The earth needs a place to store species until humans come to their senses about not destroying the planet. The top predators among fish are gone from their historic territory. They need the Arctic Ocean as their last refuge. In my book, *Deserted Ocean*, I chronicled 1000 years of fishing history in the North Atlantic. It is basically a story of overexploitation. We need to preserve the Arctic Ocean until we finally do something about fossil fuels. The planet will not survive the overexploitation of carbon-based fuels. We are looking at a 15 F rise in temperatures and a 40-100 foot rise in ocean levels by 2300.

The other thing is drilling in the Arctic means a spill. It will take 10,000 years for that crude oil to decompose. There will be thousands of animals killed over that time. Your a little intelligence and do not rape the last frontier.
