the three aforementioned citations (Skovlin et al. 1968, Coe et al. 2004) are the level of utilization and season of use. Known conflicts between livestock and elk include these two variables. No data is provided in the RMP/EIS, however, that discloses season of use or level of utilization in the areas where benefits to ungulates are anticipated under Alternative B. Thus, the conclusion is groundless. The third citation (Stewart et al. 2002) makes no specific correlation between livestock grazing and elk.	2025
10262 2b	10262 2b-9	Furthermore, the RMP/EIS is using research indiscriminately to make the case that elk will benefit by removing livestock in Alternative B. The RMP/EIS earlier cited Anderson and Scherzinger (1975), which showed that summer livestock grazing benefitted elk on winter range when done in certain seasons and intensities. Yet, that finding is ignored in the effects on elk in Alternative B. If the RMP/EIS is going to disclose beneficial effects upon elk from Alternative B, it needs to demonstrate with allotment-by-allotment data that utilization is excessive (see Wildlife Mitigations - Grazing, Travel Management, and Mining and Energy Development).	2025
10262 2b	10262 2b-35	METHOD/ASSUMPTION: The number of wild horses would increase by about 18 percent annually and be maintained by periodic removals. COMMENT: As an exotic species, the LGCA posits that an increase of 18% annually will be detrimental to the native vegetation and the economic interest of permittees and stakeholders in the Planning Area. If required by the WFRHBA, annual increases in wild horses in the Planning Area should be at the minimal allowable level allowed for under the WFRHBA.	2030
10262 2b	10262 2b-36	METHOD/ASSUMPTION: Wild horse removals (gathers) would occur about every 3 to 5 years in each HMA. COMMENT: Gathers must occur annually to decrease the environmental devastation wrought by wild horses in the Planning Area.	2030
10262 2b	10262 2b-37	METHOD/ASSUMPTION: Maintenance of wild horse populations at initial appropriate management levels in existing HMAs would be accomplished through removals and selected application of other population control practices. COMMENT: Define "appropriate management levels."	2030

**Attachment B – Draft Resource Management Plan and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table B-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
10262 2b	10262 2b-38	The overall stocking level for both livestock and wild horses in the Fifteen Mile HMA is 5,670 AUMs (RMP/EIS pg. 3-120). Overall stocking levels for both wild horses and livestock in the McCullough Peaks HMA are not discussed in the RMP/EIS. Additions to Section 3.4.10, McCullough Peaks Wild HMA, should include the overall stock level AUMs.	2030
10262 2b	10262 2b-39	Until a comprehensive study of the affects of wild horses in the Fifteen Mile and McCullough Peaks Wild HMA areas is complete, and included in the RMP/EIS, there should be no reduction in livestock AUMs (see Wild Horses Mitigation - Grazing). The BLM must consider reducing wild horse numbers and wild horse AUMs in the McCullough Peaks and Fifteen Mile HMAs to restore rangeland health until drought conditions have receded. The reduction in excess wild horses and AUMs would be consistent with the WFRHBA, Section 2 Subpart (f) which states: excess animals" means wild free-roaming horses or burros (1) which have been removed from an area by the Secretary pursuant to application law or, (2) which must be removed from an area in order to preserve and maintain a thriving natural ecological balance and multiple-use relationship in that area.	2030
10262 2b	10262 2b-40	In Section 3.4.10, Management Challenges, McCullough Peaks HMA, fertility controls are used to control population growth to an expected 15% annual rate. Section 4.4.10.1, Methods and Assumptions, states that the number of wild horses would increase by 18% annually. The percentages do not match, obviously. The Methods and Assumptions percentage of annual growth should be changed to match the fertility control method percentage annual growth rate or clarify the differences in the percentages. Wild horse HMAs should be managed according to the contraceptive measures delineated previously in this comment section.	2030
10262 2b	10262 2b-41	The agency-preferred alternative (D) in this analysis withdraws leasing from much of the AFMA and allocates the remainder to a mix of NSO and CSU. While the alternative takes a no risk approach to protecting wildlife, the alternative goes beyond what the science (Holloran and Anderson 2005; Sawyer et al. 2007a; Sawyer et al. 2007b) says is needed to protect wildlife from energy extraction activities.	2036
10262 2b	10262 2b-4	Additionally, is it not clear that measures taken in Alternative A will provide sufficient acres of occupied prairie dog towns to maintain burrowing owls (and other prairie dog obligates) at a level sufficient to preclude federal listing. The RMP/EIS needs to provide information (goals, objectives, minimum acreages of suitable habitat, monitoring strategies, stakeholder involvement, etc) on a Basin-wide scale to demonstrate that Alternative A (and other alternatives) are indeed compatible with maintaining prairie dog populations to support black-footed ferret recovery and the ESA (see Wildlife Mitigations - Grazing, Travel Management, and Mining and Energy Development).	2039
10262 2c	10262 2c-19	Page 2-97, Record 5020 mentions avoiding surface disturbing activities and ROW authorizations in view within 5 miles of important cultural sites where integrity of setting is a contributing element of NRHP significance (Alternative B). Alternative D mentions a three-mile buffer. It seems that mitigation measures described in Appendix L could go a long way to mitigating impacts of surface disturbing activities within these three- to five-mile buffers. Stipulating significant restrictions in these buffers could potentially remove a 78 square mile (five-mile buffer) and 28 square mile area (three-mile buffer) from surface disturbing activities for a single cultural site.	2004

**Attachment B – Draft Resource Management Plan and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table B-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
10262 2c	10262 2c-20	The management prescriptions under Alternative D, as outlined in Record # 5020, 5022, and 5023 (pp. 2-97 and 2-98), use the word “avoid.” The common legal definition of “avoid” is “to make void or of no effect; invalidate.” The average person may be led to the conclusion that surface-disturbing activities are precluded within 3 miles of important cultural sites throughout the Planning Area. Rather, it should be interpreted “as a term used to address mitigation of some activity” consistent with the definition provided in the Draft RMP and DEIS (p. Glossary-4). Although the use of the word “avoid” seems a poor choice, given the definition provided in the Draft RMP and DEIS it seems reasonable to include “(see Glossary)” following “avoid” in each of the Record #s referenced above.	2004
10262 2c	10262 2c-22	Page 2-97, Record 5021 describes an NSO for leasable minerals within 3 miles and a CSU stipulation within 5 miles of important cultural sites for Alternative B. For Alternative D, the buffer would be 3 miles to protect the visual integrity of important cultural sites. Again, the mitigation measures described in Appendix L and others described under 5.0 mitigation measures could reduce or eliminate impacts associated with surface disturbing activities.	2004
10262 2c	10262 2c-23	Page 2-97, Records 5020 and 5021. Mike Beis, BLM cultural specialist, and the SHPO representative in the February, 2010 meetings in Cody said they have identified up to 500 cultural sites that deserve protection. If 500 sites need to be protected by these three- and five-mile buffers, thousands of acres of land within the planning area could be removed from potential development.	2004
10262 2c	10262 2c-30	The LGCA is concerned about the nebulous nature of “setting” of a NRHP-eligible cultural site with respect to viewshed criteria. It is implied in the above text that a five-mile viewshed buffer might not be sufficient on a case-by-case basis if the development were a wind farm. There needs to be more explicit direction from the BLM in the plan with respect to buffers for protecting the setting of NRHP-eligible cultural resources.	2004
10262 2c	10262 2c-31	Page 4-265, 2nd paragraph - Clarify if limiting motorized use to designated roads and trails allows for dispersed camping and game retrieval off of roads.	2004
10262 2c	10262 2c-32	Again, the BLM and SHPO have stated in meetings that there may be 500 important cultural sites that need protected under the buffers proposed in Alternatives B and D. It should be noted that management of cultural resources for setting is only intended to apply to those properties where setting is an important aspect of the integrity of the site. As noted in the comments from the State Historic Preservation Office the majority of cultural resources (approximately 98%) recorded in the Planning Area are archaeological in nature and thus the integrity of setting is not an issue of importance. In fact, less than 1% of cultural resource properties in the Planning Area meet the criteria for the management of setting.	2004
10262 2c	10262 2c-38	The LGCA has several concerns with the treatment of cultural resources in the RMP. Most importantly, the LGCA is concerned about three- and five-mile buffers around important cultural resources within which NSO or CSU restrictions would apply under Alternatives B and D. Given that there may be as many as 500 important cultural sites in the planning area; these buffers could potentially preclude activities on thousands and thousands of acres within the planning area. The LGCA believes that mitigation measures in Appendix L of the RMP and additional measures described above can be applied that would protect these resources but still allow surface disturbing activities within the buffer zones.	2004

**Attachment B – Draft Resource Management Plan and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table B-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
10262 2c	10262 2c-21	This language would require mitigation of visual impacts for projects that impact the integrity of the subject cultural site or historic trails within the buffer but if the project does not impact the visual integrity of the subject cultural site or feature (is not within view of the site even though it is within the buffer), no mitigation would be necessary. According to the Wyoming State Historic Preservation Office (SHPO), the intact portions of the Bridger Trail comprise less than 1.5% of the length of the trail across the planning area as shown on BLM maps. The BLM should publish in the DEIS the known intact portions of the Bridger Trail as documented by Wyoming SHPO.	2010
10262 2c	10262 2c-39	Page 3-143 states that the small size of scattered parcels can result in increased difficulties in management. Please specify the acreages that correspond to these difficulties in management.	2013
10262 2c	10262 2c-47	Include reference citations for the assertion that land tenure adjustments and land use authorizations will increase over the life of the plan.	2013
10262 2c	10262 2c-48	Include more information about the metrics used in determining the priority or urgency associated with acquisitions benefiting varied resource programs.	2013
10262 2c	10262 2c-49	Include reference citations for the assertion that the number of land use authorizations will increase over the life of the plan.	2013
10262 2c	10262 2c-50	Include more information about the process of determining mineral development potential prior to a potential land disposal.	2013
10262 2c	10262 2c-51	Define “voluntary approaches” used to increase access to lands.	2013
10262 2c	10262 2c-52	Include reference citations for the assertion that consolidation of public lands would decrease the cost of public land administration in the Planning Area and enhance efficiency in management of the remaining public lands.	2013
10262 2c	10262 2c-53	Provide a description of the types of special designations that may qualify an acquisition area for a higher or lower priority.	2013
10262 2c	10262 2c-54	Please detail or reference the resource issues that drive differences in impacts between alternatives. Throughout the lands resource section of the RMP/EIS, effects from land designations on the operation of the lands and realty, renewable energy, rights-of-way, and comprehensive travel and transportation management resource areas. However, the resource issues that have precipitated those land designations are often not discussed in sufficient detail. In order to fully understand the implications of difference between alternatives for the land resources section of the document, more information must be included.	2013
10262 2c	10262 2c-55	Please clarify the methods used to identify parcels available for disposal. Areas considered for disposal due to difficulties in management but retained due to other resource concerns should be detailed under each alternative. For example, under Alternative D, 4,633 acres of BLM ownership in parcels of 160 acres or less are not considered for disposal under zones 1C, 2, 2A, 2B, or W.	2013
10262 2c	10262 2c-56	Please detail or reference the resource issues that drive differences in withdrawals, classifications, and segregations between each alternative.	2013
10262 2c	10262 2c-14	The preceding comments clearly illustrate that the BLM has failed to adequately describe historic wildlife habitat quality and quantity, population density, and viability of species analyzed in the RMP/EIS. In the Affected Environment chapter, the RMP/EIS insufficiently discloses the aforementioned variables. Given that the current condition does not properly disclose the population	2025

**Attachment B – Draft Resource Management Plan and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table B-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
		density and area of use of many species in the Planning Area, it is indiscernible to what degree a species or group of species is challenged by habitat conditions or availability.	
10262 2c	10262 2c-15	Complicating the wildlife section is the fact that the RMP/EIS does not provide measurement indicators for species. An EIS must provide measurement indicators so that management planning action effects can be applied to wildlife species and habitats. Only then can the action alternatives be accurately assessed and compared.	2025
10262 2c	10262 2c-16	Management challenges are provided for the Planning Area that describe in very nebulous terms adversities facing wildlife species. However, the management challenges are not substantiated with data gathered from the Planning Area. In fact, very little data is provided for either wildlife species or habitats. In addition, the RMP/EIS incorporation of recognized research and field studies on Planning Area species that were conducted outside the Bighorn Basin, but still relevant, are mostly absent.	2025
10262 2c	10262 2c-18	Before the RMP/EIS is finalized, the wildlife section must be substantially improved. The Affected Environment must compare historic and current wildlife species populations and habitat quality and quantity. Next, a description of how management actions and resource uses in the Planning Area, over the life of the current RMP(s), have impacted wildlife either beneficially or adversely should be provided. With a solid Affected Environment chapter, the Environmental Consequences chapter can effectively analyze proposed action alternatives. For proper evaluation, measurement indicators must be devised for each species.	2025
10262 2c	10262 2c-2	Alternative A takes the mitigation measures recommended in various publications and applies them where they overlap with key wildlife habitats. Alternative A assumes that wildlife populations are at some risk from energy extraction activities, but that the published mitigation measures will be sufficient to avoid any significant adverse effects. Alternative D, and to a greater extent Alternative B, largely ignore the current level of over-performance that elk populations are exhibiting. As noted previously, before constraints are placed on grazing, oil and gas development projects, or travel management designations in the AFMA, the constraints must be substantiated with monitoring data, research, and close coordination and cooperation with stakeholders.	2025
10262 2c	10262 2c-71	Inventory and subsequent confirmation inventory of LWCs performed by the LGCA, it is apparent that the BLM did not follow Manual 6301 procedural guidelines when conducting the inventory. The LGCA believes that the lack of confirmation of procedural guidelines has led the BLM to publically release an inaccurate LWC inventory, leading to erroneous LWC designations.	2027
10262 2c	10262 2c-72	The BLM Cody Field Office did not produce maps of the inventoried LWCs. Section 1, Subsection 13, Part A, Subpart 2a, on page 6 of BLM Manual 6301 requires the BLM to produce a map of each LWC by stating: "a map of sufficient detail to determine specific boundaries of the area in question." The Manual refers to this as a minimum standard in the inventory. The Cody Field Office is in direct violation of this section of BLM Manual 6301.	2027
10262 2c	10262 2c-73	The BLM proposed multiple LWCs of roaded areas less than 5,000 acres in size. Section 1, Subsection 14, Part B, Subpart 1, on page 8 of BLM Manual 6301, discusses the size requirements of LWCs. Determination of the size criteria requirements is two-part: 1) a roadless area of 5,000 contiguous BLM acres or 2) a roadless area of less than 5,000 acres if it is contiguous with lands such as	2027

**Attachment B – Draft Resource Management Plan and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table B-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
		wilderness, WSAs, etc. Some of the multiple BLM LWCs less than 5,000 acres are not adjacent to wilderness or WSAs. The LWCs that are adjacent to WSAs are not contiguous (Appendix A), containing roads separating the boundaries of the LWCs from the WSAs.	
10262 2c	10262 2c-74	The BLM did not inventory for man-made structures within LWCs. The BLM LWC Inventory occasionally refers to roads or structures on their inventory by hand drawing dots on LWC maps or drawing in roads with a highlighter. The BLM GIS library contains complete data sets for roads, range improvements, oil and gas fields, and other structures such as communication towers. It is clear that the BLM ignored their GIS data when preparing the LWC inventory.	2027
10262 2c	10262 2c-75	Other readily available GIS data sets ignored by the BLM are Wyoming Pipeline Authority oil and gas pipelines and Wyoming Oil and Gas Commission data for oil and gas wells. All of these structures are contained, to varying degrees, within all the BLM identified LWCs (Appendix A). Section 1, Subsection 14, Part B, Subpart 2, on page 9 of BLM Manual 6301, discusses naturalness, allowable structures, and cumulative effects of multiple structures on apparent naturalness. The BLM did not document in their inventory the structures that exist within the LWCs, nor did they document the cumulative effects of those structures on the apparent naturalness of the LWCs. This is a direct violation of the guidance set forth in BLM Manual 6301.	2027
10262 2c	10262 2c-76	Thresholds for the amount of allowable structures in LWCs should be set to create a measureable baseline. For example, a threshold should be established for the number of structures allowed per 1,000 or 5,000 acres. A second threshold may be setting minimum distance criteria between allowable structures. The process should take in account the Wilderness Act, which is quoted in BLM Manual 6301 as: A wilderness, in contrast with those areas where man and his own works dominate the landscape, is hereby recognized as an area where the earth and its community of life are untrammeled by man, where man himself is a visitor who does not remain. An area of wilderness is further defined to mean in this Act an area of undeveloped Federal land retaining its primeval character and influence, without permanent improvements or human habitation, which is protected and managed so as to preserve its natural conditions and which (1) generally appears to have been affected primarily by the forces of nature, with the imprint of man's work substantially unnoticeable; (2) has outstanding opportunities for solitude or a primitive and unconfined type of recreation; (3) has at least five thousand acres of land or is of sufficient size as to make practicable its preservation and use in an unimpaired condition; and (4) may also contain ecological, geological, or other features of scientific, educational, scenic, or historical value. The first sentence of the preceding quote and points one, two, and three are violated on a continual basis in the BLM LWC Inventory as determined by the LGCA LWC Confirmation Inventory (Appendix A). The definition of a road has the most potential to impact LWC designations. Almost all LWCs contain roads (Appendix A).	2027
10262 2c	10262 2c-77	The inconsistencies in road terminology and classifications should require the BLM to adopt a standardized road classification methodology. The BLM Road and Terminology Report contain the most comprehensive attempt at this process. It contains a chart depicting route status levels and terminologies associated. Figure 17 clearly depicts single track as trails and high clearance (commonly associated with two-tracks) as primitive roads. This terminology	2027

**Attachment B – Draft Resource Management Plan and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table B-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
		should be adapted to the LWC inventory procedures. Therefore, two-tracks would be considered roads in an LWC inventory.	
10262 2c	10262 2c-13	Wild horses are a non-native species in the Bighorn Basin that deplete and denigrate native vegetation and water sources. If the BLM proposes to increase wild horse AUMs, which would result in the alteration, reduction, or loss of domestic livestock grazing AUMs, it will be preceded by the BLM designing and implementing a comprehensive monitoring study based on state-of-the-art methods that evaluates species population density and viability, as well as the impacts of wild horses on native vegetation, water quality/quantity, and domestic livestock grazing in the Planning Area. At the conclusion of the study the BLM will coordinate with livestock grazing permittees and local governments in the Bighorn Basin preceding any proposed modification of AMPs or elimination of livestock grazing allotments in the Planning Area.	2030
10262 2c	10262 2c-24	Page 3-136, paragraph 2 - Explain how sensitivity levels were determined.	2032
10262 2c	10262 2c-25	Page 3-136, 3rd paragraph - It would be helpful to the reader if a table or diagram was provided to show how inventory classes are determined. For example, a Scenic Class A rating and a Low sensitivity rating results in a ___ Scenic Class.	2032
10262 2c	10262 2c-26	Page 3-136 - Explain why foreground and background are lumped into one distance category (Foreground/Middleground). Seems the scenic class would be different for each distance zone.	2032
10262 2c	10262 2c-27	Table 3-35 - Table footnote 1 in the Foreground/Middle Ground cell is mislabeled. Footnote one refers to scenic classes on the previous page. Suggest including a footnote on Foreground/Middle Ground that would describe the distance zones for each. For example, foreground would be 0-1/4 mile from a travel route and middleground would be 1/4 - 2-3 miles. Also visibility should be verified at the project level. This also could be considered a mitigation measure included later in the document.	2032
10262 2c	10262 2c-28	Page 3-139 - Explain how the VRM Classes in Table 3-36 was determined or what they are based on. The Source at the bottom of the Table only says "BLM 2009a" which is the GIS data base. Are these classes based on the existing RMP?	2032
10262 2c	10262 2c-29	Page 3-139 - Cite the "policy direction for renewable energy production on public lands" mentioned in the last paragraph.	2032
10262 2c	10262 2c-33	Page 4-283, 2nd paragraph under Visual Resources - The discussion about direct and indirect effects does not match the definition of direct and indirect effects on Page 4-1. Suggest that indirect effects for visual resources would be related to recreation use and economics as a result of diminished scenic quality.	2032
10262 2c	10262 2c-34	Page 4-286 - The effects analysis is written as if the impacts "would" occur as opposed to "could occur" if development were to take place. This may be a clarification needed for all resource effects.	2032
10262 2c	10262 2c-35	Page 4-288, Last sentence before Table 4-12 - Clarify why "applying VRM that is incompatible with an area's visual value would eventually alter these areas toward a higher visual inventory class." The visual inventory class is determined using the scenic quality rating (Classes A, B, and C) and the visual sensitivity level. The Forest Service visual inventory process uses inherent scenic attractiveness (Class A, B, and C) instead of scenic quality and it would not change as a result of management allocations or management actions. Alternative D.	2032

**Attachment B – Draft Resource Management Plan and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table B-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
10262 2c	10262 2c-36	Table 4-11 and Map 41: As an example of the concern raised on Page 3-139, why was the Sheep Mountain Anticline VRM Class expanded from Alternative A to Alternative D?	2032
10262 2c	10262 2c-37	1. With respect to visual inventory classes, the BLM will display in the RMP/EIS an appendix or cite the project file that explains how the visual resource inventory was completed. 2. Regarding Table 3-36 of the RMP/EIS, the BLM will explain the basis and determination of VRM Classes. It is also suggested that indirect effects for visual resources would be related to recreation use and economics as a result of diminished scenic quality. 3. The BLM will include in the RMP/EIS an appendix (or in the project file/administrative record) the process used to determine the Scenic Quality Rating.	2032
10262 2c	10262 2c-45	The RMP/EIS states that there are two fundamental tasks associated with comprehensive travel and transportation management. Both of these tasks require an accurate inventory of the existing transportation network. Please ensure that spatial inventories of the transportation network in the Planning Area accurately reflect current conditions prior to making decisions that would affect comprehensive travel and transportation management.	2034
10262 2c	10262 2c-46	Page 3-156 briefly describes five travel management plans that are currently implemented. Please include a more detailed description of these existing travel management plans, including their location, extent, goals, range of designations, and resource issues driving those designations.	2034
10262 2c	10262 2c-68	Please include reference citations for the assertion that demand for new rights-of-way or access is expected to decrease.	2034
10262 2c	10262 2c-69	Please detail or reference the resource issues that drive differences in travel management between each alternative. Inclusion of this information would be appropriate in Table R-1 as well.	2034
10262 2c	10262 2c-57	Please include reference citations for the assertion that wind energy is the most likely type of renewable energy to be developed in the Planning Area.	2065
10262 2c	10262 2c-58	Please include reference citations for the assertion that wind energy demand and development is expected to increase during the life of the plan..	2065
10262 2c	10262 2c-59	Please include reference citations for the assertion that increased development of wind energy turbines would increase the demand for ROW authorizations for transmission lines.	2065
10262 2c	10262 2c-60	Please detail or reference the resource issues that drive differences in management that limits or prohibits renewable energy development between each alternative.	2065
10262 2c	10262 2c-64	The RMP/EIS states that, overall, Alternative C has the lowest level of constraints applied to ROW authorizations. The RMP/EIS also states that Alternative A includes the fewest combined avoidance/mitigation and exclusion areas, as well as the most area of ROW corridors. These two factors would indicate that Alternative A has lowest level of constraints applied to ROW authorizations. Please clarify these apparently contradictory statements.	2066
10262 2c	10262 2c-65	Please detail or reference the resource issues that drive differences in management that limits or prohibits ROW corridors between each alternative. The process for identifying areas of designated ROW corridor is unclear. Please provide information concerning the process of designating ROW corridors.	2066
10262 2c	10262 2c-66	Please include discussion of the differences in ROW acquisition between designated ROW corridors, avoidance/mitigation areas, and areas with neither	2066

**Attachment B – Draft Resource Management Plan and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table B-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
		designation. The impact of expansion of avoidance/mitigation areas and reduction of designated ROW corridors on ROW applicants is unclear.	
10262 2c	10262 2c-70	Mitigations 1. The BLM shall ensure that spatial inventories of the transportation network in the Planning Area accurately reflect current conditions in the Final RMP/EIS. 2. In the Final RMP/EIS, the BLM shall include a more detailed description of the existing travel management plans. 3. In the Final RMP/EIS, the BLM shall detail the resource issues that drive differences in impact between alternatives for Lands and Realty, Renewable Energy, Rights-of-Way and Corridors, and Comprehensive Travel and Transportation Management. If the detailed information is included elsewhere in the RMP/EIS, a reference to that location would be sufficient. 4. In the Final RMP/EIS, the BLM shall assess the percentage of ROW corridor capacity that is currently in use, and use that information to revise ROW corridor designations for all alternatives. 5. In the Final RMP/EIS, the BLM shall provide description of the methods used to designate ROW corridors, and detail the differences between alternatives. 6. In the Final RMP/EIS, the BLM shall provide discussion of the differences ROW acquisition between designated ROW corridors, avoidance/mitigation areas, and areas with neither designation. 7. In the Final RMP/EIS, the BLM shall clarify the assertion that Alternative C includes the lowest level of restrictions on ROW authorization, and revise if applicable.	2066
10262 2c	10262 2c-40	The RMP/EIS asserts that "If the current rate of development continues and current management remains in place, designated ROW corridors should adequately meet future needs over the next 10 to 20 years." Please provide supporting information for this statement, and assess the percentage of current ROW corridor capacity in use.	2067
10262 2c	10262 2c-41	Please reference the source of oil and gas production estimates, assumptions concerning their distribution, and include provisions should activity data from these sources.	2067
10262 2c	10262 2c-42	Please provide supporting information for the assertion that demand for public land for access roads and electrical or pipeline ROWs will remain moderate over 10-20 years.	2067
10262 2c	10262 2c-44	Given the potential of the Mowry Shale Formation and EOR and unconventional gas plays elsewhere in the Bighorn Basin, the proposed ROWs in Alternative D will not allow for necessary infrastructure to develop and produce these important resources. Upon comparison of Alternative A and Alternative D ROW corridors, it was discovered that a large majority of the corridors in Alternative A are removed in Alternative D. Certain oil and gas management areas (intensely developed oil fields) were no longer being served by ROW corridors. This results in an inability to expand operations and apply new extraction techniques, such as EOR. Appropriately, as public servants with the best interest of the citizenry in mind, the LGCA has designed and developed an Alternative D ROW corridors GIS polygon and accompanying map (Map 9) and GIS shapefile. Energy producers in the Bighorn Basin met with the LGCA to discuss their needs for ROW corridors. Being able to provide corridors for CO2 pipelines into oil and gas management areas and additional space in ROW corridors for removal and transportation of oil and gas is a necessity for energy producers. The proposed ROW corridors would allow for EOR and unconventional gas plays in the Bighorn Basin. Access to oil and gas previously unattainable is not only prudent in meeting the nation's energy demands, but will provide economic and employment benefits to the Bighorn Basin, Wyoming, and the U.S.	2067

Individual Comments and Index to Summary Comments and Summary Responses**

Table B-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
10262 2c	10262 2c-61	Please include reference citations for the assertion that ROW grants will be directly proportional to the development of other resources and resource uses in the Planning Area.	2067
10262 2c	10262 2c-62	Please include reference citations for the assertion that companies would focus first on the maintenance and upgrading of existing lines before undertaking new construction of major utility lines in the Planning Area.	2067
10262 2c	10262 2c-63	Please include reference citations for the assertion that if the current rate of ROW development continues designated corridors should adequately meet future needs over the life of the plan.	2067
10262 2c	10262 2c-9	BLM greater sage-grouse Key Habitat Areas in the Planning Area are arbitrarily designated and incompatible with the January 2010 Greater Sage-Grouse Habitat Management Policy on Wyoming Bureau of Land Management (BLM) Administered Public Lands including the Federal Mineral Estate memorandum authored by the Wyoming BLM State Director (State Director). The memorandum states that "WY BLM sage-grouse Key Habitat Areas correspond to the State of Wyoming's Core Population Areas (Core Areas)." Greater sage-grouse Key Habitat Areas (1,857,477 acres) do not correspond with Core Areas (1,786,237 acres) in the Planning Area. To comply with the order of the BLM State Director, the agency-designated Key Habitat Areas in the Planning Area shall not be recognized, only the Core Population Areas designated by the State of Wyoming as described in Executive Order 2011-5.	2069
10262 2c	10262 2c-10	Management by state agencies should focus on the maintenance and enhancement of Greater Sage-Grouse habitats, populations and connectivity areas identified in Attachment A. Absent substantial and compelling information, these Core Population Areas should not be altered for at least five (5) years. Constraints on domestic livestock grazing, oil, gas, and mining development projects, and the travel management infrastructure due to the presence of greater sage-grouse core areas can be onerous to economic endeavors and recreational uses. In partnership with local governments and stakeholders, the BLM shall form an interdisciplinary team to review all greater sage-grouse core areas within the Planning Area every five years. In the event of "substantial and compelling information" that would include but is not limited to a considerable population increase or decrease, abandonment or deviation in use of one or more delineated core areas, and/or an alternation of vegetation (e.g. large-scale fire, invasive weed encroachment, plant disease) that removes minimum composition and cover requirements of greater sage-grouse, the interdisciplinary team shall convene within six months to review the core area(s) suitability and validity. Mitigations - Special Designations and Other Management Areas.	2071
10262 2c	10262 2c-17	As noted above, stated management challenges for greater sage-grouse are tantamount to a laundry list of problems facing the species throughout its range, not just the Planning Area. Challenges for the greater sage-grouse include: industrial development, livestock and wildlife grazing, mining, gravel pit operations, oil and gas activity, land exchanges and disposal, vegetation manipulation, fuel reduction projects, power lines and towers, and other activities. One or more of the preceding challenges may indeed be factual for greater sage-grouse. Without field-verified data it cannot be ascertained which are real or merely perceived challenges.	2071
10262 2d	10262 2d-1	The last paragraph on page 3-167 of the RMP/EIS, and continued on page 3-168, discusses Secretarial Order 3310. Revision is required in this paragraph by	2027

Individual Comments and Index to Summary Comments and Summary Responses**

Table B-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
		discussing the memorandum released on June 1, 2011 by Secretary of the Interior Ken Salazar, which states that there will be no public funding for Wild Lands. The memorandum directs the BLM to not designate any lands as Wild Lands. Either include the policy changes per the June 1 memorandum or remove all Wild Lands discussion from the entire RMP/EIS.	
10262 2d	10262 2d-10	The BLM shall cite the acreage difference used to calculate the percentage reported for long-term surface disturbance and the data and source of the acreage noted in the first paragraph of this section on page 4-359 of the RMP/EIS.	2027
10262 2d	10262 2d-11	The BLM shall cite the data source and methodology for determining the acres of long-term surface disturbance noted in the first paragraph of this section on page 4-361 of the RMP/EIS.	2027
10262 2d	10262 2d-12	Page 4-361 of the RMP/EIS uses the general term "management areas." The BLM shall replace this generic term with the specific names of management areas.	2027
10262 2d	10262 2d-13	The BLM shall cite the acreage difference used to calculate the percentage reported for long-term surface disturbance noted in the first paragraph on page 4-362 of the RMP/EIS.	2027
10262 2d	10262 2d-14	As cooperating agencies, the LGCA respectfully requests direct involvement in the BLM's re-inventory process of LWCs. The request is based on CEQ 1501.6 (a) 2., FLPMA Section 20, and the Federal Register (FR) Vol. 70, No. 55 from March 23, 2005 that amends 43 Code of Federal Regulations Part 1610.4-3 (pg. 14562): Section 1610.4-3 Inventory Data and Information Collection We revised the first sentence of this section to instruct Field Managers to collaborate with cooperating agencies in arranging for the collection of data and information. Other changes for this section are editorial, and do not affect the substance of this rule. Other than a minor word change (deleting "participating" from "participating cooperating agencies"), this section remains as proposed. The amended language is as follows (FR Vol. 70, No. 55, pg. 14566): 1610.4-3 Inventory data and information collection. The Field Manager in collaboration with any cooperating agencies, will arrange for resource, environmental, social, economic, and institutional data and information to be collected, or assembled if already available.*** Direct involvement of the LGCA in the BLM LWC re-inventory process of will be a two part process. Part one will involve a webinar review between the LGCA and Caleb Hiner (BLM Project Lead) of all 56 LWC GIS polygons to compare the BLM LWC Inventory to the LGCA LWC Inventory. Inclusion of additional BLM specialists designated by Mr. Hiner as essential to this review process will be welcomed. The comparison will consist of a detailed review of all GIS data sets available and the structures found in each LWC. Review discussions will focus on structures found within LWCs that detract from wilderness characteristics. Re-designation of LWCs by the BLM, derived from the review process, will be evaluated in part two of the process. Part two will include webinar reviews of the BLM re-designated LWCs with a Bighorn Basin county commissioner and/or conservation district representative from the county in which the LWC is located. The BLM will provide their methodology and cause of re-designation for discussion with the LGCA representatives. Based on local knowledge and input of the LGCA, the BLM shall be open to further re-designations. The LGCA asserts that the two-part process would conform to the laws set forth by the Federal Register Vol. 70, No. 55 Section 1610.4-3 from March 23, 2005. All discussions and re-designations shall conform to the BLM	2027

Individual Comments and Index to Summary Comments and Summary Responses**

Table B-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
		LWC inventory guidelines and the Wilderness Act of 1964.	
10262 2d	10262 2d-2	The second paragraph on page 3-168 of the RMP/EIS states that the inventory processes performed by the BLM is consistent with the process for conducting such inventories and the paragraph describes three points concerning the steps involved in the process. The LWC inventory performed is in conflict with this protocol and this is supported by the fact that the BLM did not inventory for roads and the Cody Field Office did not produce maps of the LWCs. Please remove these statements unless the inventory is corrected to reflect the guidelines set forth by BLM Manual 6301.	2027
10262 2d	10262 2d-3	The fourth paragraph on page 4-168 of the RMP/EIS discusses resource values including naturalness, solitude, and primitive recreation. Add the word “apparent” to read “apparent naturalness.” The BLM inventory guidelines use “apparent naturalness,” not “natural integrity.”	2027
10262 2d	10262 2d-4	Further, the BLM does not assess naturalness from a biological, vegetative, or scientific standpoint. The BLM version of naturalness for their wilderness characteristics inventory is essentially defined by whether or not an area looks natural to someone who may not have knowledge of the difference between natural and human-affected ecosystems. This should not be the basis for any land use planning or scientific inventory. In the same paragraph it is stated that some smaller LWCs, less than 5,000 acres, are contiguous with WSAs or are of sufficient size to manage for wilderness characteristics. That is not the case. Most LWCs adjacent to WSAs are separated from the WSAs by a road, making them noncontiguous.	2027
10262 2d	10262 2d-5	Also, several LWCs are less than 1,000 acres, which likely make them unmanageable in size (See Appendix A).	2027
10262 2d	10262 2d-6	This paragraph also discusses that impairing wilderness characteristics is appropriate within applicable requirements. The BLM must add additional language concerning lawful valid existing oil and gas leases and mining claims and rights to clarify this statement.	2027
10262 2d	10262 2d-7	The second full paragraph on page 4-355 of the RMP/EIS states “adverse impacts to LWCs occur when natural conditions are compromised.” The BLM shall add “apparent” in front of naturalness and remove the word “conditions.”	2027
10262 2d	10262 2d-8	The first paragraph of this section discusses how motorized vehicle use disturbs vegetation and contributes to the spread of noxious weeds, resulting in the degradation of native vegetation and diminishment of wilderness characteristics. That statement is true. However, the BLM guidelines do not reference native vegetation in assessing apparent naturalness for the determination of wilderness characteristics. In fact, the BLM advises against it. The LGCA LWC Inventory did account for noxious weeds and their effects on naturalness in the inventory (Appendix A). It is contradictory for the BLM LWC Inventory to assess naturalness on a non-scientific basis and the RMP/EIS to discuss native vegetation effects on wilderness characteristics. The BLM should correct their LWC inventory and inventory procedures to reflect inventories based on ecological naturalness, not apparent naturalness.	2027
10262 2d	10262 2d-9	The BLM shall cite the data source and methodology for determining the acres of long-term surface disturbance noted in the first paragraph of this section on page 4-356 of the RMP/EIS.	2027
10262 2d	10262 2d-16	Absaroka Mountain Foothills SRMA - If the goal of the management in this area is for semi-primitive motorized and non-motorized recreation, the RMP/EIS	2062

**Attachment B – Draft Resource Management Plan and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table B-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
		should provide more access in Travel Management designations from “limited to designated roads and trails” to “limited to existing roads and trails” in areas outside special designations such as Wilderness Study Areas and ACECs. This will provide for a more balanced approach to management.	
10262 2d	10262 2d-17	Bighorn River SRMA - Provide the names and numbers of river access sites that are available to the public. Also include whether or not undeveloped access is available.	2062
10262 2d	10262 2d-18	The last paragraph of this section lists the ERMAs located in the Planning Area. Include the Bighorn Basin ERMA in this list. It is listed in the Alternative D GIS file but not in the Alternative A GIS file. According to Caleb Hiner, BLM RMP Lead, the Bighorn Basin ERMA is all the lands left over after the current designations have been made.	2062
10262 2d	10262 2d-19	On page 4-332 of the RMP/EIS in the second bullet, there is no citation listed to support the statement. Corrective Action: Please provide a reference that supports the statement “because of less interest by younger generations, the number of hunters will decrease.”	2062
10262 2d	10262 2d-20	The last sentence on page 4-332 of the RMP/EIS states: Although Alternative D manages less acreage in SRMAs than Alternative A, by managing these areas for the realization of benefits by maintaining the desired RSCC, SRMAs under Alternative D would result in more beneficial impacts to recreation experiences than under Alternative A. A result in beneficial impacts to recreation is not clarified. Please clarify benefits. Do these changes benefit primitive or motorized recreationists? If primitive recreationists are benefitted by closing roads for example, then motorized recreationists are impacted, not benefitted, and vice versa. Change this sentence to clarify which type of recreation is benefitted or state how both forms of recreation is benefitted.	2062
10262 2d	10262 2d-21	Impacts Common to All Alternatives On page 4-333 of the RMP/EIS in the first paragraph under Resource Uses, there is no citation listed to support the statement. Please provide a reference to research that supports the second sentence, “The industrialized character”	2062
10262 2d	10262 2d-22	On page 4-333 of the RMP/EIS, the last sentence under Resource Uses states that mineral development would cause mostly adverse impacts to recreation. Please discuss the increase in access that may be provided by mineral production and the beneficial impacts to motorized recreation and access.	2062
10262 2d	10262 2d-23	The last paragraph on page 4-333 of the RMP/EIS under Resource Uses discusses the negative short-term impacts of mining on recreation and wildlife. There is no discussion of the long-term benefits of reclamation, post mining. Reclamation can provide renewed biodiversity. Reclamation can establish a native and natural setting that is superior, in some cases, to the surrounding landscapes. Please discuss the long-term benefits of reclamation to habitat and recreation.	2062
10262 2d	10262 2d-24	On page 4-334 of the RMP/EIS in the first sentence of the third paragraph, this statement could imply that only non-motorized recreation users are seeking solitude and allowing motorized use “degrades” the setting. Corrective Action: Edit last part of sentence. “while impairing those recreation users seeking a non-motorized recreation experience” at the end of the sentence.	2062
10262 2d	10262 2d-26	The paragraph further states that off-road motorized use for livestock support would create new trails causing new conflicts, contrast elements to the scenic characteristics, and would interfere with recreationists goals, experience, and	2062

**Attachment B – Draft Resource Management Plan and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table B-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
		benefits. The paragraph does not discuss the benefits of new trails to motorized recreationists. Clarify these impacts are to primitive recreationists and further, support the benefits of new trails to motorized recreationists.	
10262 2d	10262 2d-27	The third paragraph on page 4-335 of the RMP/EIS under Resources discusses the impacts of fire to recreation. It states that long-term wildland fire impacts may degrade and displace recreation but would also create new recreation opportunities. Please name these new opportunities resulting from wildland fires and cite references documenting these opportunities.	2062
10262 2d	10262 2d-28	The first paragraph on page 4-336 of the RMP/EIS discusses that the modification of the natural environment in VRM class III and IV may detract from recreational activities for the primitive recreationists. Please add discussion on how these alterations may benefit motorized recreationists from a new road and trail and access perspective.	2062
10262 2d	10262 2d-30	The first paragraph on page 4-340 of the RMP/EIS discusses the recreational use of the Spirit Mountain cave and the managing of cave and karst resources under the Worland Caves SRMA to provide recreation opportunities. According to Caleb Hiner, BLM RMP Lead, the Worland Caves SRMA location is sensitive information. The LGCA discovered this during a phone conversation with Mr. Hiner in an attempt to gather accurate, complete RMA GIS files. If the location of the Worland Caves SRMA is sensitive information and not divulged to the cooperating agencies, let alone the public, how does this area provide recreational opportunities? This needs to be clarified. If the Worland Caves SRMA is providing recreational opportunities then the location should be divulged and the GIS file provided to the LGCA or if the location is indeed sensitive then the Worland Cave SRMA would not provide for recreational opportunities and the statements should be removed.	2062
10262 2d	10262 2d-31	The third paragraph on page 4-340 of the RMP/EIS discloses that 30,000 acres will be affected from projected timber harvest. The BLM will cite the source and data for which this information was derived.	2062
10262 2d	10262 2d-32	On page 4-341 of the RMP/EIS, Table 4-15 in the first paragraph under RMAs identifies seven SRMAs rather than eight as noted in the text. Corrective Action: Please edit text to the correct number.	2062
10262 2d	10262 2d-33	On page 4-341 of the RMP/EIS, the second paragraph in the SRMAs section discusses applying NSOs on all or part of the listed SRMAs. The BLM will correct the paragraph by adding discussion of which SRMAs are all NSO and which are partially NSO, as well as list the acres or percentages of NSO for each SRMA.	2062
10262 2d	10262 2d-34	In the first paragraph on page 4-342 of the RMP/EIS, the last sentence discusses Rattlesnake Ridge health risks from high levels of H2S gas potential from OHV use in the area. The BLM will cite the data source of this information and what exposure ranges are considered high risk. Also the BLM must discuss the levels of H2S gas currently in the area.	2062
10262 2d	10262 2d-35	The first paragraph on page 4-342 of the RMP/EIS states 10,882 acres of long term disturbance. The BLM will cite the data and source of these acres.	2062
10262 2d	10262 2d-36	The first paragraph in this section, on page 4-342 of the RMP/EIS, states 5,000 acres of long term projected surface disturbance from mining. The BLM will cite the data and source of these acres.	2062
10262 2d	10262 2d-37	The second paragraph on page 4-345 of the RMP/EIS states a projected timber harvest of 20,000 acres. The BLM will cite the data and source of these acres.	2062
10262 2d	10262 2d-	The third paragraph on page 4-345 of the RMP/EIS discusses using vegetation	2062

Table B-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
	38	treatments to manage towards 75% Historical Climax Plant Community (HCPC). The BLM will cite the source of why 75% HCPC is desired. Also see vegetation comments concerning this issue.	
10262 2d	10262 2d-39	The fifth paragraph on page 4-345 of the RMP/EIS discusses how impacts of cultural sites are similar to Common to All Alternatives, but to a greater extent. The BLM will rewrite this sentence because the impacts from cultural sites by alternative would not be similar given the buffer for protection of cultural sites varies greatly by alternative	2062
10262 2d	10262 2d-15	2. In the Final RMP/EIS, the BLM shall assess the percentage of ROW corridor capacity that is currently in use, and use that information to revise ROW corridor designations for all alternatives. The LGCA will provide a map and GIS shapefile of proposed new Alternative D ROW corridors.	2067
10262 part 2a	10262 part2a-7	On page 5-514 it states that surface-disturbing activities (e.g., construction of well pads and roads, pits and reservoirs, pipelines and power lines, mining, and vegetation treatments), OHV use, fire and fuels management, some recreational activities, concentrated herbivory, and operation and maintenance of existing facilities and infrastructure in the Planning Area would cause fugitive dust, exhaust emissions, and smoke, thereby adversely affecting air quality through the release of HAPs, VOCs, CO, SO ₂ , NO, and PM ₁₀ into the atmosphere. In addition, these activities would release CO ₂ , CH ₄ (primarily from livestock grazing), and other GHGs into the atmosphere.	2009
10262 part 2a	10262 part2a-8	Additionally, please remove concentrated herbivory and (primarily from livestock grazing) as these activities are not considered surface-disturbing activities.	2011
10265	10265-2	The Draft RMP fails to sufficiently describe the width of the preferred ROW corridors. Each of the alternatives in the Draft RMP describes acreage available for ROW corridors. However there is no accompanying narrative that describes the actual width of any specific corridor. The calculation of the acreage available in the ROW corridors necessarily included an assumption of width and length of the ROW corridors but those assumptions are not stated. The WPA is concerned that without an explicit discussion of the width of the corridors that it is impossible for the WPA or other interested parties to analyze whether any given corridor is “used up” by existing infrastructure.	2066
10265	10265-3	The Draft RMP fails to include a ROW corridor along an existing large diameter natural gas pipeline currently providing critical service within and through the basin There is currently a 16-inch diameter interstate natural gas pipeline operated by Colorado Interstate Gas Company that trends along a north south axis through the middle of the Bighorn Basin. This existing line and ROW is acknowledged on Map 51. The Draft RMP states that at renewal, existing ROW agreements will be preserved and “allowed to continue without cost prohibitive restrictions where appropriate.” (Emphasis added). 3(Footnote: 3“Draft”RMP,“Volume”II,“p.”45311”). However, in spite of the recognition that activity will continue along that existing 16-inch diameter interstate natural gas transmission line, the ROW corridor associated with that existing 16-inch line is absent from alternatives B, C and D and maps 52, 53 and 54 respectively. No discussion is provided in the Draft RMP to account for the elimination of this specific existing ROW corridor from consideration as a corridor for future ROW demands.	2066
10265	10265-1	1. The Draft RMP fails to account for ROW that will be required for a carbon dioxide pipeline in the Bighorn Basin The analysis of the ROW requirements	2067

**Attachment B – Draft Resource Management Plan and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table B-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
		under the four alternatives is focused on the movement of oil and gas out of the Bighorn Basin. The focus of the Draft RMP on the movement of products out of the Bighorn Basin is evident from the statement in the Draft RMP: "Oil and gas production in the Planning Area is expected to continue to come from established fields that already have adequate infrastructure such as roads, power lines, and gathering/transmission lines" 1. The addition of a carbon dioxide pipeline to the Bighorn Basin requires an analysis of the ability of the ROW corridors in the various alternatives to support the addition of a carbon dioxide pipeline and the necessary lateral lines that would move carbon dioxide from a trunk carbon dioxide pipeline system to individual areas suitable for enhanced oil recovery activity. The development of a carbon dioxide pipeline in the Bighorn Basin is supported by an abundance of recent commercial activity related to carbon dioxide supply and pipelines in Wyoming. Denbury Resources Inc. ("Denbury") is currently constructing approximately 230 miles of 20-inch diameter pipeline to move carbon dioxide from the Lost Cabin Gas Treating Plant (the "Lost Cabin Plant") in Fremont County, Wyoming to locations in the Powder River Basin and beyond. The supply of carbon dioxide at the Lost Cabin Plant is approximately 50,000 thousand cubic feet ("mcf") per day.	
10262_part 3	10262_part 3-43	Chapter 3, in the Draft RMP/EIS needs to provide specific data in the existing condition section to support ACEC designation. The Chapter 3 information on ACECs is not adequate to justify the need for special management nor does it describe the detail noted in the CEQ requirements for the affected environment (Sec. 1502.15 Affected environment. "Data and analyses in a statement shall be commensurate with the importance of the impact, with less important material summarized, consolidated, or simply referenced." The LGCA believes that the ACEC designation is very important and the BLM needs the best data available to make these decisions. The BLM Planning Handbook notes: Designate ACECs and identify goals, standards, and objectives for each area, as well as general management practices and uses, including necessary constraints and mitigation measures (also see BLM Manual 1613). This direction should be specific enough to minimize the need for subsequent ACEC management plans. ACECs must meet the relevance and importance criteria in 43 CFR 1610.7-2(a) and must require special management (43 CFR 1601.0-5(a)) to: a) Protect the area and prevent irreparable damage to resources or natural systems; and, b) Protect life and promote safety in areas where natural hazards exist. Given the long term history of use of resources in the Bighorn Basin, we have not seen compelling rationale that these areas "require special management" as noted in the special area designation section of the BLM Planning Handbook.	2001
10262_part 3	10262_part 3-44	The first paragraph under the Big Cedar Ridge section lacks citations for the fossilized plants found within the area. The BLM will provide citations for the research documenting the fossilized plant communities found, and the rationale for, preservation of these plant communities.	2001
10262_part 3	10262_part 3-45	This paragraph also states that fossilized plant communities are very rare. The BLM must cite the source that discloses that the plant communities are very rare.	2001
10262_part 3	10262_part 3-46	The second paragraph, under the Big Cedar Ridge section, discusses the popular recreational activity of fossil collecting within this ACEC. It seems contradictory that the ACEC is designated to protect the intact fossil record but the public is allowed to collect and remove fossils. The BLM should either protect this area, with substantiated documentation, or remove the ACEC designation to allow for	2001

**Attachment B – Draft Resource Management Plan and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table B-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
		recreational fossil collecting.	
10262_part 3	10262_part 3-47	The first paragraph under the Red Gulch Dinosaur Tracksite section states that the tracksites are one of only a few found in the world. This is the first of three similar statements. Are the few that are found in the world all in Wyoming? The BLM shall cite the source of this information and identify the other known areas of dinosaur track occurrences in or outside of Wyoming.	2001
10262_part 3	10262_part 3-48	The Spanish Point Karst ACEC designation is proclaimed as needed because the area is an important recharge source for the Madison Aquifer. The Madison Aquifer is found beneath eight states in the U.S. and Canada: Montana, North Dakota, Wyoming, South Dakota, Nebraska, Alberta, Saskatchewan, and Manitoba. Limestone, Madison limestone in particular, rims the western flank of the Big Horn Mountains where Spanish Point Karst ACEC is found. Substantiate this ACEC designation by citing research that validates this area as of greater importance than other areas in the Big Horn Mountains with similar geologic and hydrologic settings or remove the ACEC designation.	2001
10262_part 3	10262_part 3-49	The Carter Mountain ACEC designation cites protecting fragile soils and alpine tundra. Why are these soils deemed fragile? Alpine tundra exists throughout the Beartooth Plateau and Absaroka Mountains. What makes this area of tundra more important and deserved of protection than other areas of alpine tundra? Cite the research that delineates these soils as fragile and the research separating the alpine tundra on Carter Mountain as more important than other areas of alpine tundra.	2001
10262_part 3	10262_part 3-50	The BLM cites the scenic value as well, as elk and mule deer winter ranges, for proposed expansion of the Carter Mountain ACEC. Scenic areas and winter ranges exist throughout the entire Absaroka Front. Cite the research that separates this area of scenic beauty from other beautiful areas on the Absaroka Front.	2001
10262_part 3	10262_part 3-51	Also, cite the research substantiating that this area of crucial winter range is more important than other crucial winter ranges. If the BLM cannot substantiate the scientific facts presented to expand the Carter Mountain ACEC, then the ACEC designation should be removed.	2001
10262_part 3	10262_part 3-52	The Carter Mountain ACEC proposed expansion cites the same fragile soils, alpine tundra, and crucial winter range without any references to validate this information. It also states that raptors, a BLM special status species, and special status species plants are found in the area. There is not a list of raptors or plants, or reference to data to support this claim. Provide the references to this information or remove the ACEC designation.	2001
10262_part 3	10262_part 3-53	The Five Springs Falls ACEC designation is based on four nearby endemic rare and sensitive plant species. The plant species are not listed and neither is a data source(s) for this information. Cite the source of the information used in the ACEC designation or remove the ACEC designation.	2001
10262_part 3	10262_part 3-54	The Little Mountain ACEC is proposed for expansion in part to protect potential lynx habitat. The area contains six lynx analysis units (LAU), three of which contain very little forested vegetation (2009 NAIP aerial photo review); one of which is an island of forested vegetation surrounded by open sage/grasslands, removing connectivity to other forested areas. The three forested LAUs appear to have multi-storied hare habitat on the northern and eastern aspects indicative of the thick coarse texture of the forest vegetation disclosed on the 2009 NAIP aerial photos. All forested areas within the LAUs are narrow stringers	2001

**Attachment B – Draft Resource Management Plan and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table B-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
		of forest, not large expansive forested areas typical of potential/suitable lynx habitat. Only 6,821 out of 89,145 acres are in LAUs, half of which are at best questionable. There are no known occurrences of lynx or critical lynx habitat in the Planning Area. Removal of the potential lynx habitat as one criterion for the ACEC expansion nomination must occur by the BLM. The BLM should consider reviewing expansion, only incorporating within the ACEC the curl-leaf mountain mahogany area for protection. Greater sage-grouse habitat and winter range can be found throughout the entire Planning Area, making the remaining motives for this ACEC expansion dubious. The BLM should either provide a solid science-based justification for this expansion or remove the expansion altogether.	
10262_part 3	10262_part 3-55	The Chapman Bench proposed ACEC rationale cites sagebrush habitat used by sensitive bird species and other wildlife. Sage grouse, mountain plover, and long-billed curlew are cited to use the area. The sensitive bird species have evolved over time to thrive in disturbed areas (Beauvais and Smith 2003; Dechant et al. 2002b; Knopf and Wunder 2006; Manning and White 2001). Why protect this area from surface disturbance when the sensitive species in the area thrive on surface disturbance? Remove the NSO and replace the constraint with a TLS for breeding/rearing seasons on Chapman Bench ACEC to allow surface disturbance commensurate with the disturbance regimes needed by these sensitive species.	2001
10262_part 3	10262_part 3-56	Also, there is no map, data, or references to show where the Audubon Society important bird area actually is located. The BLM must cite this information, as it is a rationale component for designating Chapman Bench an ACEC.	2001
10262_part 3	10262_part 3-57	The Rainbow Canyon is proposed for ACEC status due to the Cloverly Formation and scenic badlands. This designation seem arbitrary as there are large areas of badlands in the Bighorn Basin that are scenic, and the Cloverly Formation rims a significant portion of the foothills of the Big Horn Mountains (GIS Bedrock 500K map review). What makes this area outstanding compared to other areas of scenic beauty within the Cloverly Formation along the foothills of the Big Horn Mountains? There is no substantive rationale for this designation and the BLM should remove the proposed ACEC designation.	2001
10262_part 3	10262_part 3-58	Rattlesnake Mountain is proposed for ACEC designation by the BLM. Yet, the agency rationale for designation is generalized, without any supporting documentation. Winter ranges occur throughout the Absaroka Front, while elk parturition areas are an out of date concept. Parturition areas are ever changing with the reintroduction of wolves and an expanding grizzly bear population. The cold water fishery of the North Fork of the Shoshone River is misrepresented when considering that no reach of the river flows through the proposed ACEC. Sensitive plants species, cited as a portion of the designation, are not identified. Either cite the research, data, and analysis of these designation rationales or remove the ACEC designation.	2001
10262_part 3	10262_part 3-59	As with Rattlesnake Mountain, the criteria disclosed by the BLM for proposing Sheep Mountain as an ACEC is generalized and sans research, data, or analysis citations. Winter ranges are found up and down the Absaroka Front and parturition areas for elk are an out of date designation. Parturition areas are ever changing with the re-introduction of the wolves and the thriving grizzly bear population. The existence of potential lynx habitat is misleading since there are no LAUs within the area, it is almost completely lacking of forested vegetation, there is no defined lynx habitat, and no critical lynx habitat in the	2001

**Attachment B – Draft Resource Management Plan and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table B-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
		area. Are the visual alignments of the solstice not available in the Rattlesnake Mountain ACEC, which is only 3.5 miles away? Are there not other areas providing visual alignment of the solstice? The BLM shall remove the ACEC designation or properly substantiate the designations with research, data, and analysis.	
10262_part 3	10262_part 3-60	However, each proposed ACEC lacks references, data, and analysis to substantiate the claims extended by the BLM. CEQ Section 1502.15 mandates that data and analysis in a statement shall be commensurate with the importance of the impact, with less important material summarized, consolidated, or simply referenced. Along with ACEC designation, come major management actions or restrictions on multiple uses and resource development. Restrictions on resource development cause major socioeconomic impacts. CEQ Section 1502.15 states less important material are at the least referenced. ACEC designations are far beyond “less important,” yet the BLM fails to cite or reference data or analysis for the ACEC designations. The BLM will cite all research, data, and analyses used for the ACEC designations or remove them from potential nomination.	2001
10262_part 3	10262_part 3-16	There are also several areas in the management action Table 2-5 (RMP/EIS pg. 2-160 - 162) that states management must be consistent with “other resource objectives,” but does not disclose which resources or objectives. These other resource management actions could have significant impacts to livestock grazing but are not disclosed in the RMP/EIS. If management actions cannot be identified or disclosed that is not “consistent with other resource objectives” then this statement should be removed from all management actions.	2011
10262_part 3	10262_part 3-18	In Table 2-5 Objective LR10.2 provides for the establishment of voluntary reserve common allotments but they are not defined or locatable on any maps. Please provide a definition of reserve common allotments, where they are located, the AUMs available on these allotments, the management actions associated with these areas, who will qualify to use them, what are the impacts to AUMs and will grazing preference be maintained for these allotments?	2011
10262_part 3	10262_part 3-19	Record 6281 of Table 2-5 references Appendix W in Alternative A and carries this management action to Alternative D. However, Appendix W is Utilization Levels which is one component of an AMP. Change Alternative D to Same as Alternative C. This is more appropriate because it ties forage availability to Appendix W.	2011
10262_part 3	10262_part 3-20	Record 6283 Alternative D management action is confusing. Is livestock utilization not an appropriate use of produced water because of other resources? Please clarify what other resources would be considered or change the management action to the same as Alternative A.	2011
10262_part 3	10262_part 3-21	In Table 2-6 Summary of Environmental Consequences by Alternative it displays impacts to AUMs by closures or surface disturbing activities. There is no disclosure of impacts due to conflicts, inconsistencies or whether livestock grazing is compatible with other resource uses or changes in utilization levels. For example, on page 2-80 in Table 2-5 the Sage Grouse Objective BR: 9.1 states “Maintain large patches of high quality sagebrush habitats, with emphasis on patches occupied by greater sage-grouse.” Is this objective compatible with livestock grazing? With 1.8 million acres identified as key sage-grouse habitat, the public needs to know what uses are in conflict, inconsistent or incompatible with livestock grazing in order to understand the impact this objective will have on livestock grazing.	2011

Individual Comments and Index to Summary Comments and Summary Responses**

Table B-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
10262_part 3	10262_part 3-22	In addition, in Appendix W - Utilization there is a footnote one to Table W-1 which states in part that where extensive wildlife use occurs utilization levels may need to be adjusted downward to ensure that total utilization of current year's growth following the use period of wildlife does not exceed the prescribed level of dormant use. Why is wildlife use being given priority over grazing? What are the impacts of this policy? Additionally, why did the BLM not analyze changing levels of utilization by alternative?	2011
10262_part 3	10262_part 3-23	Prior to any reduction in AUMs or adjustments in utilization levels due to wildlife use the RMP should direct the BLM to provide multiple year monitoring data to support the reductions and provide reasonable alternative areas to graze to replace the AUMs lost due to excess wildlife use. No AUMs will be reduced due to excessive wildlife use in areas where wildlife population objectives have been met or exceeded.	2011
10262_part 3	10262_part 3-25	Prior to any changes in grazing management because rangeland objectives are not being met the BLM must provide multiple year monitoring data (3 of 5 years) to document that grazing is the cause. If other resource uses are the cause of rangeland objectives not being met then that resource use will be changed. No changes in grazing management will be implemented as a result of other resources not meeting rangeland standards. Or if the resource has been used to a degree where livestock grazing is not available other reasonable areas will be provided to replace lost AUMs as a result of other resource use.	2011
10262_part 3	10262_part 3-26	Animal Unit Month Allocations The use of the terms active use, permitted use and authorized use are confusing. Is active and authorized use the same? For long-term planning purposes which use can operators plan on and why is there no mention of grazing preference and those AUMs? Please include a description of these terms, include grazing preference and AUMs held in suspension in the existing conditions so it is clear what is potentially allowed for grazing.	2011
10262_part 3	10262_part 3-27	In Appendix P the AUMs in column 7 are labeled Active Use however there should also be a column for Preference which includes active use and use held in suspension. This will disclose the total number of animal unit months on public lands apportioned and attached to base property owned or controlled by a permittee, lessee, or an applicant for a permit or lease.	2011
10262_part 3	10262_part 3-31	Please provide the AUMs that could be affected due to maintenance of sagebrush and understory diversity in crucial seasonal greater sage-grouse habitat. If DPC is going to be used to regulate livestock grazing please provide the number of acres that have achieved DPC (or not) and the impacts to grazing as a result of DPC.	2011
10262_part 3	10262_part 3-33	Please provide the policy, law, or regulation that allows preferential use by wildlife over livestock.	2011
10262_part 3	10262_part 3-34	Provide the impacts for management action that limit, reduce, or prohibit AUMs.	2011
10262_part 3	10262_part 3-35	Please provide the data and best available science to support the designation of elk parturition habitat to justify no grazing in these areas.	2011
10262_part 3	10262_part 3-36	Please provide information on reserve common allotments and the environmental consequences they will have on livestock grazing.	2011
10262_part 3	10262_part 3-39	1. The BLM must remove footnote 1 from Table W-1 in Appendix W.	2011
10262_part	10262_part	However, there are a few topics which are not yet adequately addressed. In particular, the communities of place, under social organization and institution,	2046

Individual Comments and Index to Summary Comments and Summary Responses**

Table B-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
3	3-62	states that “Local and regional population centers relative to planning area effects may differ by community.”	
10262_part 3	10262_part 3-63	However, there are a few aspects which are not yet adequately addressed. The space aspect, for example, indicates that impact analysis should address impacts across multiple geographic scales. In particular, the impact analysis should assess how alternatives will affect individual communities within the Planning Area. However, the RMP/EIS describes impacts across the region as a whole, with no analysis of impacts to individual communities.	2046
10262_part 3	10262_part 3-64	The current alternatives of Chapter 2 contain little socioeconomic information. Section 2.3.7 Socioeconomic Resources in the RMP/EIS states that “None of the alternatives considered and subsequently eliminated from detailed analysis dealt with this resource.” However, in Section 2.3 Alternatives Considered but not Carried Forward for Further Analysis, these alternatives include topics such as: No new oil and gas leasing; Emphasize the protection of resources by removing human resources; Prohibit or exclude wind energy, oil and gas leasing, off-highway vehicle use, and livestock grazing; Suspend or eliminate all existing federal minerals leasing Each of these has the potential to affect the local communities. As the alternatives described in this section were not carried forward for detailed analysis the inclusion of these under socioeconomics should not substantially alter the preferred alternative. However, we felt it was important to highlight the lack of effort applied to the topic of socioeconomics.	2046
10262_part 3	10262_part 3-65	Table 2-4 in the RMP/EIS Key Terms and Concepts by Resource Area also highlights the lack of socioeconomic consideration. The only term or concept that pertains to socioeconomics is mitigation. This carries the implication that socioeconomics will not be considered until after all other decisions are made and then the effects to the local communities will be mitigated. Socioeconomics should also be listed for the following concepts or terms: Cooperation with agencies/government/landowners/stakeholders; Geothermal; Livestock grazing; Migration corridors; Mineral Leasing/Lease; Motorized vehicles concepts and terms; Oil and gas; Public Access; Rangeland; Recreation; Renewable energy (wind, biomass, solar); Timber harvest/firewood (personal use)/poles; Well (oil and gas); Withdrawal; Wyoming Standards for Health Rangelands Each of these resource topics has a potential effect of the human communities of the planning area. Alternatives dealing with these concepts should be considered from a socioeconomic viewpoint.	2046
10262_part 3	10262_part 3-66	On page 3-204, this section states that it “concerns the custom, culture, and history of the area as it relates to human settlement, as well as current social conditions.” However, the relevant sections simply refer the reader to a different section of the document, the Visual and Cultural Resources section. This referenced section does not contain economic and social history. This information is crucial to understanding the interconnectedness of the communities of the planning area to the lands under BLM management.	2046
10262_part 3	10262_part 3-67	On page 3-207, this section states that “at the local level, an aging population does not necessarily create substantial problems.” This statement does not consider the implications of a smaller portion of the population being of working age. The smaller portion of people working, coupled with the wage disparity between jobs in the mining industries and those in service industries, create a situation in which it is often difficult for employers to find workers at a wage they can pay. This can become a challenge for communities, particularly if the mining industry experiences a boom.	2046

**Attachment B – Draft Resource Management Plan and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table B-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
10262_part 3	10262_part 3-68	Transient populations in the oil and gas industry, particularly during boom years, are difficult to quantify. Also, many oil and gas workers live in a population center in one county, but work in another county. This is an important aspect of the population and the analysis would benefit from a more detailed description of these occurrences.	2046
10262_part 3	10262_part 3-69	On page 3-211, this section refers the reader the Cultural and Visual Resources Section. However, the referenced section contains no history of how the communities in the planning region developed. The role that mining and ranching had in developing and shaping the communities of the communities, and the importance of the multiple-use aspect of public lands, is vital to understanding how the communities are affected by policies of the RMP/EIS. For instance, in part due to revenues obtained from activities on federal lands, Wyoming residents pay no personal, state income tax. In addition, the growing role of recreation and amenity ranches is also important to understand the present conflicts.	2046
10262_part 3	10262_part 3-71	On page 3-217, this section states that “Because the BLM manages subsurface minerals in excess of the surface lands it administers, its decisions can have a potentially large effect on mining in the Planning Area. From an economic perspective, mining is a key contributor to the economic well-being of the Planning Area and therefore the BLM’s management decisions in this area could have a potentially large effect on economic conditions.” For this reason, it is imperative that the RMP/EIS adequately describes and quantifies that mining industry.	2046
10262_part 3	10262_part 3-72	The communities of the Planning Area value the multiple-use characteristic of the public lands. The majority of their public infrastructure is funded by oil and gas development, but they realize that sustainable use is important to the future recreational enjoyment of the lands. It is important to the LGCA that the costs and benefits of oil and gas exploration and development under each alternative are presented as accurately as possible to decision-makers. In order to accomplish this, economic benefits from oil and gas and costs of stipulations and mitigation should be provided in the highest level of detail possible.	2046
10262_part 3	10262_part 3-73	This section would benefit from data on travel and tourism in Park County that is attributable to Yellowstone National Park. This would help the reader to assess recreation attributable to BLM.	2046
10262_part 3	10262_part 3-74	Table 3-62 on page 3-220 details the trend in the increase in number of farms, accompanied by a decrease in the acres. A narrative describing this trend, subdividing large commercial ranches into small amenity based ranchettes, would help the reader understand the current state of ranching.	2046
10262_part 3	10262_part 3-75	The impacts by alternative described in the Environmental Consequences section are based on the data inputs described in Appendix X of the RMP/EIS, Economic Impact Analysis Methodology. Unfortunately, the input data for oil and gas is considered vastly underestimated by the LGCA and those in the oil and gas industry. Also, the ambiguity surrounding the possible reductions in AUMs by alternative has created inaccurate input data and impacts for ranching. By vastly underestimating the potential output of oil and gas in the Planning Region during the next twenty years, the RMP/EIS fails to accurately capture the impacts on the social and economic resources of the planning region. Table 4-5 and 4-7 of the RMP/EIS provide that projections for oil and gas wells and production during the 20 years of the plan based on the RFD. Alternative C, the highest production alternative, is projected to have 1,257	2046

**Attachment B – Draft Resource Management Plan and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table B-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
		wells drilled and decreasing production amounts each year of the plan for both oil and gas. An analysis conducted on the 571,278 acres of Lands with Wilderness Characteristics in the BLM’s original inventory, indicated the potential for 569 wells. These lands compose 18% of the surface area managed by BLM and 14% of the Federal Mineral Estate acres in the Planning Area. Carrying the potential to the remaining acres, our analysis indicates that the number of potential wells could be as high as 4,064 wells drilled.	
10262_part 3	10262_part 3-76	On the impact side, according to Table 4-23 of the RMP/EIS, the impacts on annual employment from oil and gas range from 505 jobs to 1,263 jobs. The LWC analysis indicated that the 14% of federal mineral lands have the potential to create 434 jobs annually from drilling and completion of wells (see Appendix C to this comment document - Economic Analysis of Lands with Wilderness Characteristics). If this is applied to the entire planning region the potential annual employment could be as high as 3,100 annual jobs. This is a vast difference from the RMP/EIS and according to industry experts may still be an underestimation.	2046
10262_part 3	10262_part 3-77	Neither the RFD nor the RMP/EIS analyzes the economic and employment potential of unconventional oil and gas plays in the Mowry Shale Formation of the Bighorn Basin. Additionally, the RMP/EIS does not adequately disclose the constraints associated with resources protections in the Mowry Shale Formation. To accurately assess constraints in the Mowry Shale Formation, the LGCA conducted a risk assessment (Map 1) (see Mineral Resources comments). Further, the LGCA used IMPLAN, an economic input-output model, to determine potential employment and tax revenue from the Mowry Shale Formation over the 20-year life of the RMP. The end product of modeling discloses that the Mowry Shale Formation could generate, depending on the level of constraints, from 1.2 million to 2.3 billion dollars in tax revenues (Table 16) and 632 to 11,499 direct employment opportunities (Table 17) over the estimated 20-year life of the RMP. The data included in Table 16 and Table 17 are estimates. Depending upon the actual volume of minerals in the Mowry Shale Formation, projections below could be lesser or greater. [Table 16 Potential Taxes Generated from the Mowry Shale Formation over the Life of the RMP] [Table 17 Employment Potential in Leased Acres of the Mowry Shale Formation over the Life of the RMP]	2046
10262_part 3	10262_part 3-79	2. The BLM will ensure that the data used from other resource areas is accurate. The BLM will consider an oil and gas boom scenario (based on new information such as Enhanced Oil Recovery) in the planning region and assist in the development of mitigation measures for oil and gas to follow should a boom occur. In addition, the BLM shall address the issue of the interconnectedness of large-scale ranches and BLM lands and how to mitigate should policies that result in reduction of useful AUMs occur.	2046
10262_part 3	10262_part 3-80	3. The BLM will include the social and economic history of the Bighorn Basin, in particular the interconnectedness of communities and public lands. This information is important to assess the social and economic role that the decisions of the BLM have on the communities.	2046
10262_part 3	10262_part 3-81	4. The BLM shall complete impact analyses for individual communities within the Planning Area. Each community is socioeconomically unique. Action alternative will have different impacts on individual communities.	2046
10262_part 3	10262_part 3-38	Upon review of the glossary definitions of surface disturbing activities, inconsistencies were discovered in the definitions between RMPs. According to	2054

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
		<p>Keith Grant and Dan Rice (LGCA members), Mr. Hiner reported that the definitions found within the glossary are policy and are consistent with the definitions of other RMPs. James K. Murkin, Acting Associate Wyoming State Director of the BLM, released Information Bulletin No. WY-2007-029 on September 4, 2007. The Information Bulletin, with the subject line "Guidance for Use of Standardized Surface Use Definitions," is germane to the incorrect definition of "surface disturbing activities" in the Draft RMP/EIS. As a guidance tool based on requests from field managers, Mr. Murkin prepared the bulletin to standardize the definitions of commonly used terms in RMPs and EISs. Clearly, by reviewing the five definitions below, the BLM has failed to implement the Information Bulletin. The following discloses the differences in definitions of surface disturbing activities between RMPs for Rawlins, Casper, Kemmerer, Grass Creek, and Bighorn Basin planning areas. Rawlins RMP: Surface Disturbance: Any action created through mechanized or mechanical means that would cause soil mixing or result in alteration or removal of soil or vegetation and expose the mineral soil to erosive processes. Used in the literal context of actual, physical disturbance and movement or removal of the land surface and vegetation. Examples of surface disturbance include construction of well pads, pits, reservoirs, pipelines, and facilities (e.g., parking lot and tanks). Casper RMP: Surface-disturbing Activities (or Surface Disturbance): The physical disturbance and movement or removal of land surface and vegetation. These activities range from the very minimal to the maximum types of surface disturbance associated with such things as off-road vehicle travel or use of mechanized, rubber-tired, or tracked equipment and vehicles; some timber cutting and forest silvicultural practices; excavation and development activities associated with use of heavy equipment for road, pipeline, power line and other types of construction; blasting; strip, pit, and underground mining and related activities, including ancillary facility construction; oil and gas well drilling and field construction or development and related activities; range improvement project construction; and recreation site construction. Kemmerer RMP: Surface-disturbing Activity: An action created through mechanized or mechanical means that would cause soil mixing or result in alteration or removal of soil or vegetation and expose the mineral soil to erosive processes. Used in the literal context of actual, physical disturbance and movement or removal of the land surface and vegetation. Examples of surface disturbance include construction of well pads, pits, reservoirs, pipelines, and facilities (e.g., parking lot and tanks). Grass Creek RMP: Surface-Disturbing Activities (or Surface Disturbance): The physical disturbance and movement or removal of the land surface and vegetation. It ranges from the very minimal to the maximum types of surface disturbance associated with such things as off-road vehicle travel or use of mechanized, rubber-tired, or tracked equipment and vehicles; some timber cutting and forest silvicultural practices; excavation and development activities associated with use of heavy equipment for road, pipeline, power line and other types of construction; blasting; strip, pit and underground mining and related activities, including ancillary facility construction; oil and gas well drilling and field construction or development and related activities; range improvement project construction; and recreation site construction. Bighorn Basin RMP Revision: Surface Disturbing Activities: These are Public Land resource uses/activities that disturb the endemic vegetation, surface geologic features, and/or surface/near surface soil resources beyond ambient site conditions. Examples of surface disturbing activities include: construction of well pads and</p>

Individual Comments and Index to Summary Comments and Summary Responses**

Table B-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
		roads, pits and reservoirs, pipelines and power lines, and most types of vegetation treatments (e.g., prescribed fire, etc.). NOTE: Some resource uses, commodity production and other actions that remove vegetative growth, geologic materials, or soils (e.g., livestock grazing, wildlife browsing, timber harvesting, sand and gravel pits, etc.) are allowed, and in some instances formally authorized, on the Public Lands. When utilized as a land use restriction (e.g., No Surface Disturbing Activities), this phrase prohibits all resource use or activity, except those uses and activities that are specifically authorized, likely to disturb the endemic vegetation, surface geologic features, and surface/near surface soils. Review of the preceding definitions revealed that only the Draft Bighorn Basin RMP is considering livestock grazing, wildlife browsing, and surface fire disturbance activities. This inclusion is inconsistent with other surface disturbing activities RMP glossary definitions. Surface disturbing activities should be limited to mechanical means, especially when there is a change in soil composition. This would remain consistent with other RMP definitions. The BLM must remove livestock grazing, wildlife browsing, and fire from the definition of surface disturbing activities to remain consistent with other RMP definitions. The Grass Creek RMP definition is very clear and should be used in the Big Horn Basin RMP. It does not consider livestock grazing and wildlife browsing as surface disturbing activities as is implied in the Big Horn Basin Draft RMP definition. The implication in the definition that unless “authorized” grazing and wildlife browsing is considered surface disturbing needs to be supported by some research or the best available science for this determination.	
10262_part 3	10262_part 3-1	The first paragraph in this section on page 4-347 of the RMP/EIS states 41,545 acres of long-term surface disturbance is projected. The BLM will cite the data and source of this information.	2062
10262_part 3	10262_part 3-10	The last paragraph on page 4-352 of the RMP/EIS discusses forest management and silviculture techniques. Previous sections for each alternative have disclosed the amount of projected timber harvest acres. The BLM will disclose timber harvest acres for Alternative D and cite the data and source of the information.	2062
10262_part 3	10262_part 3-11	The first paragraph on page 4-353 of the RMP/EIS discusses vegetation treatments managing toward a 65% HCPC. The BLM will cite the data and source for this information. Also, see vegetation section for comments regarding this issue.	2062
10262_part 3	10262_part 3-12	The second paragraph under the RMA section on page 4-353 of the RMP/EIS discusses the 12 SRMAs are substantially smaller in Alternative D than A. What is substantially smaller? The BLM will cite the acreage difference.	2062
10262_part 3	10262_part 3-13	2. The Recreation sections of this RMP/EIS mentions in several places the Recreation Setting Characteristics Condition (RSCC). It discusses maintaining the RSCC and retaining the RSCC. The document does not describe what the RSCC is for any of the areas where the BLM will be maintaining or retaining the RSCC. The BLM will describe the desired RSCC for all areas in which the RSCC is mentioned and not explained. The BLM will relate the desired RSCC to the mineral constraints or surface occupancy restrictions within each SRMA, ERMA, and RMZ. In addition, the BLM will provide the data and research conducted to rationalize the decisions on surface occupancy restrictions. If the BLM cannot provide the data and research rationale of the surface constraints in relation to the RSCC then they shall not impose those restraints specific to the SRMAs,	2062

Individual Comments and Index to Summary Comments and Summary Responses**

Table B-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
		ERMAs, and RMZs.	
10262_part 3	10262_part 3-2	The first paragraph of this section states 10,000 acres of long-term disturbance are projected from mining. The BLM will cite the data and source of this information.	2062
10262_part 3	10262_part 3-3	The last paragraph on page 4-348 of the RMP/EIS discusses adverse impacts to local tourism from the lack of WSR designations. The BLM will cite the number of tourists that visited the WSRs and the revenue generated from these tourists. Also, cite the anticipated loss of revenue from the tourists that will not visit these river reaches due to loss of WSR designation. If this cannot be quantified, then remove the statement.	2062
10262_part 3	10262_part 3-4	The fourth paragraph of this section on page 4-349 of the RMP/EIS states that there will be 40,000 acres of timber harvest throughout the planning period. The BLM will cite the data and source of this information.	2062
10262_part 3	10262_part 3-6	The first paragraph of this section on page 4-351 of the RMP/EIS states 28,079 acres of long-term surface disturbance is projected. The BLM will cite the data and source of this information.	2062
10262_part 3	10262_part 3-7	The first paragraph of this section on page 4-351 of the RMP/EIS discusses mineral entry and mining. Previous sections of Resource Uses states the acres available for mineral entry and long-term surface disturbance. This paragraph does not. The BLM will provide those acreages and cite the data and sources of this information.	2062
10262_part 3	10262_part 3-8	The third paragraph of this section on page 4-351 of the RMP/EIS discusses the qualitative differences in ROWs between alternatives. The BLM will add acreages to this discussion to quantify the differences.	2062
10262_part 3	10262_part 3-9	The first paragraph of this section on page 4-352 of the RMP/EIS states that three new ACECs with recreation values have been added in Alternative D. State the names of them in this paragraph.	2062
10262_part 3	10262_part 3-15	The plan states that the current AUMs of 305,887 will only be reduced by 1-2% over the life of the Plan. However, according to the Plan, the direct impacts to livestock grazing result from management actions that change AUM allocations or restrict livestock grazing. Yet, the only disclosure of impacts is for surface disturbing activities and closures. There are no direct impacts disclosed under any of the alternatives for management actions that change AUM allocations. There are no impacts disclosed for management actions relating to wildlife habitat, special status species, special designations, etc., although it states that “when rangelands are not meeting resource objectives, the BLM implements changes in grazing management.” The utilization levels have changed from the last RMP to the current draft yet there is no disclosure of impacts as a result of decreased utilization levels. Specifically for the allotments not meeting or not making acceptable progress towards meeting rangeland health standard where utilization levels have gone from 50% of current year’s growth to 35% and from 60% of dormant to 40% of dormant.	2074
10262_part 3	10262_part 3-42	The plan states that the current AUMs of 305,887 will only be reduced by 1-2% over the life of the Plan. However, according to the Plan, the direct impacts to livestock grazing result from management actions that change AUM allocations or restrict livestock grazing. Yet, the only disclosure of impacts is for surface disturbing activities and closures. There are no direct impacts disclosed under any of the alternatives for management actions that change AUM allocations. There are no impacts disclosed for management actions relating to wildlife	2074

Individual Comments and Index to Summary Comments and Summary Responses**

Table B-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
		habitat, special status species, special designations, etc., although it states that “when rangelands are not meeting resource objectives, the BLM implements changes in grazing management.” There are also several areas in the management action Table 2-5 (RMP/EIS pg. 2-160 - 162) that states management must be consistent with “other resource objectives,” but does not disclose which resources or objectives. These other resource management actions could have significant impacts to livestock grazing but are not disclosed in the RMP/EIS. These statements should be removed from management actions if the impacts cannot be disclosed.	
10262_part 3	10262_part 3-24	On page 3-176 it states that “When rangelands are not meeting resource objectives, the BLM implements changes in grazing management.” However, the Wyoming Standards for Healthy Rangelands applies to all resource uses on public land, therefore if resource objectives are not being met due to a use other than livestock grazing then that use should be changed, not grazing. This policy could have significant impacts on the lessee because they have no control over other resource uses and cannot adjust their operations nor should they have to because of poor management of other resource uses.	2076
10262_part 3	10262_part 3-28	Despite the fact that livestock grazing has existed in the Big Horn Basin for over 100 years it appears to be the first resource use that gets eliminated or AUMs reduced in favor of other resources (i.e. wildlife, special status species). If these areas are worthy of special designation or listing they most likely evolved with the livestock grazing and therefore grazing should not be penalized due to these designations. Please include the following in methods and assumptions: “If livestock grazing has historically existed prior to wildlife management areas, special use areas or listing of special status plants or animals then the management for these species or within these areas will not affect livestock grazing allocations.”	2076
10268	10268-1	[Cedar Mountain WSA] We recommend, per record 7217, that in addition to management under the current IMP, current management acreage of 20,407 be increased to upwards of 26,975 acres in order to capture and protect through adaptive management the unique wilderness qualities listed above.	2019
10268	10268-10	â€œ [McCullough Peaks WSA] We recommend, per record 7217, that in addition to management under the current IMP, current management acreage of 24,531 be increased to upwards of 37,359 acres in order to capture and protect through adaptive management the unique wilderness qualities listed above. This additional acreage includes a major fossil site and breaks along the Shoshone River. Boundaries of the area are set by the Shoshone River on the west, a powerline on the north, and ways, private land, and topographic features on the south and east.	2019
10268	10268-11	â€œ We recommend, per record 7217, that in addition to management under the current IMP, current management acreage of 688 be increased to upwards of 8,985 acres in order to capture and protect through adaptive management the unique wilderness qualities listed above. The Wyoming Game and Fish Department has identified the Castle Rocks section as a potential bighorn sheep reintroduction site. Therefore, BLM should maintain the required habitat.	2019
10268	10268-2	[Honeycombs WSA] We recommend, per record 7217, that in addition to management under the current IMP, current management acreage of 20,156 be increased to upwards of 52,764 acres in order to capture and protect through adaptive management the unique wilderness qualities listed above.	2019

**Attachment B – Draft Resource Management Plan and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table B-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
10268	10268-4	[Alkali Creek WSA] We recommend, per record 7217, that in addition to management under the current IMP, current management acreage of 9,475 be increased to upwards of 17,117 acres in order to capture and protect through adaptive management the unique wilderness qualities listed above.	2019
10268	10268-5	The citizens' proposed additions, including the Dry Medicine Lodge Canyon, would further protect and enhance the complete ecosystem and alter a two-track to a trail.	2019
10268	10268-6	â€¢ [Medicine Lodge WSA] We recommend, per record 7217, that in addition to management under the current RMP, current management acreage of 7,182 be increased to upwards of 16,654 acres in order to capture and protect through adaptive management the unique wilderness qualities listed above.	2019
10268	10268-7	[Bobcat Draw Badlands WSA] We recommend, per record 7217, that in addition to management under the current IMP, current management acreage of 16,967 be increased to the BLM recommendation acreage of 18,540 acres or further 29,706 acres in order to capture and protect through adaptive management the unique wilderness qualities listed above.	2019
10268	10268-8	[Sheep Mountain WSA] We recommend, per record 7217, that in addition to management under the current IMP, current management acreage of 23,258 be increased to upwards of 24,615 acres in order to capture and protect through adaptive management the unique wilderness qualities listed above. This expansion would form more manageable boundaries, and result in the Sheep Mountain area being adjacent to the Red Butte area.	2019
10268	10268-9	â€¢ [Red Butte WSA] We recommend, per record 7217, that in addition to management under the current IMP, current management acreage of 10,805 be increased to upwards of 23,685 acres in order to capture and protect through adaptive management the unique wilderness qualities listed above. 'This provision 'expansion, per record 7228, allows the Red Butte area to adjoin the Sheep Mountain area. The BLM should, in turn, acquire the split estate land in Section 16 and small state acreage on the northern border for uniform management of the area.	2019
10268	10268-14	By recognizing the lands with wilderness characteristics in the 15-Mile Basin area, the BLM could ensure a unified management approach that links the three WSAs in this area (Sheep, Mountain, Red Butte and Bobcat Draw), which would have many benefits (Maps 63 and 72). The same is true of the three WSAs on the Bighorn Front (Trapper Creek, Alkali Creek and Medicine Lodge) - linkages among these areas can and should be created by recognizing the wilderness character of nearby lands in this area. Recognizing the wilderness character of these lands could also compliment and improve the management of many of these areas as special recreation management areas and zones, and as ACECs. Protection of the wilderness characteristics of these lands would complement the recreational and important resource values goals reflected by the designation of many of these areas as special recreation management areas or ACECs. Of the 16 LWCs inventoried in the 15-Mile Basin (see Table 1), the BLM has recommended that no special management prescriptions be made for any.	2027
10268	10268-15	Protecting the wilderness qualities of all LWCs on the Absaroka-Beartooth Front would complement the management of the McCullough Peaks WSA, existing Carter Mountain ACEC and its proposed expansion, Rattlesnake Mountain ACEC, Sheep Mountain ACEC and Upper Owl Creek/Absaroka existing ACEC and proposed expansion.	2027

**Attachment B – Draft Resource Management Plan and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table B-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
10268	10268-17	We believe that only by managing to protect the wilderness and natural characteristics of all eight LWCs on the Bighorn Front, the values currently provided by Trapper Creek WSA, Alkali Creek WSA, Medicine Lodge WSA, Paint Rock Creek Canyon CWP, Brown/Howe Dinosaur ACEC and Spanish Point Karst ACEC will be adequately preserved. In order to keep these areas intact as full ecological systems, these LWC additions are essential; otherwise not only will the critical winter range and habitat be lost, but the opportunity for management of a contiguous ecological unit along the Bighorn Front will be lost.	2027
10270	10270-2	Appendix R -10 2.0 Known Road and Trail Network maps do not define and document known Motorcycle Trails and also does not include the input from the public OHV riders.	2034
10270	10270-3	The Trail Definition is not defined in the BLM RMP document. I propose the definition to read as follows. "Trail: A linear route managed for human-powered, stock, or off-highway vehicle forms of transportation or for historical or heritage values. Trails are not generally managed for use by four-wheel drive or high clearance vehicles."	2034
10270	10270-1	The high soil erosion rates of 53,758 tons per year for Alternative C is incorrect per page 33, 4-22 Table X-11 estimates a 2011 OHV RVD's of 33,687 with 75% being utilized on approximately 14,873 Open OHV riding acres. This calculates out to a 2.3 RVD / Open OHV riding acre. Alternative D has 5,941 Acres of Open OHV Riding which equals a 5.7 RVD / Open OHV riding acre. This is a 148% increase in usage per acre which equates to much higher erosion rates than Alternative C.	2045
10274	10274-1	Real Estate: BLM has identified areas of "low value" to exchange for lands of "higher value." BLM has unilaterally-established a concept of "value" to the public without accountability. An example is the area to the west of the town of Greybull, which is used by locals for mountain-biking, 4-wheeling, and other recreational opportunities, but is considered to be of "low value" and suitable for disposal. I could not tell from the documents how the determination was made.	2013
10281	10281-5	The WGFD recently updated their Strategic Wildlife Action Plans along with their Strategic Habitat Plan (April 2010) and TU suggests that the BLM incorporate the new information. Currently, the DRMP references the 2001 Strategic Habitat Plan (Table 1-3, page 1-15).	2002
10281	10281-2	The list is outdated (2008) and the since the Wyoming Department of Environmental Quality updates these lists every 2 years, a 2010 update should be included.	2031
10281	10281-3	The assumption that coal bed methane produced water is expected to be the same quality and quantity as produced water from conventional or deep oil and gas wells is unfounded in the DRMP (Ch. 4, page 4-31). If there exists data that confirms this statement, TU would like the Final RMP to include that data analysis and a discussion on how to manage such produced waters.	2031
10281	10281-6	However, the DRMP states that economic analysis from recreation use is limited to nonresident only. Limiting the economic discussion while expanding the use discussion does not make sense and diminished the importance of resident's contributions to local businesses, outfitters, guides, tourism, etc. In addition, the WGFD fish and game licenses depend on both resident and nonresident license sales as economic input to their budget.	2046

Individual Comments and Index to Summary Comments and Summary Responses**

Table B-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
10281	10281-4	Table 4-7 (Ch. 4, page 4-6) illustrates the acreages for oil and gas development potential but limits the potential development list to “moderate to none”. Yet, in Chapter 3, (see 3.2.5, page 3-46) there is a discussion on the two new areas that are actively being pursued in future oil and gas development plans (Southeastern Beartooth Front and Deep Basin-Centered Gas). New unconventional gas fields that include the potential for gas development include tight sands, shale gas and under-pressured gas. These areas are discussed in terms of gas recovery in large amounts for all three types of natural gas within the Bighorn Basin area. We feel the Table (and consequent baseline drilling analysis discussion under leasable minerals) is an inaccurate account of potential development scenarios and should be amended to include the discussion in Chapter 3.	2061
10283	10283-5	2. The BLM should add “in compliance with Wyoming water laws” within the management action record #1037 dealing with natural flow regimes in priority streams supporting fisheries.	2002
10283	10283-1	Research has shown that timing limitations do not achieve their desired results when development occurs on lands with anything more than four pads per section in crucial ranges for both mule deer and pronghorn. This level of development constitutes “high” or “extreme” impacts to these habitats requiring mitigation measures in addition to seasonal/timing restrictions (WGFD Recommendations for Oil & Gas Resources within Crucial & Important Wildlife Habitats (2009) at 11).	2025
10283	10283-2	WWF suggests avoiding development or surface disturbing activities within migration corridors and stopover points “this includes roads, well pads and support facilities. Limiting the ability of migrating big game to access critical habitats reduces their chances to survive and thrive (Sawyer and Kaufmann 2009, Sawyer and Nielson 2011).	2025
10283	10283-3	The BLM should not focus solely on timing limitations in crucial winter ranges as the primary mitigation measure for big game (Sawyer et al. 2010). The results of the Sublette Mule Deer Study, assessing development under the standard timing stipulations indicate that it is inappropriate to rely on prior assumptions that timing limitation stipulations alone will prevent significant changes in big game abundance.	2025
10283	10283-4	Detrimental actions are listed within Appendix H - Wyoming BLM Mitigation Guidelines, but it isn’t exactly clear which actions the BLM is referring to in Chapter 2 with the language in Appendix H. This needs clarified within the final RMP.	2054
10283	10283-6	14. The WGFD recently updated their Strategic Wildlife Action Plans along with their Strategic Habitat Plan (April 2010). The BLM should incorporate the new information. Currently, the DRMP references the 2001 Strategic Habitat Plan (Table 1-3, page 1-15).	2055
10285	10285-1	3. Livestock grazing is an integral part of Washakie County’s agricultural base. The only disclosure of impacts disclosed is for surface disturbing activities and closures. There are no direct impacts disclosed that would warrant a reduction in animal unit months. The RMP/EIS states that the current AUMs of 305,887 acres will only be reduced by 1-2% over the life of the RMP. However, according to the RMP/EIS, the direct impacts to livestock grazing result from management actions that change AUM allocations or restrict livestock grazing. Yet, the only disclosure of impacts is for surface disturbing activities and closures. There are	2074

**Attachment B – Draft Resource Management Plan and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table B-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
		no direct impacts disclosed under any of the alternatives for management actions that change AUM allocations. There are no impacts disclosed for management actions relating to wildlife habitat, special status species, special designations, etc., although it states that “when rangelands are not meeting resource objectives, the BLM implements changes in grazing management.” There are also several areas in the management action Table 2-5 (RMP/EIS pg. 2-160-162) that state management must be consistent with “other resource objectives,” but does not disclose which resources or objectives. The other resource management actions could have significant impacts to livestock grazing, but are not disclosed in the RMP/EIS.	
10286	10286-46	The BLM indicates that the soil erosion from disturbed areas and fugitive dust has the potential to contribute to climate change because soils may darken snow cover and cause faster snow melt. Bighorn RMP/DEIS, pg. 3-8. Although fugitive dust has been shown to cause faster snow melt, it is inaccurate and misleading to suggest that this is a factor in global climate change. Local impacts such as snow melting are simply not comparable to global climate change issues. The BLM should clarify this statement in the final EIS.	2003
10286	10286-36	The BLM needs to significantly revise and clarify its proposed management action under Alternatives Band D that would “implement projects for the investment of maximum cultural resources protection.” Bighorn RMP, Record No. 5025, pg. 2-98. As currently drafted, the BLM’s management action suggests that the protection of cultural resources is the highest and best use of BLM lands. Such a requirement is not consistent with the BLM’s multiple use mandate and inconsistent with Devon’s existing lease rights.	2004
10286	10286-73	The BLM indicates that under Alternative B, the BLM would prohibit surface disturbing activities within potential cultural sites for ground buffers that may be up to 3 miles wide. The BLM does not, however, identify how or when setting would be important to a site’s integrity. Bighorn RMP/DEIS, pg. 4-274. The BLM must identify and disclose to the public specific criterion that would be used when and if surface disturbing activity would be prohibited in a specific area in order to protect a site’s integrity.	2004
10286	10286-14	“The Secretary of the Interior, through the Interior Board of Land Appeals (“IBLA”), has unequivocally determined that, in Wyoming, the State and not the BLM, has authority over air emissions: In Wyoming, ensuring compliance with Federal and State air quality standards, setting maximum allowable limits (NAAQS and WAAQS) for six criteria pollutants CO (carbon monoxide), SO ₂ (sulfur dioxide), NO _x , ozone and particulate matter (PM ₁₀ and PM _{2.5}), and setting maximum allowable increases (PSD Increments) above legal baseline concentrations for three of these pollutants (SO ₂ , NO _x , and PM ₁₀) in Class I and Class II areas is the responsibility of WDEQ [Wyoming Department of Environmental Quality], subject to EPA oversight. Wyoming Outdoor Council, et al., 176 IBLA 15, 26 (2008). Decisions of the IBLA are binding upon the BLM and have the same force and effect of a Secretarial decision. 43 C.F.R. § 4.1 (2010) (noting that the Office of Hearings and Appeals, which includes the IBLA may decide matters as fully and finally as the Secretary of the Interior); see also IMC Kalium Carlsbad, Inc. v. Interior Bd. of Land Appeals, 206 F.3d 1003, 1009 (10th Cir. 2000) (holding that IBLA has de novo review authority over the decisions of subordinate agencies such as the BLM). Devon encourages the BLM to add a statement in the Bighorn Basin RMPs clarifying the scope of the BLM’s authority as defined by the IBLA. The BLM does not have the authority to impose	2009

Individual Comments and Index to Summary Comments and Summary Responses**

Table B-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
		regulations or control measures on emission sources, including oil and gas operations, within Wyoming.	
10286	10286-16	Devon additionally believes that the BLM's goals to "improve air quality in the Planning Area as practicable" are unnecessary given the authority of the EPA and WDEQ over air quality. Bighorn RMP/DEIS, Record No. 1000, pg. 2-42. Congress has already directed the EPA to develop new and revised national ambient air quality standards based on the latest scientific knowledge. 42 U.S.C. 7408(a)(2), 7409(b)(1).	2009
10286	10286-48	To the extent possible, and even if the data is not considered "official" the BLM should include information from the newly installed monitoring site near Worland in the final EIS as the information will likely be far more accurate than information gathered from the Powder River Basin.	2009
10286	10286-43	Devon also objects to the BLM's proposal under Alternative B and Alternative D to prohibit surface disturbing activities within 5 miles or 2 miles of other historic trails. Bighorn RMP/DEIS, Record No. 7192, pg. 2-204. The BLM has not justified the necessity of protecting the trails to such an extent. Notably under the BLM's proposed management under Alternative D, the BLM would effectively place 1,047,962 acres off limits to oil and gas development because they are within approximately 3 miles of the identified trails. The proposed management is unreasonable and would effectively prohibit development in currently existing significant oil and gas areas including the Worland Unit. Incredibly, the BLM's proposed management under Alternatives D and B would significantly limit surface disturbing operations within heavily populated areas in the Bighorn Basin including Cody, Powell, and Worland as well as smaller towns such as Kirby, Manderson, Burlington, Deaver and Frannie, which are all located in a few miles of the trails. The BLM's radical departure from its previous management, which only protected areas within one-quarter mile of these historic trails, is unnecessary, unjustified, and inconsistent with Devon's existing lease rights.	2010
10286	10286-44	The only currently Congressionally designated trail within the planning area is the Nez Peirce Trail. As such, it is the only trail that necessitates significant protection. The BLM must ensure it is only attempting to protect contributing segments of trails. Further, the BLM should only attempt to protect areas outside of the trail when setting is an important component. According to the State Historic Preservation Office, setting is an important criterion in very few parts of the Planning Area. Historic trails such as the Bridger Trail should not be protected with the same restrictions as those Congressionally designated trails because they do not have the same status and are not entitled to equivalent protections. Finally, it is important for the BLM to recognize that only contributing segments of trails are entitled to or deserving of any protection. Non-contributing segments should be utilized for all multiple use activities without restrictions.	2010
10286	10286-25	The BLM should ensure that it does not place unnecessary requirements, limitations, or procedures on seismic and geophysical surveys. The BLM indicates that under the revised RMP geophysical exploration will be allowed within the "constraints necessary to protect other resources." Bighorn RMP/DEIS, Record No. 2034, pg. 2-58. On a national scale, the BLM has recognized that geophysical exploration is the type of activity that does not individually have a significant effect on the human environment because geophysical exploration has been identified as a Department-wide categorical	2016

**Attachment B – Draft Resource Management Plan and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table B-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
		exclusion. "Approval of Notices of Intent to conduct geophysical exploration of oil, gas, or geothermal exploration of oil, gas, or geothermal, pursuant to 43 C.F.R. 3150 or 3250, when no temporary or new roads construction is proposed." DOI Manual - 516 DM 11.9.B.6., 72 Fed. Reg. 45504, 45539 (Aug. 14, 2007); see also BLM NEPA Handbook, H-1790-1, Appendix 4, B.6 (Ret. 1-1710, 01/30/2008); 40 C.F.R. Â§ 1508.4(2010) (defining categorical exclusions).	
10286	10286-49	The BLM should clarify the language in the first sentence under the heading "Exploration" in Section 3.2.5 so that the public understands a federal oil and gas lessee is not required to conduct geophysical or seismic activities on BLM administered lands. 43 C.F.R_ subpart 3150. As currently drafted, the language in the Bighorn RMP may suggest that a lessee is required to conduct geophysical or seismic operations on BLM lands.	2016
10286	10286-29	The BLM's proposed management for the Absaroka Front under Alternative D is poorly drafted and confusing. Although BLM suggests Alternative D will be managed the same as Alternative B with a few exceptions, Bighorn RMP/DEIS, Record No. 4080, pg. 2-77, the BLM indicates the entire area will be closed to leasing under Alternative B, but suggests that portions of the area will be open to oil and gas leasing with CSU and NSO restrictions under Alternative D. The BLM should clearly indicate which areas are open and closed to leasing under each alternative. Further, Alternative B suggests the area will be managed as a ROW avoidance area, but Alternative D makes no reference to ROWs. Id. The BLM should clarify how ROWs will be treated under each alternative.	2020
10286	10286-13	Record No. 0003, pg. 2-42, states that BLM will utilize recommendations found in Wyoming Game and Fish Department (WGFD) Recommendations for Development Oil and Gas Resources within Crucial and Important Wildlife Habitats (WGFD 2009). The BLM makes a similar statement in Record No, 4061. The BLM must revise these statements to clarify that it will consider, not necessarily "utilize" all of the WGFD's recommendations. The BLM alone has primacy and the responsibility to manage federal lands under its jurisdiction in Wyoming.	2025
10286	10286-28	The proposed language under Alternative B that would prohibit all surface use within big game crucial winter range. Bighorn RMP/DEIS, Record No. 4079, pg. 2-77. As the BLM is aware, current seasonal stipulations in the existing Bighorn Basin RMPs prohibit construction and drilling activities in specific crucial winter ranges, but do not prohibit routine production operations necessary to safely maintain facilities. It would be inappropriate for the BLM to preclude all production operations in crucial winter range areas. Such a decision would essentially preclude year-round production operations and would lead to a significant decrease in domestic energy production. Moreover, many species such as pronghorn and mule deer have been found to habituate to increased traffic so long as the movement remains predictable. See Reeve, A.F. 1984. Environmental Influences on Male Pronghorn Home Range and Pronghorn Behavior. PhD. Dissertation; Irby, L.R. et al., 1984; "Management of Mule Deer in Relation to Oil and Gas Development in Montana's Overthrust Belt" Proceedings III: Issues and Technology in the Management of Impacted Wildlife. To the extent the BLM intends to apply the new restriction on existing leases, the BLM could be violating existing lease or taking private property without just compensation. The BLM must ensure that existing lease rights will be maintained and that production operations are allowed to continue throughout the year.	2025

Individual Comments and Index to Summary Comments and Summary Responses**

Table B-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
10286	10286-30	Devon is strenuously opposed to the BLM's proposed management action under Alternative B or D that would allow the BLM to apply wildlife seasonal "protections for surface-disturbing and disruptive" activities on the maintenance and operations of developed projects. Bighorn RMP/DEIS, Record No. 4082, pg. 2-78. As the BLM is aware, current seasonal stipulations in the existing Bighorn Basin RMPs prohibit construction and drilling activities in specific crucial winter ranges, but do not prohibit routine production operations necessary to safely maintain facilities. It would be inappropriate for the BLM to preclude all production operations in crucial winter range areas. Such a decision would essentially preclude year-round production operations and would lead to a significant decrease in domestic energy production. Moreover, many species such as pronghorn and mule deer have been found to habituate to increased traffic so long as the movement remains predictable. See Reeve, A.F. 1984. Environmental Influences on Male Pronghorn Home Range and Pronghorn Behavior. PhD. Dissertation; Irby, L.R. et al., 1984; "Management of Mule Deer in Relation to Oil and Gas Development in Montana's Overthrust Belt" Proceedings III: Issues and Technology in the Management of Impacted Wildlife.	2025
10286	10286-54	The BLM indicates in Chapter 3 that mule deer populations have declined because of decline in habitat quality and quantity. Bighorn RMP/DEIS, pg. 3-97. The BLM has not, however, provided sufficient data to support this analysis. Researchers in Colorado have attributed decline in Colorado mule deer populations primarily to competition from increased populations, loss of vegetation by overgrazing by deer in the 20 th Century, and the loss of habitat due to farmland conversion. R. Bruce Gill, Colorado Division of Wildlife. 1999. Declining Mule Deer Populations in Colorado: Reasons and Responses. The Oregon Department of Fish and Wildlife has also concluded that declines in the mule deer populations in Oregon are attributable to multiple natural changes in habitat including severe winters and droughts, changing predator-prey relationships, and changing grazing enforced management practices. The BLM should consider all of these factors and not simply assume oil and gas development is causing the decline in mule deer populations	2025
10286	10286-55	The Bighorn RMP/DEIS imposes significant restrictions in big game parturition (calving) area, but has not provided sufficient data to justify these restrictions. The BLM should review existing literature and determine whether such restrictions are actually justified. Based on the demonstrated success for avoiding adverse effects on wandering elk within crucial winter range, there are no major adverse energy extraction-related effects that cannot be mitigated with a combination of controlled surface use and other timing restrictions. Elk populations within the Bighorn Basin are well above WGFD's herd objectives and the BLM has not justified additional restrictions in these areas.	2025
10286	10286-72	The BLM describes the potential impacts from oil and gas operations to big game species in the Bighorn RMP/DEIS. Bighorn RMP/DEIS, pg. 4-170. The BLM does not, however, include information regarding how species habituate to oil and gas activities. See Reeve, A.F. 1984, Environmental Influences on Pronghorn Range and Pronghorn Habitat, PhD Dissertations, Erv, Irby, L.R., et al., 1984; "Management of Mule Deer in Relation to Oil and Gas Development in Montana" proceedings III: Issues in Technology in the Management of the Impact to Wildlife.	2025
10286	10286-42	Devon is particularly concerned that the BLM's analysis of land with wilderness characteristic is not accurate. Several local governments involved in the	2027

**Attachment B – Draft Resource Management Plan and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table B-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
		planning process have identified flaws with the BLM's inventory and analysis process. Given this information, the BLM needs to re-inventory and correct its information regarding the approximately 571,000 acres of lands it believes to have wilderness characteristics using the characteristics outlined above and in the BLM policies.	
10286	10286-68	The BLM indicates in Section 4.2.5.2 that the BLM will manage Wild Lands as administratively unavailable for oil and gas leasing under Alternatives Band D. Given recent changes in the Department of the Interior's administration of lands with wilderness characteristics and "Wild Lands" the BLM should reassess and inform the public how Wild Lands will be treated and whether or not they will be made available for oil and gas development in the Bighorn planning area.	2027
10286	10286-7	The BLM should clarify its intention and authority to designate Wild Lands in the Bighorn RMPs and explain to the public how the law and the Secretary's memorandum will impact modifications to the Preferred Alternative.	2027
10286	10286-26	The BLM suggests it will manage intermittent streams on a watershed scale basis and will attempt to acquire perennial flow rights for streams under both Alternative B and the Preferred Alternative. Bighorn RMP/DEIS, Record No. 4055, pg. 273. In Wyoming, the allocation and adjudication of water rights are administered solely and exclusively by the State Engineer and Board of Control. Wyo.Const. art. 8, Â§ 5; WYO. STAT. ANN. Â§Â§ 41-101 - 1014 (LexisNexis 2011). All water within the State of Wyoming is owned by the State of Wyoming. Wyo. Const. art. 8, Â§ 1. Although certain water rights may be reserved to the federal government under very specific, narrow exceptions, the BLM does not have the right to manage water rights in Wyoming. The BLM should refrain from attempting to administer any water rights within the State. Further, under Wyoming law, only the state of Wyoming has the right to seek and hold a water right for instream flows for either wildlife or recreational purposes. WYO. STAT. ANN. Â§Â§ 41-1001 - 1014 (LexisNexis 2011); In re the General Adjudication of All Rights to Use Water in the Big Horn River Water System, 835 P.2d 273, 279 (Wyo. 1992).	2031
10286	10286-64	The BLM also suggests that impacts under Alternative D may result in fewer long-term adverse impacts to water resources due to increased reclamation standards and the requirements for mitigation under this Alternative. Bighorn RMP/DEIS, pg. 4-29. As explained earlier, reclamation plans are currently required for all oil and gas operations under Onshore Order No.1. The BLM should quantify or explain how or why it believes the reclamation plan is required under Alternative D will increase reclamation success over that already required on federal lands.	2031
10286	10286-37	As currently drafted, maps 38, 39, 40, and 41 appear to impose BLM visual resource management ("VRM") restrictions on BLM, private, and State of Wyoming lands without regard to ownership. The BLM has no right or authority to impose VRM restrictions on either State of Wyoming or private lands. As the BLM should be aware, one of the reasons the BLM Director remanded portions of the Rawlins RMP in 2008 was the BLM's apparent attempt to impose VRM restrictions on State of Wyoming and private lands. See Director's Protest Resolution Report, Rawlins Resource Management Plan, December 24, 2008, pgs. 139 - 140. See also Rawlins RMP pg. 1-1. The BLM must prepare new maps for the Bighorn RMP Final EIS that excludes State of Wyoming and private lands within the Bighorn Basin.	2032
10286	10286-38	Under Alternatives Band D, the BLM proposes to substantially increase the	2032

Table B-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
		number of acres subject to Class II VRM restrictions. Bighorn RMP, Record No. 5052, pg. 2-103. Much of the area is not currently subject to VRM Class II restrictions. When proposing VRM restrictions in areas already leased for oil and gas development, the BLM cannot attempt to impose new VRM objectives or operations on existing leases. The IBLA has clearly recognized that BLM cannot impose visual resource objectives inconsistent with lease rights, and the BLM must consider the impacts of oil and gas operations and existing leases when developing VRM objectives during the planning process. See Southern Utah Wilderness Alliance, et. al., 144 IBLA 70, 84-88 (1998). The BLM cannot impose VRM objectives without considering existing leases and ongoing oil and gas operations.	
10286	10286-39	The proposed VRM Class II designation for lands covered by leases may be in conflict with, and provide confusion about, prior decisions made to lease the same lands without restrictions for visual resources under the current RMP. The IBLA has addressed a similar situation in the past. In Southern Utah Wilderness Alliance, 144 IBLA 70 (1998) ("SUWA") a resource management plan designated certain lands as VRM Class II. The BLM had leased the same lands for oil and gas development under the existing RMP. The IBLA found this improper, and it criticized the San Juan, Utah Resource Area BLM office for applying VRM Class II restrictions to lands where it had previously approved oil and gas leases. The IBLA stated that where the BLM has made the decision to issue oil and gas leases, the BLM should not put the same lands in VRM Class II because it is "inherently contradictory" and creates a "conflict." Southern Utah Wilderness Alliance, 144 IBLA 70, 87 (1998).	2032
10286	10286-40	Placing VRM Class I or II restrictions on a significant portion of the planning area would significantly restrict oil and gas development, potentially even on existing leases. Bighorn RMP/DEIS, Record No. 5052, pg. 2-103. Based on past experience, and even language in the Bighorn RMP/DEIS itself, the BLM will essentially preclude oil and gas development in VRM Class I and Class II areas. Devon is concerned it may not be able to develop its existing leases if the BLM is precluded from proving rights-of-way or facility locations across newly created VRM I and II areas that did not exist at the time its leases were issued. The imposition of unreasonable restrictions on existing leases or federal units may result in an illegal taking of Devon's contractual and property rights. Finally, the BLM has not adequately studied the potential economic or socio-economic impacts the creation of new VRM Class I and II areas may have upon the public or the human environment as required by FLPMA and NEPA.	2032
10286	10286-74	When proposing visual resource management restrictions in areas already leased for oil and gas development, the BLM cannot attempt to impose new VRM objectives on operations on existing leases. The IBLA has clearly recognized that the BLM cannot impose VRM objectives inconsistent with lease rights, and that BLM must consider the impacts of oil and gas operations and existing leases when developing VRM objectives during the planning process. Southern Utah Wilderness Alliance, et al., 144 IBLA 70, 84 - 88 (1998). The BLM cannot impose VRM objectives without considering existing leases and ongoing oil and gas operations. Because the BLM failed to consider the number and nature of existing leases when preparing its visual resource assessment for the Bighorn planning area, the BLM must revise and redo its analyses. The BLM must correctly account for all oil and gas developments and, as recognized by the IBLA in the Southern Utah Wilderness case cited above, the BLM must not	2032

Individual Comments and Index to Summary Comments and Summary Responses**

Table B-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
		impose VRM restrictions higher than VRM Class III on existing leases.	
10286	10286-57	The BLM suggests that the mountain plover is still a proposed threatened species in the Bighorn RMP/DEIS. Bighorn RMP/DEIS, pg. 3-108. The United States Fish and Wildlife Service ("USFS") published a withdrawal of the proposed listing of the mountain plover on May 12, 2011. 76 Fed. Reg. 27756 (May 12, 2011). The BLM should update this information in the final EIS for the Bighorn Basin. The BLM also needs to correct the information regarding the mountain plover on page 3-113 of the Bighorn RMP.	2041
10286	10286-27	The BLM states that under all alternatives, it will limit access to crucial habitat and sensitive species habitat. Bighorn RMP/DEIS, Record No. 4071, pg. 2-75. The BLM should rephrase this statement by adding the language "to the extent consistent with existing rights." Although the BLM retains substantial authority to prohibit access to designated critical habitat under the Endangered Species Act, 43 C.F.R. 3101.1-2 (noting that the BLM can restrict access to surface leasehold to comply with nondiscretionary statutes), the BLM does not have the right to prohibit access to a leasehold to protect crucial habitat in a manner inconsistent with the lease rights conveyed. See, e.g., National Wildlife Federation, et al., 150 IBLA 385, 403 (1999).The BLM cannot, for example, limit access to crucial winter habitat for Pronghorn in a manner inconsistent with existing rights.	2042
10286	10286-33	The BLM should, however, revise DR Goal 9.1 to make it clear the BLM will maintain large patches of high quality sage brush habitat, while still providing for multiple use management. Although preserving the sage-grouse is of paramount importance to the State of Wyoming, the BLM, and operators like Devon, management for the species must be considered in the larger multiple-use mandate requirements for the BLM.	2042
10286	10286-56	On page 3-103 of the Bighorn RMP/DEIS the BLM suggests that special status wildlife species are governed under BLM Manual 68-40 (BLM 2001 (a)). The BLM should be aware that its special species management manual was updated and reissued in 2008 and that the 2001 version was replaced. See BLM Manual 68-40 Rel. 6-125 (12/12/2008). All references to the 2001 special status species manual or any requirements therein should be replaced with references to the 2008 manual.	2042
10286	10286-18	Devon is particularly opposed to the requirement under Alternative B to require 50 percent pre-disturbance of desired vegetation within three growing seasons and 80 percent cover within five years of initial seeding_ Bighorn RMP/DEIS, Record No. 1018, pg. 2-45. Such a requirement is not consistent with the existing BLM policy as expressed in Wyoming Instruction Memorandum 2009-022.	2045
10286	10286-32	It also appears the BLM failed to consider the significant detrimental impact to the local economy the seasonal prohibition on oil and gas operations would have upon the local economy. By precluding production during several months of the year, the BLM would force operators to significantly reduce their workforces on an annual basis. The management action would create a seasonal boom and bust cycle with routine maintenance workers and pumpers being laid off annually. The inconsistent nature of the work would almost certainly reduce the number of local employees lessees are able to hire, which would restrict or eliminate the long-term beneficial impacts of the oil and gas development to the local economy. The BLM's current socio-economic analysis does not account for this cycle.	2046

Individual Comments and Index to Summary Comments and Summary Responses**

Table B-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
10286	10286-10	In particular, Alternative B is not a reasonable alternative because it virtually eliminates oil and gas development from the public lands contrary to the BLM's multiple use mandate. Under FLPMA, the BLM is required to manage the public lands on the basis of multiple use and sustained yield. 43 U.S.C. Â§ 1701 (a)(7) (2010). "'Multiple use management' is a deceptively simple term that describes the enormously complicated task of striking a balance among the many competing uses to which land can be put, 'including, but not limited to, recreation, range, timber, minerals, watershed, wildlife and fish, and [uses serving] natural scenic, scientific and historical values.'" Norton v. Sothorn Utah Wilderness Alliance, 542 U.S. at 58 (quoting 43 U.S.C. Â§ 1702(c)). Further, under FLPMA, mineral exploration and development is specifically defined as a principal or major use of the public lands. 43 U.S.C. Â§ 1702(1). Under FLPMA BLM is required to foster and develop mineral development, not stifle and prohibit such development. Alternative B does not comply with the BLM's multiple use mandate and must be eliminated.	2047
10286	10286-11	The adoption of Alternative B, and to a lesser extent Alternative D, would significantly curtail domestic production compared to both the baseline scenario and any of the other alternatives analyzed by the BLM. Bighorn RMP/DEIS, pg. 4-57. The loss of such an enormous energy supply is contrary to the best interests of the nation, and inconsistent with the Energy Policy Act of 2005.	2047
10286	10286-5	When revising the Bighorn RMPs, the BLM should ensure that stipulations developed for future oil and gas leasing are the least restrictive necessary to adequately protect other resource values. Since the BLM issued the Washakie RMP in 1988, the Cody RMP in 1990, and the Grass Creek RMP 1998, Congress passed the Energy Policy Act of 2005. Section 363 of that Act required the Secretary of the Interior and the Secretary of Agriculture to enter into a Memorandum of Understanding (MOU) regarding oil and gas leasing and to ensure that lease stipulations are applied consistently, coordinated between agencies, and "only as restrictive as necessary to protect the resources for which the stipulations are applied." Energy Policy Act of 2005, Pub. L. No. 109-58, Â§ 363(b)(3), 119 Stat. 594, 722 (2005). The Memorandum of Understanding required by Â§ 363 of the Energy Policy Act of 2005 was finalized in April of 2006 as BLM MOU W0300-2006-07. The stipulations for oil and gas leases within the revised Bighorn RMPs should not be onerous or more restrictive than necessary. Based on Devon's review of the proposed alternatives in the Bighorn RMP/DEIS, the BLM did not follow the guidance in this MOU or the express direction in the Energy Policy Act of 2005. In almost every circumstance, the BLM proposes to adopt stipulations that are overly restrictive and unduly limiting. The BLM must consider the MOU when selecting the agency's Preferred Alternative or adopting the Bighorn RMPs.	2047
10286	10286-65	The BLM improperly suggests on page 4-58 that a VRM Class II restriction is only a moderate constraint on oil and gas development. Bighorn RMP/DEIS, pg. 4-58. The BLM more appropriately recognizes later in the Bighorn RMP/DEIS that "oil and gas exploration and development activities may be restricted or limited in VRM Class II areas. VRM objectives in Class II areas may limit the development of [oil and gas] facilities." Bighorn RMP/DEIS, pg. 466. Given the extreme restrictions on oil and gas development within VRM Class II areas, Devon urges the BLM to treat VRM Class II restrictions as a major restriction on oil and gas development, not a moderate restriction.	2047

Individual Comments and Index to Summary Comments and Summary Responses**

Table B-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
10286	10286-70	Devon further remains opposed to the BLM's proposition under Alternative B to manage big game crucial winter range and parturition habitat with and NSO restriction that would prevent surface occupancy for all oil and gas activities. Bighorn RMP/DEIS, pg. 4-70. Devon does not, however, believe the BLM has adequately described the potential adverse impacts such a restriction would have on oil and gas operations. The BLM merely notes that the mitigation measures may "increase project costs." Closing almost 1.4 million acres to surface occupancy would do far more than merely increasing project costs or making some areas inaccessible to oil and gas development. It would effectively eliminate all oil and gas development within a huge portion of the Bighorn Basin planning area. Such a closure would additionally lead to significant losses of revenue for the local, state and federal treasuries as well as significant losses in regional jobs.	2047
10286	10286-8	Further, the BLM should inform the public that only the Secretary of the Interior could withdraw the entire planning area from oil and gas leasing under FLPMA and that withdrawals can only be made using specific procedures mandated by FLPMA. 43 U.S.C. Â§ 1714(a), (b) (2010) (requiring withdrawals to be made by the Secretary of the Interior, or a person in the Secretary's office who has been appointed by the President with the advice and consent of the Senate and listing the requirements necessary for the Secretary to withdraw public lands).	2047
10286	10286-9	Under all four alternatives, the BLM proposes to make large areas of land unavailable to oil and gas leasing. Withholding an area from leasing constitutes a withdrawal under FLPMA. Unbelievably, under Alternative B, the BLM proposes to close almost 2,300,000 acres and render them unavailable for oil and gas leasing. Because closing areas to oil and gas leasing constitutes a withdrawal, the Department of the Interior will be required to comply with the procedural provisions of section 204 of FLPMA. 43 U.S.C. Â§ 1714 (2010). The BLM effectively admits that areas administratively unavailable to oil and gas development would "prohibit oil and gas exploration and subsequent development and exploration." Bighorn RMP/DEIS, pg. 4-62. This language confirms Devon's position that closing areas to leasing is effectively a withdrawal under FLPMA.	2047
10286	10286-19	The BLM should clarify that under all of the alternatives reclamation plans are required for all oil and gas drilling operations under Onshore Order Number 1, Section III, 4, j, 72 Fed. Reg. 10308, 10333 (Mar. 7, 2007). As currently described under Record No. 1019, the public may have the impression that reclamation plans are not always required for oil and gas development activities.	2049
10286	10286-31	Further, the BLM has not analyzed or apparently even considered the damage that could be done to oil and gas wells if they are shut-in on an annual basis. Nor has the BLM analyzed the very real threat that federal minerals would be effectively drained by offsetting wells on State of Wyoming and private lands if federal wells are annually shut-in. The BLM must prepare this analysis in order to disclose the significant adverse impacts that would be associated with the closure of oil and gas development on a seasonal basis, including the potential loss of federal reserves and royalties.	2049
10286	10286-76	Section 2.1 of Appendix A should also be revised to eliminate references to the 1983 Oil and Gas Onshore Order No. 1 and replace it with the revised version issued in 2005.	2049
10286	10286-24	Devon additionally encourages the BLM to adopt language similar to that contained in the Pinedale RMP that allows for the modification and expansion	2050

**Attachment B – Draft Resource Management Plan and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table B-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
		of Oil and Gas Management Areas in the event oil and gas development extends beyond the currently identified Oil and Gas Management Areas. The Pinedale RMP authorized the expansion of "Intensively Developed Fields" in two situations. First, an expansion of an existing oil and gas field without the need to amend the Pinedale RMP when bottom-hole density reached a specific level and when geology and reservoir analysis determined additional bottom-hole development is necessary to effectively drain a resource. See Record of Decision and Approved Pinedale RMP, pg. 2-22 (2008). Second, the Pinedale RMP authorizes the creation of new Intensively Developed Fields through an amendment to the Pinedale RMP if the above referenced geologic criteria are met, but the new field is not located adjacent to an existing Intensively Developed Field.	
10286	10286-66	The BLM describes areas of having high oil and gas potential if there is a potential for more than 100 wells per township. The BLM describes areas of moderate potential as having between 20 and 100 wells per township. Bighorn RMP/DEIS, pg. 4-59. Although such descriptions were generally true for traditional vertical oil and gas development, the same is not true for more recent horizontal development. As discussed earlier, oil and gas operators are often drilling long horizontal well bores capable of developing a single 640 acre section with a single well bore. As such, an extremely prolific area may have only 36 oil and gas wells within an entire township, yet it will be fully and effectively developed. The BLM should recognize that its traditional analysis regarding oil and gas development potential by wells per township is not, necessarily, accurate given recent advances in technology.	2051
10286	10286-12	Further, as described in more detail in Devon's comments regarding Chapter 4, the BLM has not analyzed or disclosed the potential impacts the restrictions on future leasing may have upon operations on existing leases. As the BLM acknowledges in Chapter 3 and Map 7, a significant extent of the Bighorn planning area is currently leased for oil and gas development. Some leases, however, are isolated making them virtually impossible and not economically feasible to develop in their current state. Any responsible oil and gas producer who decides to take the risk of exploring by drilling a wildcat area must do so only after assembling a large enough block of leasehold acreage so that, if the drilling is successful, it can obtain an adequate return on the high risk dollars invested. The BLM has, in another context, recognized the need for control of a reasonable acreage block. See <i>Prima Oil 8: Gas Co.</i> , 148 IBLA 45, 51, (1999) (BLM policy to suspend leases when "a lessee is unable to explore, develop, and produce leases due to the proximity, or comingling of other adjacent Federal lands needed for logical exploration and development that are currently not available for leasing"). The BLM must recognize, study, and report the economic impact of its decision to close significant portions of the planning area to leasing, or to make significant portions of the planning area only available with major constraints will have upon future exploration and development in the area. It is not enough for the BLM to simply assert that existing lease rights will be protected, the BLM must analyze further how existing lease rights will be impacted by future limitations on leasing and development and what protection it will afford existing leases in the above-described scenario.	2052
10286	10286-20	BLM should, however, clarify the language in Record No. 1019 of the Preferred Alternative that suggests "stipulations" will be required prior to the approval of surface disturbing operations. As discussed above, the BLM does not have the	2052

**Attachment B – Draft Resource Management Plan and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table B-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
		authority to modify stipulations on existing leases. Leases are valid, existing rights that cannot be modified by a newly developed RMP. The IBLA recently confirmed the fact that the BLM cannot add additional stipulations to a lease after it has been issued. Dejour Energy (USA) Corp., IBLA No 2010-175 (April 29, 2010).	
10286	10286-21	Further, the BLM has not analyzed or disclosed the potential impacts the restrictions on future leasing under Alternative B may have upon operations on existing leases. Devon owns numerous leases within the planning area, but to the extent such of these leases are isolated, they are virtually impossible and not economically feasible to develop. Any responsible oil and gas producer who decides to take the risk of exploring by drilling a wildcat area must do so only after assembling a large enough block of leasehold acreage so that, if the drilling is successful, it can obtain an adequate return on the high risk dollars invested. The BLM has, in other contexts, recognized this need for control of a reasonable acreage block. See Prima Oil Ei: Gas Co., 148 IBLA 45,51 (1999) (BLM policy to suspend leases when "a lessee is unable to explore, develop, and produce leases due to the proximity, or commingling of other adjacent Federal lands needed for logical exploration and development that are currently not available for leasing").	2052
10286	10286-22	Similarly, in Record No. 2011 the BLM suggests that under all alternatives it will include new stipulations on leases or restriction on existing leases when determined necessary. Bighorn RMP/DEIS, Record No. 2011, pg. 2-54. The BLM cannot impose stipulations or new restrictions on existing leases and particularly cannot impose new NSO restrictions on existing leases. Courts have recognized that once the BLM has issued an oil and gas lease conveying the right to access and develop the leasehold, the BLM cannot later impose unreasonable mitigation measures that take away those rights. See Conner v. Burford, 84 F.2d 1441, 1449-50 (9th Cir. 1988); 43 C.F.R. Â§ 3101.1-2 (2006) (BLM can impose only "reasonable mitigation measures ... to minimize adverse impacts ... to the extent consistent with lease rights granted").	2052
10286	10286-23	Devon is vehemently opposed to the proposed management actions under Alternative B and Alternative D that would allow the BLM to prohibit suspension of existing leases, even on a case-by-case basis. Bighorn RMP/DEIS, Record No. 2028, pg. 2-57. The terms of the Mineral Leasing Act of 1920 clearly and unequivocally allow the BLM to grant lease suspensions for a variety of reasons, the most important of which is when a suspension is in the interest of conservation. 30 U.S.C. § 209 (2010); 43 C.F.R. Â§§ 3103.4-4 and 3165.1. The BLM should not attempt to modify, alter, or curtail aspects of the Mineral Leasing Act and the BLM's regulations and manuals. Requesting and receiving suspensions is critical to oil and gas operators, particularly when the delays associated with oil and gas development are caused by the BLM. More often than not, oil and gas operations are delayed for years and years while the BLM completes the analysis and processes required by laws such as NEPA. Under IBLA guidance, the BLM's manual, and decisions of the Solicitor of the Department of the Interior, lessees are entitled to suspensions in the interest of conservation during the preparation of such analysis. See, e.g., River Gas Corp. et al., 149 IBLA 239,245 (1999); BLM Manual, 316010.2.21. A.1, 3160-10.2.21.B.1. (Rel. 3-150, 3/13/1987); see also BLM Manual, 3160-10, Appendix 1 Solicitor's Memorandum dated July 14, 1975	2052
10286	10286-3	The BLM's Land Use Planning Handbook also specifically recognizes that existing	2052

**Attachment B – Draft Resource Management Plan and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table B-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
		rights must be honored. BLM Land Use Planning Handbook H-1601-1, III.A.3, pg. 19 (Rel. 1-1693 3/11 IDS). The BLM must comply with its planning handbook and recognize existing rights. The authority conferred in FLPMA is expressly made subject to valid existing rights. 43 U.S.C. § 1701. Thus, an RMP prepared pursuant to FLPMA, after lease execution and after drilling and production has commenced, is likewise subject to existing rights. See Colorado Environmental Coal, et al., 165 IBLA 221, 228 (2005). The Bighorn RMPs, when revised, cannot defeat or materially restrain Devon's valid and existing rights to develop its leases through conditions of approval or other means. See Colorado Environmental Coal, et al., 165 IBLA 221,228 (2005) (citing Colorado Environmental Coal., 135 IBLA 356, 360 (1996) aft'd, Colorado Environmental Coal. v. Bureau of Land Management, 932 F.supp. 1247 (D. Colo. 1996). The BLM partially recognizes that it cannot modify existing lease rights in the Bighorn RMP/DEIS, but the agency negates this statement by suggesting that it will impose conditions of approval on operations that will, effectively, impose new limitations on leases. Bighorn RMP/DEIS, pg. 4-57. The BLM cannot use conditions of approval ("COAs") to modify or take existing lease rights.	
10286	10286-4	In the revised Bighorn RMPs and accompanying environmental impact statement ("EIS"), the BLM should state clearly that an oil and gas lease is a contract between the federal government and the lessee, and that the lessee has certain rights thereunder. See Mobil Oil Exploration & Producing Southeast, Inc. v. United States, 530 U.S. 604, 620 (2000) (recognizing that lease contracts under the Outer Continental Shelf Lands Act gives lessees the right to explore for and develop oil and gas); Oxy USA, Inc. v. Babbitt, 268 F.3d 1001, 1006-7 (10th Cir. 2001) (noting that the Tenth Circuit has long held that federal oil and gas leases are contracts) rev'd on other grounds, BP America Production Co. v. Burton, 549 U.S. 84 (2006). Although the BLM may revise the existing RMPs for the Bighorn Basin, the BLM-and the public-should be reminded that the BLM cannot unilaterally alter or modify the terms of existing leases. The BLM recently recognized the nature of existing oil and gas lease rights in the Pinedale RMP issued by the BLM in November of 2000. "Existing oil and gas or other mineral lease rights will be honored. When an oil and gas lease is issued, it constitutes a valid existing right; BLM cannot unilaterally change the terms and conditions of the lease ... Surface use and timing restrictions from this RMP cannot be applied to existing leases." Pinedale RMP, pg. 2-19. Similar language exists in the December of 2008 Rawlins RMP. Rawlins RMP, pg. 20. Devon encourages the BLM to include similar language in the Bighorn Basin RMPs.	2052
10286	10286-59	The BLM needs to clarify the language on page 4-4 of the Bighorn RMP/DEIS. In the third bullet point on page 4-4, the BLM suggests that the Secretary of the Interior has the authority to impose restrictions on lease terms. Bighorn RMP/DEIS, pg. 4-4. To the extent the BLM is suggesting it can impose restrictions on existing leases, the BLM's statement is factually and legally incorrect. As discussed in detail above, once the BLM has issued a federal oil and gas lease without no surface occupancy stipulations, and in the absence of non-discretionary statutory prohibition against development, the BLM cannot completely deny development on a federal leasehold. National Wildlife Federation, et al., 150 IBLA 385, 403 (1999).	2052
10286	10286-69	The BLM again suggests through Chapter 4 it intends to impose additional mitigation measures on exploration and development activities, or COA on operations in areas that have been designated unavailable for leasing in the	2052

**Attachment B – Draft Resource Management Plan and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table B-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
		revised RMP in order to exclude surface occupancy and restrict surface disturbance. As discussed above, the BLM has no authority to impose conditions of approval or other mitigation measures on valid existing rights. Even in areas where the BLM has determined that lands should not be available for leasing in the revised Bighorn RMPs, the BLM cannot limit surface use and occupancy. Doing so constitutes a taking of valid property rights in contravention of federal law and the Constitution of the United States.	
10286	10286-75	Devon vehemently opposes the language in Section 2.0 that suggests, however, the contract can be changed with the express consent of the authorized officer. Because the lease is a contract, it can only be modified by the mutual agreement of both the lessee and the lessor, the BLM does not have the authority to change the contract unilaterally. The BLM should revise the language in Section 2.0 of Appendix A in the final EIS.	2052
10286	10286-51	Devon believes that the BLM has significantly underestimated the oil and gas potential of the Planning Area. According to the Wyoming Oil and Gas Conservation Commission, the Bighorn Basin is the biggest oil and gas producing area in the Rocky Mountains and 78% of the Basin has never been developed. Several oil and gas operators in the Basin are currently setting significant new and previously undevelopable oil and gas reserves within the Bighorn Basin. In particular, the BLM has underestimated the potential of the Phosphoria formation in the Bighorn Basin. Existing Phosphoria formation traps likely contain significant oil and gas reserves that can be economically developed given appropriate price conditions and recent advances in technology. Additionally, the BLM has underestimated the potential for development from the Mowry Shale formation within the planning area. Interest in the Mowry Shale formation in the Bighorn Basin has increased due to the recent boom in production from the Bakken Shale formation in the Williston Basin of North Dakota. Success in the Bakken came from the analyses of geologic data from decades-old producing areas which identified untapped resources that, with the application of new development and drilling technology, have made the area the nation's largest oil producing region. The Mowry Shale shares many of the same characteristics of the Bakken Shale and other successful shale reservoirs within the United States. These characteristics include a significant thickness of hydrocarbon bearing shales, eticquette naturation, and the capacity to maintain open fractures, and susceptibility to fracture stimulation. To date, only limited production has been reported from the Mowry Shale in the Bighorn Basin because exploration and development are in the earliest stages. There has, however, been recent success in drilling development within the Mowry Shale in the Bighorn Basin. The United States Geologic Survey recently evaluated the Mowry Shale in the Bighorn Basin and estimated that undiscovered continuous oil and gas reserves included over 5 million barrels of oil and 348 billion cubic feet of natural gas. There is significant potential in the Planning Area that BLM should protect. Other operators in the Basin have estimated that the potential of the Mowry Shale is so significant the BLM's Reasonably Foreseeable Development Scenario ("RFD Scenario") may be twenty-five to fifty times understated. The BLM needs to reconsider its RFD Scenario for the entire Planning Area given the significant potential of Mowry development in this region.	2061
10286	10286-52	The BLM should also consider the increased potential of oil and gas development in the region using carbon dioxide (CO2) flooding procedures. The	2061

Individual Comments and Index to Summary Comments and Summary Responses**

Table B-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
		Wyoming Enhanced Oil Recovery Institute ("WEORI") estimates that an additional 800 million to 2.25 billion barrels can be recovered from the Bighorn Basin as a result of enhanced oil recovery operations using carbon dioxide to displace stranded oil. Enhanced oil recovery is particularly important for the Bighorn Basin because, in many cases, existing infrastructures such as roads and well pads can be utilized to unlock this important domestic energy reserve. The sequestration of CO2 provides another important benefit. The BLM needs to reconsider its RFD Scenario given the extreme potential for enhanced oil recovery in this region.	
10286	10286-53	Thus, the BLM must carefully explain to the public that the RFD Scenario is not a cap or limitation on future development. In the most recent published decision from the IBLA regarding the RFD Scenario, the IBLA unequivocally determined that the RFD Scenario is not, and cannot be used as, a limitation on future oil and gas development. "While an important tool in the land use planning process, RFD scenarios do not constitute fixed or maximum limits on development under FLPMA such that exceeding them constitutes a violation of that statute." Biodiversity Conservation Alliance, et al., 1741BLA 1, 11 (2008). In order to prevent future litigation and appeals, the BLM must include language in the Record of Decision and the Bighorn RMPs describing the purpose of the RFD Scenario and the fact that the RFD Scenario is not a planning decision or limitation on future oil and gas development. Instruction Memorandum 2004-089, Policy for Reasonably Foreseeable Development (RFD) Scenario for Oil and Gas (Jan. 16, 2004).	2061
10286	10286-67	Devon questions whether the BLM has provided for adequate surface disturbance in Table 4.2 for the RFD Scenario. Bighorn RMP/DEIS, pg. 4-487. As the BLM is aware, oil and gas operators are currently utilizing horizontal development techniques in Wyoming, in particular, in the Bighorn Basin to develop and produce oil and gas from shale or other formations that previously could not be developed. The use of horizontal drilling techniques, however, requires the creation of much larger individual well pads than traditional vertical or directional development. Although the number of actual wellbores maybe less and, as noted above, as little as one well pad per section, individual well pads are often significantly larger-as large as ten or twelve acres in size prior to interim reclamation. The larger well pad size is necessary to accommodate larger drilling rigs utilized for horizontal development and to accommodate the significant amount of equipment necessary for large stimulation and hydraulic fracturing processes necessary to develop these resources. As many as 100 individual tanks may be necessary to store the water, sand, and other materials necessary to hydraulically fracture a single horizontal well. The BLM should account for this additional disturbance in its RFD Scenario to ensure that it has adequately and properly analyzed potential impacts on oil and gas development in the Bighorn Basin RMP/EIS.	2061
10286	10286-41	BLM's proposal under Alternative B, Alternative C, or Alternative D to substantially increase the number of acres subject to ROW exclusion and avoidance areas in the proposed Bighorn RMPs. Bighorn RMP, Record No. 6034, pg. 2-111. The BLM has not justified this substantial increase in the number of acres subject to ROW exclusion and avoidance areas. Devon is particularly concerned that the ROW excludance and avoidance areas will be utilized to significantly hamper or decrease oil and gas operations. The BLM must be willing to work with oil and gas lessees and operators to design access routes	2066

**Attachment B – Draft Resource Management Plan and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table B-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
		for proposed oil and gas development projects. Future limitations on road construction could impact Devon's valid and existing lease rights or its rights as the operator of a unit such as the Worland Unit. While the issuance of an oil and gas lease does not guarantee access to the leasehold, a federal lessee is entitled to use such part of the surface as may be necessary to produce the leased substance. 43 C.F.R. Â§ 3101.1-2.	
10286	10286-34	For reasons that are not sufficiently explained in the Bighorn RMP Draft EIS, the BLM proposes to create management areas for sage-grouse that are very different from the Sage-grouse Core Areas developed by the State of Wyoming. See State of Wyoming Executive Order No. 2011-5 (June 2, 2011) (Footnote 3: Although Devon does not fully support the sage grouse core strategy developed by the State of Wyoming, Devon was an active participant in the process and believes the policy provides for an important tool to both protect the sage grouse and foster continued oil and gas development. Although the Wyoming sage grouse core policy is far from perfect, it is a vast improvement from the sage grouse policy and protections developed by the BLM in the Bighorn RMP (DEIS). It is imperative that the BLM and the State of Wyoming recognize and develop similar management objectives for sage-grouse core areas. Absent virtually identical management areas and mitigation measures, operators will be placed in a very difficult and precarious position of complying with different and potentially inconsistent management approaches.	2069
10286	10286-58	Further, the BLM's decision to create Key Habitat Areas in the Planning Area is incompatible with the State of Wyoming Sage-Grouse Core Areas and, thus, contrary to the January 2010 Greater Sage-Grouse Habitat Management Policy on the Wyoming Bureau of Land Management administered public lands including the federal mineral estate instruction memorandum authored by Wyoming BLM State Director, Don Simpson, that specifically requires and indicates the BLM will adopt the State of Wyoming's Sage-Grouse policy. See Instruction Memorandum No. WY-2010-012 (December 29, 2009). In the Instruction Memorandum, the BLM specifically and unequivocally indicates that Wyoming BLM sage-grouse "Key Habitat Areas correspond to the State of Wyoming's Core Population Areas (Core Areas)." Instruction Memorandum No. WY-2010-012, pg. 1.	2069
10286	10286-71	Additionally, the BLM has not adequately described the potential impacts the protective restrictions for Greater Sage-Grouse would have upon oil and gas development. The significant timing in NSO limitations proposed under Alternative B would effectively eliminate oil and gas development across large portions of the planning area. The BLM's extremely unreasonable noise restrictions may also have significant detrimental impacts to oil and gas development. The prohibition on additional noises beyond ambient levels in the majority of the planning area would effectively eliminate oil and gas development across the planning area. The BLM must more accurately describe these impacts in the RMP so the public is aware of the significant losses of revenue and jobs caused by the BLM's proposed management activities.	2071
10286	10286-45	In Section 2.7 the BLM suggests that under Alternative C, there is potential to exceed the NAAQS or WAAQs if the Alternative is adopted. Given the fact the BLM has not performed any air quality modeling for the Bighorn RMPs, and given the fact the State of Wyoming DEQ has recently implemented significant and comprehensive control requirements on all oil and gas operations within the State of Wyoming, the BLM has not sufficiently justified this assumption.	2009_1

Individual Comments and Index to Summary Comments and Summary Responses**

Table B-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
		Devon encourages the BLM to work with the WDEQ to determine if, given these new regulations, there is any potential for an exceedance of the NAAQS and WAAQS.	
10286	10286-47	In Table 3-3, the BLM indicates that a representative concentration for ozone is 62 parts per billion ("ppb"). The Bighorn RMP/DEIS, pg. 3-9. The text on page 3-13 of the Bighorn RMP/DEIS, however, suggests a slightly higher 66 ppb measurement, albeit that measurement was taken from a site on the other side of the Bighorn Mountains. Bighorn RMP/DEIS, pg. 3-13. The BLM should explain this apparent inconsistency.	2009_1
10286	10286-60	The BLM indicates in Section 4.1.1.1 that emission factors used to measure proposed emissions within the Bighorn planning area were obtained using WDEQ best available control technology ("BACT") levels for natural gas fired engines. The BLM should clarify whether it utilized BACT standards from 2011 or earlier standards. The WDEQ recently completed a rule making significantly modifying and reducing BACT standards in Wyoming. These new standards will undoubtedly reduce emissions from oil and gas projects. To the extent the BLM has not utilized the most recent BACT information the information contained in Chapter 4 and in Appendix U will not be accurate	2009_1
10286	10286-61	On page 4-9 of the draft RMP, the BLM indicates that as a result of higher levels of mineral development CH4 emissions are anticipated to be highest under Alternative C, followed by Alternatives A, D, and B, respectively. Bighorn RMP/DEIS, pg. 4-9. On page 4-7 of the document, however, the BLM indicates that as a result of mineral development, CO2 emissions will be highest under Alternative C followed by Alternatives D, A, and B, respectively. Given the fact oil and gas development would be higher under Alternative C followed by Alternatives A, and then D, it seems likely that this should be the order for emissions as well. Bighorn RMP/DEIS, pg. 4-57. The BLM should explain this inconsistency.	2009_1
10286	10286-62	The BLM discussed that air quality impacts would primarily result from minerals development and production, and oil and gas activities. Bighorn RMP/DEIS, pg. 4-6. In fact, previous modeling performed by the State of Wyoming, EPA, and the Forest Service suggested that 90% of the air quality impacts at the Bridger Wilderness Area is attributable to distant forces outside of Wyoming, and not local sources within Wyoming. See The Southwest Wyoming Regional Calpuitt Air Quality Modeling Study: Final Report (SWWYTAF) (February 2001).	2009_2
10286	10286-63	In general, the BLM seems to assume, without analyses or support, that oil and gas development will necessarily cause greater impacts from fugitive dust and construction emissions than other types of energy development. Possibly this underestimation is simply a result of BLM's greater familiarity with potential impacts of oil and gas development given the long history of oil and gas development within the State of Wyoming. Devon encourages the BLM to review carefully its emissions analyses as contained in Appendix U to ensure it is adequately and accurately capturing potential construction and future dust emissions related renewable energy development. If BLM does not have adequate information to support its analyses that oil and gas development, rather than renewable energy development or other uses of the public lands, then BLM should not imply that oil and gas development necessarily causes more emissions from fugitive dust and construction emissions. The BLM also should ensure it has adequately captured the motor vehicle emissions associated with maintaining renewable energy infrastructure, including wind	2009_2

Table B-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
		turbines. Just like oil and gas wells must be visited on a near-daily basis, wind turbines must be similarly inspected and maintained on an on-going basis.	
10288	10288-5	Based on WGFD Big Game Crucial Habitat identification, the area identified as Big Game Crucial Winter Range by the BLM within the Plan Area is much larger (almost double) than necessary for the maintenance of populations at objective levels. Consequently, we request BLM re-evaluate areas identified as Big Game Crucial Winter Range in the BHB Draft RMP and limit the designation of such areas to those necessary for the maintenance of populations at objective levels (i.e. to be consistent with WGFD Big Game Crucial Habitats).	2022
10288	10288-6	Based on the USFWS's recent findings and determination regarding the mountain plover, the stipulations and protections afforded to the mountain plover under the BHB RPM in Management Action #4125 and the Chapman Bench ACEC (Page 2-88, Table 2-5, Record #4125) is no longer warranted or scientifically justified.	2041
10288	10288-2	The Impact Analysis for Planning Model (IMPLAN) is a model using regional analysis. It appears the Big Horn Basin would be better analyzed with a more geographic specific approach. For example, in Table X-1, IMPLAN identifies regional oil and gas well numbers including coalbed natural gas. There has been very limited exploration and not any marketable sales from coalbed natural gas development in the Big Horn Basin. It appears the model may be using the entire state of Wyoming for a regional model. It is precisely because of the use of data like this that has no bearing on oil and gas development in the BHB makes the reported information and findings questionable.	2046
10288	10288-9	Discrepancy between Cooperating and Coordinating Agencies in the Scoping Process of the RMP and EIS. County Commissioners, certain conservation districts, the State of Wyoming, and certain agencies of the State of Wyoming applied for and were granted "cooperator" status during the scoping process of the RMP/EIS as provided for in the National Environmental Policy Act (NEPA) and BLM regulations. However, it does not appear that state and local governments were accorded "coordinating" status as required by FLPMA.	2060
10288	10288-3	Devon questions whether the BLM has provided for adequate surface disturbance in Table 4.2 for the RFD Scenario. Bighorn RMP/DEIS, pg. 4-487. As the BLM is aware, oil and gas operators are currently utilizing horizontal development techniques in Wyoming, in particular, in the Bighorn Basin to develop and produce oil and gas from shale or other formations that previously could not be developed. The use of horizontal drilling techniques, however, requires the creation of much larger individual well pads than traditional vertical or directional development. Although the number of actual wellbores maybe less and, as noted above, as little as one well pad per section, individual well pads are often significantly larger-as large as ten or twelve acres in size prior to interim reclamation. The larger well pad size is necessary to accommodate larger drilling rigs utilized for horizontal development and to accommodate the significant amount of equipment necessary for large stimulation and hydraulic fracturing processes necessary to develop these resources. As many as 100 individual tanks may be necessary to store the water, sand, and other materials necessary to hydraulically fracture a single horizontal well. The BLM should account for this additional disturbance in its RFD Scenario to ensure that it has adequately and properly analyzed potential impacts on oil and gas development in the Bighorn Basin RMP/EIS.	2061

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
		Document, Appendix U, were labeled "Summary of ROW and Corridors Emissions" for Alternatives A, B, C, and D - tabled for the years 2005, 2015, and 2024, respectively. Activities included, for total purported emissions (PM10, PM2.5, NOx, SO2, CO, VOC, HAPs): "Heavy Equipment - Fugitive Dust; Heavy Equipment - Vehicle Exhaust; Commuting Vehicles - Fugitive Dust; Commuting Vehicles - Vehicle Exhaust." Emission levels were an order of magnitude lower in these tables, for similar vehicle operations, as compared to the tables labeled "Total Annual Emissions from Oil Wells." Source locations of the variables to generate emission figures - are questionable. It is not clear if emission figures were generated from data gathered within the Planning Area. On a similar note - Regarding motor vehicle operations/emissions/fugitive dust and Yellowstone National Park -visitation was down 5 percent, with 2,383,614 visitors, this year to date (Cody Enterprise - 08/08/2011). However, vehicle emissions from tourism and air quality effects were not addressed in the RMP - albeit air quality monitoring data from "oil wells" were.	
10289	10289-1	Designate all HMAs and HAs in the planning area as wild horse ranges to be managed principally for wild horse herds pursuant to 43 C.F.R. 4710.3-2. Wild horses should be allocated a minimum of 51 percent of forage and water resources in the HMAs.	2030
10299	10299-3	One of the most upsetting parts is the reasonable foreseeable development. According to the Wyoming Enhanced Oil Recovery Commission, there are great possibilities with CO2 flooding and enhanced oil recovery. Additionally, the BLM fails to include reasonably foreseeable development which addresses horizontal and directional drilling - technologies happening in our neighbor communities.	2005
10299	10299-2	Research shows that BLM dependent ranch operations use of one AUM of BLM grazing would support 2.46 AUMs of livestock production. These numbers equate to the following: (all numbers are Millions of \$)Value of Livestock Value of BLM AUMs Value of Total Production Value to Ranch Viability Production \$10.9 \$15.8 \$26.9Earnings \$3.5 \$5.0 \$12.4Employment 107 155 382.	2011
10299	10299-6	There is a discrepancy in the Big Game Winter Range area identified by the BLM and also by the WGFD. BLM Big Game Crucial Range covers nearly twice the area as WGFD Big Game Crucial Habitat, nearly 649,246 acres.	2022
10299	10299-9	The BLM did not conduct a study of special designations and other management areas and the economic impact on stakeholders and locals governments from the associated constraints and restrictions.	2046
10299	10299-7	As for Sage grouse conservation / protection, the BLM should defer to the USDA, State of Wyoming's Executive Order 2011-5 and local ranchers and farmers for the best management practices. The USDA is providing 21.8 million dollars to encourage ranchers and farmers in Wyoming to conserve habitat for the greater sage grouse, according to Agriculture Secretary Tom Vilsack.	2071
10329	10329-2	There are 687 grazing allotments in the planning area. Of those, 203 are either completely or partially in LWCs. The inventoried LWCs cover 569,277 acres or approximately 27% of the allotments. The following numbers are provided by Van Tassel and Richardson (1998) and Taylor (2004). Research shows that BLM dependent ranch operations use of one AUM of BLM grazing would support 2.46 AUMs of livestock production. These numbers equate to the following: (all numbers are Millions of \$) Value of BLM AUMs Value of Total Production Value to Ranch Viability Value of Livestock Production \$10.9 \$15.8 \$26.9Earnings \$3.5 \$5.0 \$12.4Employment 107 155 382	2011

Individual Comments and Index to Summary Comments and Summary Responses**

Table B-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
10329	10329-1	The plan states oil & gas development would result in adverse impacts to wildlife habitat. As quoted in the plan: "As the number of wells, roads, and facilities increase, habitat in and near well fields, due to degradation, invasive species spread, and fragmentation, may become less suitable until most animals no longer use these areas". I ask what scientific study was done in the basin to prove this statement as true? As an outdoors person I have found antelope and deer in habitats with oil pads, drilling rigs, and roads hauling equipment.	2025
10329	10329-5	You state in the plan "reducing the number of biological entities in a system or making some of them less abundant reduces diversity", Yet nowhere in the plan do you address, using sound science, the decrease in this diversity having negatively affected the planning area,	2025
10329	10329-3	According to the Dean Runyan Report 2007, 80% of our Big Horn Basin tourist activities are outdoor activities. According to Wyoming Travel & Tourism; tourism spending reached \$350 million dollars in 2010 in the Big Horn Basin and supported 4660 jobs with earnings of over \$97 million dollars. This generates \$35 million dollars in sales tax collections for the Basin.	2046
10329	10329-4	Sage grouse conservation / protection, The BLM, in their plan, should defer to the USDA, State of Wyoming's Executive Order 2011-5 and local ranchers and farmers for the best management practices,	2071
10331	10331-1	4) Interior Secretary Ken Salazar has directed the BLM to "take no action under the Wild Lands Order," which Alternatives B & D were written for. Even if the term "wild lands" is changed to a new term, they are still illegal because the new term would merely be a synonym with the same intent.	2027
10332	10332-1	7. Western's transmission lines are likely already designated as ROW corridors within the two field offices. Please confirm this, as well as whether other linear features, such as pipelines, other transmission lines or distribution lines, will be required to locate adjacent to Western's transmission lines. If that is the case, then Western will work with the new proponent to ensure the continued safe and reliable operation of its facilities.	2066
10333	10333-2	the RMP is inadequate and understates the future potential of oil and gas development and recovery of existing reserves. Marathon recommends that the document be updated to include the concerns of industry and the State of Wyoming Joint Minerals, Business and Economic Development Committee, as stated in their letter to the BLM dated June 27, 2011.	2061
10336	10336-1	Designate all HMAs and HAs in the planning area as wild horse ranges to be managed principally for wild horse herds pursuant to 43 C.F.R. 4710.3-2. Wild horses should be allocated a minimum of 51 percent of forage and water resources in the HMAs.	2030
10340	10340-2	Please explain on the record, in the response to public comments on the DEIS, how BLM has determined that reaching an agreement on the final plan in advance of analyzing public comments or even completing the public comment period aligns with its obligations under NEPA, How does BLM maintain credibility with the public when a decision is apparently reached in violation of the intent of the NEPA public comment process?	2054
10361	10361-1	The efficient and effective operation of the power delivery system is fundamental to Tri-State and its member entity operations. The power delivery infrastructure encompasses the construction of new transmission facilities to support electricity demand and load, and maintaining existing transmission facilities to ensure reliable supply of electricity. What specific management	2066

Individual Comments and Index to Summary Comments and Summary Responses**

Table B-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
		prescriptions (mitigation requirements) is BLM considering for construction and operation of new transmission lines in the areas mapped on Map 54 as "Right-of-way Avoidance and Mitigation Areas"? Will these new management prescriptions be applied to existing facilities now or in the future when these facilities are upgraded or improved?	
10362	10362-2	The Big Horn is the first, with studies this year for its potential for CO2 sequestration and "transitional sequestration" sites, new sources for CO2, and Rare Earth Elements and new gas and oil. We believe the final RMP and EIS should address these and other private and public explorations which will certainly continue into the twenty year time period of the RMP.	2015
10362	10362-1	We feel the draft RMP and draft EIS do not adequately address the application of Enhanced Oil Recovery (EOR). All of the known oil fields in the Big Horn Basin have been identified as residual oil zones (ROZ) by the University of Wyoming's Enhanced Oil Recovery Institute (EORI). Success by the Institute working with private oil field owners in recovering quantities of oil from similar old fields through the application of CO2 flooding is prompting private industry to look for CO2 sources in the Basin and to plan for pipelines into the Basin which will transport CO2 from western Wyoming, all of which will generate income. Within the last 60 days a pipeline/gas company has discussed their desire to place a pipeline into the Big Horn Basin for delivery of CO2. The Big Horn Basin ROZ will almost certainly be subject to CO2 flooding during the twenty-year RMP period. The final RMP and EIS should certainly take into account the reality of the potential for EOR activities.	2051
10364	10364-2	Record # 4055 (p. 2-73), under Alternative B and D, indicates that the BLM will "[i]ntensively manage intermittent streams judged as having potential to become, or return to being, perennial streams with fish on a watershed scale to perennial flows." This seems both inappropriate and unrealistic, if not contrary to Wyoming law. Only the State of Wyoming is able to obtain and hold a right for instream fisheries purposes.	2002
10364	10364-16	The management prescriptions under Alternative D, as outlined in Record # 5020, 5022, and 5023 (pp. 2-97 and 2-98), use the word "avoid." The common legal definition of "avoid" is "to make void or of no effect; invalidate." One may be led to the conclusion that surface-disturbing activities are precluded within 3 miles of important cultural sites throughout the Planning Area. Rather, it should be interpreted "as a term used to address mitigation of some activity" consistent with the definition provided in the Draft RMP and DEIS (p. Glossary-4). Although the use of the word "avoid" seems a poor choice, given the definition provided in the Draft RMP and DEIS it seems reasonable to include "(see Glossary)" following "avoid" in each of the Record #s referenced above.	2004
10364	10364-15	It appears as if Record #4077, Alternative D, was developed to address disruptive activities associated with grazing in delineated elk parturition habitat. I and others are concerned with the accuracy of current parturition habitat lines and further believe that those lines vary from year-to-year based on predator pressure and weather patterns. Consistent with comments outlined in letters from the Wyoming Game and Fish Department and the Wyoming Department of Agriculture, I cannot support this Alternative and would not support restricting cattle grazing in parturition areas based on the premise of disturbance. However, if Record #4077 was developed to address potential brucellosis impacts, I recommend the following language, "BLM would consider implementation, on a case by case basis, management actions jointly	2020

**Attachment B – Draft Resource Management Plan and Draft Environmental Impact Statement

Table B-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
		recommended by wildlife managers, grazing permittees, and animal health officials that would control the transmission of brucellosis.”	
10364	10364-18	For example, on July 25, 2011 Bob Abbey, BLM Director, issued IM No. 2011-154, Requirement to Conduct and Maintain Inventory Information for Wilderness Characteristics and to Consider Lands with Wilderness Characteristics in Land Use Plans. As stated in the IM, “[t]his IM placed Bureau of Land Management (BLM) Manuals 6301, 6302, and 6303 into abeyance until further notice.” But still, portions of the Draft RMP and EIS refer to Manuals 6301, 6302, and 6303. The Final RMP and EIS, when released, should apply current law and guidance and thus remove all references and narrative relating to Secretarial Order 3310 and its associated manuals. (See for instance: Executive Summary and Chapters 1 through 4.)	2027
10364	10364-19	The BLM’s analysis of lands with wilderness characteristics done in conjunction with the development of the Draft RMP and DEIS is of particular concern. As you are aware, local cooperators have presented information that appears to identify flaws with the BLM’s inventory and analysis. Local cooperators identified that almost 20% of BLM lands were erroneously identified as having wilderness characteristics. In this area, the BLM identified 56 areas comprising a total of 571,000 acres. This area includes 634 miles of roads (of which 518 are two track), 442 reservoirs, 296 miles of fence, 569,273 acres of active allotments, 154 range improvements, 10 miles of water pipeline, 17 water wells, 8 oil fields, 68 miles of oil and gas pipeline, 8 active oil and gas wells, 59 plugged and abandoned oil and gas wells, and 248,315 acres (43%) which have oil and gas leases. Based on a review of the BLM and local cooperator findings, I cannot support the designation of any lands with wilderness characteristics in the Bighorn Basin. Further, the BLM should, in conjunction with local cooperators, initiate a new inventory process in order to correct what otherwise appears to be a misclassification of approximately 571,000 acres of land as lands with wilderness characteristics.	2027
10364	10364-8	The BLM intends to designate oil and gas management areas in the Bighorn Basin where the priority use is oil and gas development. For each of the ROZ Potential Sites listed in Table 1 (see Attachment A), the State requests that the BLM adopt (and spatially expand where necessary) the oil and gas management areas identified in Alternative C. The oil and gas management areas identified in Alternative D are insufficient to accommodate EOR development in all of the ROZs. In addition, the State requests BLM expand the Alternative C oil and gas management areas by 24,819 acres to encompass all federal surface and minerals within each ROZ Potential Site. The State requests that all Federal surface and minerals within the ROZ Potential Sites shown on Figure 1 (see Attachment A) be designated as oil and gas management areas as defined for Alternative C. A summary of the additional sections of federal surface and minerals that should be added to the Alternative C oil and gas management areas for each ROZ Potential Site is provided in Table 2 (see Attachment A). The primary resource use in the areas designated as oil and gas management areas will be oil and gas development. The BLM should clearly state in the RMP that development will be allowed to proceed within oil and gas management areas without amending the RMP so long as new well spacing does not exceed current well spacing in the fields. As stated previously, the State requests BLM adopt Alternative C for oil and gas management areas. In addition, the state requests BLM modify the description of Alternative C in Record # 2029 (Table 2-	2050

**Attachment B – Draft Resource Management Plan and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table B-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
		5) as follows: "Delineate Oil and Gas Management Areas (Map 21) (568,164 592,983 acres) around intensively-developed existing fields and existing fields with potential for enhanced oil recovery, using a buffer zone of up to 2 miles from the outer boundary of the existing field (Map 23), and incorporating all Federal surface and minerals within the boundaries of ROZ Potential Sites. Within these areas, manage primarily for oil and gas exploration and development (including EOR) and carbon sequestration; consider all other surface uses secondary." The oil and gas management areas would be allowed to be developed at the well spacing and surface densities (for all surface disturbing activities) of the existing fields.	
10364	10364-12	The description of CO2 sequestration (Record # 2035, p. 2-58) for Alternatives B and D are unrealistic. BLM needs to recognize that at some point in time EOR projects may qualify as sequestration projects for myriad federal and state laws and regulations. In fact, many now agree that the only currently-economic mechanism for geologic sequestration of CO2 is EOR. Alternative B would prohibit CO2 sequestration and Alternative D would allow sequestration only where it does "not detract" from other resource objectives. BLM needs to consider the link between EOR and sequestration when evaluating the feasibility of these alternatives. BLM should not and likely cannot adopt Alternative B. Further, the standard established by Alternative D is arbitrary and capricious. I request that the BLM adopt Alternative C for CO2 sequestration and dismiss Alternatives B and D from the Final EIS.	2051
10364	10364-3	The Draft RMP and DEIS fails to discuss advances in horizontal drilling and hydraulic fracturing technologies that are unlocking commercial oil rates from tight oil sands in the Turner, Parkman, and Sussex formations and shale oil from the Niobrara and other Cretaceous shales in other basins of the state.	2051
10364	10364-5	Recent advances in EOR, particularly using carbon dioxide (CO2) have proven economically effective in producing large quantities below the oil-water contact in similar (but with lower oil saturations) reservoirs in the Permian Basin in Texas. Based on recent studies completed in the Bighorn Basin by EORI and discussion with operators, it is reasonable to conclude that historically produced MPZs and previously uneconomic ROZs in the Bighorn Basin will be the target of EOR projects during the RMP projection period. The Wyoming Pipeline Authority has completed work that projects that the CO2 necessary to support EOR could reasonably be delivered to the Bighorn Basin as early as 2016. Current and projected oil prices indicate that EOR in the Bighorn Basin will be economically viable. The State of Wyoming has initiated and will continue to support significant efforts to accelerate potential EOR development in the Bighorn Basin and local governments in the Planning Area strongly support these efforts. EOR potential in the Bighorn Basin needs to be more fully described in the Final RMP and Final EIS.	2051
10364	10364-6	If the CO2 network is implemented as stated above, oil production would mimic the curve shown on Figure 2 (see Attachment A) and production could rise to over 20 million barrels per year by 2028 (the BLM RFD Scenario projects 4.2 million barrels per year). Obviously, such a significant increase in production would positively affect the forecasted annual earnings for all the alternatives contained in the Draft RMP and DEIS (p. 2-226). Not only would an increase in oil production from the basin benefit the Federal coffers and the State of Wyoming, significant increases would be expected in local revenues and would change for the better the dismal annual employment forecasted in the Draft	2051

**Attachment B – Draft Resource Management Plan and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table B-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
		RMP and DEIS (p. 2-226). I request that the BLM fully evaluate the potential for significant EOR development in the Bighorn Basin during the projection period in the Final EIS and revise the Draft RMP as necessary to facilitate and expedite EOR. I will expect the Final RMP and EIS to provide sufficient analysis and candid public disclosure to allow EOR development in the ROZs to proceed using Environmental Assessments rather than lengthy Environmental Impact Statements with significant plan amendments.	
10364	10364-20	The definition for surface-disturbing activities provided in the Draft RMP and DEIS (p. Glossary-38) is not the agreed upon definition by the BLM and cooperators, nor is it consistent with any other RMP in the state. I recommend that the BLM apply the definition for surface disturbing activities outlined in Information Bulletin No. WY-2007-029, Guidance for Use of Standardized Surface Use Definitions.	2054
10364	10364-4	In particular, I believe that additional discussion of production potential from the Mowry Shale should be addressed in the Final EIS and RMP.	2061
10364	10364-7	However, the BLM is not as clear on how impacts are treated and how disturbance is calculated from these well counts. It is my understanding that disturbance and impacts projected using the RFD well counts is also provided solely for the purposes of comparing impacts between Alternatives and that it is not BLM's intention that any of the estimates of disturbance or impacts provided in the RMP or EIS represent "analysis thresholds" for determining what actions may require a plan amendment. The relationship between disturbance estimates and impacts and what constitutes an analysis threshold is not clear in the Draft RMP and DEIS and BLM needs to provide a clear statement that exceeding the estimates of disturbance or impacts in the EIS will not result in the need for an RMP amendment. For instance, in Appendix T of the Draft RMP and DEIS BLM calculates short- and long-term surface disturbance from leasable oil and gas for each of the alternatives. Short-term disturbance during the 20-year projection period ranges from 1,527 (Alternative B) to 3,771 acres (Alternative C) on public lands. The projection for fee and state surface is 1,533 acres for all alternatives. BLM needs to clarify in the Final RMP and EIS that these estimates are provided for analysis purposes only to demonstrate the difference between alternatives and that disturbance or impacts beyond the analysis assumptions does not require a plan amendment.	2061
10364	10364-11	In addition, it is questionable that over 60 percent of the federal minerals and 80 percent of the BLM managed surface in the planning area needs to be subjected to "stringent terms and conditions" associated with ROW avoidance/mitigation areas. I request that the BLM reevaluate the criteria used to delineate ROW avoidance/mitigation areas with a goal toward balancing other resource uses of public lands. It may be beneficial to segregate avoidance and mitigation areas into two separate analyses so that it is clear to the public which areas should be avoided and which areas will require mitigation.	2066
10364	10364-10	While none of the ROW exclusion areas under either Alternative C or D appear to conflict with development of the ROZ Potential Sites, my staff did locate numerous areas during review of the BLM shapefiles where ROW exclusion areas overlap corridors for Alternative D. Where such overlap occurs regardless of Alternative, I request the BLM clearly document in the RMP that the ROW corridors take precedence over the ROW exclusion areas. Record # 6034 (p. 2-111) addresses ROW avoidance/mitigation areas. Under Alternative D BLM proposes to manage 2,512,202 acres within the planning area as ROW	2067

**Attachment B – Draft Resource Management Plan and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table B-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
		avoidance/mitigation areas. Under Alternative C 1,174,335 acres would be managed as ROW avoidance/mitigation areas. The draft RMP/EIS defines "avoidance areas" as they pertain to ROW as follows: "ROWs either will not be granted in these areas, or if granted will be subject to stringent terms and conditions." (p. Glossary-4)[Footnote 5: Each polygon is attributed with a width in the shapefile, but we were unable to discern whether that width represented a width limit for the corridor or whether the attribute was used for mapping purposes.] In many cases, these ROW avoidance/mitigation areas are located within or overlap oil and gas management areas and corridors identified for both Alternatives C and D. It is inconsistent to identify an area where development will be the priority use while at the same time designating the same area as a ROW avoidance/mitigation area. I request that ROW avoidance/mitigation areas be removed from areas designated as oil and gas management areas and corridors under all alternatives.	
10364	10364-9	Right-of-Way Corridors and Right-of-Way Avoidance/Mitigation Areas The right-of-way (ROW) corridors identified in Alternative D will "strand" several of the ROZ Potential Sites from cost effective CO2 delivery and product shipment and may result in a disproportionate impact to private lands. I request that the BLM adopt the ROW corridors identified in Alternative C and shown on Map 53. If Alternative C is selected, all the ROZ Potential Sites can be accommodated using RMP corridors. I have been unable to locate in the Draft RMP and DEIS a specific description of the width of these ROW corridors and the ROW corridor polygons in the GIS shapefile provided by BLM for review by my staff appears to vary depending on location [Footnote 5]. Discussions with BLM staff have suggested that the width of these ROW corridors would be left to the discretion of the authorized officer. I believe that discretionary decisions will lead to confusion and may undermine the benefits to the environment intended by the ROW corridor designations. Consequently, I request that the BLM adopt corridors identified in Alternative C and modify Record # 6033 in Table 2-5 (p. 2-111) as follows: "Designate ROW corridors as shown on Map (Map 53). No limit will be placed on the width of these corridors as long as new linear facilities are constructed adjacent to existing linear facilities recognizing the need for adequate separation for operating system integrity, safety (construction and operations), appropriate federal, state and local statutes, regulations and policies, and land use constraints. Where BLM determines that a linear facility should be moved away from an adjacent utility to avoid a resource conflict, the new linear facility will still be considered to be within the RMP corridor."	2067
10364	10364-14	As noted in the Draft RMP and DEIS, Key Habitat Areas established by the BLM are not consistent with the Core Areas identified in Governor's Executive Order 2011-5 (71,241 acres larger). It is critical and is my expectation that the BLM's Key Habitat Areas remain consistent with the Core Areas (version 3). Deviation is one thing that will undermine support for the greater sage-grouse conservation strategy embodied in the Executive Order. BLM's Instruction Memorandum (IM) No. WY-2010-12 states that "WY BLM sage-grouse Key Habitat Areas correspond to the State of Wyoming's Core Population Areas (Core Areas)." The U.S. Fish and Wildlife Service consider the Core Population Area Strategy "a sound framework for a policy by which to conserve greater sage-grouse in Wyoming." BLM has served as a member of the Sage-Grouse Implementation Team with equal opportunity for input into the development of Core Areas. The Key Habitat Areas and associated protections identified in the Draft RMP and DEIS should be changed to reflect Core Areas (version 3) and	2069

**Attachment B – Draft Resource Management Plan and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table B-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
		stipulations outlined in Governor’s Executive Order 2011-5.	
10364	10364-13	The Draft RMP and DEIS references the “Wyoming Office of the Governor 2008” (pp. 3-111 4-497, and 6-29), a reference to Governor’s Executive Order 2008-2 Greater Sage-Grouse Core Area Protection. This is inaccurate. Governor’s Executive Order 2008-2 was replaced by Governor’s Executive Order 2010-4 and subsequently replaced by Governor’s Executive Order 2011-5 Greater Sage-Grouse Core Area Protection, which I signed on June 2, 2011. To the extent necessary these references and associated language should be corrected to reflect the most up to date information. Further, the references - e.g., “WGFD has identified core areas” (p. 3-111) or “core areas identified by the WGFD” - should instead note that the established or identified core areas are by virtue of my Executive Order 2011-5.	2071
10366	10366-1	Comment #3: The above referenced table (Table 4-25 Bighorn Basin Draft Resource Management Plan/Draft Environmental Impact Statement) reflects a dramatic difference in local ad valorem production taxes when compared with the below information: (See Figure 35, Ecosystem Research Group (ERG)). The BLM/RMP Alternative C estimates a total collection of royalties, state severance taxes and local ad valorem production taxes of \$93.5 million of 2008 dollars. The ERG group, when estimating tax revenue dollars generated from potential development from the Mowry Shale Formation could reach \$2.3 billion over the life of the plan. COMMENT THIS RESOURCE MUST BE RECOGNIZED AND DEVELOPMENT OF THIS POTENTIAL RESOURCE MUST BE ENCOURAGED WITHIN THE BLM/RMP!!!	2046
10368	10368-8	Page 2-34, third paragraph: the restriction limiting surface disturbing activities within 500 feet and up to 1/4 mile of riparian wetland areas may eliminate the ability of the Company to serve customers who are located near or adjacent to these areas because distribution lines generally cannot span such long distances. The Company recommends that a site-specific exemption process for such instances be incorporated under Alternative D,	2033
10368	10368-9	Same location as above: the NSO restriction on wetland areas greater than 20 acres is arbitrary and requires further rationale to support the use of that specific acreage,	2033
10368	10368-11	In Table 2-5, Management Action 4113, the Company would like the BLM to clarify what is intended by the statement regarding retrofitting of existing lines. The Company has coordinated extensively with the U.S. Fish and Wildlife Service to develop and enact an Avian Protection Plan. It is not feasible to make all existing power lines and structures avian-safe all at once. Retrofitting is done according to a risk analysis which prioritizes higher risk lines and structures first. All new lines are built avian-safe. Furthermore, the Company has done extensive research regarding the use of anti-perch devices which demonstrate that they are not effective, in many cases are counter-productive, and lastly have no basis in scientific findings.	2042
10368	10368-12	Page 4-319, third paragraph: The Company seeks clarification regarding the use of the term 'aboveground'. Specifically, the Company is adverse to 'underground' powerlines as a form of mitigation given the general lack of understanding regarding the complications, high levels of disturbance, and limitations of underground transmission.	2066
10368	10368-2	The Company also requests that the BLM disclose what is meant by the term 'crowding' especially as it relates to electrical facilities. Similarly, the statement in the first paragraph on page 4-314 regarding 'maximum safe density of	2066

**Attachment B – Draft Resource Management Plan and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table B-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
		existing powerlines' requires further explanation. As stated above, the Company has a legal and regulatory obligation to plan and provide electricity and transmission service in a safe, reliable, adequate, and efficient manner to its customers. In the Company's experience as well as that of many utilities, concentrating transmission lines in a single ROW is counter to good planning and professional practice in that doing so can compromise system reliability and decrease system efficiency.	
10368	10368-4	The Company also suggests that the BLM modify its assumption on page 4-311 under Section 4.6.3.1 which states 'In terms of major utility lines, companies would focus first on the maintenance and upgrading of existing lines before undertaking new construction of major utility lines in the Planning Area.' As a starting point, the BLM should define what it means by 'major utility lines.' The Company suggests that the BLM base its definition on those used by the agencies under which electrical utilities are regulated, namely the Federal Energy Regulatory Commission (FERC) and the Western Electricity Coordinating Council (WECC). More importantly, the BLM needs to better understand the complexities and limitations behind the Company's ability to upgrade existing facilities because in many cases doing so may conflict with the Company's regulatory obligations to its customers. For example, existing lines may not be located in areas with increased load demand; upgrading an existing line may not provide the necessary benefit nor be the most prudent solution; and/or it may not be possible to take extended outages on fully-utilized existing lines in order to complete upgrades. It is important for the BLM to recognize that the capability of an electrical sub-transmission and distribution system is limited by the distance of the line. If only existing ROWs are used, then the ability to serve load using existing facilities may be greatly reduced by the additional line miles realized. Therefore, effectively reducing the capacity of sub-transmission and distribution systems may actually result in an increased transmission presence in the Basin due to the Company's regulatory need to build more transmission facilities to meet customer demand. Other restrictions, such as major re-routes (detours that increase line mileage by greater than 15%) could also have similar affects. Therefore, the BLM should assume that new ROWs will be needed within the planning horizon outside those currently occupied by existing lines.	2066
10368	10368-6	The Company is concerned about the dramatic decrease in areas available for new ROWs (from 788,275 acres down to 132,219 acres) and increase in areas identified as ROW avoidance/mitigation areas (from 1,003,194 acres up to 2,551,205 acres). These changes seem disproportionate to the need for future ROWs in the Planning Area.	2066
10368	10368-7	The Company would also like the BLM to explain its rationale to use the criteria for ROW avoidance/mitigation areas identified in the first bullet on page 4-313 as 'areas having a 25 percent or greater slope.' In fact, the Company has extensive ROW in such areas and is concerned that making such a blanket assumption will result in unnecessary complications to process new ROW in such areas. The Company recommends that the BLM identify an exemption process that will not preclude development of future ROWs due to the wholesale application of this criteria.	2066
10368	10368-1	With this in mind, the Company respectfully disagrees with the statement in the last paragraph on page 3-154 which states 'If the current rate of development continues and current management remains in place, designated ROW corridors should adequately meet future needs over the next 10 to 20 years. At this rate	2067

**Attachment B – Draft Resource Management Plan and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table B-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
		of development, corridors could eventually be more intensely used, but the BLM does not anticipate crowding. This statement is mostly reiterated in Section 4.6.3.1 on page 4-312 as an assumption used by the BLM in analyzing impacts to rights-of-way (ROW). In addition, the Company disagrees with the statement in the first paragraph on page 3-155 which implies that oil and gas production in the Planning Area is expected to come mostly from established fields that already have adequate infrastructure in place as well as the statement in the subsequent paragraph that the demand for electric ROWs in the Planning area will remain moderate over the next 10 to 20 years. In fact, the Company expects that its electrical facilities in the Big Horn Basin are not adequate to serve load in the next 10-15 years. For example, the Oregon Basin substation is currently seeking approval to expand in support of oil development that is occurring over the next two years. Furthermore, current load requests will require substantial subtransmission additions by 2014. If these trends continue the electrical system in the area will be substantially larger than today's system. Therefore, the impacts of implementing alternative D are not accurately portrayed in the document because the designated corridors will not adequately meet the future needs over the short term, let alone the planning horizon of the Project. Additionally, the current rate of development as defined by the BLM is not an accurate metric and should be updated to anticipate an increased rate of development which the Company would gladly collaborate with the BLM to help develop.	
10368	10368-3	Finally, the Company disagrees with and requests further clarification as to the origins of the statement in the sixth paragraph on page 3-155 that the development of transmission lines on public lands can create 'perceived threats to safety.'	2067
10368	10368-5	The Company has recognized that some of its existing transmission facilities should be represented in Map 54 (Land Resources Rights-of-Way and Corridors under Alternative D) and identified as ROWs that are not located in avoidance/mitigation areas. Attachment 1 is a low resolution map depicting the Company's existing facilities in the Planning Area; a better map can be provided upon BLM's request. Some of the facilities that need to be identified (demarcated in the red bubbles in Attachment 1) include: the 115kV transmission line between Thermopolis and the Hilltop Substation near Worland, the 115kV transmission lines extending to the west interconnecting with a Western Area Power Authority line as well as serving the Curly Creek pumping station (Express Tap), the 69kV transmission line between the Oregon Basin Substation and the South Cody Tap (not represented on Attachment 1).	2067
10368	10368-10	Page 3-111, third paragraph: abandonment of habitat by Greater Sage -grouse due to powerlines is not supported by scientific studies.	2071
10369	10369-12	This discretionary authority must be limited. In order to conduct safe and effective oil and gas operations, it is imperative for operators to have, at a minimum, limited access to well locations year-round to perform inspections, maintenance and other obligatory operations. BLM must recognize that certain inspection and maintenance activities must be conducted regularly and cannot be delayed. We recognize that limitation on some disruptive activities and access to well locations during critical seasons may be necessary, such as prohibiting construction activities (e.g. well pads, roads, pits) or limiting the number of trips allowed in the winter on big game crucial winter range when warranted. Therefore, we strongly recommend that BLM modify this proposal	2020

**Attachment B – Draft Resource Management Plan and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table B-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
		under Alternative D such that BLM will allow reasonable access to existing well locations year-round for maintenance and operation of developed projects, even in wildlife sensitive habitats; basic maintenance and operation activities necessary to maintain safe, effective, and environmentally sound operations should not be subject to wildlife seasonal restrictions.	
10369	10369-13	As such, we recommend BLM specifically identify areas where BLM will be able to apply seasonal wildlife protections on a case-by-case basis, and limit the use of case-by-case determinations to areas where application of protections is warranted and appropriate.	2020
10369	10369-10	Implementing a 4 ½ month TLS for crucial winter range and a 2 month TLS for parturition habitat will significantly, but unnecessarily, limit oil and gas development in these large areas. Consequently, we recommend that BLM limit the expanse of these habitat areas to the amount necessary for big game sustainability. We further recommend that BLM utilize WGFD Big Game Crucial Habitat Priority Areas (CHPA) as a guide for identification of these areas. Big Game CHPAs include crucial winter ranges, parturition areas, and migration routes with a ½-mile buffer for big horn sheep, elk, mule deer, pronghorn, moose, and mountain goat. Consequently, consistency with CHPAs will provide adequate protection of these important habitat areas. A comparison of big game crucial winter range and parturition habitat identified in the RMP (Map 35) to WGFD Big Game CHPAs reveals that the BLM's habitat areas are inexplicably much more expansive throughout the planning area, especially along its eastern, western (including the Absaroka Front Management Area), and southern boundaries. In light of this major discrepancy, it is necessary for BLM to re-evaluate its designation of big game crucial winter range and parturition habitat locations, and make them consistent with WGFD Big Game CHPA's.	2022
10369	10369-11	Based upon the identification of Big Game Crucial Habitat Priority Areas (CHPA) within the MA by the WGFD, the MA is much larger than necessary to protect big game populations. The total area defined as Big Game Crucial Habitat within the MA by the WGFD is significantly smaller than BLM's. In fact, the WGFD has only identified relatively small pockets of Big Game Crucial Habitat within the MA. In light of this discrepancy, we urge BLM re-evaluate the size and boundaries of the Absaroka Front Management Area such to include only habitat areas actually in need of special management, as indicated by WGFD Big Game Crucial Habitat designations. Additionally, this discrepancy clearly demonstrates that subjecting 130,984 surface acres to MA restrictions (e.g. CSU, NSO, and unavailable for leasing) is not justified.	2022
10369	10369-8	Big game crucial winter range and parturition habitat acreage for all alternatives (Map 35) is inexplicably much greater than Big Game Crucial Habitat Priority Areas (CHPA) defined by the Wyoming Game and Fish Department (WGFD). WGFD Big Game CHPAs include "crucial winter ranges, parturition areas, and migration routes with a ½ mile buffer for big horn sheep, elk, mule deer, pronghorn, moose, and mountain goat." A comparison of big game crucial winter range and parturition habitat identified in the RMP to WGFD Big Game CHPAs reveals that the BLM's habitat areas are much more expansive throughout the Project Area, especially along the eastern, western (including the Absaroka Front Management Area), and southern boundaries of the Project Area. I understand the value of protecting crucial wildlife habitat. However, in light of this discrepancy it is difficult to justify the extent of big game crucial	2022

**Attachment B – Draft Resource Management Plan and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table B-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
		winter range and parturition habitat under all alternatives in the BHB RMP. As such, I suggest BLM re-evaluate the designation of big game crucial winter range and parturition habitat locations, and reduce the size of these areas such that they are consistent with WGFD Big Game CHPAs.	
10369	10369-31	I request BLM remove the language concerning designation of 52,485 acres of LWCs as wildlands. As you are aware, the 2011 Continuing Resolution does not allow the BLM to move forward with designations of any wildlands.	2027
10369	10369-32	I also object to the adoption of seasonal restrictions on activities in both McCullough Peaks and Fifteen Mile Herd Management Areas from February 1 to July 31 because no scientific justification has been provided to show that oil and gas development is detrimental to wild horse populations.	2030
10369	10369-20	However, the BLM fails to recognize the beneficial impact of produced water discharges in stabilizing ephemeral and intermittent stream channels through creation of riparian zones, thus reducing natural erosion.	2031
10369	10369-21	Discharges of produced water can increase the total dissolved solids concentration in surface water. However, BLM fails to recognize that most of the streams receiving produced water discharges are naturally ephemeral or intermittent. Water users in the Big Horn Basin would rather have water with elevated levels of total dissolved solids that can be put to beneficial use, than no water at all.	2031
10369	10369-22	Mineral development is one of many human activities as well as natural events that have the potential to impact shallow groundwater quality and quantity. There are many other activities which can impact shallow groundwater quality and quantity. To single out mineral development as the principal activity impacting ground water, is a biased assumption, particularly if the BLM has no scientific justification or data for making this assumption.	2031
10369	10369-23	The WEPP model estimate that with no disturbance there would only be trace amounts of runoff, seems to disregard the amount of natural runoff experienced in the interior of the basin during snow melt or precipitation events. The badland topography and the clay content of soils in the Big Horn Basin can result in significant amounts of natural runoff and erosion from areas like McCullough Peaks, 15 Mile and other badland areas of the basin, which have very minimal human disturbance.	2031
10369	10369-24	While it is true that more surface disturbance can result in more impact to water, it does not hold true in many cases. Many surface disturbing activities associated with oil and gas are very far away from any live water and runoff from these disturbed areas would typically never reach live water, particularly with the BMP requirements mandated in Storm Water Construction permits. In some instances, BMPs installed at disturbed sites can actually decrease the rate of natural erosion from a site and promote stable vegetation establishment.	2031
10369	10369-25	Does this statement mean that the BLM intends to start requiring Water Management Plans for WPDES discharges in the Big horn Basin? If so, would this requirement be for existing surface discharges, or only for proposed new surface discharges.	2031
10369	10369-26	Produced water discharged from oil and gas operations is generally hotter than the naturally occurring surface water. However, most produced water discharges first enter a naturally ephemeral drainage that would otherwise not contain surface water. By the time the produced water does reach a perennial water, the temperature has cooled dramatically and there is little if any impact	2031

**Attachment B – Draft Resource Management Plan and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table B-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
		on the perennial water. One benefit of the increased water temperature in those ephemeral drainages is that it typically provides an unfrozen year round water source for wildlife and livestock. Also, in many cases the organic component of the produced water has naturally attenuated by the time it reaches live water	
10369	10369-27	How does the BLM plan minimize impacts on surface water quality from components of produced water? As previously stated the Wyoming DEQ permits WPDES discharges and promulgates and enforces water quality standards. It is not the duty, nor the legal authority of the BLM to set water quality standards or to issue WPDES permits.	2031
10369	10369-28	However, the BLM fails to recognize the beneficial impact of produced water discharges in stabilizing ephemeral and intermittent stream channels through creation of riparian zones, thus reducing natural erosion.	2031
10369	10369-29	It cannot be expected that produced water from coalbed CBNG will be of the same quality and quantity as produced water from conventional or deep oil and gas wells.	2031
10369	10369-30	What is meant by “conforming BLM actions to Wyoming DEQ water quality standards, enforcement, and remediation?” As previously stated the Wyoming DEQ permits WPDES discharges and promulgates and enforces water quality standards.	2031
10369	10369-16	Although surface discharge of produced water may increase runoff and erode soils if BMPs are not applied; likewise discharge of produced water can decrease the erosion of soils due to development of riparian zones and wetlands associated with surface discharge of produced waters. Discharge of produced water in the Big Horn Basin has resulted in the creation of hundreds of miles of riparian zones and thousands of acres of wetlands. These riparian zones have stabilized stream banks on otherwise natural highly erosive ephemeral and intermittent drainages, thus reducing erosion of soils. Wetlands, created by produced water discharges, slow and filter natural runoff, thus reducing soil transport and improving water quality. There are many examples of this in the Big Horn Basin, including Cottonwood Creek, Dry Creek Kirby Creek, and Gooseberry Creek to name a few.	2045
10369	10369-17	Is loam soil the best soil texture to use for WEPPP modeling in the Big Horn Basin (BHB)? Since most soils in the interior of the BHB contain a lot of clay (bentonite), should clay loam be used for modeling purposes rather than a loam soil? Also, clay loam may not be the correct soil type to use in this model, “clay soils” is probably a better soil type to reflect actual soil conditions here in the Big Horn Basin (especially on BLM lands in the interior of the Big Horn Basin). If the WEPP model is limited to use for soil types that are not the primary soil type in the Big Horn Basin (i.e. model limited to loam type soils), then this model should not be utilized to predict erosion rates in the Big Horn Basin, because it will be inherently inaccurate.	2045
10369	10369-18	If the WEPP model predicts little or no erosion on undisturbed rangelands and forestlands, then it will dramatically underestimate the amount of natural soil erosion in the BHB.	2045
10369	10369-19	Is the WEPP model, which was used to predict erosion rates and runoffs, calibrated to account for installation and implementation of Best Management Practices required by the Wyoming DEQ under the Stormwater Construction Permitting Program, which essentially requires no discharge of pollutants	2045

Individual Comments and Index to Summary Comments and Summary Responses**

Table B-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
		(including soil) from the construction site?	
10369	10369-7	Based on the statistics quoted above, there are 136,433 more acres administratively unavailable for oil and gas leasing under Alternative D than Alternative A (i.e. under current management). However, no discussion or justification has been provided in the DEIS. Increasing the acreage administratively unavailable will decrease management flexibility in the Plan Area. We strongly recommend that BLM re-evaluate the number of acres administratively unavailable for oil and gas leasing and consider opening these areas to potential leasing subject to the standard lease form and moderate/major constraints.	2047
10369	10369-14	BLM cites the West Tavaputs Plateau Natural Gas Full Field Development Plan Draft EIS (2008), Glossary for the definition of disruptive activity in the BHB Draft RMP. However, disruptive activity is not defined in the West Tavaputs Plateau Natural Gas Full Field Development Draft EIS document. What is the explanation for this incorrect citation?	2054
10369	10369-15	The definitions for surface-disturbing activities and disruptive activity in the BHB RMP are overly broad in application. When used as a land use restriction (e.g. Table 2-5, Record #4082) these terms may be interpreted to completely limit all activities within an area. For example, the definition of disruptive activity includes "activities that disrupt or alter wildlife actions." This language may be interpreted to include almost any minimal activity occurring on the land, including activities that do not have a negative impact on the energy reserves, health, or population of a species. I am not opposed to limiting surface-disturbing and disruptive activities to a reasonable degree provided it can be scientifically justified. For example, prohibiting construction activities (e.g. well pads, roads, pits) or reducing the number of trips allowed in the winter on big game crucial winter range is reasonable. However, we are concerned BLM may endeavor to completely restrict all minimally disruptive activities under these definitions. Therefore, we call upon BLM to modify the definitions of surface-disturbing and disruptive activities to expressly exclude access to locations for the maintenance and operation of developed projects.	2054
10369	10369-1	COMMENT: KHAs designated by BLM are inconsistent with the State of Wyoming's Core Areas. If the intent of BLM is to obtain and maintain consistency between KHAs and the State of Wyoming's Core Areas, then why are KHAs identified in this RMP different than Core Areas provided for in Wyoming EO 2011-5, Attachment A (Sage-Grouse Core Breeding Areas Version 3)? Figure Q-1 of the RMP clearly illustrates the discrepancies between Sage-Grouse Core Breeding Areas Version 3 and KHAs.	2069
10369	10369-2	Furthermore, there are 71,241 more acres of KHA (1,857,485) than acres of Core Areas (1,786,244) located within the total planning area. What are the justification and scientific reasoning for expanding KHAs and changing KHA boundaries from Core Area boundaries? The Wyoming Sage Grouse Implementation Team (SGIT) conducted an extensive public process supported by the best available science to develop the Core Area strategy and the Core Population Areas provided for in EO 2011-5.	2069
10369	10369-3	Within these OGMA's I support waiver of all sage grouse stipulations where the OGMA does not overlap with a State of Wyoming Core Habitat Area. In areas where the OGMA does overlap with a State of Wyoming Core Area, I support incorporation of only non-core area stipulations with the exception that no new surface disturbances will be allowed within 0.6 miles of a lek. For "existing	2069

Table B-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
		activities” waivers of all sage grouse stipulations outside of core areas, and relaxation of core are stipulations to non-core stipulations is consistent with Governor Mead’s Executive Order (EO) 2011-5 (Part 2 page 2 and Part 7 page 3 of EO 2011-5). BLM needs to ensure that the Big Horn Basin Resource Management Plan matches exactly with the State of Wyoming Core Area management plan, and Governor Mead’s EO, as was committed to by the BLM representative on the Sage Grouse Implementation Team.	
10369	10369-4	However, sage grouse stipulations Under Alternative D are not consistent with stipulations provided for under EO 2011-5: Core Areas/Key Habitat Areas - Seasonal Use: Leks: Under EO 2011-5 - Activity will be allowed from July 1 to March 14 (i.e. not be allowed from March 15 to June 30) outside of the 0.6 mile perimeter of a lek in Core Population Areas where breeding, nesting and early brood-rearing habitat is present (EO 2011-5, pg. 9, Item 3). Alternative D - BLM extends this seasonal use restriction by two weeks, placing TLS on surface disturbing activities on nesting/early brood rearing habitat from March 1 to June 30 (Table 2-5, pg. 2-84). It is my understanding that BLM has chosen to start the TLS on surface disturbing activities on nesting/early brood rearing habitat two weeks earlier under the RMP than EO 2011-5 because sage grouse in the lower elevations of the BHB tend to start mating approximately two weeks earlier than leks at higher elevations in the BHB and other leks across Wyoming. I am not opposed to starting the TLS two weeks earlier to account for geographic differences in sage grouse behavior. A one-size-fits-all approach is not always preferred in wildlife management, and EO 2011-5 states that “adjustments to the stipulations may be necessary based upon local conditions and limitations.” However, in these low elevation areas we request that BLM also end the TLS two weeks earlier to maintain consistency of overall TLS duration. If sage grouse mating starts two weeks earlier in lower elevations, then it should also end two weeks earlier in these areas. If the Wyoming Sage Grouse Implementation Team (SGIT) has determined that a 3 ½ month TLS for nesting/early brood rearing is adequate throughout Wyoming, then it should also be adequate in the BHB. An overall expansion of TLS duration is not necessary to protect breeding sage grouse.	2071
10369	10369-5	Again, I am not opposed to starting the TLS two weeks earlier to account for geographic differences in sage grouse behavior and biological requirements, if it is scientifically justified. However, if BLM is starting the TLS on winter concentration areas two weeks earlier to account for geographic differences, we request BLM end the TLS two weeks earlier to maintain consistency of overall TLS duration. If the SGIT has determined that a 3 ½ month TLS for winter areas is adequate throughout Wyoming, then it should also be adequate in the BHB.	2071
10369	10369-6	I request BLM limit sage grouse stipulations outside of KHAs and OGMAs to, at a maximum, ¼ mile CSU and a 2-mile seasonal buffer to occupied leks, to achieve consistency with EO 2011-5. In OGMAs located outside of Core Population Areas/KHA, sage grouse stipulations should be waived to encourage development of hydrocarbon resources in these. This would be consistent with EO 2011-5.	2071
10370	10370-3	The DEIS appears to argue that its “Lands with Wilderness Characteristics” are not WSAs, and FLPMA allows management for certain resources associated with Wilderness (opportunities for solitude, outstanding opportunities for primitive and unconfined recreation etc.). Thus BLM argues, the Non Wilderness Study	2027

**Attachment B – Draft Resource Management Plan and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table B-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
		Area Lands with Wilderness Characteristics designation is legal. But, in certain alternatives, BLM is proposing to manage these areas to protect Wilderness Character, just like the IMP. The BLM is simply calling these new WSAs by a different name. The agency is claiming Federal Land Policy and Management Act (FLPMA) Section 201 is the legal foundation for designating Non Wilderness Study Area We note this section does refer to a continuing inventory, but for "all public lands and their resource and other values...." BRC acknowledges that the agency can inventory to its heart's delight. This includes inventorying for resources or values associated with Wilderness. It is improper to make decisions based upon an inventory for a single resource value, in this case "Wilderness character."	
10370	10370-4	As noted above, the BLM has no authorization to engage in inventories for a small segment (Wilderness) of only part of the spectrum of "resources and other values" (recreation). Table 3- 46 is an example of how the DEIS has unlawfully excluded recreational uses and values that are incompatible with Wilderness management in its analysis.	2027
10370	10370-1	(H-1601-1 Appendix C, pages 18-20) BLM's directives seem clear. At least insofar as Off Highway Vehicle based recreation. Except in "Closed" and "Open" areas, each BLM office is required to develop a specific travel management plan, limiting all motorized vehicles to designated roads, primitive roads and trails. However, your Land Resources Travel management Maps (Map 55 - 58) indicate that "travel limited to existing roads and trails" is a management option. Ditto for Appendix R and other sections in the DEIS. The DEIS appears to state that except where we identify areas that will be limited to designated roads and trails, travel will be limited to existing roads and trails (unless we identify a specific reason or resource concern that mandates a travel management plan designating roads and trails). Travel limited to "existing" roads and trail is not consistent with the agency's planning criteria number 8.8. For program-specific guidance regarding land use planning-level decisions, the process will follow Land Use Planning Manual 1601 and Handbook H-1601-1, Appendix C. This appears to be a serious flaw in the DEIS. It is difficult to see how the agency can remedy this without issuing a supplemental analysis disclosing the agency's direction for travel management.	2034
10370	10370-6	The BLM needs to include a site specific and up to date review of the Oil and Gas potential identified by the most current USGS Resource Assessment. The DEIS uses a regional analysis when a more accurate geographic specific approach is required.	2061
10371	10371-2	Appendix P contains only the "active use" column. Therefore, the MCD requests that Appendix P of the Draft RMP also include a "permitted use" column in order to express in AUM's, what is formally allocated and recognized by the RMP.	2074
10372	10372-7	Through personal conversation with Dick Loper, Wyoming State Grazing Board, the use of "Wyoming Standards for Healthy Rangelands", Appendix N is outdated. I would request BLM update their rangeland monitoring information.	2011
10372	10372-8	Mr. Loper suggested to me that the BLM should get rid of the entire Appendix W as well as Table W-1.	2011
10372	10372-3	Please remove Appendix S, Lands with Wilderness Characteristics from the RMP document as Secretary of the Interior, Ken Salazar has rescinded Secretarial Order No. 3310. (Record #6255, Obj. LR:9.1 Prefer Alt. C.)	2027

**Attachment B – Draft Resource Management Plan and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table B-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
10372	10372-1	The RMP is sorely lacking in all aspects of the socioeconomic analysis of the alternatives. This oversight needs to be corrected before an accurate review of the alternatives can be conducted. In particular, the oil and gas potential in the RMP and the effects of reduced livestock grazing are not clearly addressed. Nearly all the alternatives could include a reduction in AUMs but this reduction is not accounted for in the socioeconomic analysis. Any reduction in AUMs will have a direct impact on livestock producers as well as county revenues.	2046
10374	10374-2	Since the Draft Plan acknowledges that “Climate change is likely to combine with other human-induced stress to further increase the vulnerability of ecosystems to “loss of native species”, affecting “breeding patterns, water and food supply, and habitat availability” (3-257), we suggest that it would be prudent to err on the side of caution by minimizing other human-caused stressors that are well understood. This conservative approach is especially important in large areas of intact, relatively undeveloped habitat, which provide the best sanctuary for wildlife, and in critical habitat areas such as breeding grounds, wintering grounds, and migration routes. The 2010 Wyoming Wildlife Action Plan recognized the necessity of incorporating planning for a changing climate into all wildlife and habitat management activities. That Plan explicitly acknowledged that the effects of a rapidly changing climate will profoundly affect Wyoming’s wildlife and the habitats on which it depends. We strongly urge the BLM to fully incorporate climate change planning into the final decision on this Resource Management Plan, and to adopt a conservative, precautionary approach to ensure that wildlife has the best chance of surviving in a changing climate.	2003
10377	10377-3	The draft RMP should be re-written utilizing the best, most complete available scientific data. It should shown 5 year historical trends in each of the resource areas and provide alternative goals for these resources.	2054
10378	10378-25	I could find no mention of the abandoned town and mines of Gebo north of Thermopolis in the Heritage and other sections of the plan.	2004
10378	10378-6	Heart Mountain is the only NHL in the Big Horn Basin. I found no acreage given to protect the view shed. But it has been established on BLM administered mineral estate, with BLM administered surface in view of the site. After being there August 25, I do not believe that the 5-Mile buffer zone should apply. As I understand it, the housing for the 12,000 Japanese was located to the north of the present designated site. The view of the fields north to Heart Mountain enhances the idea that those Japanese who farmed for the camp excelled at it. The many photographs on view in various forms are sufficient to show the vastness of the camp itself. If a buffer zone outside the present landmark is deemed necessary, could it not consist of tree plantings instead of acreage?	2004
10378	10378-26	Most helpful would be a pullout-to-be-copied INDEX. Specific areas of interest could then be studied without having to search for items such as Mountain Plover. Who of the general bird-watching public would have thought to look up Mountain Plover under Vol. 3 “Appendix G, Exception, Modification, and Waiver Criteria Table G-1?” All the information that Vol. 3, Appendix K - Biological Resources, Table K-2 Appendix K-14 gave me was Mountain plover and the scientific name. No reference to the listing in Appendix G.	2006
10378	10378-28	Another example of the need for a pullout Index: In Vol. 3, Appendix G, Table G-1, Oil and Gas Lease Stipulations Appendix G-5. Scenic and Recreational Resources the 28 entries are mostly non-specific. Areas within the Bighorn River ERMA [Extensive Recreation Management Area] and Bighorn River SRMA	2006

Individual Comments and Index to Summary Comments and Summary Responses**

Table B-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
		[Special Recreation Management Area.] In order to understand the initials I had to finger through Volume 1 for the first 17 pages before I found the guide to them.	
10378	10378-29	The summary should be laid out in the same order as the explanatory text. The “catalogs” are confusing in that the summary doesn’t necessarily follow the outline or language of the subjects in the main bodies of text. Eg. The summary, on pages ES-8 to ES-9 is devoted to Mineral Resources and is divided into locatable, leasable, and salable minerals. On pages 4-53, 54 and 55 of Vol. 2, some detailed information is given under “Leasable Minerals - Geothermal.”	2006
10378	10378-31	What is SRMA? “Special Recreation Management Area” Not listed in Vol 1 SRMAs on page 3-364 or 3-165. Oh, yes. Here it is – it’s in that 6160 South Bighorns RMZ (back to ACRONYMS “Recreation Management Zones.”)	2006
10378	10378-16	NATIONAL BACK COUNTRY BY WAY: Special Designations I do not like Alternatives B or D, because B, “considers additional designations on a case-by-case basis” while already proposing two other roads, the Hyatville Logging Road and the Hazelton (33-Mile) road. Alt. D proposes the same two roads. My concern is that there is no acreage given. Is there viewshed or buffer zone acreage attached to these roads? Also, will this lead to closing of other area roads and forcing people to only use these two roads? Since tourism is an essential part of the Big Horn Basin economy, will these roads lead to tourists stopping in towns along the way?	2034
10378	10378-17	NATIONAL HISTORIC TRAILS: Special Designations None of these alternatives gives an acreage amount.	2010
10378	10378-8	There are three additional unspecified Paleontological resources under “Special Designations “Question: I assume that the field work for Prehistoric, Historic and Other Trails has been done otherwise STIPULATIONS affecting them cannot be applied?	2010
10378	10378-27	And, should the alfalfa weevil really be lumped in with wildlife instead of there being a table for Insects?	2025
10378	10378-11	The first column in the LWC chart is labeled - Lands with Wilderness Characteristics Area Name. The first entries were numbers, which did not relate to anything I could find, nor could I find duplicate acreages for Cedar Ridge and Upper Owl Creek in other information on LWCs.	2027
10378	10378-24	These VRM Classes should have been defined in the Summary.	2032
10378	10378-18	Vegetation: The EIS states “long-term surface disturbance contributes to the decline in abundance, distribution, or health of vegetation communities. Conversely, short-term surface disturbance from vegetation treatments would improve vegetation communities.” What is considered short-term and long-term? What length of time has to be passed to determine whether surface disturbance is beneficial?	2033
10378	10378-19	Alt. C (no acreage given) has the most long-term surface disturbance and most activities that would adversely affect forests and woodlands.	2033
10378	10378-20	ALT. D, A, and B respectively allow the greatest use of silviculture treatments resulting in the greatest beneficial impacts to the harvest of forest products. Does the BLM have long-term scientific proof of this?	2033
10378	10378-30	Oil and Gas Stipulation. Middle Fork of the Powder River??? The Powder River is on the east side of the Big Horns in the Powder River Basin. But there it is, Middle Fork of the Powder Rive SRMA. Vol 3, Table G-1, Appendix p. G - 23.	2049

**Attachment B – Draft Resource Management Plan and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table B-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
		Bighorn Basin Resources Management Plan Revision Project. Stipulation Description is as follows: Apply a CSU stipulation on the Middle Fork of the Power River SRMA Exception: EC-011 Modification: MC-014 Waiver: NONE. There is no Middle Fork of the Powder River under “Middle Fork” or “Powder River” listed in any of the counties within the bounds of the Big Horn Basin plan,	
10378	10378-32	Yes, if I’m not on your mailing list please put me on it.	2060
10378	10378-1	In the RECREATION Appendix there are three pages of information related to the entire Big Horn Basin. There are NO Alternatives A and C in this Appendix.	2062
10379	10379-15	In order to comply with the secretarial order and the AGO initiative, the final RMP must incorporate management direction for responding to climate change impacts in the planning area. In particular, wildlife management direction must take into account the added detrimental effects that climate change is and will continue to have on wildlife, including special status species, in the planning area. The unique threats of climate change must be considered in developing monitoring and evaluation criteria so that information gathering in the future helps inform smart planning. Finally, better use can be made of the Rapid Ecoregional Assessment process and Landscape Conservation Cooperatives. These tools are alluded to in the DEIS but should be more effectively engaged to solved the difficult challenges faced.	2003
10379	10379-22	The NEPA process requires the consideration of climate change as part of the cumulative effects analysis. The cumulative impacts principles described above demonstrate that the effects of climate change on individual resources in the planning area must be considered cumulatively with the effects of the proposed RMP. A failure to look at climate change is a failure to take a “hard look” and impacts that will occur in the planning area. While there is no national direction for analyzing the impacts of climate change on BLM planning area, the Oregon BLM office has provided a useful resource to guide the development of this analysis. Instruction Memorandum OR-2010-112 provides direction and information regarding analysis of greenhouse gas emissions and consideration of changing climate conditions in NEPA documents. For example, the IM states that “[a] predicted change in climate conditions would be relevant to NEPA analysis if it would alter baseline conditions related to an issue identified for analysis or would alter the effectiveness of the proposed action.” Based on this guidance, the final DEIS must analyze the effect of proposed management on special status species and wildlife resources in the context of climate change impacts.	2003
10379	10379-21	The DEIS cumulative impacts analysis shares the same flaws discussed above with regard to wildlife and special status species. While the impacts are correctly identified, especially in terms of outside activities that will affect the planning area, the analysis does not go beyond placing the alternatives on a spectrum. Alternative B is identified as having the lowest level of impacts throughout the DEIS so it follows that it would contribute the least to cumulative impacts from other sources. The final DEIS should go deeper in its analysis, especially of impacts to wildlife, to analyze the capacity of the resources in the planning area to absorb the additional effects of the proposed alternatives on top of those cumulative effects already known to occur.	2005
10379	10379-16	The BLM put in place oil and gas leasing reforms through IM 2010-117. These reforms, among other things, established a “Master Leasing Plan” process with the intent to fully consider important natural resource values before making a decision on oil and gas leasing and development, especially in areas with heavy	2014

**Attachment B – Draft Resource Management Plan and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table B-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
		leasing. The oil and gas management approach in the preferred alternative, which would establish oil and gas management areas to be managed primarily for exploration and development, is inconsistent with this BLM policy. Instead of focusing on providing sufficient analysis and mitigation for biological resources in areas with heavy oil and gas development, the preferred alternative would completely ignore biological resources in these newly established management areas. This opposite approach would go from full analysis and consideration of wildlife, as required by BLM reforms, to none. The final RMP should not establish oil and gas management areas because of their inconsistency with BLM policy direction on oil and gas leasing and development.	
10379	10379-2	The preferred alternative adopts a case-by-case approach to wildlife management that runs counter to BLM wildlife policy. There are a number of plan components in which Alternative B lays out a specific benchmark or standard, but Alternative D takes a step back from that standard to a case-by-case or as opportunities arise management model. For example, in record #4073, Alternative B requires that habitat enhancement for big game be completed on at least 200 acres of land in the planning area each year. The preferred alternative shirks this specific guideline for management for enhancement as opportunities and funding allow. DEIS at 2-76. While either option could lead to more habitat enhancement, the preferred alternative leaves the door open for no habitat treatments to occur at all, notwithstanding the fact that 200 acres may not even be sufficient to provide benefits for big game.	2020
10379	10379-3	In record #4082, Alternative B requires the plan to Apply wildlife seasonal protections for surface- disturbing and disruptive activities to maintenance and operation of developed projects when the actions are determined to be detrimental to wildlife. (Appendix H lists detrimental actions). DEIS at 2-78. This references Wyoming state BLM guidelines for wildlife management, which provide some specific mitigation guidelines for a few species. The approach in the preferred alternative, however, gets rid of the clear-cut guidance for wildlife management and provides only for protections to be applied on a case-by-case basis. While arguably the standards in the state BLM guidelines should be enhanced to meet the needs in the planning area, the preferred alternative abandons guidelines altogether, leaving us with no idea what standards might be imposed to protect wildlife for any given surface disturbing activity. At a minimum, the final RMP must meet obligations under 6500 by implementing clear management actions to support wildlife case-by-case management is not sufficient. Management actions should be measurable so that their achievement can be monitored and sideboards should provide directions for how on the ground application of objectives should work. Defenders recommend that Alternative B management direction be enhanced and adopted or that Alternative D management direction be modified to adopt actual standards, instead of leaving wildlife management to chance.	2020
10379	10379-10	Wildlife and Fish Monitoring protocols in the appendix are not sufficient, even if they are fully implemented as designed. While indicators are set for each resource, and action triggers are identified for each indicator, it is unclear what action is required once a trigger has been reached. For example, Greater Sage-grouse is an indicator for Wildlife, and action is triggered if annual lek site visits indicate a declining trend in the number of males and females. DEIS at C-8. Presumably, this monitoring would occur considering the importance of the	2025

**Attachment B – Draft Resource Management Plan and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table B-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
		species, but what is unclear is what response is required, and on what timeline with what resources, in the event that a declining trend is identified. Without these parameters for action, the plan cannot guarantee successful responses to negative monitoring data.	
10379	10379-11	Another key problem with the monitoring and evaluation protocol is the lack of a clear pathway for public involvement. While information is available to the public, it is unclear whether the public will have an opportunity to influence the responses being made to monitoring and evaluation, except for during NEPA processes where involvement is mandated. The implementation plan provides for working groups for monitoring and other areas of the plan, but it is unclear how the public would be involved in these groups moving forward. DEIS at D-1.	2025
10379	10379-13	This DEIS lays out at the outset that one of the main purposes of this RMP is retaining flexibility to adapt to new and emerging issues and opportunities and to provide for adjustments to decisions over time based on new information and monitoring. DEIS at ES-2. Defenders supports the careful use of adaptive management as a tool to reach wildlife management objectives, especially in cases where monitoring indicates that objectives are not being met. However, without clear objectives, reliable monitoring information and analysis, and direction for appropriate ways to respond in an adaptive management context, this approach is at best ineffective, and at worst reckless. The final RMP must resolve issues with wildlife and special status species objectives, remedy deficiencies in the monitoring program, and provide clear direction for land use managers on how to respond in an adaptive capacity.	2025
10379	10379-9	First, the DEIS makes clear that the “BLM will rely upon cooperating agencies for the funding, facilities, and labor to assist in or perform this data analysis.” DEIS at C-1. This fails to guarantee that monitoring and evaluation to ensure that goals are being met will even occur, let alone that it will be effective. If state agencies doing monitoring have different priorities than the BLM, indicators on the list found in Appendix C may not be monitored effectively, or even at all.	2025
10379	10379-5	What is missing, again, is any discussion of whether either Alternative B or D present methods capable of protecting raptors in the planning area from future development. The DEIS points out helpfully that Alternative B is the most protective option for raptors and that Alternative D is less protective, but in justifying the selection of D the DEIS does not demonstrate what the long term impacts of either the larger or smaller buffer areas. DEIS at 4-222. Without that information it is unclear what the impact of the preferred alternative will be on raptors and there is no way to compare alternatives based on BLMs special status criteria to ensure protection of raptors under the new RMP.	2036
10379	10379-6	It is unclear what the exception to the prohibition provided for in the preferred alternative means because the DEIS does not define how the human health and safety exception would be applied. DEIS at 2-89. In addition, it is unclear whether the exception is even necessary, considering that more effective options than poisoning prairie dogs are available for dealing with plague.	2042
10379	10379-7	We also have concerns that there is insufficient active management to protect prairie dogs in the planning area. As the DEIS states, Black-footed ferrets are associated with and depend on prairie dog colonies in the Planning Area. DEIS at 4-231. Prairie dogs are especially important in the Bighorn Basin planning area, where the black-footed ferret was rediscovered in 1981. The RMP would allow for new areas to be protected for prairie dogs in the future if they are	2042

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
		identified by the Fish and Wildlife Service or by the Wyoming Game and Fish Department as having potential for ferret reintroduction. DEIS at 2-88. We recommend that, instead of waiting for other agencies, areas be identified in this RMP and that, in addition to no surface occupancy protections, these areas have management direction in place to protect prairie dogs from shooting, disease, and other threats, and to restore prairie dogs through translocation and habitat enhancement.	
10379	10379-19	The fundamental problem with the analysis of oil and gas development in the DEIS is that, while the impacts of each alternative on the amount of oil and gas production is included, the impacts of various levels of oil and gas production on other resources, including wildlife, are not examined. This analysis could occur as part of the discussion of oil and gas development or as part of the discussion of biological resources. The final RMP must go beyond listing the amount of acres available for oil and gas development under each alternative to analyzing the effects of these different levels of development on biological resources in the planning area. This is especially important considering the clear indication that oil and gas development is likely to have the largest impact on these sensitive resources.	2054
10379	10379-1	The DEIS states that Alternative B, described as having an emphasis on conservation, is “less focused on supporting resource uses than the other alternatives.” DEIS at 2-29. However, a number of emerging issues that this new RMP is required to respond to indicate increasing demands on BLM lands, like “increasing conflicts between resource uses and protection of specific wildlife and wildlife habitat” and “cumulative increase in surface disturbance.” DEIS at 1-5. These emerging issues call for a conservation based approach that can support multiple uses by providing for resource extraction while also conserving biological resources. Some components for this type of approach were developed as part of Alternative B, but are then abandoned in the preferred alternative. Other components necessary for conserving biological resources are missing. The lack of clear management standards in the preferred alternative provides no guarantee that wildlife and other biological resources will receive necessary protection in the face of intensive resource development. A more balanced approach must be found.	2055
10379	10379-17	While placing the alternatives on a spectrum is certainly an important step in providing decision makers with the information they need to make a choice, it is not enough to be considered a “hard look.” The final EIS should provide an analysis of the outcomes of each alternative’s wildlife management approach. For example, does current science indicate that a no surface occupancy restriction in big game crucial winter range and parturition habitat is necessary to avoid declines in big game numbers? Answering this and similar questions would allow decision makers to determine whether the preferred alternative is sufficient in its wildlife management, or if additional protections need to be in the final RMP. Without such an analysis they are left to guess.	2055
10379	10379-20	Defenders would also like to point out that an alternative offering another approach to oil and gas development was left out of the analysis. The DEIS indicates that a phased oil and gas development approach was looked at, but ultimately was not considered. DEIS at 2-7. A phased approach could offer an additional option for decision makers to meet obligations for protecting biological resources and allowing for oil and gas development as a multiple use. Defenders urge BLM to reconsider analyzing a phased oil and gas development	2055

		alternative.	
10379	10379-4	However, the DEIS and draft RMP fail to demonstrate that this approach is biologically consistent with BLM objectives under 6840. Without this analysis, it is impossible to establish this GSG management approach with any confidence that listing can be avoided. We recommend that additional analysis be completed, and in the meantime, we recommend erring on the side of caution and selecting the most protective measures feasible for the Greater Sage-grouse.	2071
10381	10381-1	The section on air quality is very disturbing. How can the BLM analyze emissions with no baseline? Using data from other areas doesn't allow for accurate accounts, either.	2009
10381	10381-2	The socioeconomic section was also poorly analyzed. The IMPLAN model used is a regional model and a more local model would more accurately address the issue. The BLM doesn't mention how oil and gas is the lifeblood of the communities, and provides many programs and services like water, sewer, roads, hospitals and schools.	2046
10382	10382-2	Big Game Crucial Winter Range acreage identified by BLM for all alternatives (Map 35 - Biological Resources, Fish and Wildlife Resources, All Alternatives) is much greater than Big Game Crucial Habitat Areas identified by the Wyoming Game and Fish Department.	2022
10382	10382-1	Enhanced oil recovery (EOR) research that my company is pursuing that may allow us to develop additional oil and gas fields and extend the life of current fields. As well, directional and horizontal drilling may cause additional resources to become profitable to develop. Both of these reasonably foreseeable technologies are not considered in the Reasonably Foreseeable Development section of the RMP.	2051
10382	10382-3	Emissions from oil and gas activity are incomplete and are inconsistent with nonoil and gas activity emissions. Tables labeled "Total Annual Emissions from Oil Wells" failed to include any actual emissions from oil wells. Tables labeled "Summary of ROW and Corridors Emissions" were much lower for the same activities as were listed in the tables labeled "Total Annual Emissions from Oil Wells." Tourism related vehicle emissions and air quality effects were not considered in the RMP.	2009_1
10383	10383-11	Relevance and importance criteria used in the analysis of Areas of Critical Environmental Concern (ACEC) is generic and does not include data sets to confirm or deny the four noted importance criteria and the five relevance criteria.	2001
10383	10383-10	There is an indiscriminate selection of air quality monitoring sites to properly evaluate alternative impacts. Thunder Basin Special Purpose Monitoring (SPM) and Interagency Monitoring of Protected Visual Environments (IMPROVE) sites are included in the analysis, but Boulder and Bridger Wilderness IMPROVE air monitoring sites are not used for analysis purposes although they are closer to the Planning Area (100 miles vs. 70 and 58 miles, respectively).	2009
10383	10383-17	Prior to any proposed modification of AMP or elimination of livestock grazing allotments in the Planning Area as a protective measure for greater sage-grouse and/or other wildlife species, the BLM must follow the grazing regulations set forth in Section 4100 of the BLM's public land grazing regulations. Changes must and can be made through using solid data, professional range and wildlife expertise of the BLM, range consultants when needed/contracted by the	2011

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
		permittee and the permittee’s own knowledge and historical insights.	
10383	10383-14	Avoiding weed invasions generally requires a number of aggressive actions to be successful. Those actions include: Rapid re-establishment of desired vegetation; Timely weed surveys; Aggressive weed control where needed; Periodic monitoring; Prompt re-treatment where warranted. Nowhere does this draft EIS embrace the above common sense, adaptive management scenarios. Why?	2012
10383	10383-4	Recognition of elk parturition areas are not contained in current elk scientific literature. If there is such new scientific information the BLM should share that with the public. There are 205,872 acres of BLM-recognized elk parturition habitat in this draft EIS which would prohibit or restrict grazing, oil and gas development, and motorized access. The Guardians do not support this intended management approach, nor do we recognize it as scientifically valid.	2025
10383	10383-5	What the RMP/EIS does not bring to the discussion is how the overpopulation of elk has negatively affected BLM permittees. As affected parties, the LGCA and the Guardians asks that the RMP/EIS qualify and quantify how the increase in elk has: Complicated grazing for BLM permittees; Compromised the economic viability of permittees; Disrupted attaining utilization standards.	2025
10383	10383-19	The draft in no way addresses or even looks at the range conditions and impacts associated with over populations, year round grazing and no management rotation strategies of wild horses as they relate to rangeland health.	2030
10383	10383-6	The agricultural community has become greatly dependent on the surface discharge from oil and gas development. It has become a vital water source for livestock and provides perennial fresh-water sources. Additionally, the water creates hundreds of miles of riparian zones and thousands of acres of wetlands. The draft never mentions this. A document such as this should speak to such realities if it is to be a credible and balanced document. There is an inherent obligation to inform the public of such collateral beneficial details as such information is not generally known or appreciated but certainly important in helping the public to see how things are connected.	2031
10383	10383-13	Vegetation inventories are deficient, particularly invasive species inventories. A return to “historical vegetation” is unnecessary on a total landscape scale. This term ignores the appropriateness of blending that concept with having the vegetation move in a forward rangeland health direction.	2033
10383	10383-2	ECONOMIC STRATEGIES WORKSHOP - NOT CONDUCTED BUT REQUIRED There is no record of the BLM having conducted a credible Economic Strategies Workshop which would have allowed the public to “identify desired economic and social conditions” and to “collaborate with BLM staff members to identify opportunities to advance local economies and social goals through planning and policy decisions.”	2046
10383	10383-9	The BLM doesn’t clearly represent the results of oil and gas development and mining in the Basin. The BLM needs to look at more locally available data in regards to our economic viability (for instance the research done by Bighorn Basin Resource Alliance). This data clearly shows how important oil and gas is to our communities and in 2,000 pages the BLM doesn’t clearly articulate how important it is. For instance, all four of the counties in the Bighorn Basin received 54 percent of their property taxes directly from oil and gas development. By including this information, it will inform citizens of the current economics. The regional IMPLAN model allows for much flawed data. A more	2046

Individual Comments and Index to Summary Comments and Summary Responses**

Table B-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
		local model would represent the data more accurately	
10383	10383-12	Measurement indicators are missing for all resources, making it infeasible to conduct an effects analysis.	2054
10383	10383-7	Livestock grazing should not be considered a surface disturbing activity. Any final RMP should be absolutely clear that livestock grazing is not to be viewed, perceived or “managed” as a surface disturbance with accompanying restrictions. To do so would be patently deceitful, and unjustified. Definitions deserve lasting transparency so they cannot be later “redefined” by anti-grazing interests.	2054
10383	10383-16	It is not possible to recreate maps and information based on information provided in the RMP/EIS. Therefore, the BLM must better describe and disclose methodologies and correct GIS data issues.	2057
10383	10383-8	No proper science exists that would support changes which would increase the acreage of “administratively unavailable” for oil and gas leasing from 150,000 to almost 300,000. Additionally the amount of moderate restrictions rose dramatically from 1.7 million acres to 3.5 million acres. Why? Where is the substantiation for this change which increases restrictions? The potential impacts to livestock grazing with these increases in unavailable acreages and increases in moderate restrictions are not addressed, yet the potential exists.	2071
10383	10383-3	There are no direct impacts disclosed under any of the alternatives for management actions that change AUM allocations. No credible “management document” should be absent of substantiated reasons for changes (up or down) in AUM allocations.	2074
10384	10384-1	EOC in the Big Horn Basin has not been given adequate consideration in the draft RMP. Oil industry representatives are clear that tremendous EOC potential exists in the aging oil fields within the region, yet the BLM has repeated stated “Low to moderate potential”. There is also huge potential in Mowry Shale development. At the present time, the records room in the Big Horn County courthouse is over-run with oil industry representatives who are researching oil and gas lease information. I strongly urge the BLM to take a hard look at these two areas, using current scientific information, and update the final RMP accordingly. Definition of Reasonable Foreseeable Development needs to accurately define today’s developments. Mineral potential in the Bighorn Basin is significantly underestimated in the RFD scenarios. Of special concern to us in Big Horn County is the mining of bentonite, which is a vital part of our local economy.	2051
10384	10384-2	Related to the above, Rights of Way corridors need to be better protected in the final RMP, as EOC will require pipelines for carbon dioxide injection and oil transportation away from the Big Horn Basin. Carbon sequestration is a secondary industry with great possibilities that could be realized, but that, too, is contingent on the availability of pipelines to carry the material. The preferred alternative (D) of the draft RMP greatly increases the acreage designated as Right-of-Way (ROW) corridor avoidance/mitigation and exclusion areas. This increase will make the construction of the aforementioned EOR pipelines difficult into many existing oilfields in the Bighorn Basin. Where Right of Way Corridors conflict with Right of Way Avoidance/Mitigation Zones, it should be clearly documented in the final RMP that the ROW corridors will take precedence over the ROW exclusion areas.	2066
10385	10385-2	2. Page 3-42 in Management Challenges Approximately 30,000 acres of land has	2015

**Attachment B – Draft Resource Management Plan and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table B-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
		been disturbed in the Bighorn Basin due to bentonite mining, along with approximately 4,000 acres of road and haul-road disturbance (BLM 2008c).The approximate of 4000 acres of road disturbance from bentonite activities cannot be accurate. Assuming 30 linear feet of width per road, this equates to 1100 miles of roads from bentonite activity. Unless the other bentonite mines have substantially more roads than my mine, the 4000 acres of road disturbance stated in the RMP should be reviewed for accuracy.	
10385	10385-5	5. Page 3-169 in Lands with Wilderness Characteristics The BLM performed an inventory of lands in the Planning Area to determine if any BLM-administered lands had wilderness characteristics. Wilderness characteristics are resource values that include naturalness, outstanding opportunities for solitude, and outstanding opportunities for primitive and unconfined recreation. Areas evaluated for wilderness characteristics generally occur in undeveloped locations of sufficient size (usually at least 5,000 acres) to be practical to manage for these characteristics. Smaller areas are considered if they are contiguous with designated Wilderness or WSAs or are of a manageable size. Map 63 Land Resources - In the Township T55N R93W there is a Wilderness designated area to the east of our patented mining claims which is actively being mined day and night. Based on the Wilderness characteristics listed above in the RMP, this area should not be classified as a WSA because the area is certainly not in solitude with the dozers, scrapers and blasting operating daily nor is it an unconfined recreation area either for the same reason.	2027
10385	10385-1	1. Page 3-41 in Locatable Minerals In the plan it states: The six mines in the Bighorn Basin employ 132 persons, and another 360 persons are employed at the milling -processing facilities at six different mills (one in the Worland area, two near Greybull, and three near Lovell, Wyoming).The number of employed people in the bighorn basin from the bentonite industry is a lot more than the number stated in the plan. My mine alone has four full-time contractors (stripping overburden, hauling bentonite, drilling/blasting and conducting environmental activities) totaling over 60 employees. The number stated in the RMP is the number of employees who work "in-house" for the bentonite companies, i.e. not contractors. Please modify in the RMP the number of people employed from the bentonite industry in the Bighorn basin. My guess is the number of workers in the bentonite industry is 10X more than what the RMP states.	2049
10385	10385-4	4. Map 54 Land Resources Rights-of-Way and Corridors Alternative D Why is the area east of the Big Horn River and SE of Lovell mostly classified as Right-of-Way Avoidance/Mitigation Area? This area is a major active bentonite mining region in the Bighorn basin. Won't this designation hurt the bentonite industry when we need to obtain a ROW to access new mining areas in the future?	2066
10386	10386-4	We believe that the Lands with Wilderness Characteristics (LWC) analysis which was conducted by the BLM is flawed. It was based on erroneous data. The Chamber believes this flawed effort was clearly substantiated when private citizens, county commissioners and conservation district supervisors documented the lack of wilderness characteristics in numerous situations. A clearly disturbing reality is that using the BLM's own criteria for what would qualify as lands with wilderness characteristics was not met time and again, yet the parcels went forward as qualifying as LWC, which we believe is misleading. We are extremely concerned that the designation of these flawed LWCs could potentially erase billions of dollars in total potential output.	2027

Individual Comments and Index to Summary Comments and Summary Responses**

Table B-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
		Consequently, many socio-economic aspects stand to be impacted.	
10386	10386-1	Socio-economics: There is a disconnect between the concerns of the communities of the Planning Area and the BLM's socio-economic analysis. It does not appear that the BLM has complied with the requirement for the public to "identify desired economic and social conditions" and to "collaborate with BLM staff members to identify opportunities to advance local economies and social goals through planning and policy decisions." This is a significant weakness in this draft EIS. The potential socio-economic impacts of each proposed alternative in this Resource Management Plan/DEIS deserve full development, consideration and justifications. Real numbers, current numbers and solid data sets are absolutely necessary to comply not only with the requirements of the National Environmental Policy Act, but to respect the legitimate expectations of all the communities involved. The agency needs to strengthen all of the socio-economics in this DEIS if it is to fulfill its public trust.	2046
10386	10386-2	The draft EIS does not set forth data relative to the historic and current conditions for the Planning Area (PA). This makes a proper analysis of the various alternatives impossible. There should be a clear and verifiable discussion of the starting point for this landscape scale document (PA). This PA has been under management scenarios for decades, and these management scenarios are based in public documents which were developed under the National Environmental Policy Act. How these management scenarios have affected the Planning Area is missing from this draft EIS in any substantive way.	2054
10386	10386-5	One of the most worrisome general themes in this draft EIS is the continual statements of perception that are used to recommend management changes or to characterize a multiple use. Such statements and/or missing data sets can be found relative to reduction in livestock grazing, wildlife habitats, analysis of Areas of Critical Environmental Concern (ACEC), enhanced oil recovery, mineral potential to name only some. It appears more than likely that in the planning process for this RMP/EIS the BLM has violated or not conformed to the Data Quality Act of 2000.	2055
10386	10386-3	Rights-of-way (ROW) which would require avoidance/mitigation areas seem beyond reasonable. They range in magnitude from 941,778 acres - 2,717,617 acres depending on the alternative. However, there are no justifications as to why these acreages are necessary, or if they would be effective in protecting resources. This seems economically irresponsible, as NEPA requires the socio-economic impacts be fully considered and set forth. This document lacks that information.	2066
10387	10387-11	We did not see any documentation to support that irreparable damage was taken into consideration on the designation of current ACECs or on the newly proposed ACECs.	2001
10387	10387-7	Trapper-Medicine Lodge ACEC area, we would like to express our concern over the listing of this area. We realize the importance of the water recharge area to the local municipalities in the area and believe that all municipal and irrigation waters are important. We would like to see supporting documentation to justify the special geologic qualities of the above area. Much of the State of Wyoming is a recharge area for many aquifers, and we do not understand what criteria have been used to classify this particular one as an ACEC. The Madison Limestone appears to us to receive recharge over a much greater section than just the ACEC plotted area. Why does the erosional environment make this area so special?	2001

**Attachment B – Draft Resource Management Plan and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table B-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
10387	10387-1	In Appendix W, in the fifth paragraph on page W-1, narrative states that watershed and vegetation management objectives would not be met if utilization levels consistently exceed the levels in Table W-1. Please include in the Final RMP peer reviewed, science based support for this statement.	2011
10387	10387-2	We have noticed that Appendix P contains only the “active use” column, and would like to request that a “permitted use” column be added in order to show what is formally allocated and recognized by the BLM.	2011
10387	10387-5	Permittees also need to be included in the list of those with whom the BLM intends to cooperate in the collection, analyzing, and reporting of monitoring data. Looking at Appendix C under DATA COLLECTION, we find that permittees are not included. On page 3-176 it states that “When rangelands are not meeting resource objectives, the BLM implements changes in grazing management.” The lessee has no control over the other resource uses and shouldn’t be penalized for the poor management of other resource uses. Prior to any changes in grazing management because rangeland objectives are not being met the BLM must provide multiple year monitoring data (3 to 5 years) to document that grazing is the cause.	2011
10387	10387-8	prior to any reduction in AUMs or adjustments in utilization levels due to wildlife use, the BLM will provide monitoring data to support the reductions and provide reasonable alternative areas to graze to replace the AUMs lost due to wildlife excess use. The BLM needs to provide the policy, law, or regulation that allows preferential use of wildlife over livestock.	2011
10387	10387-14	Big Game Crucial Winter Range: The Draft Plan covers nearly twice the area identified by the Wyoming Game and Fish Department as Big Game Crucial Habitat which seems unnecessary to us. The state agency designations should be supported as it is difficult in the BLM document to determine what the BLM intends with their designations.	2022
10387	10387-15	Elk Parturition Areas: Hamilton Ranch does not support the removal of cattle or sheep due to elk disturbance concerns unless it, too, can be scientifically supported. There is no scientific evidence in the plan suggesting that stock grazing creates problems for birthing elk.	2025
10387	10387-6	Big Horn Sheep: The RMP states (pg. 3-97): Bighorn sheep populations in the Planning Area have increased due to the establishment of native core areas in occupied bighorn sheep habitat and because of habitat augmentation and improvement through burning and livestock permit changes. What is this statement suggesting? Does it suggest that the elimination of domestic sheep and goats allotments in Big Horn Sheep habitat has increased population numbers? We are not aware of any sheep allotments in the Big Horn Sheep designated habitat. BLM needs to furnish data on historic grazing allotment and Big Horn Sheep population data to see if there are correlations and if increases have taken place. Also, what does habitat augmentation entail? We'd like to see a definition of this term in the RMP.	2025
10387	10387-10	Much of the mapping presented by the BLM does not include many of the roads, range improvements, pipelines, water wells, and oil fields that are currently on the land. The BLM needs to do a new inventory of the 56 proposed areas that potentially could be managed as LWCS. These designations are just one more way to regulate the grazing and other industries that have occurred in the area for over a century. Nowhere is it stated in the Draft RMP that the area is already surrounded by 9.13 million acres of U.S. Forest Service, Wilderness	2027

Individual Comments and Index to Summary Comments and Summary Responses**

Table B-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
		Areas and National Parks. We question why there is a need for more areas that are restricted or closed. Many of the areas proposed do not represent what we would consider to be lands with wilderness characteristics because most of them certainly show some habitation and use by man. In the BLM Manual 6301 it is stated that naturalness refers to looking natural to the average visitor who is not familiar with the compositions of a natural ecosystem. An average visitor from a metropolitan area may not recognize weed infestations and other man induced influences. To most anyone living in the city, much of the Big Horn Basin BLM lands will look like wilderness. How can the agriculture possibly survive, if untrained individuals are influencing the determination of lands with wilderness characteristics? Also, many of the LWCs do not meet the requirement that they contain 5000+ acres or if not meeting that requirement they are not contiguous to wilderness or existing WSAs.	
10387	10387-12	We do not think the BLM has taken into consideration the Reasonably Foreseeable Development (RFD) that could potentially occur in the Big Horn Basin. Horizontal and directional drilling is happening in other areas and should be considered in this next 20 year plan.	2051
10387	10387-4	Please change the definition of surface-disturbing activity as stated in Appendix 2 (Footnote 1, Table W-1). Livestock and wildlife are listed as a surface disturbing activity, and it appears that this RMP is the only one in Wyoming that views it as such. Surface-disturbing activities should only include uses that remove non-renewable resources such as top soil, sand, gravel, etc. We feel that the surface disturbing activity applies more to construction of well pads, roads, reservoirs, pipelines, power lines, parking lots, etc	2054
10387	10387-9	Please clarify “stakeholder” and “interested publics.” The term “stakeholder” needs to taken out of the grazing section and abolished. The Code of Federal Regulations (CFR) 4100.0-5 has a specific definition for “interested publics” and is a term used in the grazing portion of the code, and we feel it is important that the BLM definition is consistent with the existing regulations. A “stakeholder” can be any citizen of the United States. The above regulation states that the U.S. citizen actively request involvement before being consulted on grazing management and Allotment Management Plans. Please include the above CFR definition in the RMP.	2054
10387	10387-13	BLM management needs to be consistent with the core areas identified by the State of Wyoming. Also, the Executive Order from the Wyoming Governor specifically conveyed that normal livestock and rangeland management practices be considered “de minimus” by that Order.	2069
10388	10388-6	Page ES-7, last P: As previously discussed, livestock grazing has to be listed as a surface disturbing activity on our Public Lands.	2011
10388	10388-7	Page ES-10, P 5: As previously discussed, livestock grazing causes 98+ percent of the wetland/riparian habitat impacts and must be thoroughly addressed here.	2011
10388	10388-5	Page ES-5, last P: Shouldn't all the existing HMPs be listed here?	2025
10388	10388-2	Based on the total lack of information on Stock Pond Wetlands in the entire three volumes of this RMP/EIS document, it appears that BLM has purposely chosen to ignore them in an attempt to once again freely mismanage these Range Improvement Projects as Public Land GRAZING SACRIFICE AREAS. Previous BLM Grazing EISs and MFP/RMPs of the 1980s specifically addressed Stock Pond Wetlands, as required by EO 11990, which led to the subsequent preparation of BLM Reservoir Habitat Management Plans to guide the steady	2033

**Attachment B – Draft Resource Management Plan and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table B-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
		improvement of the wetland values at these abundant water collection sites by the Range and Wildlife manager public servants. Also, Stock Pond Wetlands meet every published definition of the term “wetland,” including the one in the EO and those in this EIS/RMP document. Obviously (although BLM currently refuses to recognize the fact), the purpose of the EO was to protect/improve all wetland values on Public Land. It makes no difference to wildlife if a palustrine Stock Pond Wetland furnishes them their habitat needs as a result of water collected behind a man-made dam or if habitat needs are furnished in a wetland created by a beaver dam or as an indirect result of man’s activities associated with irrigation. It appears that most of the current BLM public servants in the Bighorn Basin, versus those of the 1980s, are trying to justify their failure and lack of ingenuity and dedication to protect/improve ALL wetlands on Public Lands. On page 4-133, it states that, ALL (emphasis added) riparian/wetland areas are evaluated per the Wyoming Standards for Healthy Rangelands (Appendix N) and managed toward proper functioning condition (PFC). Thus, the condition/trend of Stock Pond Wetlands must also be presented in this RMP/EIS.	
10388	10388-8	Page 1-6, last bullet: Must mention EOs 11990 and 11988 (Protection of Floodplains) as existing Statutes.	2033
10388	10388-4	Page ES-3, 5th bullet: Must list EO.	2054
10389	10389-10	In addition to lacking an adequate range of geographic alternatives for the MLPs, Appendix Y also lacks an adequate range of management alternatives. This is because beyond identifying the proposed special designations for each of the MLPs and referring the public to an “oil and gas constraints” map, BLM did not provide a detailed analysis of the management prescriptions for those designations in Appendix Y.	2014
10389	10389-11	As a critical first step in the development of MLPs, BLM must identify and fully evaluate the impacts of oil and gas leasing and development on “important resources and values” within the MLP planning areas. Those resources and values include lands with wilderness characteristics, wildlife habitat and others specifically identified in section II.A of IM 2010-117, as well as any other important resource or value that may be present within the MLP planning areas. This approach is also required under NEPA, as discussed above. However, Appendix Y, merely lists a number of “resources of concern” that exist within each MLP planning area, without further description or evaluation of potential impacts.	2014
10389	10389-12	As discussed in Section X.A, the only measures identified in Appendix Y to resolve potential resource conflicts in MLP planning areas are special designations and the customary range of “oil and gas constraints.” However, IM 2010-117 also requires BLM to “consider a range of new constraints” and “other planning decisions” like phased leasing, capping surface disturbance and requiring compliance with best management practices. Id. at II.B. Some of these measures are already analyzed under one or more of the Draft RMP’s proposed alternatives, while others are not evaluated in any of the alternatives.	2014
10389	10389-13	Furthermore, prioritizing leasing “in areas where development is most likely to occur based on historical development, adjacent development, or geologic information” was a principle recommendation of the team of resource specialists who prepared the “Stiles Report”(Footnote 3: Available at: http://www.doi.gov/documents/BLM_Utah77LeaseParcelReport.pdf) and was carried forward into IM 2010-117 as a measure that BLM should evaluate when	2014

Table B-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
		preparing MLPs. IM 2010-117 at II.B. Thus, BLM must consider phased leasing - i.e., prioritizing leasing in areas with high development potential, such as the Oil and Gas Management Areas, and minimal resource conflicts - as a means of resolving potential resource conflicts in the MLP planning areas.	
10389	10389-14	BLM should identify areas with conflicts between existing leases and the protection important resources, in particular lands with wilderness characteristics and critical wildlife habitat, and should then evaluate allowing those leases to expire and closing them to future leasing in the MLPs. BLM made such a commitment in the Jack Morrow Hills Coordinated Activity Plan for an area that, like the MLP planning areas, contains critical wildlife habitat and other “sensitive” resources	2014
10389	10389-8	While BLM addressed the MLPs in the Draft RMP, it did so superficially. Instead of developing and presenting to the public a full range of alternatives for the MLPs, BLM simply summarized in a brief appendix how it addressed the management of the MLPs throughout the Draft RMP and then described how such a “holistic” approach addressing “land use allocations for all resources” was preferable to actually preparing MLPs. Draft RMP at App. Y-1.	2014
10389	10389-9	In order to consider an adequate range of alternatives for the MLPs, BLM must evaluate a wider range of geographic areas, including the areas nominated by the public and, for Absaroka-Beartooth Front, the “core” area separate and in addition to the nominated area.	2014
10389	10389-1	The definition and application of “wilderness characteristics” in the RMP and related documents must be corrected. The Glossary in the Draft RMP includes a definition of “Wilderness Characteristics” that refers to a 2003 IM, which should be replaced with the current IM 2011-154, Attachment 1, which defines wilderness characteristics.	2027
10389	10389-4	The Draft RMP also overstates the potential impacts on oil and gas production from managing lands to protect their wilderness characteristics. The Draft RMP acknowledges that BLM expects oil and gas development to be focused in established fields (see, i.e., Draft RMP, p. 3-155). Most of the lands with wilderness characteristics are outside these fields, which is not discussed in the Draft RMP and, therefore, not fully taken into account in weighing the impacts of protecting lands with wilderness characteristics on oil and gas development.	2027
10389	10389-5	Given the substantial acreage identified with wilderness characteristics, only evaluating protection of all the acres or less than 10% of those acres does not represent an actual consideration of alternatives and makes the Preferred Alternative appear to be “a foreordained formality” in contravention of NEPA, as well as FLPMA and the agency’s current guidance on considering management of lands to protect their wilderness characteristics. The range of alternatives for the Bighorn Basin RMP must include a true range of alternatives to protect lands with wilderness characteristics; the BLM must expand the analysis in the Draft RMP.	2027
10389	10389-6	IM 2011-154 sets out considerations in deciding whether to manage lands to protect their wilderness characteristics, including analysis of “manageability” and other resources values and uses. Attachment 2, p. 2. The Draft RMP purports to have engaged in these considerations, as well, in compliance with previous guidance. Draft RMP, p. 3-174. However, while the Draft RMP does not provide a detailed discussion of this process, the information provided indicates the evaluation needs to be corrected. Table 3-46 sets out the “other resource values and uses” and also appears to identify manageability factors. Draft RMP,	2027

Table B-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
		pp. 3-169 - 3-173. However, the table includes “proximity to wildland urban interface” as a resource value/manageability issue. As noted above, outside human impacts are generally not to be considered in evaluating “naturalness”	
10389	10389-7	The mere proximity of the wildland urban interface is not an appropriate measure. In addition, IM 2011-154 requires that BLM analyze not only whether other resources and values are present in lands with wilderness characteristics, but also whether those resources are available on other public and private lands outside those areas “thus ensuring that the BLM considers the relative importance of the resources and values located within the lands with wilderness characteristics. Attachment 2, p. 2. However, Table 3-46 does not include this analysis at all.	2027
10400	10400-5	Different divisions within the Wyoming Department of Environmental Quality (WDEQ) have different regulations for the resources they are charged with protecting. The citation should be for the Water Quality Rules and Regulations to avoid confusion for the reader. Additionally, for the same reason the applicable WDEQ division should be referred to specifically throughout this document. Class I waters are those surface waters in which no further water quality degradation by point source discharges other than from dams will be allowed, nonpoint sources of pollution shall be controlled through implementation of appropriate best management practices, and the water quality and physical and biological integrity which existed on the water at the time of designation will be maintained and protected. Water quality, aesthetic, scenic, recreational, ecological, agricultural, botanical, zoological, municipal, industrial, historical, geological, cultural, archaeological, fish and wildlife, the presence of significant quantities of developable water and other values of present and future benefit to the people are all considered by the Environmental Quality Council in designating these waters. However, a water does not need to possess all of these values to be designated as Class 1, and such designation does not necessarily create requirements to protect values which are not related to water quality.	2031
10400	10400-6	Although produced water has the potential to cause these negative impacts, the WYPDES program regulates discharges to protect water quality and support designated uses, and to protect against these negative impacts. This paragraph needs to elaborate on the WYPDES program's role in increasing beneficial impacts and reducing negative impacts, as well as discussing how the BLM should communicate with the WQD if such issues associated with permitted discharges are identified. WEPP Model starting at pages 4-14 and 4-29; and Appendix V The WEPP model discussion is very brief and provides little information, other than the results, to the reader. The model appears to grossly underestimate runoff and erosion, and it appears to need to be calibrated to the Bighorn Basin. Assuming that undisturbed areas have essentially no runoff implies there was no streamflow, other than from springs and snowmelt from the mountains, prior to the basin being settled, and that all runoff seen today is only from disturbed areas. The low amount of runoff associated with disturbed areas is also very low, since it appears to predict that over 95% of the precipitation that falls on disturbed areas does not run off. The model should be run in various watersheds in the basin in comparison to water quantity and sediment load data to see how it correlates with surface disturbed areas, etc. If the WEPP model has been calibrated to actual Bighorn Basin data, Appendix V needs to discuss this in much more detail. Based on these issues it is difficult to	2031

**Attachment B – Draft Resource Management Plan and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table B-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
		support the model as more than a qualitative tool; however, ranking of the relative amounts of erosion and sediment loading associated with the different alternatives appears correct.	
10400	10400-1	The WOGCC has regulations that require reporting of the anticipated completion and stimulation (hydraulic fracturing) program (WOGCC Rules and Regulations, Chapter 3). Language should be included in the document to reflect this regulation.	2049
10400	10400-2	discusses conforming with WQO regulations and meeting Wyoming water quality standards, yet this record implies the BLM will only use BMPs to meet those requirements. The WQO has a number of permitting and other requirements that the BLM, its permittees and/or authorized actions must meet that rely on more than BMPs. For example, Wyoming Water Quality Rules and Regulations (Chapter 4, "Reporting and Cleanup of Releases of Oil and Hazardous Substances") requires reporting of leaks and spills to the WQO - a requirement which is often overlooked or ignored. Please change the language: "BLM actions will conform with WQO regulations and requirements through application of BMPs and other measures, consistent with resource goals and objectives. Require reporting of leaks and spills to the WQD."	2054
10400	10400-3	It may be appropriate for this line to reference State Engineers Office regulations (Part III) for proper water well abandonment.	2054
10400	10400-4	Although the 2010 and 2008 303(d) Lists are similar, we can see no clear justification why the BLM did not use the most recent 2010 303(d) List which was published in April 2010. Additionally, the WQD is currently in the process of developing TMDLs for 14 of these 303(d) listed waters. The FEIS should use the 2010 303(d) List.	2054
10400	10400-7	Detailed groundwater monitoring discussions should be included in the report. "Groundwater Quality and Quantity Impacts and/or Proactive Management Actions" contains some general source discussion, but no detail on groundwater monitoring. Appendix C, Monitoring and Evaluation, contains broad monitoring and evaluation requirements, but a detailed discussion of groundwater monitoring requirements related to energy development should be included, if not in this section, elsewhere in the document. (Section 2.3.2 Mineral Exploration contains some discussion of oil and gas development.) Wherever the BLM chooses to include groundwater monitoring detail in the document, here is some suggested language to include in WQD's comments to the BLM: The WQD supports the recent BLM/USGS document "Regional Framework for Water Resources Monitoring Related to Energy Exploration and Development" (Framework). This guidance document provides a seven (7) step framework for developing a monitoring strategy for measuring and mitigating water resource damage. The framework should be specifically referenced in the EIS and the monitoring framework should be followed to develop a monitoring plan for both surface and groundwater prior to any development.	2054
10400	10400-8	This is not the definition of Surface-Disturbing Activities agreed to by the BLM and Cooperators throughout this process of developing this RMP, nor is it even similar to that in any other RMPs in the state. This definition muddies the waters and confuses the reader by including vegetation disturbance in the definition of surface disturbance. Surface disturbance is the physical removal of the land surface by mechanical means. Vegetation can be "disturbed", such as by grazing or browsing, without creating surface disturbance.	2054

**Attachment B – Draft Resource Management Plan and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table B-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
10401	10401-1	Grazing permittees in these areas have BLM maps showing many times the developments than are shown in the maps presented in this plan and wildland evaluations prepared to nominate these areas.	2027
10408	10408-1	Big Game Crucial Winter Range acreage identified by BLM for all alternatives (Map 35 - Biological Resources, Fish and Wildlife Resources, All Alternatives) is much greater than Big Game Crucial Habitat Areas identified by the Wyoming Game and Fish Department (WGFD) (WGFD Habitat Priority Areas - Revised January 2009, WGFD GIS Section, http://gf.state.wy.us/habitat/portal/index.asp).	2022
10412	10412-1	we are requesting a 90 day extension and will be meeting here in Billings as soon as possible to discuss the Big Horn Basin RMP	2007
10413	10413-1	o Tables labeled "Total Annual Emissions from Oil Wells" failed to include any actual emissions from oil wells.	2009_1
10479	10479-5	The negative environmental consequences of the RMP's and EIS' proposed livestock grazing practices must be analyzed and compared to alternative grazing practices.	2011
10479	10479-1	The RMP states that the HMA Plan or the grazing permit renewal process is the proper forum for AML revisions. However, it is the RMP which guides the management and distribution of the resources within the Planning Area. AMLs are based on resource allocation. Therefore, the RMP must include options to increase AML and reinstitute zeroed-out Herd Areas (HAs).	2030
10479	10479-2	The BLM must include an alternative for increasing AMLs. Increasing AML can be accomplished through the agency's Adaptive Management Strategy and by decreasing livestock grazing within the complex, pursuant to 43 C.F.R. 4710.5(a).	2030
10479	10479-4	The RMP fails to provide cross-reference information regarding the wild horse HMAs and zeroed-out HAs by livestock allotments. Inspecting the maps to try to see where the two intersect is imprecise, and the maps don't identify individual allotments due to their sheer number -- 687 -- covering virtually all 3,200,000 acres of BLM-administered "surface land."	2054
10480	10480-3	The DEIS states that the gray wolf is a Bureau sensitive species. The Service recommends that the text state that gray wolves in Wyoming are also currently listed as a nonessential experimental population under the Act.	2025
10480	10480-4	The DEIS states that wolverines existing in the planning area. The DEIS should state that the species is currently a candidate for listing under the Act.	2025
10480	10480-1	Please reword the text to state that this species is currently a candidate for listing under the Act.	2033
10480	10480-2	The DEIS states that the mountain plover is proposed for listing; However, on May 12, 2011, the Service announced the decision to withdraw the proposed listing of the mountain plover as a threatened species under the Act (76 FR 27756). Please change the text to reflect this change in status.	2041
10480	10480-5	Please correct this typographical error to state December 1 - September 30.	2054
10481	10481-1	Table 2-5. Detailed Alternatives. Record #4031. p. 2-65: The WDA does not support the language in the Agency Preferred Alternative (Alternative D): "Manage to achieve or make progress towards achieving 65 percent or more of Historical Climax Plant Community (HCPC)." We recommend removing this language and using the language provided in the first portion of Alternative A: "Implement objectives for Watershed Protection, Forestland Management and	2011

**Attachment B – Draft Resource Management Plan and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table B-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
		Livestock Grazing." This, in addition to the second paragraph in Alternative D, provides flexibility to define the Desired Plant Community (DPC) most compatible with management objectives, budget and personnel capabilities and current land use. Furthermore, if managing for HCPC is the goal, the DPC can include this. Currently, Alternative D does not provide the flexibility to manage for both DPC and HCPC.	
10481	10481-4	Record #6253 allows "permitted livestock grazing use consistent with other resource objectives and in agreement with the Wyoming Standards for Healthy Rangelands." The WDA recommends removing "consistent with other resource objectives" from this management action. Livestock grazing has occurred on these lands for decades without harming wilderness characteristics and it is reasonable to conclude that livestock grazing managed to meet the Standards for Healthy Rangelands will not reduce these characteristics.	2011
10481	10481-5	Table 2-5. Detailed Alternatives. Record #6268. p. 2-160:The WDA strongly urges the BLM to delete the word "stakeholder" from this management action and add the words "interested publics." Interested publics is an established term used in the livestock grazing portions of the Code of Federal Regulations (CFR) and this RMP must be consistent with existing regulations. CFR 4100.0-5 includes a specific definition for interested publics. It is important to cite these regulations in the RMP: CFR 4100.0-5 Interested public means an individual, group, or organization that has:(1)(i) Submitted a written request to SLM to be provided an opportunity to be involved in the decision making process as to a specific allotment, and(ii) Followed up that request by submitting written comment as to management of a specific allotment, or otherwise participating in the decision making process as to a specific allotment, if BLM has provided them an opportunity for comment or other participation; or(2) Submitted written comments to the authorized officer regarding the management of livestock grazing on a specific allotment. Even though there is a definition of stakeholders in the glossary, stakeholders are not included in the grazing portion of the regulations and cannot be used in this RMP. The definition of stakeholders in the glossary can include anyone holding U.S. citizenship. The CFR regulations cited above require U.S. citizens to actively request involvement before being consulted on grazing management decisions and Allotment Management Plans.	2011
10481	10481-6	Chapter 3 - Affected Environment, Livestock Grazing Management. AUM Allocations, p. 3-176 - 3-177: New statistics are available from the USDA National Agricultural Statistics Service on the impact of cattle and sheep in Wyoming and the U.S. Please update the statistics to include up-to-date information.	2011
10481	10481-7	The DEIS states: "Livestock and, to a lesser extent, wild horses and wildlife would contribute to the introduction and spread of invasive species." The WDA does not believe the BLM has sufficient data to show livestock are the main reason invasive species are introduced and spread. It is not reasonable to prioritize the culprits in the introduction and spread of invasive species. We recommend the DEIS strictly discuss the fact that invasive species will continue to spread in the planning area and this could occur for several reasons including livestock, wild horses, wildlife, surface disturbance, vehicles and travel routes, etc. If the BLM insists livestock are the primary factor in the introduction and spread of invasive species in the Bighorn Basin, we would request data to verify this statement be included.	2011

**Attachment B – Draft Resource Management Plan and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table B-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
10481	10481-8	Chapter 4 - Environmental Consequences, Special Status Species - Plants, Alternative B, Resource Uses, p. 4-208: The DEIS states "Alternative B places more emphasis on meeting the rangeland health standards and maximizing multiple use benefits." This statement is not correct. Each alternative places equal weight on obtaining the Wyoming Standards for Healthy Rangelands and Alternative B does not emphasize multiple use benefits.	2011
10481	10481-9	Chapter 4 - Environmental Consequences, Special Status Species - Wildlife, Trophy Game, Alternative A, p. 4-227: The DEIS does not disclose the true impact of livestock grazing on grizzly bears. While the paragraph does describe conflicts between livestock and grizzly bears, there is no disclosure on how choosing Alternative A (or Alternative D, p. 4-246) will truly impact grizzly bears. The WDA does not believe opening or closing areas to livestock grazing will greatly impact grizzly bears on BLM land. How much overlap actually exists between livestock allotments and grizzly bear habitat? How many conflicts have arisen? Will closing additional areas to livestock grazing under Alternative B really decrease conflicts? The true impacts are not currently displayed in the DEIS and we recommend deleting this discussion since the Wyoming Game and Fish Department manages wildlife in Wyoming.	2011
10481	10481-3	If Record #4077, Alternative D, was developed to address disruptive activities associated with grazing in delineated elk parturition habitat, then the WDA does not support this Alternative. We are concerned with the accuracy of current parturition habitat lines and believe these lines vary year-to-year based on predator pressure and weather patterns. Therefore, we do not support restricting cattle grazing in parturition areas based on the premise of disturbance. However, if Record # 4077 was developed to address potential brucellosis impacts, we recommend the following language, "SLM would consider implementation, on a case by case basis, of management actions jointly recommended by wildlife managers, grazing permittees, and animal health officials that would control the transmission of brucellosis."	2020
10481	10481-10	Chapter 4 - Environmental Consequences, Livestock Grazing Management, Alternative D, Resources, p. 4-378: The DEIS states that Alternative D "allows water development projects in sage-grouse nesting habitat with 10 inches or less annual precipitation if adverse effects can be avoided or mitigated based on site-specific analysis, a less restrictive requirement for allowing water development than that under Alternative B," The DEIS should clearly state how this action will impact livestock grazing management. For example, will it make distribution and management of livestock more difficult? Will it be costly to mitigate impacts?	2071
10484	10484-1	The plan mentions that the adverse impact to allowing timber harvest is an increase in unplanned ignition sources (chainsaws) in woodlands. What is this statement based on? How many fires have started due to chainsaws? How do these numbers compare to natural ignitions such as lightning.	2008
10487	10487-1	Fidelity believes BLMs sage grouse management should be consistent with Wyoming EO 2011-5 and the KHAs acreage should mirror the sage grouse core areas. There is no justification or scientific evidence provided to explain this discrepancy in the RMP	2069
10489	10489-2	The Impact Analysis for Planning Model (IMPLAN) is a model that uses regional analysis. It appears the Big Horn Basin would be better analyzed with a more geographic-specific approach. Example, in Table X-1, IMPLAN identifies regional oil and gas well numbers including coal bed natural gas. There has been very	2046

**Attachment B – Draft Resource Management Plan and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table B-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
		limited exploration and not any marketable sales from coal bed natural gas development in the Big Horn Basin. The model appears to be using the entire state of Wyoming for a regional model. Data like this has no bearing on oil and gas development in the Big Horn Basin and makes the reported information and findings questionable as well as misleading.	
10490	10490-1	For purposes of clarification, we request the BLM insert "(see Glossary)" following "avoid" in record #s 5020, 5022, and 5023 on pages 2-97 and 2-98. We also suggest on page 3-131 in paragraph 2, "buffer zones" be replaced with "visual resource management areas" as this may help to clarify how the BLM is proposing to manage these types of cultural resources.	2004
10572	10572-2	How can the BLM have standards that the mining companies have to comply with but the mining is exempt?	2032
10572	10572-1	Cretaceous strata in the Bighorn Basin have yielded important paleontological finds. In particular, outcrops of the Cloverly, Meeteetse, and Lance Formations produce dinosaur bones, while outcrops of the Thermopolis Shale and Mowry Shale produce the fossil bones of marine reptiles. (page 3-133) Where are the findings? It states on page 3-133 that there is a lack of information.	2059
10577	10577-1	It is not clear to me if you are referring to mountain bikes in record 6049 or something else. Based upon a discussion of this topic elsewhere in the document, it is clear to me that you are talking about motorized vehicles. "Mechanized vehicle" is not in the glossary of terms. "Mechanized use" is in the glossary and refers to mountain bikes. There are a couple of issues here that apply to other areas of this document besides this record, but this is where it first arises. First, areas with "limited travel designations" are an OHV designation and does not apply to mountain bikes. Second, I would suggest this section be checked for meaning to make sure you are not inappropriately lumping motorized and mechanized together. It would help to add a glossary term for "limited travel designations".	2034
10578	10578-1	Any closure of Tatman Mountain for emergency communications is unacceptable. As the Sheriff for Big Horn County, we are responsible for the safe dispatching of ambulance fire search and rescue, and law enforcement. Over 13,000 citizens require our services. Tatman Mountain is the only location we have found that provides adequate communication for the entire counties emergency resources.	2054

COMMENTER RESPONSE INDEX

1.0 INTRODUCTION

The tables presented in Attachments C and D are provided to assist commenters in finding their submitted comments and identifying the associated BLM comment summary and response in the Comment Analysis Report. Table C-1 provides a list of first and last names of commenters, the commenter’s affiliation (if applicable), and the commenter’s comment document number. PDF copies of all received comment documents are located on the BLM website: <http://www.blm.gov/wy/st/en/programs/Planning/rmps/bighorn.html>. Within Attachment D, also located at the above website, Table D-1 includes all individual substantive comments and identifies the BLM summary comment and response number associated with individual comments, organized by comment document number.

To use these tables:

1. Locate your name and associated comment document number in Table C-1.
2. Using the comment document numbers from Table A-1, go to Attachment D on the BLM website address provided above and find your identified individual comment(s), comment text, and BLM summary comment and response numbers in Table D-1.
3. The BLM summary comment/response numbers match those provided in Section 4.2.2 of the Comment Analysis Report.

With this information (comment document number, comment number, and summary comment and response number) commenters can locate a copy of their original comment document on the BLM website, their individual comments in Attachment C, and BLM summary comments and responses in Section 4.2.2 of the Comment Analysis Report.

ATTACHMENT D

Table D-1 includes all individual substantive comments and identifies the BLM summary comment and response number associated with individual comments. The table is organized by comment document number. Please refer to Attachment C, Table C-1 within the Comment Analysis Report for the Bighorn Basin Resource Management Plan Revision Project to locate your name and associated comment document number.

Table D-1. Individual Comments and BLM Response Index

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1005	1005-3	Alternative F Record 49. It is counter productive to the sage grouse to limit livestock grazing on burn areas. Record 50 is completely unnecessary ~it is extreme to fence off a burned area and to not allow grazing within a specific time frame. It appears there is an obvious agenda against Livestock grazing under the guise of restoration of the land Alternative E & F appear to be totally against livestock grazing on public lands. There is no proof that livestock grazing on public lands degenerates the grasses.	3011
1005	1005-2	Chapter 4:3 Some of the lands in the West NEED controlled burns and grazing to help manage wildfires. If the grass and weeds are not thinned out and forest clearings are not allowed, periodically, a natural fire will get out of control quickly and uncontrollably!	3011
1008	1008-82	This discretionary language calls into question the BLM's commitment to implement the conservation measures outlined in its policy. The Bighorn Basin RMP should include language that is mandatory, not discretionary.	3027-1
1008	1008-80	BLM should correct the deficiencies in the State policy by requiring that nesting habitats be delineated, and that new road construction be sited at least 0.8 mile from leks, nesting habitat, and winter concentration areas. Within these areas, jeep trails should be used for access, and seasonal closures to motor vehicles should be applied during breeding, nesting, and wintering periods.	3039-1
1008	1008-79	Unfortunately, both the State and Wyoming BLM Core Area strategies (and Bighorn Basin RMP Preferred Alternative) only require protective buffers of 0.6 miles around leks in designated core habitat; this corresponds to a 6% probability of lek persistence (Christiansen and Bohne 3008). BLM itself concedes, "Energy development within two miles of leks is projected to reduce the average probability of lek persistence from 87% to 5% (Walker et al. 2007a)." DEIS at 367. By comparison, the NTT report recommends a 4-mile lek buffer for siting industrial development in sage-grouse habitat (SGNTT 2011), a prescription in greater accord with the science.	3035_2

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1008	1008-78	This policy required BLM to complete an Ecoregional Assessment for the Wyoming Basins Ecoregion. Id. at 11. This Wyoming Basins Ecoregional Assessment publication (“WBEA”)3 was completed in 2011, and BLM should reference the findings of this report as they apply to the Bighorn Basin RMP, which falls within the Wyoming Basins Ecoregion, in order for the BLM has not met its obligation to “use the best available science” including publications specifically mandated under the Strategy. This study included a complete land cover mapping exercise including analysis of human footprint, which would have been useful to include in the Affected Environment section of the FEIS. Chapter 5 of this publication (WBEA at 112) specifically addresses sage grouse avoidance of oil and gas developments and other permitted facilities. This analysis found that sage grouse density was negatively correlated with major highways, powerlines, and the presence of oil and gas wells. WBEA at 124. These researchers pointed out, “Any drilling <6.5 km [approximately 4 miles] from a sage-grouse lek could have indirect (noise disturbance) or direct (mortality) negative effects on sage-grouse populations.” WBEA at 131. This finding supports the NTT recommendation of a 4.0-mile no-surface-disturbance buffer, but not the application of an 0.6-mile buffer as in the proposed Bighorn Basin RMP Preferred Alternative. Model results (WBEA at 134) could have been used to examine what proportion of high abundance roost sites and general use areas were encompassed by the Core Area and non-Core mitigation measures applied under each alternative.	3035_2
1008	1008-77	With this in mind, we ask the BLM to gather each of the scientific articles referenced in the Literature Cited section of these comments, review them thoroughly and incorporate their findings into the EIS, and add them to the administrative record for this RMP revision.	3035_2
1008	1008-75	In the Bighorn Basin RMP DEIS, BLM failed to apply baseline information from the Wyoming Basins Ecoregional assessment and other scientific studies and reports to inform its analysis of impacts by alternative. BLM also failed to map and present sage grouse wintering habitat as part of the baseline information requirement. Text on Affected Environment with regard to sage grouse habitat also failed to discuss the winter habitat needs of the birds (SDEIS at 3-3), in spite of clear scientific evidence that impacts to sage grouse by oil and gas development on winter ranges can have profound effects on the birds (Walker 2008). BLM Sensitive Species policy imposes additional requirements to provide baseline information. For BLM Sensitive Species, the agency is responsible for “Determining, to the extent practicable, the distribution, abundance, population condition, current threats, and habitat needs for sensitive species, and evaluating the significance of BLM-administered lands and actions undertaken by the BLM in conserving those species.” BLM Manual 6840.2(C)(1). Furthermore, the agency is responsible for “Monitoring populations and habitats of Bureau sensitive species to determine whether species management objectives are being met.” BLM Manual 6840.2(C)(3). The BLM must make up for the absence of population status and trend data for BLM Sensitive Species by generating these data of its own accord where they are unavailable through WGFD, Wyoming Natural Diversity Database, or other external sources.	3035_2

Individual Comments and Index to Summary Comments and Summary Responses**

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1008	1008-71	Do not use fire in precipitation zones < 12", except as last resort and where conditions allow and cheatgrass is a very minor component. (Northwest Colorado RMP Amendments).	3011
1008	1008-70	Avoid all new structural range developments and location of supplements (salt or protein blocks) unless independent peer-reviewed studies show that the range improvement structure or nutrient supplement placement benefits sage grouse. (North Dakota RMP Amendments).	3035_8
1008	1008-69	Where riparian and wetland areas are already meeting standards they would be maintained in that condition or better. Where a site's capability is less than PFC, BLM would manage to achieve or move toward capability. Manage wet meadows to maintain a component of perennial forbs with diverse species richness relative to site potential (e.g., reference state) to facilitate brood rearing. (North Dakota RMP Amendments).	3034
1008	1008-68	Authorize new water developments only when no adverse effect to sage grouse. (Northwest Colorado Plan Amendments).	3023-1
1008	1008-67	Prioritize assessments that include sage grouse habitat parameters, using ESD to determine if rangeland health standards are met. Develop objectives to conserve, enhance or restore sage grouse habitat. Give preference to SG habitat unless site-specific circumstances warrant an exemption. Manage toward ecological site potential and toward reference state to achieve sage grouse objectives. (Northwest Colorado Plan Amendments). Develop drought contingency plans that provide for a consistent/appropriate response. (Northwest Colorado Plan Amendments).	3035_8
1008	1008-66	Bury new distribution lines within 1 mile of leks. (HiLine RMP revision). Incorporate sage grouse habitat objectives into grazing permit renewals. (Northwest Colorado RMP Amendments).	3035_8
1008	1008-65	Find General Habitats unsuitable for surface mining; apply disturbance cap with exception when SG population is stable or increasing. Offsetting mitigation as needed. Recommend minimization of impacts. (Northwest Colorado RMP revision).	3035_8
1008	1008-64	Noise limited to no more than 10 dBA above ambient, where technologically feasible. (Buffalo RMP revision).	3035_8
1008	1008-63	Only allow geophysical operations by heliportable drilling methods and in accordance with seasonal timing restrictions. (North Dakota RMP Amendments). High-profile structures exceeding 10 feet in height, would be eliminated, designed or sited in a manner which does not impact SG. Permanent (longer than 2 months) structures which create movement must be designed or sited to minimize impacts to GRSG. (North Dakota RMP Amendments).	3035_8
1008	1008-62	Allow new routes/realignments during site-specific travel planning if it improves GRSG habitat and resource conditions. Allow no upgrading of existing routes that would change route category (road, primitive road, or trail) or capacity unless the upgrading would have minimal impact on sage grouse habitat, is necessary for motorist safety, or eliminates the need to construct a new road. (North Dakota RMP Amendments).	3035_8

**Attachment D – Supplement to the Draft Resource Management Plan
and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1008	1008-61	Site and/or minimize linear ROW to reduce disturbance to sagebrush habitats. Maximize placement of and transportation routes in existing ROWs. Power lines would be buried, eliminated, designed or sited in a manner which does not impact SG. ROWs would be allowed with appropriate mitigation and conservation measures identified within the terms of the authorization to minimize surface disturbing and disruptive activities. Co-locate new ROWs within existing ROWs where possible. (North Dakota RMP Amendments).	3035_8
1008	1008-60	Conduct restoration of roads, primitive roads and trails not designated in travel management plans. (North Dakota RMP Amendments).	3035_8
1008	1008-59	Limit motorized use to existing roads and trails pending travel management planning. Complete planning within 5 years of ROD.	3039-1
1008	1008-58	Avoid all new structural range developments and location of supplements (salt or protein blocks) unless independent peer-reviewed studies show that the range improvement structure or nutrient supplement placement benefits GRSG. Design any new structural range improvements and location of supplements to conserve, enhance, or restore SG habitat through an improved grazing management system relative to SG objectives. Evaluate existing range improvements and location of supplements during AMP renewal process to make sure they conserve, enhance or restore SG habitat. (North Dakota RMP Amendments).	3035_8
1008	1008-57	Evaluate the role of non-native seedings to determine if they should be restored to sagebrush; seedings that contribute to grazing management that improves SG habitat can remain. (Northwest Colorado RMP Amendments).	3035_8
1008	1008-56	Do not allow treatments with a potential to adversely affect SG. Retain a minimum of 70% of ecological sites capable of supporting 12% cover in Wyoming big sage or 15% cover in mountain big sage. Manage a total disturbance cap of less than 30% lands not meeting these criteria. Irrigated meadows do not count against the disturbance cap. (Northwest Colorado RMP Amendments).	3035_8
1008	1008-55	Authorize water developments only when no adverse effect to sage grouse. Analyze springs, seeps, and pipelines to see if modifications are needed. (Northwest Colorado RMP Amendments).	3035_8
1008	1008-54	Priority Habitats are exclusion areas for new renewable energy ROW permitting. (North Dakota RMP Amendments; HiLine, Buffalo, and South Dakota RMP revisions). Maximum 25% forage utilization for livestock grazing in each grazing allotment. (North Dakota RMP Amendments).	3035_8
1008	1008-53	Close Priority Habitats to energy and non-energy leasable minerals leasing. (HiLine RMP revision).	3035_8
1008	1008-52	No Surface Occupancy stipulations required for any new fluid minerals leasing. (North Dakota RMP Amendments; HiLine, Billings/Pompeys Pillar, Miles City, and South Dakota RMP revisions).	3035_8

**Attachment D – Supplement to the Draft Resource Management Plan and
Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1008	1008-51	Priority Habitat would be a priority in consideration of land acquisitions. Retain public ownership of PH. Consider exceptions where: There is mixed ownership, and land exchanges would allow for additional or more contiguous federal ownership patterns within the priority sage-grouse habitat area; Under priority sage-grouse habitat areas with minority federal ownership, include an additional, effective mitigation agreement for any disposal of federal land. As a final preservation measure consideration would be given to pursuing a permanent conservation easement. (North Dakota Plan Amendments).	3035_8
1008	1008-50	Prohibit or bury powerlines within 0.6 miles of leks unless no SG declines can be demonstrated. Prohibit overhead transmission except within 0.5 mile of existing lines, corridor a maximum of 1 mile wide. Bury lines where possible. (Buffalo RMP revision). High-profile structures exceeding 10 feet in height, would be eliminated, designed or sited in a manner which does not impact sage grouse. Permanent (longer than 2 months) structures which create movement must be designed or sited to minimize impacts to sage grouse. (North Dakota RMP Amendments).	3035_8
1008	1008-49	New road construction would be limited to realignments of existing roads, if that realignment has a minimal impact on greater sage-grouse habitat, eliminates the need to construct a new road, or is necessary for public safety. Incorporate BMPs. Existing roads used to access valid existing rights; if unavailable, construct to minimum standard necessary. (HiLine RMP revision, North Dakota RMP Amendments).	3035_8
1008	1008-48	Conduct restoration of roads not designated during travel planning. (Northwest Colorado RMP amendments).	3035_8
1008	1008-47	Use existing roads, or realignments as described above to access valid existing rights that are not yet developed. If valid existing rights cannot be accessed via existing roads, then build any new road constructed to the absolute minimum standard necessary. Allow no upgrading of existing routes that would change route category (road, primitive road, or trail) or capacity unless the upgrading would have minimal impact on sage-grouse habitat, is necessary for motorist safety, or eliminates the need to construct a new road. (North Dakota RMP Amendments).	3035_8
1008	1008-45	For geophysical exploration (Record #86), the protections in Alternative E are unnecessarily strict, and Alternative F is preferable as it will fulfill the requirements of sage grouse to avoid disturbance while minimizing the need for wildcat exploration through drilling. DSEIS at 2-31.	3023-4
1008	1008-44	We agree with Record #36 for both alternatives (SDEIS at 2-22), although the use of Plateau in heavily cheatgrass-infested areas might be allowed in cases where sage grouse are not using the treated habitats. This might be accomplished by deliberately driving grouse off by teams on foot prior to treatment, and by treating from backpack units rather than aerial or truck/ATV application.	3014

**Attachment D – Supplement to the Draft Resource Management Plan
and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1008	1008-41	The BLM has also not considered protections for sage grouse for lands outside Priority Habitats, and has not fully considered NTT or Sage-grouse Recovery Alternative measures proposed for sage grouse general habitats. What will be the impact of permitted activities on grouse populations that fall outside the Priority Habitats/ACEC boundaries under this plan? The SDEIS is silent on this matter.	3035_1
1008	1008-40	We are concerned that the BLM has not fully considered the Sage-grouse Recovery Alternative or the National Technical Team recommendations in full, and has not provided sufficient explanation for why this has occurred. In particular, measures to protect sage grouse wintering habitat are entirely absent from all alternatives, and there is no impacts analysis for permitted activities on wintering sage grouse and their habitats. There is a notable absence of baseline information in the SDEIS on wintering habitats, and the lack of impacts analysis leaves open the question of how heavily wintering sage grouse will be affected by permitted activities under the new RMP, and what effect this will have on the viability of sage grouse populations both inside and outside Priority Habitats.	3035_1
1008	1008-39	The Bighorn Basin DEIS supplement, and the Draft EIS to which it is related, do not appear to consider alternatives to provide enhanced protections for sage grouse General Habitats of the type recommended in the National Technical Team report.	3035_1
1008	1008-38	Placing salt blocks in upland areas is not an effective means of drawing cattle use away from riparian areas. Bryant (1982:784) found that salt placement and alternate water sources did not influence cattle preference for riparian habitats, and came to the following conclusion: "These cattle used the salt when convenient but did not alter behavior patterns to obtain it." Thus, the BLM should not rely on the placement of salt blocks as a means to draw livestock away from riparian habitats.	3034
1008	1008-37	The pattern of grazing may have a significant effect on efforts to maintain riparian areas in Properly Functioning Condition. Bryant (1985) found that season-long grazing had the greatest negative impact on riparian vegetation. Late season grazing may result in less disturbance to riparian communities (Green and Kaufman 1995). Clary (1995:24) made the following recommendation for grazing in riparian areas: "If utilization guidelines are used, those rates that do not exceed 30% of the annual biomass production will likely maintain production the following year." Riparian areas should be the focus of monitoring efforts, as these areas can become ecologically impaired before upland habitats begin to show signs of damage.	3034

**Attachment D – Supplement to the Draft Resource Management Plan and
Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1008	1008-34	According to the Conservation Objectives Team (U.S. Fish and Wildlife Service 2013: 45), the following objective should be a guiding principle: Conduct grazing management for all ungulates in a manner consistent with local ecological conditions that maintains or restores healthy sagebrush shrub and native perennial grass and forb communities and conserves the essential habitat components for sage grouse (e.g. shrub cover, nesting cover). Should Alternative E not be selected, the Bighorn Basin RMP should implement its management standards such that this direction is achieved. Furthermore, we recommend that BLM should include a provision to retire livestock grazing allotments on a willing-permittee basis when they come up for renewal under all alternatives, as is included under all alternatives in the BLM's South Dakota RMP Draft EIS. We support the effort in Alternatives E and F to effect this change.	3035_6
1008	1008-33	for sage grouse Priority and General Habitats there should be a decision procedure and actions described below, depending on habitat conditions. 1. Assess which lands meet the Connelly et al. (2000) guidelines both in riparian areas and upland areas in Table 3. Include the conservation community and grazers in this assessment. 2. For those not meeting these guidelines, determine that the allotment does not meet rangeland health standards. To meet these standards, the sagebrush community must meet or exceed the height and percent canopy cover percents for sagebrush, native grasses, and forbs in Table 3 (Connelly et al. 2000). 3. Change grazing use as necessary so that upland and riparian areas have a positive 2 or better Grazing Response Index (GRI) score for allotments not meeting standards. 4. For allotments that meet standards, insure grazing practices produce a "0" or plus net GRI score. 5. In sage grouse nesting areas, do not allow grazing until after the 20th of June (Braun 2006). 6. During permit renewal, inventory the amount of forage produced in the allotment, assess the allotment ecological conditions, and document past grazing use. As a part of permit renewal, conduct a range capacity analysis to assess the stocking rate for the allotment. Stocking levels for allotments that meet standards should lead to less than 25% utilization (Braun 2006) and for allotments not meeting standards, less than 15% utilization. 7. For allotments not meeting the rangeland health standards, prohibit grazing during a severe or worse droughts as defined by the national drought monitor. 8. For allotments that meet the standards, reduce grazing use prior to a drought to utilization levels less than 10-15% utilization for forage expected during the drought. 9. In sage grouse habitats, produce an annual end-of-season report for each allotment.	3035_6
1008	1008-32	If Alternative E is not adopted, all allotments in Priority Habitats must be managed to meet or exceed Rangeland Health standards, and following natural fires, livestock should be excluded for a 2-year period. We concur with the wisdom of applying Records # 88 through 101 for Alternative F as a backup plan in this regard. Record #113 is a good goal for the management of wild horses, and should be applied equally to domestic livestock on all grazing allotments within Priority Habitat.	3035_6
1008	1008-31	The RMP should include at least one alternative that targets a 10.2-inch residual summer height throughout sage grouse nesting habitat during the nesting season.	3042

**Attachment D – Supplement to the Draft Resource Management Plan
and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1008	1008-30	For allotments where sage grouse nesting is known to occur, shifting on-off dates (if necessary) could minimize the chances of impacts to nesting sage grouse, and livestock drives should be routed to avoid sage grouse leks during the strutting and nesting seasons.	3035_6
1008	1008-29	BLM should fence off natural springs and place livestock water sources outside the fences rather than at the spring itself. If past actions have dried up natural springs or wetlands to create stock tanks, then remedial action should be required return some water to ground for sage grouse and vegetation, in an area protected from livestock.	3017-3
1008	1008-28	We strongly concur with the need to abstain from vegetation treatments in Priority Habitats, per both Alternatives E and F. SDEIS at 2-21, 22. There is a growing scientific consensus that burns and mechanical treatments are deleterious to sage grouse. For Record # 102, the Alternative E language should be adopted, as Alternative F allows the continued degradation of sage grouse habitats through treatments that may not be compatible with sage grouse persistence.	3011
1008	1008-27	Taking into account the negative effects of vegetation treatments on sage grouse nesting and lekking areas, and uncertainty in the overall extent of sage grouse nesting habitat surrounding lek sites in the Great Plains region, the BLM should prohibit vegetation treatments within 3 miles of sage grouse lek sites.	3042
1008	1008-26	BLM proposes to continue to allow the use of prescribed fire in Core Areas, which will cause negative impacts to sage grouse populations. BLM measures under Alternative F would "limit" prescribed fire in ACECs on lands with less than 12 inches of annual precipitation, but apparently still allow it. SDEIS at 2-23. "Limit" is a word so poorly defined that it is impossible to tell whether it has any effect at all; it appears purely discretionary. Prescribed fire not only harms sage grouse by eliminating the sagebrush that is their key habitat element, but also promotes the spread of cheatgrass (smooth brome and Japanese brome), which are becoming ever more widespread in the Bighorn Basin. Required measures for prescribed fires reduce the negative effects but do not drop them below the threshold of a significant impact to sage grouse.	3011
1008	1008-25	BLM should rigorously evaluate all sagebrush habitat treatment projects to determine how exactly they will impact sage grouse populations prior to counting such projects as assets toward sage grouse recovery or threats to sage grouse persistence.	3042

**Attachment D – Supplement to the Draft Resource Management Plan and
Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1008	1008-24	We are concerned that many, if not most, of these "habitat improvement" projects are actually harming sage grouse habitat in the long term and that the remainder will cause short-term impacts to sage grouse populations that contribute to the multiple serious threats to their existence. The scientific basis for many such projects (which include prescribed burns and mechanical or herbicidal thinning or removal of sagebrush) is extremely shaky, and given the lack of familiarity of the project proponents with basic sage grouse habitat requirements, such projects may unintentionally cause additional damage to sage grouse habitats. The impacts (positive and/or negative) of such projects have not been rigorously tested, and thus their results for improving (or harming) sagebrush habitats remain open to speculation.	3042
1008	1008-23	The Bighorn Basin RMP should cure these problems for BLM-managed lands and projects on BLM-managed minerals by establishing Priority and General Habitat boundaries as inviolate and permanent designations (at least throughout the life of the Plan) and by precluding exceptions or waivers of sage grouse measures within these respective habitats. BLM must ensure that all Core Area/Priority Habitat/ACEC protections are nondiscretionary standards, so the agency can rely on them as conservation measures that are adequate and reliable in the context of Endangered Species decisionmaking by the U.S. Fish and Wildlife Service.	3035_1
1008	1008-22	All new roads should be located farther than 1.9 miles from active leks; Alternative F is deficient in this regard by allowing tertiary roads as close as 0.6 mile, although the NSO stipulations in Alternative E are well within the scientifically sound thresholds described by peer-reviewed studies that do not result in significant impacts to breeding populations. Seismic activity should be limited to periods outside the breeding/nesting or winter use season, for breeding/nesting and winter concentration habitats, respectively. Allowing heliportable geophysical exploration in Priority Habitat only outside the season of use is the proper approach.	3039-1
1008	1008-20	We concur with the need to manage Priority habitats as right-of-way exclusion areas per Alternative E rather than avoidance areas per Alternative F. SDEIS at 2-17, 27, 28. An exception could be allowed to the exclusion for buried powerlines, regardless of location. Similarly, Priority Habitats should be exclusion areas for wind power projects and met towers, per Alternative E. SDEIS at 2-19. Discretionary "avoidance" is too weak, and there is no evidence extant that compensatory mitigation has increased sage grouse numbers anywhere. Despite tens of millions of dollars being spent on offsite mitigation in the Pinedale Field Office, the result has been a net loss of sage grouse.	3033-1

and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1008	1008-19	On Density and Disturbance, we support the approach as outlined in Alternative E as the preferable approach to managing the density of surface disturbances. SDEIS at 2-17, Record #7. Some modifications would be helpful here. The section should read "do not exceed one disturbance per 640-acre section" to remove any and all ambiguity as to how the density calculations will be made. While using square-mile sections has its limitations, it is more rigorous than averaging the density over a larger area, and all sage grouse scientific studies have calculated well pad density on a per-square mile basis (not using a DDCT), so their results would be applicable to an RMP that managed density in this way. We agree with 3% as the maximum allowable density of disturbance that should be allowed in Priority Habitats. We appreciate the language requiring the well to be sited on the portion of the lease most distal from the lek. Record #76 for Alternative E fleshes out additional NSO requirements that would best protect leks -- and to some degree, nesting habitat -- from individual disturbances. SDEIS at 2-30.	3035_4
1008	1008-18	Alternatives E and F both include a 3% disturbance cap, within the range recommended by the NTT, but they calculate disturbance based on a DDCT. This use of the DDCT results in an inaccurate disturbance calculation that allows more than 3% per square mile on a section-by-section basis, the threshold at which negative impacts to sage grouse occur. BLM should manage Core Area habitats to prevent significant impacts to sage grouse, including from surface disturbance in excess of 3% per square mile, within Core Areas under the new RMP.	3035_4
1008	1008-17	We support the designation of the "Key Habitats" as shown in Map SEIS-1, rather than the Core Habitats that would apply to Alternative F, because the Key Habitats more closely represent the Core Areas as originally designated in 2008 and prior to gerrymandering of boundaries that excluded major areas near highly populated leks that has occurred subsequently. BLM has itself identified that the Key Habitat Areas, beyond state-designated Cores, "include additional productive habitats identified as important to greater sage grouse in the Planning Area." SDEIS at 3-3. We find that the changes made by the SGIT from the original Core Area map on balance have a negative effect on the ability to conserve grouse in the Bighorn Basin, and would unduly facilitate industry proposals that would degrade key grouse habitats that need to be protected. We would further recommend that connecting corridors be established between the ACEC units, and managed for sage grouse retention and passage. These corridors should follow the 4-mile buffers of more lightly populated leks wherever possible.	3035_1

Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1008	1008-16	Importantly, the BLM has a better option: Implement the National Technical Team recommendations, which are in fact consistent with state Executive Order 2011-5. EO 2011-5 prescribes a maximum of 1 well pad or mine site per square mile as calculated within a DDCT area; applying a one well pad or mine site per section limit as recommended by the NTT would result in a lesser density than 1 site per square mile when calculated with a DDCT area, and therefore would be allowable under EO 2011-5. Requiring a no surface disturbance buffer of 4 miles would never allow surface disturbance within 0.6 mile of leks inside Core Areas, and therefore would be allowable under EO 2011-5 because the state prohibition of surface disturbance within 0.6 mile of leks would be upheld. An unconditional burial of electrical distribution lines would never violate the state guideline to bury powerlines when possible. Implementing a 2.5% or 3% cap on surface disturbance on a per-square mile basis would always yield a disturbance result less than the state's 5% limit and therefore within the realm of acceptable outcomes under the state policy. At no point does state policy mandate that impacts to sage grouse reach the maximum levels allowed under the policy; the state thresholds under EO 2011-5 are written as limits, not targets. The BLM therefore has the opportunity (and indeed under NEPA, FLPMA, and Manual 6840, the responsibility) to implement the science-based measures recommended in the NTT Report in order to both maintain consistency with state Core area policy and protect this BLM Sensitive Species with measures that satisfy NEPA's scientific integrity standards and prevent unnecessary or undue degradation to sage grouse Core habitats under FLPMA.	3035_4
1008	1008-14	Given the limitations in the Wyoming strategies and considering new scientific information on sage grouse, it is unlikely that application of the strategies in Alternative F will prevent further declines in sage grouse. BLM should instead apply at minimum the measures recommended by the BLM's National Technical Team, and more preferably the Sage Grouse Recovery Alternative attached to these comments. See Attachment 1. The impact of the failure to apply adequate protections to Core Areas would likely to result in major impacts to sage grouse. Given the inadequacy of mitigation measures proposed under Alternative F to protect sage grouse in Core Areas, the consequences for making sage grouse Core habitat available to sage grouse populations are likely to be locally severe.	3035_1
1008	1008-13	We have grave concerns about the adequacy of conservation measures employed by the State of Wyoming and the Wyoming State Office of the Bureau of Land Management (BLM) under its Instruction Memoranda to conserve greater sage grouse in that state, carried forward in the detailed provisions of Alternative F. The two entities' Core Area strategies are similar and share weaknesses that prevent them from successfully addressing the conservation needs of sage grouse. These policies were established in State Executive Order 2011-5 and BLM Instruction Memoranda WY-2010-012 and WY-2010-013, and carried forward in Instruction Memorandum WY-2012-019.	3035_1

**Attachment D – Supplement to the Draft Resource Management Plan
and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1008	1008-12	Alternative F appears to adopt the state's Core Area policy and 2012 BLM instruction memoranda to guide sage grouse management measures. The performance to date of sage grouse Core Area protections under state Executive Orders and Wyoming BLM Instruction Memoranda has been poor, and they have in many cases failed to prevent significant impacts to sage grouse populations in Core Areas. In many cases, the BLM appears to have limited its own conservation measures for sage grouse to those included in state Executive Order 2011-5 (EO 2011-5). However, this alternative excludes many of the most important conservation measures recommended by the NTT. Importantly, EO 2011-5 was promulgated in the absence of a NEPA process, and this lack of NEPA foundation has undermined its effectiveness. Because there was no "hard look" at potential impacts to sage grouse in Core Areas under EO 2011-5, and no requirement of scientific integrity as imposed under NEPA, many of the measures included in EO 2011-5 do not reflect the best available science and their implementation in the face of industrial uses of the land to which the Order applies will in fact result in significant impacts to the viability of sage grouse populations in Core Areas.	3035_1
1008	1008-11	We are concerned that Alternative F will not uphold BLM's obligation to manage Sensitive Species to "minimize or eliminate threats," either within or outside of Core Area habitats. As detailed elsewhere in these comments, mitigation measures applied under Alternative F (and the even less-protective Alternatives A through D in the original RMP DEIS) will inevitably lead to serious impacts to sage grouse populations within Core Areas. This result represents an unnecessary and undue degradation of key sage grouse habitats.	3035_1
1008	1008-9	We strongly urge the BLM that Priority Habitats should be withdrawn from future oil and gas leasing, allowing existing leases to lapse as they expire, as in Alternative E. SDEIS at 2-29. Existing leases should have all measures approved under the RMP revision applied as Conditions of Approval. However, the Preferred Alternative would not apparently close Priority Habitats to future oil and gas leasing. Id. BLM should close sage grouse Priority Habitats to future oil and gas leasing as a means of steering future land uses away from conflict in the future.	3035_9
1008	1008-8	BLM should consider a phased leasing alternative under which a third or less of the planning area is open at any given time to leasing and development. Leases that are not drilled and held by production are forfeited back to the agency after their 10-year lease term expires, except in cases of unitization. It makes the best sense for BLM to close areas that are highly sensitive to future leasing even if they are leased today; most of BLM's Wilderness Study Areas were heavily leased upon establishment, and even though operators were given the opportunity to be grandfathered in if these leases were developed, few were and today WSAs are almost entirely free of the encumbrance of oil and gas leases.	3023-3

**Attachment D – Supplement to the Draft Resource Management Plan and
Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1008	1008-7	The level of protection outside Core Areas should be maintained under the Preferred Alternative and adopted into the RMP, and this level of protection should be accorded to Core and Connectivity Areas as well. As perch inhibitors do not fully prevent raptor perching, this measure should be amended to allow buried powerline but prohibit new overhead lines under any circumstance.	3033-2
1008	1008-6	The NTT Report recommends that all electrical distribution lines be buried within Core Areas, period; BLM does not evaluate this under Alternative F. See SDEIS at 2-17, 18; Records # 8, 10. Under both alternatives, the agency would evaluate the need to bury existing power lines. Id. But in Alternative F, Priority Habitats would be an avoidance area, not an exclusion area. Id. At Record #10. BLM itself points out reductions of sage grouse use within 2.9 miles of powerlines. According to BLM (2003: 2-8), Power lines may also cause changes in lek dynamics, with lower growth rates observed on leks within 0.25 miles of new power lines in the Powder River Basin of Wyoming as compared with those further from the lines. This was attributed to increased raptor predation (Braun et al. 2002).	3033-1
1008	1008-5	According to BLM IM 2012-44, "The conservation measures developed by the NTT and contained in Attachment 3 must be considered and analyzed, as appropriate, through the land use planning process by all BLM State and Field Offices that contain occupied Greater Sage-Grouse habitat." This must be done fully in the Bighorn Basin EIS supplement. IM 2012-44 does not provide an option not to analyze these measures in at least one alternative unless a clear finding is provided that the measure is not appropriate, and BLM has provided no such findings in the context of the Bighorn Basin supplement.	3035_1
1008	1008-3	Importantly, the BLM appears to rely heavily on discretionary measures such as "avoidance" rather than "exclusion" of activities known to be detrimental to sage grouse inside Priority Habitat areas. And even more importantly, BLM in many cases adopts measures that provide inadequate protections based on the available science, which outlines thresholds at which significant impacts can be expected. The lack of sufficient regulatory mechanisms to conserve sage grouse and their habitats was identified as a primary threat leading to the USFWS warranted but precluded finding in 2010. 75 FR 13910. The Preferred Alternative (presumably Alt. F) will need to be strengthened to meet the level of protection recommended in the National Technical Team Report at minimum in order to represent effective conservation measures that have some chance of obviating the need to list the greater sage grouse in general, and this population in particular, as Threatened or Endangered. We are concerned that BLM may not fully apply mitigation measures identified in the RMP revision, using agency discretion to create loopholes in cases where project proponents find mitigation measures to be onerous. RMP language should be clearly articulated that standards are indeed standards and will be applied rigorously throughout the life of the Plan.	3035_1

**Attachment D – Supplement to the Draft Resource Management Plan
and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1008	1008-1	BLM must consider implementing key sage grouse protections recommended by USFWS and the BLM's own National Technical Team (e.g., a 4-mile no surface disturbance buffer for active leks within Core Areas). The agency must also consider the Sage-Grouse Recovery Alternative attached to these comments; it is important to note that this alternative has been considered in detail for sage grouse plan amendments elsewhere within BLM purview. The agency must consider expanding Priority Habitat designations beyond the Core Areas designated under State Executive Order, and we applaud the agency for doing this under Alternative E's Key Habitats. And the BLM must consider measures that require the elimination of surface disposal of coalbed methane wastewater.	3035_1
1009	1009-6	Also, if the mining company is unable to claim this and mine through then the mining company would not be able to continue the cast back technique and this would require a stop and start that would result in additional disturbance and which is not a desired BMP from an ecological basis.	3020
1009	1009-4	The socioeconomic section of the Draft RMP failed to include bentonite mining industry even though 16% of the employment for Big Horn County is the mining industry generating 22% of the earnings. The proposed options E & F would have a greater impact than what is portrayed in this section and I believe that the author is incorrect with their analysis.	3036-1
1009	1009-3	When developing a mine plan for submission it is occasionally found where a corner or a small amount of bentonite is located outside of the existing claims and will be claimed prior to submitting the plan of operation. If the lands became an ACEC then the existing claims would be valid in the above instance however, the mining company would not be able to obtain the additional mineral since it will be proposed to be withdrawn by Congress.	3020
1009	1009-2	In regards to the proposed ACEC lands for both E (1, 764,621 Acres) & F (1,529,955 Acres), they will have a significant impact on the mining companies as well as grazing. Both of these industries provide a significant source of revenue to the Big Horn Basin. This would be fine if all of the lands were claimed, but they are not. With the additional restrictions placed on the ACEC such as drill notices requiring a plan of operation in order to assess whether or not the bentonite is a viable option for mining would be detrimental to the industry for those operating on federal lands based on the additional time and work to complete the notice. This would also at least double the workload of an already "super busy" Field Offices.	3020
1011	1011-7	Record #50 requiring fencing off of burned areas is another proposal designed to destroy the economic viability of livestock grazing on Federal lands and cannot be scientifically justified. Proper herd management is currently used to avoid unwarranted intrusion into sensitive areas and is effective.	3011
1011	1011-6	Record #49 the concept of eliminating livestock grazing from grazing in burned areas is very counterproductive to the resource. Many shrubs take many years (50-60) to develop and the elimination of livestock grazing is not scientifically justifiable and again, another radical and single use, environmentally biased proposal designed to eliminate livestock grazing from Federal lands.	3011

**Attachment D – Supplement to the Draft Resource Management Plan and
Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1011	1011-5	Chapter 4.3 Fire and Fuels Management: This restrictive use of fire as a management tool is another scientifically unjustified provision available to land managers and should not be eliminated from the options available to sustain and improve the forage potential of Federal lands.	3011
1011	1011-2	Chapter 2, Table 2.3 Alternatives E & F. This clause establishes sage grouse as the single dominant use at the expense of all others. It cannot be justified scientifically. Our cattle operation, commercial hunting business and guest ranch, all use lands inhabited by sage grouse with no negative effects. The predator problem, especially coyotes, is in fact a serious problem and as their population has increased, there has been increasingly serious pressure on the sage grouse on our ranch lands, both private and public.	3001
1011	1011-1	2. Chapter 2, Table 2.2 states that Desert Land entries would be abolished. The fact is that irrigated lands, blended with Federal lands are a positive relative to sage grouse habitat. We have local evidence on our own fee property, proving this and our private irrigated land base has consistently assisted the survival rate of sage grouse during severe winters.	3016-1
1012	1012-1	We recommend that the BLM continue to maintain Alternative D as the Preferred Alternative in the Bighorn Basin RMP. While we appreciate the analysis of the new Alternatives E and F for Greater Sage-grouse conservation, we do not believe that these alternatives are necessary. Alternative E would establish an Area of Critical Environmental Concern (ACEC) based on a modified version of the federally managed portions of Wyoming's Version 2 Core Areas, which we believe have little biologic value in the eastern Bighorn Basin. Alternative F would establish an ACEC based on federally managed portions of Wyoming's Version 3 Core Areas. While we feel that the Version 3 Core Areas have biologic value, we feel that the State of Wyoming is already providing adequate and appropriate protection for sage-grouse and the species' habitat. The State of Wyoming's Greater Sage-grouse Core Area Protection strategy, currently set by Executive Order 2011-5, has proven to be an effective conservation strategy for the sage-grouse. This strategy has been endorsed by the United States Fish and Wildlife Service, and we also believe that the BLM has been able to successfully implement it on projects occurring on federal land in Wyoming. Further, the strategy applies to regulated development on all lands whereas the proposed Alternatives would only apply to BLM land though a significant amount of non-BLM land exists in these areas. As such, we believe that the protections provided by the strategy exceed those that could come from the proposed Alternatives.	3001
1013	1013-6	Appendix L, Best Management Practices, Vegetation Treatments/Fire and Fuels Management, #24-25, p. L-7: The Best Management Practices refer to "annual grasslands." Generally, annual grasslands are an ecosystem that exists in California and not in Wyoming. The WDA recommends changing the language to "areas infested with undesirable annual grasses" or similar language to decrease possible confusion.	3042

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1013	1013-5	4.4.2 Vegetation -Grassland and Shrubland Communities. 4.4.2.3 Detailed Analysis of Alternatives, Alternative F, Resource Uses. p. 4-46: "livestock grazing management in this ACEC includes multiple management actions that would benefit grasslands and shrublands, including requirements for land health assessments to determine whether rangeland health standards are being met..." The BLM is already required to determine whether rangeland health standards are being met. This requirement includes meeting standards for wildlife habitat, including greater sage-grouse habitat. Alternative F does not change or extend this requirement. We recommend removing this portion of the analysis.	3042
1013	1013-4	Table 2.5. Detailed Alternatives, 7000 Special Designations (SO) -ACECs - Proposed Greater Sage-Grouse Priority Habitat Area ACECs, Record #110, p. 2-35: Alternative F -"Identify the specific allotment(s) where retirement of grazing privileges is potentially beneficial. (See Appendix P for a list of all grazing allotments in Core Habitat Area; this list indicates the universe of allotments where retirement could be considered, not those currently identified for retirement)." The WDA continues to be concerned about identifying allotments through an RMP process where retirement of grazing privileges is "potentially beneficial." We do not recommend carrying this action forward as part of the preferred alternative.	3017-1
1013	1013-3	Table 2.5. Detailed Alternatives, 7000 Special Designations (SD) -ACECs - Proposed Greater Sage-Grouse Priority Habitat Area ACECs, Record #31, p. 2-21: Alternative E -"If there ever is any legitimate need to reduce "thatch" in meadows, grass mowers will be used. Thus, livestock manure, trampling damage to soils, weed spread will be minimized." The action expressed in this record includes many negative statements towards livestock grazing, assumes livestock cannot be managed in a manner to reduce "thatch," introduces bias immediately against the idea of reducing "thatch" in meadows and contains more analysis points than actual actions. The WDA recommends removing bias and analysis points from Record #31 by rewriting the action to read "If necessary, "thatch" in meadows will be reduced using grass mowers." The BLM should analyze the pros and cons of using other methods, such as livestock, in Chapter 4. In addition, we do not recommend carrying this action forward as part of the preferred alternative	3042
1013	1013-2	The WDA requests the BLM incorporate language similar to the following in order to be consistent with EO 2013-3, Greater Sage-Grouse Core Area-Grazing Adjustments, which supplements EO 2011-5: "The BLM will collaborate with appropriate Federal agencies, and the State of Wyoming as contemplated under Governor Executive Order 2013-3, to: 1) develop appropriate conservation objectives; 2) define a framework for evaluating situations where Greater Sage Grouse conservation objectives are not being achieved on federal land, to determine if a significant causal relationship exists between improper grazing (by wildlife or wild horses or livestock) and Greater Sage-Grouse conservation objectives; and 3) identify appropriate site based action to achieve Greater Sage-Grouse conservation objectives within the framework." We recommend the BLM add the above language as a standalone management action in the preferred alternative .	3017-1

**Attachment D – Supplement to the Draft Resource Management Plan and
Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1013	1013-1	The actions addressed in Alternatives E and F are built with the perception that livestock grazing is always a negative influence on greater sage-grouse habitat and the BLM's management options to improve livestock grazing management, and thus greater sage-grouse habitat, are limited. In reality, livestock grazing can be managed to maintain or improve greater sage-grouse habitat and the BLM already has the authority to make changes to livestock grazing management without additional restrictions added through this RMP Revision process. Choosing Alternative E or Alternative F as the preferred alternative will have negative consequences on livestock grazing, the ability to manage livestock grazing, local economics and the custom and culture of Wyoming and the West.	3017-3
1016	1016-5	6. The last-minute introduction of Sage Grouse mitigation measures into this planning process is unacceptable. After years of a drawn-out planning effort, numbing the participants to the point where some have abandoned the process, two new alternatives have suddenly been mandated by BLM political leadership. These last-minute additions have then been run through an amended EIS process. We have been repeatedly assured that the Preferred Alternative is not one of these new sage-grouse-friendly alternatives, but there is no certainty that this will not change. Within the Cooperating Agencies there is a dread that a "bait-and-switch" scenario may replace the Preferred Alternative with one of the sage grouse alternatives at the last minutes.	3027-1
1016	1016-3	4. Hot Springs County's 2002 Natural Resources Plan for State & Federal Lands mandates sage grouse mitigation. Specifically, on Page 62 the Plan states: Hot Springs County supports sage grouse recovery efforts which are implemented by management techniques that do not negatively affect the general we/fare/economy of the County. Therefore, the County has identified habitat improvement (mechanical, chemical, irrigation, controlled fires, fire suppression policies, reseeding, and grazing), predator control and revision of hunting seasons if necessary as acceptable management techniques. Management techniques which negatively affect the economy, especially restrictions and stipulations on grazing and mining/oil/gas operators, are strongly discouraged by the County. Hot Springs County is currently in the process of updating its Natural Resources Plan. However, in its current draft form the language of the paragraph quoted above is retained with only a few minor changes. In summary, the 2002 HSC Natural Resource Plan mandates that efforts which do not impact the socio-economic fabric of the County must be pursued prior to any measures which do have the potential to impact the County's economy. The Big Horn RMP should be amended to contain similar language	3036-2

and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1016	1016-2	2. Socio-Economic Impacts to local communities are not being adequately addressed. This is also a NEPA requirement (section 1502.22), and is elemental to the environmental review process. Typical examples of these impacts include reduced funding to local school districts, County operational funding, infrastructure maintenance and repair (i.e. bridges, highways), and other major local services due to reductions in tax revenues from oil, gas, and mineral operations on BLM lands. It is important to note that oil & gas revenues and property taxes fund approximately 80 percent of Hot Springs County's operating budget, and the overwhelming majority of that production activity in the County occurs on BLM lands. While oil & gas production has been steadily decreasing over the past four decades, the increasing unit value of these resources has allowed revenues to remain consistent. Increasing regulations and restrictions on this activity -- particularly those addressing sage grouse habitat--will accelerate this drop in production and subsequent decrease in revenues, very likely outpacing the ability of the rising value of these commodities to keep pace with reduced production. Furthermore, these regulations should consider that the United States now has nationwide strategic considerations which render it undesirable to discourage oil and gas production. I have attached two pie-charts (HSC 2012 Valuation and HSC 2012 Tax Dollars Distribution) that illustrate the overwhelming importance of oil & gas revenues to schools and other local government operations in Hot Springs County. It is not unreasonable for us to expect that potential adverse impacts to local residents and local communities should be given the same detailed scrutiny as potential adverse impacts to sage grouse	3036-2
1016	1016-1	1. Cumulative Impacts are not adequately addressed. This had been a problem from the outset, and appears to be the result of a misinterpretation of NEPA's original intent, perhaps due to limited funding and personnel. These impacts must include seasonal restrictions, buffer zones, habitat expansion, surface restrictions, etc., and have already combined to create a substantial damper on the local economy. Addressing cumulative regulatory impacts is a NEPA requirement, and must include all existing or proposed regulations from other state and federal agencies. In the Big Horn Basin, these would include-but not be limited to-the ongoing Shoshone Forest Management Plan, the Big Horn River TMDL Study, and current Wyoming Game & Fish Department and U.S. Fish & Wildlife Service practices. Several of these involve existing or proposed regulations which combine to dramatically impede activities on public lands in the Big Horn Basin, such as oil and gas production, bentonite mining, public access, recreation, etc.	3008
1017	1017-130	With respect to projections of oil and gas development, the LGCA believes that the BLM significantly underestimated the potential for recent and upcoming technologies to develop existing resources. The LGCA is concerned about potential impacts on grazing that are not explicit in the SEIS. The land use plans are clear in that they are opposed to any reductions in grazing, particularly if they are not backed up by scientific data.	3027-2

Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1017	1017-129	The LGCA fully supports the goals of multiple use and sustained yield, balancing increasing and competing demands for resources on public lands while serving the best interests of the residents of the Bighorn Basin. The LGCA finds both Alternatives E and F unacceptable in their current form.	3027-1
1017	1017-122	The LGCA Conservation Districts and Counties each have Land Use Plans which address goals, objectives, and policies for lands within the counties. The BLM has not adequately considered the counties' land use plans or the importance of oil and gas to Washakie. Hot Springs or Big Horn Counties in the SEIS. Hot Springs County has brought to the BLM's attention that 80% of their budget comes from oil and gas production, but this fact has not affected the BLM's analysis of the potential impacts to the oil, gas, minerals, and socioeconomic resources. Big Horn County's Comprehensive Land Use Plan also recognized the importance of industry. Policies directly related to the SEIS are excerpted below.	3027-2
1017	1017-121	According to Table 4-22 the impacts to livestock grazing are identical for Alternatives A, D, and F. Please provide support for your analysis .	3017-5
1017	1017-119	We request that this impact on livestock grazing, and therefore on the socioeconomic resource, be included in the assessment.	3017-5
1017	1017-118	Please address the cumulative impacts of oil and gas restrictions, including increased length of permitting due to additional management measures.	3008
1017	1017-117	The LGCA requests that the BLM incorporates the potential social and economic impacts summary tables provided in our PDSEIS comments into the SEIS.	3036-1
1017	1017-116	The cumulative impacts section includes the following statement on page 4-147: "While the reduction from Alternative A to alternatives B and E would still be substantial, the stability of state and private production would moderate the change in federal policy." This statement does not take into consideration the changes in tax revenue for private versus federal lands. In addition, the analysis should also consider changes to community health if oil and gas production is increasingly pushed onto state and private lands, which constitute a small portion of the area in the region. Also included in this section (page 4-19) is the statement that: Despite the potential for cumulative impacts resulting from various operations in the Planning Area, overall cumulative impacts of BLM and non-BLM actions are not anticipated to have long-term adverse impacts on livestock grazing on public lands, since anticipated impacts to grazing lands would occur gradually over the life of the plan, except in Alternatives 8 and E where the impacts of livestock grazing withdrawals would be substantial. The LGCA believe that the impacts from changes in other RMP revisions need to be analyzed in conjunction with changes in this RMP to determine the cumulative impact of the current environmental movement to remove grazing from public lands .	3036-1

**Attachment D – Supplement to the Draft Resource Management Plan
and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1017	1017-115	The SEIS asserts on page 4-137 that "Geographically, the change in job opportunities -and related impacts on housing and community services - would be spread across the Planning Area and would be spread over time." These are assumptions that were made within the analysis itself, rather than results of the impact analysis. Where the impacts would occur and at what time period was not analyzed. The LGCA would like to clarify that there are small communities within the planning area which will experience large impacts from small changes. A \$5 million difference in revenues over two decades is a significant effect to our small counties. And, by making the assumption that the impacts will spread across the planning area, the BLM is failing to provide required monitoring and mitigation measures for adverse impacts that may arise to particular communities.	3036-2
1017	1017-114	The following remark is included in the summary of impacts from Alternative F on page 4-136: "In comparison to Alternative A, the average annual number of jobs supported by recreation activities and livestock grazing would increase, while the number of jobs supported by oil and gas would decrease by approximately 4%." According to Table 4-22 the impacts to recreation are constant across all alternatives and the impacts to livestock grazing are identical for Alternatives A, D, and F. The conclusion that jobs in livestock grazing would increase with the additional seasonal and other restrictions in Alternative F is inconsistent with the experience of the LGCA. Please provide support for your analysis. Furthermore, while we understand that the use of 2008 data facilitates comparison between the four original and two new alternatives, we are concerned that employing 2008 figures has the effect of understating the true economic impacts to county, state, and federal revenue streams.	3036-1
1017	1017-113	The LGCA also request that additional language be included in the analysis on page 4-135 to clarify the summary of impacts. In our experience, an increase in management stipulations results in the decrease of future economic opportunities. This means that Alternatives E and F are in conflict with the land use plans that emphasize maintaining multiple-use in order to maximize future economic opportunities. Additionally, there is a high level of impact due to the seasonal and discretionary closures.	3036-1
1017	1017-110	While we understand that the impacts are low based on IMPLAN results, the inclusion of additional constraints in Alternatives E and F that were not analyzed has the potential to create high impacts. Our requested solution is to state a range of impacts from low to high based on outcomes of further analysis. This will ensure that the reader who skims the document and focuses on the summary tables to understand impacts is receiving accurate information. Also, this will provide the opportunity to incorporate monitoring and mitigation plans to ensure the health of local communities should seasonal and travel restrictions create high impacts. Prior to the PDSEIS, the LGCA submitted the following language for inclusion in the PDSEIS. This language was not included in the SEIS. We request that it be included in the Final RMP.	3036-1

Individual Comments and Index to Summary Comments and Summary Responses**

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1017	1017-109	Our comments prior to the PDSEIS focused on the potential for Alternatives E and F to greatly impact the social and economic conditions in the planning area. While the BLM did include language on the uncertainty of impacts in the PDSEIS, which was expanded in the SEIS, the summary conclusions still state that there will be low impact to most social and economic conditions. By leaving the summary and related tables unchanged, the BLM is failing to ensure that needed monitoring and mitigation plans will take place.	3036-2
1017	1017-108	Another major concern is the lack of analysis of restrictions placed on ROWs and seasonal use, as well as management discretion contained in the two new alternatives.	3033-1
1017	1017-107	As the LGCA has previously expressed, the summary of the level of impacts by alternative (Table 2.6, page 2-43) is misleading to readers and policy makers. The conclusion that the alternatives will have low impacts on the social and economic conditions of the planning area are based on assumptions that ROW restrictions, changes to the Travel Management Plan, seasonal restrictions, and management actions with discretionary decision-making will have no impact grossly understates the likely impacts. The LGCA requests that Table 2-6 be revised to clarify the range of potential impacts (low to high) and to include language that recognizes the uncertainty of the level impact as provided in the analysis.	3036-1
1017	1017-106	Page 2-24 of the SEIS states: The BLM closes the same acreage in the Planning Area to livestock grazing as alternatives A and D (5,171 acres). Alternative F manages grazing lands consistent with Alternative D, except that in the Greater Sage-Grouse Habitat Core Habitat Areas ACEC where the BLM prioritizes the consideration of sage-grouse habitat objectives and management considerations over livestock grazing objectives through the imposition of restrictions on livestock grazing location and timing, and range improvements projects. The location and timing of grazing is critical to ranch viability in the planning area. Ranchers move herds to allotments on specific days in order to grow enough hay to feed the cattle through the winter. If a small window of time is closed in a specific allotment the operations for a ranch may be impacted for the entire year. We request that this impact on livestock grazing, and therefore on the socioeconomic resource, be included in the assessment.	3017-5
1017	1017-105	Lastly, we believe that the cumulative impacts are understated. Cumulative impacts should also address the impacts of the changes in other RMP revisions within Wyoming. There is currently a strong push by the environmental community to remove livestock grazing from public lands. The movement's effect on management actions outlined in RMP revisions across Wyoming and Idaho must be addressed in this analysis. Also, cumulative impacts of oil and gas restrictions, including increased length of permitting due to additional management measures, should be addressed.	3008

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1017	1017-104	Additionally, as with the Draft EIS, the SEIS socioeconomic analysis fails to provide an adequate analysis of the dispersion of impacts across the planning area. There are some communities in the planning area that are primarily ranching communities, while others are population centers for oil and gas workers. Small changes in livestock grazing policies have the potential to create large impacts in small ranching communities. By aggregating impacts across the region, the BLM and LGCA are missing the opportunity to develop proper monitoring and mitigation measures during the planning process and within the ROD.	3036-2
1017	1017-103	The LGCA believes that Alternative E and F should be more accurately portrayed as having restrictive impacts on economic activities in the planning area. We request that if any of the management actions from these two alternatives are included in the preferred alternative, or if Alternative E or Fare selected by the BLM, that a comprehensive socioeconomic monitoring and mitigation plan be included in the ROD. Further, at present the summary conclusions in the SEIS are not consistent with the analysis performed in the document. We are concerned that a cursory reading of the document shows only a low to medium impact from Alternative F, when in fact the impacts to the resource are unknown at this time due to ROW, travel, seasonal restrictions, and management discretion. Further analysis is needed to determine the socioeconomic impacts with any level of certainty for both Alternatives E and F.	3036-2
1017	1017-102	While a limited amount of the narrative that was provided prior to the completion of the PDSEIS was incorporated, we were impressed with the level of responsiveness from the BLM in integrating the majority of our recommendations on the PDSEIS in to the current SEIS. At this point in the process, the major change the LGCA requests is that the BLM incorporates the potential social and economic impacts summary tables provided in our PDSEIS comments into the SEIS. These are included again below for your convenience (Table 2 and Table 3).	3036-1
1017	1017-101	We support the 5% disturbance cap, which when combined with other collaborative conservation efforts provides sufficient measures for the protection of sage-grouse populations in the Bighorn Basin Planning Area. The LGCA requests that the 3% disturbance cap in Alternative F be changed to 5%.	3035_4
1017	1017-98	We support the State of Wyoming's Executive Order 2011-5 regarding greater sage-grouse conservation and request that the BLM use only Core Area habitat designations across all alternatives. We insist that the BLM work with the State of Wyoming to adhere to the Executive Order.	3035_1
1017	1017-96	We are concerned about the restriction of herbicide use within ACECs, particularly about the BLM's capacity to manage invasion plant species in existing, potentially expanded, and newly proposed ACECs. This is critical for the ACECs designated for Key or Core sage-grouse habitats, where weed management would greatly benefit sage-grouse. We suggest the BLM consider a pilot program where herbicide use would be allowed in all new acreage brought into the ACEC designation that is Core Area or Key sage grouse habitat for any noxious weed infestation that totals more than 5 acres.	3014

Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1017	1017-93	We encourage the BLM to add the replacement of windmills with solar pumps for stock water tanks and ponds to BMPs for greater sage-grouse. This technology has proved highly beneficial and effective in the Pinedale Planning Area for providing domestic livestock with water sources, producing overflow water that increases vegetative cover and forage production for sage-grouse, and removing the raptor perches provided by the windmill structures. Please see livestock grazing comments for more details on the BLM Pinedale planning efforts.	3035_6
1017	1017-91	The LGCA is concerned that the BLM claims to be following Wyoming's Core Area policy in Alternative F, yet uses a 3% disturbance cap, not the 5% disturbance cap outlined in Wyoming's Core Area strategy. We feel this represents an excessive restriction. A recent review of the BLM's NTT Report corroborates our belief: According to the NTT, the report "provides the latest science and best biological judgment to assist in making management decisions." In reality, the NTT report represents a partial presentation of scientific information to justify a narrow range of preferred conservation measures and policies that will be imposed as land use regulations by the BLM. In contrast, an objective scientific review would have led to a broadening of conservation alternatives for decision makers to choose from. (Ramey II 2013)	3035_4
1017	1017-89	We understand the need to balance the development and maintenance of industry and commercial activities with the management of healthy fish and wildlife populations. We therefore support the State of Wyoming's Executive Order 2011 -5 regarding greater sage-grouse conservation. Copeland et al. (2013) predict that using Wyoming's "Core Area" policy combined with \$250 million in targeted easements could reduce projected losses of sage-grouse populations to 9-15%, cutting anticipated losses by one-half statewide and nearly two-thirds within sage-grouse core breeding areas (Copeland et al. 2013). These projected losses were calculated based on projected future build-out of oil and gas, wind energy and residential development.	3035_1
1017	1017-88	The history of horse management in the Fifteen Mile HMA is described on page 3-119 of the Draft RMP. We find the wild horse estimates by the BLM especially problematic in the context of the NTT Report directing the agency to incorporate sage-grouse habitat objectives within HMA management plans for those HMAs within Key and Core sage-grouse habitat areas. Please consider revising HMA management in light of Record 113 (page 2-36 of the Draft RMP), which authorizes the BLM to prioritize evaluation of all Appropriate Management Levels based on indicators that address structure/condition/composition of vegetation and measurement specific to achieving sage-grouse habitat objectives within Key and Core sage-grouse habitat.	3045

and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1017	1017-81	Record 50 in Table 2.5 provides for the following management action under Alternative F: "Where burned sage-grouse habitat cannot be fenced from other unburned habitat, the entire area (e.g., allotment/pasture) should be closed to grazing until recovered." Please amend this management action by specifying the acreage of burned greater sage-grouse habitat that would trigger an area (allotment/pasture) closure. This can be done either by establishing a minimum burned acreage or a percentage of greater sage-grouse habitat within an existing allotment. We suggest the following language: Where recently burned sage-grouse Core Area habitats exceed 20% or sage-grouse general habitats exceed 40% of a specific pasture or allotment that cannot be fenced from other unburned habitat, the entire area (e.g. allotment/pasture) should be closed to grazing by domestic livestock until area recovers. Recovery is based upon BLM's recovery formula.	3035_6
1017	1017-80	The LGCA is strongly in favor of using the Greater Sage-grouse Core Habitat Areas, as designated by the Wyoming Governor's Office, across all alternatives (Wyoming Office of the Governor 2011). We request that the BLM omit the use of Key Areas in the Final RMP and EIS.	3035_1
1017	1017-78	Please include language in that acknowledges the impacts wild ungulates and feral horses may have on the quality and composition of key forage species.	3045
1017	1017-75	The Draft RMP states on page 3-98: Management challenges for big game species include poor habitat conditions, fire management, drought, increased development and urbanization, habitat fragmentation, motorized vehicle misuse, disease, hunter access, and the impacts of livestock grazing management on the frequency, quality and composition of key forage species. The above text singles out domestic livestock as the only grazing impact on big game species. This is inconsistent with the SEIS language in Section 3.4.9, which suggests that grazing and browsing from wild ungulates (deer, pronghorn, moose, elk, mountain goat, and bighorn sheep) impact special status species habitat. Please include language in section 3.4.6 that acknowledges the impacts wild ungulates may have on the quality and composition of key forage species. Wild ungulates have the capacity to alter and impact frequency, quality and composition of key forage species as well. Wild or feral horses, depending on how an agency chooses to classify them, are ungulates too. Grazing and browsing by these horses influence frequency, quality and composition of key forage species. The LGCA requests language to this effect is included in section 3.4.6.	3045
1017	1017-69	Please provide additional explanation of how the BLM national greater sage-grouse planning strategy led to the decision to propose the two new ACECs, when neither the NTT nor the statewide BLM specify that ACECs are a required designation for sage-grouse habitat protection. Since Alternatives E and F are almost the same as B and D, please address what about ACEC designation in particular responds to the directives in these above-discussed memoranda and directives.	3001
1017	1017-68	Please clarify how the additional layer of proposed ACEC designation meet the stated objectives beyond what is already provided in Alternatives B and D.	3001

**Attachment D – Supplement to the Draft Resource Management Plan and
Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1017	1017-67	The BLM national greater sage-grouse planning strategy provides the following language as directive for treatment of sage-grouse in the RMP revision process: Based on the identified threats to the Greater Sage-Grouse and the FWS timeline for making a listing decision on this species, the BLM needs to incorporate explicit objectives and desired habitat conditions, management actions, and area-wide use restrictions into LUPs by the end of FY 2014. The BLM's objective is to conserve sage-grouse and its habitat and potentially avoid an ESA listing. (BLM 2011 a) Further: The NTT-developed conservation measures were derived from goals and objectives developed by the NTTThese goals and objectives are a guiding philosophy that should inform the goals and objectives developed for individual land use plans. However, it is anticipated that individual plans may develop goals and objectives that differ and are specific to individual planning areas. "(BLM 2011a) (emphasis added). The LGCA interprets this statement as providing flexibility to individual land use plans for crafting their own area-specific goals and objectives. The SEIS, however, treats ACEC designation as arising naturally from the BLM directives above, rather than actually being just one of many conservation strategies that would have met the conservation measures referenced above. The SEIS states on page 4-122: The proposed Greater Sage-Grouse Key Habitat Areas and Greater Sage-Grouse Core Habitat Areas ACECs were developed in response to the greater sage-grouse habitat management policy guidance set forth in WY BLM Instruction Memorandum (IM) No. WY-2012-019 (BLM 2012a), and in accordance with the BLM Washington Office IM No. 2012-44 (BLM 2012b), BLM National Greater Sage-Grouse Land Use Planning Strategy. Proposal and consideration of these ACECs represent proactive conservation measures that reduce or eliminate threats to greater sage-grouse to minimize the likelihood of and need for listing of this species under the ESA. Please provide additional explanation of how the BLM national greater sage-grouse planning strategy led to the decision to propose the two new ACECs, when neither the NTT nor the statewide BLM specify that ACECs are a required designation for sage-grouse habitat protection. Since Alternatives E and F are almost the same as B and D, please address what about ACEC designation in particular responds to the directives in these above-discussed memoranda and directives.	3001
1017	1017-64	The goals and objectives for Special Designations are as follows on page 2-163: Goal SD 1: Protect and prevent irreparable damage to important historic, cultural, or scenic values, fish and wildlife resources or other natural systems or process, or to protect life and safety from natural hazards. Objectives: SD1.1: Utilize special designations to meet resource protection needs within appropriate geographical areas. SD 1.2: Provide for appropriate interpretation of sites of high public interest. How does the additional layer of proposed ACEC designation meet these objectives beyond what is already provided in Alternatives B and D? The creation of Alternatives E and F does not appear to the LGCA to address the goals and objectives more substantially than the existing alternatives.	3001

Individual Comments and Index to Summary Comments and Summary Responses**

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1017	1017-63	The LGCA continues to support the Governor of Wyoming's Executive Order for Greater Sage-grouse (Wyoming Office of the Governor 2011), which established core areas for protection. We believe that this order provides for sage-grouse and sage-grouse habitat protection while avoiding unnecessary additional restrictions. The latest scientific findings corroborate the strength of core areas designation in protecting sage-grouse adequately to prevent an ESA listing (Copeland et al. 2013). The BLM should work with the State of Wyoming and with the LGCA to determine what conformance to the Executive Order means specifically for this planning area.	3035_1
1017	1017-60	Correct the boundaries of the Alternative F VRM Class II for the Sheep Mountain Anticline ACEC to provide a 1/4-mile buffer of the adjacent VRM Class IV to fully encompass the bentonite potential areas depicted in the BLM-developed bentonite potential GIS file.	3043
1017	1017-59	Until the impacts associated with Alternatives E and F are fully analyzed and understood, we request that the BLM dismiss these alternatives.	3027-1
1017	1017-57	While applying a leasing screen during the RMP/EIS revision process to ensure consistency with proposed protections for greater sage-grouse is justified, the first modifying statement does not provide clear or consistent management direction. More importantly, it is not clearly described in the Draft RMP/EIS or SEIS how the BLM intends to evaluate oil and gas leasing decisions for these areas that address resources of concern and better fit the MLP criteria. Given that there will be no changing circumstances, updated policies, or new information not already examined in the RMP/EIS revision, how would the MLP analysis differ from that performed during the revision and why would it be required?	3023-6
1017	1017-55	Alternative F withdrawals and VRM Class II restrictions encompass the Sheep Mountain Anticline ACEC and the VRM Class II east and west boundaries coincide with the BLM-developed potential for bentonite GIS layer boundaries. The VRM Classes are definitive boundaries on the map and management of the VRM boundaries should take place strictly within the area boundaries, not on areas outside the boundaries or on a viewshed basis. For example, do not conclude that operations in Class IV areas detract from the visual resources of the adjacent Class II because the operation can be viewed from within the Class II. This conclusion would result in an inaccurate determination of undue environmental degradation for a Plan of Operations in the adjacent class boundary. Therefore, the boundaries of the Alternative F VRM Class II encompassing the Sheep Mountain Anticline ACEC should be modified to provide an additional 1/4-mile buffer of the adjacent Alternative F VRM Class IV to more fully encompass the bentonite potential areas depicted in the BLM-developed bentonite potential GIS file.	3043
1017	1017-54	While it is acknowledged that there will be a decrease in earnings and output under Alternative F when compared to Alternative D, the increase in additional timing limitations included in Alternative F are not adequately analyzed or presented. Until the impacts associated with these alternatives are fully analyzed and understood, we request that the BLM dismiss Alternatives E and F.	3023-6

**Attachment D – Supplement to the Draft Resource Management Plan and
Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1017	1017-53	The Wyoming Enhanced Oil Recovery Institute (WEORI) estimates that another 1.3 to 2 billion barrels of oil can be recovered from the Bighorn Basin as a result of enhanced oil recovery (EOR) operations using CO2 to displace stranded oil (Wyoming Enhanced Oil Recovery Institute 2011). The LGCA agrees that large reserves of oil can be recovered with the implementation of CO2 EOR in the planning area and believes that Alternative E would have significant impacts that have not been disclosed. The same holds true for Alternative F. The SEIS states (page 4-143): Based on the IMPLAN model, regional earnings and output under Alternative F for the modeled sectors (oil and gas, grazing, and recreation) would be similar to but slightly less than under Alternative D due to additional NSO restrictions for oil and gas development in greater sage-grouse Core Habitat Areas. This NSO restriction would reduce estimated oil and gas development when compared to alternatives A and D.	3023-6
1017	1017-52	Further, Sublette County Commissioner Joel Bousman has indicated that several innovative approaches to wildlife mitigations exist (Bousman pers. comm.). These including the possibility of the broad scale purchase of conservation practices as payment for ecosystem services, as described in the BLM Socioeconomics Strategic Plan 2012-2022 (BLM 2013). One practice in particular that the BLM should consider is coordination and assistance with cost-sharing in the conversion from windmill water developments to solar power. This practice was surprisingly successful in the Pinedale Planning Area, as the conversion took away raptor perches, thereby reducing a risk to sage-grouse. At the same time, overflow water was newly available into mid-September, which kept some plant communities and key forb species in a more productive state, increasing habitat quality for sage-grouse clutches.	3035-7
1017	1017-51	The LGCA also suggests that the BLM Bighorn Office communicate with the BLM Pinedale Office to take advantage of their experience with sage-grouse related conservation measures. Sublette County, which is within the Pinedale Planning Area, has been extensively involved in project and planning level BLM projects and has experience with developing effective mitigations for sage-grouse, including improved livestock distribution, fencing, and water developments. Their range improvements are consistent with NTT recommendations. Generally, ranching and cattle water developments provide water resources that the sage-grouse depend upon. The retirement of grazing leases could reduce water availability to sage-grouse, while effective mitigation measures to existing allotments has been shown to benefit sage-grouse	3035_6
1017	1017-49	Provide the impacts for management actions under Alternative F that limit, reduce, or prohibit AUMs.	3017-3

and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1017	1017-48	<p>Please clarify the management actions language in Table 2.5 as discussed above. "Our review of the Draft RMP's glossary definition of surface disturbing activities indicates an inconsistency with the Rawlins, Casper, Kemmerer, and Grass Creek RMP glossaries. Only the Bighorn Basin Draft RMP considers livestock grazing as a surface disturbing activity. BLM IM No. WY-2007-029, "Guidance for Use of Standardized Surface Use Definitions," is relevant to the incorrect definition of "surface disturbing activities" in the Draft RMP. The 1M directs BLM managers to standardize the definitions of commonly used terms in RMPs and EISs. Review of the five definitions below indicates that the BLM has failed to implement the directive. Rawlins RMP: Surface Disturbance: Any action created through mechanized or mechanical means that would cause soil mixing or result in alteration or removal of soil or vegetation and expose the mineral soil to erosive processes. Used in the literal context of actual, physical disturbance and movement or removal of the land surface and vegetation. Examples of surface disturbance include construction of well pads, pits, reservoirs, pipelines, and facilities (e.g., parking lots and tanks). Casper RMP: Surface-disturbing Activities (or Surface Disturbance): The physical disturbance and movement or removal of land surface and vegetation. These activities range from the very minimal to the maximum types of surface disturbance associated with such things as off-road vehicle travel or use of mechanized, rubber-tired, or tracked equipment and vehicles; some timber cutting and forest silvicultural practices; excavation and development activities associated with use of heavy equipment for road, pipeline, power line and other types of construction; blasting; strip, pit, and underground mining and related activities, including ancillary facility construction; oil and gas well drilling and field construction or development and related activities; range improvement project construction; and recreation site construction. Kemmerer RMP: Surface-disturbing Activity: An action created through mechanized or mechanical means that would cause soil mixing or result in alteration or removal of soil or vegetation and expose the mineral soil to erosive processes. Used in the literal context of actual, physical disturbance and movement or removal of the land surface and vegetation. Examples of surface disturbance include construction of well pads, pits, reservoirs, pipelines, and facilities (e.g., parking lot and tanks). Grass Creek RMP: Surface-Disturbing Activities (or Surface Disturbance): The physical disturbance and movement or removal of the land surface and vegetation. It ranges from the very minimal to the maximum types of surface disturbance associated with such things as off-road vehicle travel or use of mechanized, rubber-tired, or tracked equipment and vehicles; some timber cutting and forest silvicultural practices; excavation and development activities associated with use of heavy equipment for road, pipeline, power line and other types of construction; blasting; strip, pit and underground mining and related activities, including ancillary facility construction; oil and gas well drilling and field construction or development and related activities; range improvement project construction; and recreation site construction. Bighorn Basin Draft RMP: Surface-Disturbing Activities: These are Public Land resource uses/activities that disturb the endemic vegetation, surface geologic features, and/or surface/near surface soil resources beyond ambient site conditions. Examples of surface-disturbing activities include: construction of well pads and roads, pits and reservoirs,</p>	3017-1
D-28		<p>pipelines and power lines, and most types of vegetation treatments (e.g. prescribed fire, etc.). NOTE: Some resource uses, commodity production and other actions that remove vegetative growth, geologic materials, or soils (e.g., livestock grazing, wildlife browsing, timber harvesting, sand and gravel pits, etc.) are allowed, and in some instances formally authorized, on the Public Lands. When utilized as a land use restriction (e.g., No Surface</p>	Bighorn Basin Proposed RMP and Final EIS Comment Analysis Report

Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1017	1017-46	The only text in Appendix P precedes Table P-3, "Current Livestock Grazing Allotments or Portions of Allotments in Greater Sage-Grouse Core Habitat Areas." It reads as follows: "The determination of retirement of grazing privileges of allotments or portions of allotments in Greater Sage-grouse Core Habitat Areas would be made upon site specific National Environmental Policy Act analysis." The LGCA has several questions here. What goal, objective, or management action would trigger a NEPA analysis? In other words, would grazing lease retirement be the proposed action itself, or would it be considered indirectly, as a necessary part of Greater sage-grouse Core Habitat Area management? Secondly, why is there no chart or language regarding allotment treatment under Alternative E? Please indicate here that Alternative E would cancel all grazing allotments in Key Areas. Lastly, please provide an explanation of the actions and impacts of the three management categories, "custodial," "improve," and "maintain," in relation to the NEPA analyses cited above. Are Custodial and Improve category allotments slated for retirement of grazing privileges under Alternative F, as their definition in the Draft RMP/EIS Glossary can be read to imply? Please clarify if this is or is not the case. If it is, the socioeconomic effects analysis must include the impacts of such management actions. Please see Socioeconomic Resource comments.	3017-1
1017	1017-45	In sum, the LGCA believes that Alternative F has indirect, direct, and cumulative impacts to the livestock grazing resource which have not been adequately addressed in the SEIS. We request this analysis be included in the Final RMP/EIS.	3017-3
1017	1017-44	The LGCA requests that the BLM incorporate these impacts into the analysis in the socioeconomic resources section of the SEIS. We have the same comments regarding the text on page 4-121: Within priority sage-grouse habitat, objectives and management considerations that benefit greater sage-grouse are incorporated into all BLM grazing allotments through AMPs or permit renewals, and additional restrictions would be placed on riparian/wetland and wet meadow areas to promote recovery or maintenance of appropriate vegetation and water quality. Under Alternative F, grazing and trailing would also be avoided within lekking, nesting, brood-rearing, and winter habitats of priority sage-grouse habitat during periods of the year when sage-grouse are utilizing such areas. A focus on greater sage-grouse habitat considerations in the Greater Sage-Grouse Core Habitat Areas ACEC, over consideration that would provide greater benefits to livestock grazing management, would result in adverse impacts from seasonal and other closures and a reduced ability to perform vegetation treatments. Management considerations under Alternative F would result in similar beneficial impacts to forage availability as alternatives A and D, except within the Greater Sage-Grouse Core Habitat Areas ACEC. Additional vegetation management restrictions within priority sage-grouse habitat would reduce the availability of livestock forage over a larger acreage than alternatives A and D. In addition, Alternative F would create seasonal and spatial limitations on grazing activities within the Greater Sage-Grouse Core Habitat Areas ACEC.	3036-1

and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1017	1017-43	The LGCA agrees that "such a requirement could adversely affect livestock grazing in a substantial portion of the Planning Area since sagebrush may take multiple years to reestablish." We ask that the impacts to the livestock grazing and the socioeconomic resource be adequately characterized here, given that sagebrush ecosystem recovery could take decades. The same comment applies to the adverse effects on the resource that would result from the following actions, described on page 4-121: The management of surface-disturbing activities and livestock grazing near surface water and riparian/wetland areas under Alternative F is the same as Alternative D, except in the Greater Sage-Grouse Core Habitat Areas ACEC. In these areas surface disturbance limitations would result in beneficial impacts to vegetation health and forage productivity compared to alternatives A, C, and D, but would limit the ability of permittees to implement surface-disturbing rangeland improvement projects. Alternative F manages grazing use of riparian/wetland and wet meadow areas consistent with Alternative D, except in the greater sage-grouse Core Habitat Areas where closures to hot-season grazing and adjustments to the seasonal distribution of livestock may apply. Alternative F applies the same wildlife and special status species management action as Alternative D, except in greater sage-grouse Core Habitat Areas. Under Alternative F, grazing in lekking, nesting, brood-rearing, and winter habitats would be seasonally avoided. These restrictions on location and season of use would have adverse impacts on forage availability for livestock grazing compared to alternatives A and D, where these restrictions do not apply.	3017-5
1017	1017-42	Please disclose who the responsible party will be for performance and funding of the myriad monitoring and data collection activities required above. Is it the permittee? The BLM? Also, please disclose the impacts to the resource and to the socioeconomic resource as a result of these management actions. The description of Alternative F management actions continues, again without an impacts assessment, as follows on pages 4-120 to 4-121: Alternative F would result in the same acreage of prescribed fire treatment as alternatives A and D, although the emphasis of protecting and enhancing greater sage-grouse habitat for treatments in Core Habitat Areas under Alternative F could reduce the benefits to livestock grazing forage availability compared to those alternatives. In particular, Alternative F excludes livestock grazing in burned Core Habitat Areas (35 percent of BLM-administered surface lands) until woody and herbaceous plants achieve sage-grouse habitat objectives; such a requirement could adversely affect livestock grazing in a substantial portion of the Planning Area since sagebrush may take multiple years to reestablish (Manier et al. 2013). Similar to Alternative E, the fire and fuels management of Alternative F may also result in an increased risk of forage loss due to catastrophic fire.	3017-1

Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1017	1017-41	Page 4-118:The use of herbicides to control invasive species would be minimized within the Greater Sage Grouse Core Habitat Areas ACEC under Alternative F. Flash burners, mowing, and selected handcutting would be prioritized in these areas. Therefore, Alternative F may restrict grazing permit holders to more labor-intensive methods to control weeds when compared to Alternative D. Our concern with this directive is that ranchers will be restricted to using labor-intensive methods to control weeds and that the impacts of this management prescription have not been entirely disclosed in the impacts analysis. Please see the socioeconomic comments in this document regarding this issue.	3017-4
1017	1017-40	The LGCA is very concerned about the impacts analysis for Alternative F. It does not come close to disclosing the range of adverse impacts to the livestock grazing resource that are inevitable under the management actions described below. Page 4-116 of the SEIS states: "Livestock grazing management under alternatives A, O, and F-the alternatives most likely to apply management actions on a case-by-case basis-would generally result in a continuance of current grazing practices." This conclusion is unsupported, given that management actions developed for protection of sage-grouse core habitat often limit or prohibit grazing (see below). Please change this sentence to indicate that livestock management would substantially change under Alternative F. Below we excerpt descriptions of management under Alternative F that would have significant adverse impacts on livestock grazing. Please disclose these impacts to the resource in this section as well as in the socioeconomic resource section of the Final RMP/EIS. Alternative F Page 4-118: The use of herbicides to control invasive species would be minimized within the Greater Sage Grouse Core Habitat Areas ACEC under Alternative F. Flash burners, mowing, and selected hand-cutting would be prioritized in these areas. Therefore, Alternative F may restrict grazing permit holders to more labor-intensive methods to control weeds when compared to Alternative D.	3017-3
1017	1017-37	We ask that the Final RMP/EIS document include language that acknowledges the positive effect that grazing has on sage-grouse habitat when BMPs regarding seasonal rotation and stocking rates are followed.	3035_6
1017	1017-35	The SEIS states in Table 2-6 that that the current AUMs of 305,887 will only be reduced by 1-2% over the life of the RMP/EIS under Alternatives A, C, D, and F. According to this assessment, impacts to livestock grazing result only from management actions that directly change AUM allocations or otherwise restrict livestock grazing. There are no impacts disclosed under the array of Alternative F management actions that will inevitably change AUM allocations. As noted in detail below, these impacts are considerable. The LGCA also requests that the RMP include language that limits the decreases to AUMs to no more than 1-2% over the life of the plan, and that any restrictions that result in further decreases beyond the 1-2% are significant and require a full NEPA analysis.	3017-3

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1017	1017-34	"For all HMAs within priority sage-grouse habitat, prioritize the evaluation of all AMLs [sic.; AMUs] based on indicators that address structure, condition, and composition of vegetation and measurements specific to achieving sage-grouse habitat objectives." We recognize that the BLM is hamstrung by horse management priorities. But there is nothing in here about managing horses at minimum populations. We are concerned that if there are management actions conducted to address range conditions, the burden of those actions is going to fall on the agricultural community and not on horse management.	3045
1017	1017-33	"Any vegetation treatment plan must include pretreatment data on wildlife and habitat condition, establish non-grazing exclosures, and include long-term monitoring where treated areas are monitored for at least 3 years before grazing returns. Continue monitoring for 5 years after livestock are returned to the area, and compare to treated, ungrazed exclosures, as well as untreated areas." Please disclose the vegetation treatments to which this management action applies, and indicate if grazing is deferred while pretreatment data is collected.	3017-4
1017	1017-32	"Encourage partners to monitor effects of retiring grazing permits in sage-grouse habitat." Please identify the partners that would perform monitoring.	3035_6
1017	1017-31	Regarding structural range improvements and supplements, the "[p]otential for invasive species establishment or increase following construction must be considered in the project planning process and monitored and treated post-construction." Our concern is that the burden of monitoring, and potentially treating, invasive species that establish themselves post-construction falls entirely on the rancher. This is especially problematic when considering that the establishment of the invasive species in the area may not have been caused by the new structures and supplements, but may have happened concurrently.	3017-4
1017	1017-30	"Design post-fuels-management projects to ensure long-term persistence of seeded or pre-treatment native plants. This may require temporary or long-term changes in livestock grazing management, wild horse and burro management, travel management, or other activities to achieve and maintain the desired condition of the fuels management projects." This directive may lead to confusion and inconsistent management in the event that seeded or pre-treatment native plants are not flourishing. Please provide specific language on the what, where, and degree of "persistence" necessary for seeded or pre-treatment native plants after fuels management activities.	3011
1017	1017-29	"Rest treated areas from grazing for three full growing seasons unless vegetation recovery dictates otherwise." Please clarify how vegetation recovery will be determined.	3017-4

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1017	1017-28	"Design post-restoration management to ensure long-term persistence. This could include changes in livestock grazing management, wild horse and burro management, travel management, or other activities to achieve and maintain the desired condition of the restoration effort that benefits sage-grouse." Please modify this language for clarity, so that the record gives precise limits to the extent of management actions. As it reads, this management direction can be interpreted to allow for the prohibition of all livestock grazing, access, or "other activities" as long as a case is made that such restrictions help "achieve and maintain the desired condition of the restoration effort that benefits sage-grouse."	3001
1017	1017-22	Table 4-16, Acres of Management in Lands with Wilderness Characteristics (page 4-115), is indicative of the BLM's problematic and inconsistent direction regarding LWCs. First, footnote 1 illustrates the muddled understanding the BLM has of the state of this resource: "Due to differing scales of analysis, numbers do not add to the total acreage for LWCs in the Planning Area" (page 4-115). We request clarification of these multiple scales of analysis. Further, we request that the BLM decide on one scale of analysis in order to adequately characterize the resource.	3046
1017	1017-21	The BLM's inventory of LWCs included in the Draft RMP/EIS remains problematic because it is still the de facto inventory relied upon in the SEIS. Crystal Creek and Sheep Mountain both have contorted borders that are a reflection of a desire to maintain land as LWC despite its roaded nature. The redesignation of inventoried roads that exist within LWCs as a new "border" is disingenuous. From the west side of the Crystal Creek LWC, one can see cars driving up and down the mountain. From the east, one can see the Georgia Pacific wall board plant. The BLM indicated to one LGCA member to pretend there was a curtain around this LWC, a directive which violates the viewshed requirements for LWCs. We ask that the LWC inventory be updated responsibly to reflect the current state of the resource. As it stands now, the addition of new borders amounts to gerrymandering, and sets a dangerous precedent. Further, the BLM's LWC inventory leaves out seismic trails and silt retention systems, which should be included in the updated inventory. Please see Appendix.	3046
1017	1017-19	SEIS Table 2-5, Detailed Alternatives, Record 60, provides for the following management action under both Alternatives E and F (page 2-27): Conduct restoration of roads, primitive roads, and trails not designated in travel management plans in priority habitat. This also includes primitive routes/roads that were not designated in Wilderness Study Areas and within lands with wilderness characteristics that have been selected for protection in previous RMPs. This management action gives us pause. It can be interpreted to call for the restoration of all roads and trails within LWCs that are protected in "previous RMPs." It effectively gives carte blanche to rewilding efforts of all of the LWCs, especially those that no longer contain wilderness characteristics nor are being actively managed for their current, past, or (now apparently) potential future wilderness character. We find this management action to be in violation of the principles of multiple use and sustained yield, and driven by a wilderness agenda.	3046

and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1017	1017-18	The LGCA is opposed to the designation of the 571,288 acres of Lands with Wilderness Characteristics under Alternatives B and E (Page 2-10 of SEIS). We also oppose the continued designation of 52,485 acres of LWCs under Alternatives D and F. Our reasons are twofold: one, we feel that this management designation is irresponsible and incorrect, considering that the LWC inventory relied upon by the BLM is inadequate. As communicated in several memoranda since the availability of the Draft RMP/EIS in 2011, we have urged the BLM to remove the LWC designation from lands that are actually roaded and have manmade structures, as they no longer contain wilderness characteristics.	3046
1017	1017-10	It is requested that the BLM adopt Alternative C ROW corridors in the Final RMP/EIS. The LGCA suggests that ROW avoidance/mitigation areas be removed from areas designated as oil and gas management areas and corridors under all alternatives. This includes segregating avoidance and mitigation areas into two separate analyses so that it is clear to the public which areas should be avoided and which areas will require mitigation.	3033-1
1017	1017-9	Please clarify why only carbon dioxide emissions were included in the calculations in Tables 4-3 and 4-4.	3002
1017	1017-8	Please provide a reference for this statement that CO ₂ from prescribed fires is "typically considered to be counterbalanced" by increased productivity of existing larger vegetation and new growth .	3002
1017	1017-7	Footnote 1 for Tables 4-3 and 4-4 reads as follows: "Carbon Dioxide Equivalent is a measurement that allows an aggregate comparison of multiple greenhouse gases, created by multiplying the emissions of each gas by its relative global warming potential. For this analysis, however, metric tons of Carbon Dioxide Equivalent includes only carbon dioxide (CO ₂) emissions." Since the analysis does not include any additional greenhouse gases, please remove the word "Equivalent" in the titles of both tables and delete the footnote in order to avoid confusion. Secondly, why were the other greenhouse gases not included in the calculation? The omission of methane from the table is especially confusing, given the following statement on page 4-6 states, "CH ₄ is more than 20 times as effective as CO ₂ at trapping heat in the atmosphere and accounted for 8.2 percent of GHG emissions in 2008 (based on CO ₂ equivalents (EPA 2010))." Lastly, please explain why the carbon dioxide analysis was conducted for 2018 and 2028, rather than the years 2015 and 2024, as in all other air emission analyses.	3002
1017	1017-6	On Page 4-6, the SEIS states that "Wildland fires, including prescribed burns, would also result in CO ₂ emissions. However, CO ₂ from fires, particularly prescribed fires, is typically considered to be counterbalanced by the increased productivity of existing larger vegetation and new growth of vegetation post-fire." While it is possible that prescribed fires would have such a benefit, it seems that large wildfires may only be partially balanced by vegetative re-growth, and such re-growth may take years to accomplish. Please provide a reference for this statement that CO ₂ from prescribed fires is "typically considered to be counterbalanced" by increased productivity of existing larger vegetation and new growth.	3002

Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1017	1017-5	On Page 4-4 the SEIS states that "Alternative E would result in the lowest levels of emissions in 2015 and 2024 and, therefore, it is unlikely that emissions under this alternative would contribute to an exceedance of the National Ambient Air Quality Standards (NAAQS) or Wyoming Ambient Air Quality Standards WAAQS)." It does not follow logically that just because it has the lowest emissions, Alternative E will not exceed NAAQS or WAAQS. Please indicate whether this statement is based on modeling predictions, on the logic that since current air quality in the planning area is within National and Federal Standards thus the future air quality must also be within standards, or on some other reasoning.	3002
1017	1017-4	Lastly, the LGCA continues to support the Wyoming Governor's Executive Order 2011 -5 regarding Greater Sage-grouse Core Habitat, and Executive Order 2013-3 regarding Sage-Grouse Core Habitat grazing adjustments. We request that all key habitat designations and management stipulations in the Final RMP and EIS be changed to Core, in keeping with Wyoming's directive and priorities. We also request that BLM work with the State of Wyoming and the LGCA to determine what conformance to the Executive Order means specifically for the Bighorn Basin Planning Area.	3035_1
1017	1017-2	This leads us to one of our major concerns about the SEIS: we would like to see in the final the inclusion of a full characterization of the socioeconomic impacts of Alternatives E and F. We request that the BLM fully characterize the socioeconomic impacts of new alternatives both quantitatively and qualitatively. The LGCA wants the information contained in the Final RMP and EIS to allow decision makers and our constituents to understand the impacts of additional management restrictions. The potential impacts to the socioeconomic, livestock grazing, and minerals resources are considerable under both Alternatives E and F. We would like the Final RMP and EIS to adequately measure the impacts to these resources under Alternative E, which is very restrictive of multiple uses and sustained yield, but also of Alternative F. At various times throughout the SEIS development process, BLM staff members have communicated to the public and to the LGCA that the difference between Alternative E and F is not significant, and/or that the difference between Alternative D and F are also insignificant in terms of impacts to grazing, oil and gas, and therefore socioeconomics. Our analyses of the management actions actually indicate the opposite: Alternative E and F both have major impacts.	3036-1
1018	1018-6	Record #50 " It is unrealistic to assert that an entire allotment /pasture should be shut off from grazing if the burned area can't be fenced. This is completely unnecessary and extreme. It reflects an absence of on the ground realities. These allotments can be huge, burned areas can be huge and fencing unrealistic. It again reflects the obvious agenda against livestock grazing under the guise of caring about restoration.	3011
1018	1018-5	Record #49 " Alternative F: It is counterproductive for sage grouse to exclude livestock from grazing in burned areas until wood and herbaceous plants achieve sage-grouse habitat objectives. Woody shrubs in this ecology could take as long as 60 years to re-establish and in the meantime grasses could compete with them. Livestock grazing should be permitted during this time frame, if in fact sage-grouse stewardship is on the radar screen.	3011

Individual Comments and Index to Summary Comments and Summary Responses**

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1018	1018-4	Chapter 4.3 Fire and Fuels Management: Proactive Management section “ Marginalizing and restricting the use of fire within areas of environmental concern will only worsen the invasive weed problem already ahead of land managers. We need all tools to help control invasive weeds and not worsen the weed problem by slowing management. Proactive fire management must not move slowly, it must continue at a rapid and consistent pace to improve habitat.	3011
1018	1018-3	Chapter 2, Table 2.3: Alternatives E & F not necessary to put 1,857,485 acres or 1,786,241 acres under the restrictions of Areas of Environmental Concern (ACECs). While sage-grouse may be present, it does not mean that they will be negatively impacted or the area degraded if left open to the public. This document and these alternatives seek to manage for one species--the sage-grouse to the detriment of all other resources. Alternative E adds 9 additional Areas of Critical Environmental Concern (ACECs) to the restricted use picture: The nine proposed ACECs are Chapman Beach, Clarks Fork Basin/Polecat Bench West Paleontological Area, Clarks Fork Canyon, Foster Gulch Paleontological Area, McCullough Peaks South Paleontological Area, Rainbow Canyon, Rattlesnake Mountain, Sheep Mountain, and Greater Sage-Grouse Key Habitat Areas. Where is the demonstrated justification for this closeout? The American public can co-exist with many value systems and has for decades.	3001
1018	1018-2	Chapter 2, Table 2.2: No lands open for Desert Land Entry. No justification for this, as any such entries would take into account sage-grouse life cycle if they were present. These entries, while underutilized should remain an option to the American public	3016-1
1019	1019-3	Transmission Line Impacts on Wildlife May Be Overstated. Basin Electric is a member of the Avian Power Line Interaction Committee (APLIC), an organization that works with utilities, resource agencies and the public in a collaborative way to develop practical, effective solutions to potential avian problems such as nesting, electrocution, and collision with power lines. As indicated in APLIC’s September 26, 2013 comment regarding the Buffalo Field Office Draft Resource Management Plan, recent studies suggest the effect of energy infrastructure on sage grouse may be overstated. As such, many of the proposed restrictions and conditions for BLM ROW use may be unnecessary. Echoing APLIC’s position, stipulations for sage grouse should not include any mitigation requirement unless it is based on valid science, not anecdotal evidence or casual observation. Further, the science should be specific to the sage grouse, not surrogate species such as the prairie chicken.	3049

Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1019	1019-2	Above-ground facilities are not allowed in many cases on BLM-administered preferred range of alternatives. Only buried utilities would be allowed. As a G&T cooperative, Basin Electric may need to construct additional 230 kilovolt (kV) or higher voltage transmission lines the Planning Area. It is generally not economically feasible to bury power lines with voltages higher than 34.5 kV. The cost for high voltage transmission lines is already significant at more than \$400,000 per mile for 230 kV lines to over \$1,000,000 per mile for 345 kV lines. If placed underground, this cost would be increased by a factor of 10 to 20 times. Furthermore, underground power lines would require continuous excavation along the entire route, which in turn creates significantly more disturbance than overhead construction. Underground power lines may be less reliable and are more difficult to maintain. Line breaks may be difficult to locate, resulting in long outages for customers. Additional ground disturbance would be necessary because excavations would be required to facilitate repairs.	3033-2
1019	1019-1	Restrictions and Limitations on new ROW Alternatives under consideration by the BLM propose restrictions or limitations on ROW ranging from 1,003,194 to 2,943,655 acres in the Planning Area. It is important to note the total area included in the Planning Area is only about 5.6 million acres, including all lands (federal, state, and private). Any new limitations on ROW use, including uses for electric distribution and transmission lines within the Planning Area, would have a significant negative impact on Basin Electric's ability to site new infrastructure. The increased restrictions are expected to increase costs for infrastructure that may utilize BLM lands. Alternatively, longer routes (with concomitant increases in surface disturbance and cost) may be necessary to avoid BLM lands. In any case, new BLM ROW restrictions are expected to impact electric utility customers through increased costs and time delays for new projects.	3033-2
1020	1020-6	The EORC continues to feel strongly that the Bighorn Basin RMP should carefully consider the large enhanced oil recovery potential in and near the existing oil fields in the basin and the management option chosen by the Bureau of Land Management (BLM) should be developed to accommodate the associated facilities to the largest extent feasible. Of critical importance to the future of CO2 and EOR development is the provision for adequate infrastructure to deliver CO2 to the basin.	3023-3
1020	1020-5	EORC recommends that BLM consider development of unconventional reservoirs in Bighorn Basin when evaluating alternatives during the RMP process. There is a strong likelihood that unconventional development opportunities may exist within the deeper portions of the basin; i.e. the center of the basin.	3023-3
1020	1020-4	Likewise, Alternative F would have a large impact on EOR development opportunities within the basin due to increased restrictions. Under Alternative F, 62% and 58% of the proven and possible EOR development areas in the basin, respectively, would be subject to moderate constraints; and increase of 18% and 23% (as compared to Alternative C). Additionally, less land is available for development under standard restrictions by 17% and 25% as compared to Alternative C.	3023-3

**Attachment D – Supplement to the Draft Resource Management Plan
and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1020	1020-3	It is our opinion that Alternative E would have a large impact on EOR development in the basin. Under this alternative, 62% and 57% of the proven and possible EOR development areas in the basin, respectively, would be subject to major constraints and/or administratively unavailable to development including portions of existing active oil fields in the basin. In Alternative C only about 4% and 5% of the proven and possible development areas, respectively, would be subject to the same limitations with little or no impact to most of the currently producing fields in the basin. Assuming that no development would occur in areas with major constraints or those administratively closed, Alternative E could reduce overall recovery from proven areas by between 0.8 billion to 1.2 billion barrels of oil or about half of the production that is likely to result from EOR CO2 recovery in the Bighorn Basin. The corresponding net reduction of severance taxes and ad valorem taxes paid to state and county governments would range from \$7.4 to \$11.5 billion dollars. Reduced oil development in the affected counties will reduce direct employment, indirect employment, sales taxes, and property taxes.	3036-1
1020	1020-2	While it is impossible to predict what these additional moderate constraints would mean to project specific development, it is reasonable to conclude that development in some additional areas (as compared to Alternative C) would be slowed and possibly eliminated due to costs associated with additional constraints. Activities, such as drilling, would still be allowed, but would only be allowed to occur during shortened seasons. The cost of these constraints to individual projects is impossible to accurately estimate but in some areas with multiple seasonal closures it is expected that the cost would eliminate some future oil and gas development.	3023-6
1020	1020-1	EORI staff conducted an Enhanced Oil Recovery technical analysis of the economic impact on oil related revenue with respect to Alternatives C, E and F. From an EOR perspective, both Alternative E and Alternative F would be less desirable than Alternative C because they both pose additional constraints to oil and gas development in areas that may be redeveloped using CO2 EOR.	3023-3
1021	1021-19	Wyo-Ben supports conservation of sage grouse habitat, as long as such conservation does not dominate at the expense of other resources, and where responsible, sound science supports such conservation. We strongly dispute the idea expressed throughout the SEIS that the NTT report, and Alternative E (and portions of F), represents the best available science on Sage Grouse management and should form the basis for BLM's sound management objectives in the revised RMP. As a rebuttal to this idea, Wyo-Ben directs the BLM, by reference to Dr. Rob Roy Ramey II's September 19th, 2013 "Review of Data Quality Issues in A Report on National Greater Sage-Grouse Conservation Measures Produced by the BLM Sage Grouse National Technical Team (NTT)." There, Dr. Ramey describes the many scientific inconsistencies and inaccuracies contained in the NTT report that are a concern for Wyo-Ben.	3035_1

Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1021	1021-18	Specifically regarding bentonite mining, Alternative E promotes poor ecology and unnecessary disturbance, even with a 3% cap. Modern bentonite reclamation occurs concurrently with mining taking place in an engineered, continuous castback sequence. The pit that is being opened casts overburden, subsoil and topsoil into the pits behind it. Under the proposed Alternative, this extremely effective reclamation and conservation practice would no longer be possible. Once the disturbance threshold is met, the entire continuous sequence would stop. Soils that normally would be spread live would sit idle. Backfilling and re-vegetating the open pit would no longer be possible. This will force the mining company to use archaic bank stockpiling techniques for overburden, topsoil, and subsoil which effectively doubles the disturbance required for each mine site. Such practices are scientifically-demonstrated to have longer re-vegetation times and may result in poorer vegetative production along with a higher incidence of weeds. Ultimately, as a result of this forced larger footprint, the portion of the mineral estate that can be developed is cut in half: Only 1.5% of the surface may effectively have the bentonite removed. In addition to unintended environmental consequences, the standards suggested in Alternative E are in direct conflict with the rights conferred under the General Mining Law of 1872. While such rights are not unfettered, an arbitrary, non-statutory standard that effectively removes 98.5% of the estate from development for an undefined-but-decades-long waiting period open the RMP to legal action by mining claimants. Recommendations: 1) BLM must eliminate reference to a 3% disturbance cap in favor of developing site specific management plans where conservation goals are desirable 2) Respect the rights of mining claimants under the 1872 Mining Law, who rely on access to the mineral estate for their viability 3) Develop conservation plans for mine operators that allow for contemporaneous reclamation with the smallest possible footprint of disturbance	3020
1021	1021-17	If BLM does not use one of the existing Alternatives for its final plan but instead chooses, or is required, to blend parts from various Alternatives, then neither the SEIS nor the Draft RMP will have adequately addressed the potential effects of combination. This will not allow BLM to meet its NEPA analysis responsibility. Recommendation: If a hybridized Alternative is used for the final plan then BLM must prepare a new Environmental Impact Statement that examines the combined effects of this new Alternative and submit this to the public for comment	3027-1

**Attachment D – Supplement to the Draft Resource Management Plan
and Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1021	1021-16	On page 2-31, Table 2-5 explains at Record 84 that, for both Alternative E and F, nonfederal surface estate over federal minerals should be managed with the same conservation measures as those applied to lands where the federal government owns both the surface and the mineral estate. Even though this acknowledges the long standing legal doctrine that mineral estate rights trump surface estate rights it fails to acknowledge that the federal government has no right to exercise any management of the private surface unless and until the mineral estate is developed, and then only with regard to that development. At Record 85, the Table incorrectly ignores the superior rights of the mineral estate, assuming that when the non-federal minerals under federal surface are developed it can arbitrarily apply Fluid Mineral BMPs to the surface used during development even where minerals subject to the Mining Law are being developed. Recommendations: 1) BLM must recognize that the management of private surface overlying federal minerals is exclusive to the surface owner 2) BLM must acknowledge the superior right of private mineral under federal surface and apply surface management practices specific that do not hinder the development rights of the mineral owner 3) Recognize the provisions of 43 CFR 3809.31(d) regarding Stockraising Homestead Act Lands that no Plan of Operations is required for authorization except where there is no landowner consent	3019
1021	1021-15	The SEIS repeatedly comments on Validity Testing of mining claims under the 1872 Mining Law. Wyo-Ben does not disagree with the use of validity tests in the context of mineral patenting as allowed by the Mining Law, but does disagree with the arbitrary and capricious use of such tests for any other purpose. We also strongly oppose delay of mining authorizations and activity while waiting for non-mineral patent related validity examinations. Recommendations: 1) BLM should uniformly apply validity tests in order to determine compliance with the General Mining Law of 1872, and not as a means to enforce unrelated resource management goals such as Special Status Species 2) BLM should not use validity tests to unnecessarily restrict or delay legitimate mineral activity; BLM should state when and where validity testing will be performed and how examinations may affect authorizations 3) BLM should publish validity criterion as means to inform the public and mining community	3020
1021	1021-14	Table 4-9 is confusing, suggesting that Big Game Habitat will close or otherwise restrict locatable mineral development. BLM does not have the discretion to restrict locatable mineral development in big game habitat. The BLM does not have authority to manage game species, as this oversight is reserved for the states. Regardless of authority, Wyo-Ben has and will continue to voluntarily work with BLM and Wyoming Game and Fish regarding crucial wintering habitat. Recommendations: 1) Annotate or clarify Table 4-9 on what "closed" means 2) Recognize the unique right of the states to manage game animals and birds 3) Avoid authoritative management in favor of cooperative management with non-discretionary mining activities where wildlife concerns exist	3049

**Attachment D – Supplement to the Draft Resource Management Plan and
Draft Environmental Impact Statement
Individual Comments and Index to Summary Comments and Summary Responses**

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1021	1021-13	BLM must re-evaluate the socioeconomic impact of the SEIS policies on the Big Horn Basin using realistic models and up-to-date data, including the impact on all natural resource industries operating in the Basin. In doing this, BLM must: a. meet the NEP A threshold for socioeconomic analysis and avoid demotion of socioeconomics relative to wildlife and other resource analyses b. Recognize probabilistic economic outcomes from forced reductions in output as a result of locatable mineral activity restrictions c. Evaluate the national economic significance of the potential loss of a strategically important and unique mineral like bentonite d. Provide a realistic human population, lifestyle, and economic analysis with the effects of each alternative e. Evaluate the socioeconomic effects of delayed permitting due to mineral restrictions and RMP conflicts	3036-1
1021	1021-12	The socioeconomic impact on the Big Horn Basin resulting from the impact of the restrictions described in the SEIS on bentonite mining was ignored on pages 4-134 and 4-135, where only oil and gas (commensurate in size with bentonite) and lesser industries were noted. Because of the dependence of the economy of the Big Horn Basin on natural resource industries and the predominance of federal lands in the Basin, the policies described in the SEIS will have a highly-significant impact on the economy of the area. The economy of Big Horn County is virtually completely reliant on the extractive industries, and bentonite mining is a major contributor to the economies of Washakie and Hot Springs Counties as well. If employment in the bentonite industry is reduced, due to the policies in the SEIS, the communities of Lovell, Greybull, and Basin will face a crisis.	3036-1
1021	1021-11	Mining is also a premium employer with the highest average wages and benefits in the county. Finally, the Wyoming Mining Association estimates that each mining job creates 3 additional jobs, underscoring dependence of as many as 3600 jobs in Big Horn County.	3036-2
1021	1021-10	The Cumulative Impact section does not even list locatable minerals as a line item in its 4-22 and 4-23 charts, and in 4-24 mining is lumped together with Oil and Gas. Moreover, the information is incorrect. Per the Big Horn County Land Use Plan (2009) mining is the single largest employer in Big Horn County with over 900 direct jobs. Since that time, employment has increased	3036-1
1021	1021-9	The SEIS is woefully inadequate in researching the impact to the local economy as a result of the actions required by either Alternative E or F. Any financial burden placed on operators tests the highly-competitive international marketplace at the expense of domestic bentonite production.	3036-1
1021	1021-8	Consider the economic effects from delays and expenses should EIS's replace Environmental Assessments for mining authorization in ACECs	3020
1021	1021-7	3) BLM must develop habitat management solutions that are alternatives to the use of ACEC's, which selectively encumber land uses other than Sage Grouse conservation	3001
1021	1021-6	Acknowledge that only Congress may withdraw large segments of land from mineral location	3020

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1021	1021-5	An Environmental Impact Statement may be required by BLM to meet the NEPA requirements for mining authorization in ACEC's as a result of the avoidable synthetic conflict created by the new designation. Traditionally, much less costly Environmental Assessments have been adequate but for new lines on the map. EIS's do not generate superior results, despite the additional research, time, and expense. Likewise, the artificial creation of widespread ACEC's establishes conflict where none existed previously, favoring conservation over mineral development. Finally, withdrawal is a virtually-irrevocable designation that forever removes a critical mineral resource from society.	3020
1021	1021-4	Both Alternative E and F use ACEC's as a regulatory mechanism for restricting locatable mineral development. At a minimum, Notice Level Activity such as exploration will require a Plan of Operations, which is an additional burden in time and expense without any identified environmental or ecological benefit. The SEIS mentions this impact to bentonite operators, but not the effect or economic burden.	3020
1021	1021-3	Under 4.2.1 Locatable Minerals, Alternatives E utilizes a mineral withdrawal in the form of an ACEC which specifically favors sage grouse conservation over mineral development in 1.75 million acres. This is not consistent with FLPMA's recognition of the importance of mining on the federal estate, nor is it consistent with BLM's multiple use mandate and direction under the Mining and Minerals Policy Act.	3020
1021	1021-2	The State of Wyoming manages game animals and retains the sole authority for that function. BLM's use of the word "habitat" in place of "sage grouse" does not grant authority for game management. Alternative F, in that regard, is at least partially consistent with the State of Wyoming's Core Habitat Plan, but is superfluous in light of the State's existing and exclusive authority for game management. In addition, the BLM already has guidance from other BLM generated manuals and instructional memoranda that would be recognized by the USFWS as meeting their Policy for Evaluating Conservation Efforts (PECE). For example, BLM manual 6840, a manual prepared to guide the conservation of candidate and other special status species, was not referenced in the NTT report and thus not used for conservation recommendations in alternatives E or F (NWMA review of NTT report). Finally, the State of Wyoming has developed an encompassing plan in two related Executive Orders that provide substantial protection to sage grouse habitat in locally developed Core Areas (BHB RMP SEIS Page 3-3). Recommendations: 1) Recognize the State of Wyoming as the sole authority to regulate sage grouse as game animals 2) Eliminate the use of habitat management or habitat conservation as de facto authorization to manage sage grouse	3035_2

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1021	1021-1	43 CFR 3809.420 states: (3) Land-use plans. Consistent with the mining laws, your operations and post-mining land use must comply with the applicable BLM land-use plans and activity plans, and with coastal zone management plans under 16 U.S.C. 1451, as appropriate. Wyo-Ben rejects any thought process that restrictions contained in a new RMP render locatable mineral development as subordinate to the RMP. On the contrary, BLM is fully-aware of its responsibility to manage land use consistent with the dominant mineral estate, both existing and future. Recommendation: Design the RMP Alternatives to be consistent with locatable mineral development pursuant to direction from the BLM 3809 Handbook (2012), section 5.2.3	3020
1022	1022-19	Recommendation: Strengthen the prescription in the preferred alternative to exclude wind energy development in key habitat areas. Outside key habitat areas, require that wind energy development be sited at least five miles from active sage-grouse leks (Manville 2004; Jones 2012) and at least four miles from the perimeter of sage-grouse winter habitat.	3032
1022	1022-18	Recommendation: While eliminating grazing in key habitat areas would best support sage-grouse conservation and recovery, the selected alternative in the proposed RMP and final EIS should at least adopt management prescriptions included in Alternative F, with additional minimum standards described above, for grazing within and outside key habitat areas. The proposed action should also support voluntary grazing permit retirement in sage-grouse range.	3035_6
1022	1022-15	Management plans should adopt a conservative approach to grazing in sagebrush steppe to maintain and restore native vegetation and reduce impacts on sage-grouse. Management objectives should be based on, in priority order, potential natural community within the applicable Ecological Site Description, Connelly et al. (2000: 977, Table 3), or other objectives that have been demonstrated to be associated with increasing sage-grouse populations. Utilization levels should not exceed 25 percent annually on uplands, meadows, flood plains and riparian habitat (Holecheck et al. 2010; B.J.M & USFS 1994). Habitat objectives should be applied to all sage-grouse habitat areas and plans should include the following three conservation measures: (1) grazing should maintain 2: 18 cm grass height in sage-grouse nesting and brooding-rearing habitat (Connelly et al. 2000; Braun et al. 2005); (2) livestock grazing should be restricted where cheatgrass (<i>Bromus tectorum</i>) occurs in sagebrush steppe to avoid contributing further to its incursion on the landscape (Reisner et al. 2013); and (3) grazing permit retirement should be prioritized in sage-grouse habitat to lessen impacts on the species (see SGNTT 2011: 17).	3017-3
1022	1022-14	Recommendation: The selected alternative in the proposed RMP/ final EIS should make key habitat areas administratively unavailable for new fluid mineral leasing, and adopt prescriptions in Alternative E to direct development of leased mineral estate, except that it should require larger buffers to protect sage-grouse leks outside of key habitat areas.	3023-3

Individual Comments and Index to Summary Comments and Summary Responses**

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1022	1022-13	Recommendation: Identify restoration habitat to support habitat connectivity and sage-grouse range expansion in the Bighorn Basin, and adopt standards in Alternative E (Records 20-27, 30) to maintain and restore sagebrush steppe in the final preferred alternative.	3035-7
1022	1022-12	Recommendation: Map sage-grouse winter habitat in the proposed RMP and final EIS. Prohibit surface disturbance or disruption year-round in winter habitat within and outside key habitat areas in the final preferred alternative.	3035_2
1022	1022-11	Recommendation: The selected alternative in the proposed RMP/ final EIS should adopt recommendations in the NTT report, Alternative E, and other recent findings on sage-grouse by implementing a 4-mile no surface occupancy buffer to protect sage-grouse leks and limiting surface disturbance to one developed site and no more than three percent total disturbance per section.	3035_4
1022	1022-10	It is unclear if the total included on Table 4-9 in the SEIS is acres of key sage-grouse habitat areas in existing or proposed ACECs, or both.	3035_3-2
1022	1022-9	Alternative E would designate greater sage-grouse key habitat areas as an ACEC, totaling 1,857,485 acres, including 1,231,383 acres of BLM surface ownership (SEIS 2-11, Table 2-3; see also SEIS: 4-58, Table 4-9) (although the SEIS also indicates the key habitat areas ACEC is 1,436,941 acres, SEIS: ES-3). In contrast, the DRMP analyzed only 138,172 acres for expanded or new ACECs that might have benefited sage-grouse, and the preferred alternative only proposes to designate a small portion of this total -16,925 acres- in the final plan (Defenders analysis; DRMP 4-381, Table 4-118). In total, existing and/or proposed ACECs1 in the preferred alternative would specially protect only 23,144 acres of sage-grouse key habitat areas (SEIS 4-58, Table 4-9). Recommendation: Designate sage-grouse key habitat areas as an ACEC in the proposed RMP and final EIS with more protective management prescriptions like those in Alternatives E or F to give sage-grouse the best chance at recovery in the Bighorn Basin.	3035_1
1022	1022-8	Recommendation: Adopt key habitat areas proposed in the preferred alternative and Alternative E, but add missing habitat and connective corridors depicted on the "core areas" map (Version 3) (see SEIS Q-3, Figure Q-1), which would also add more sage-grouse leks to key habitat areas (see DRMP Map 34). Do not allow key habitat areas to be reduced in size over the life of the plan.	3035_1

Table D-1. Individual Comments and BLM Response Index (Continued)

Comment Document Number	Individual Comment Number	Comment Text	Summary Comment Response Number
1022	1022-6	By comparison, Alternative E in the SEIS, which strives to protect remaining habitat and limit effects of harmful land uses on sage-grouse, is more likely to support the species' conservation and recovery in the planning area. Alternative E would specially designate key sage-grouse habitat as an ACEC (SEIS 2-11, Table 2-3; SEIS ES-12) and apply stronger restrictions on resource use in key habitat areas (SEIS 4-76), which would result in less surface disturbance in key habitat areas (SEIS 476), less habitat fragmentation and degradation (SEIS ES 4-78), and fewer additional acres invaded by weeds (SEIS ES-7, 4-77) than any other alternative, making it the most beneficial alternative for sage-grouse (SEIS 4-78). The cumulative impacts of land uses on all land ownerships in Management Zones I and II is anticipated to have the least effects on sage-grouse in the Bighorn Basin under Alternative E (SEIS 4-154). federal agencies may supplement and improve analyses and modify management alternatives, including the proposed action (40 C.F.R. § 1503.4(a)). The BLM should modify the preferred alternative in the DRMP to better support sage-grouse conservation and potentially preclude the need to list the species under the ESA. Alternative E can be a model for how to improve conservation measures in the preferred alternative. The following recommendations are based on a comparison between the two alternatives as presented in Table 1, "Sage-Grouse Conservation Issues in the Bighorn Basin Resource Management Plan Revision Project."	3035_1
