More scientific studies and research must be done on the potential impacts on the coastal plain of the arctic refuge from oil and gas development and also what affects the oil and gas development will have on climate change..

Climate change is already affecting the state of Alaska with temperatures rising twice as fast as the rest of the country, coastal erosion, warming of the ocean's waters, shrinking ice packs, permafrost melting and releasing more carbon in to the air, and abnormal weather.

I do not want to see the Arctic Refuge destroyed by oil and gas development, and the affects of climate change getting worse.
