

U.S. Department of the Interior
Bureau of Land Management

Coastal Plain Oil and Gas Leasing Program

Environmental Impact Statement

FINAL

Volume 3: Appendix S

September 2019

Prepared by:

US Department of the Interior
Bureau of Land Management

In cooperation with:

US Fish and Wildlife Service
US Environmental Protection Agency
Native Village of Kaktovik
Native Village of Venetie Tribal Government
Venetie Village Council
Arctic Village Council
North Slope Borough
State of Alaska

Estimated Lead Agency Total
Costs Associated with Developing
and Producing this EIS: \$3,970,000

Mission

To sustain the health, diversity, and productivity of the public lands for the use and enjoyment of present and future generations.

Cover Photo: Northward view in central coastal plain area near the Sadlerochit River showing gently rolling topography typical of the area. Natural oil indications are visible of an oil seep that occurs along the coast (Barter Island). Photo by David Houseknecht (USGS).

Appendix S. Public Comments and BLM Responses

This volume presents comments the Bureau of Land Management (BLM) received on the Coastal Plain Oil and Gas Leasing Program Draft Environmental Impact Statement (Leasing EIS). It also includes a description of the public comment process, how the BLM considered all comments, and responses to all substantive comments.

S.1 DRAFT LEASING EIS COMMENT PROCESS

The National Environmental Policy Act (NEPA) requires that all substantive comments received before reaching a decision must be considered to the extent feasible, and that agencies must respond to all substantive written comments submitted during the public comment period for an EIS (40 CFR 1503.4). Comments must be in writing (including paper or electronic format or a court reporter's transcript taken at a formal public meeting or hearing), substantive, and timely, in order to merit a written response.

Although the BLM diligently considered each comment letter, the comment analysis process involved determining if a comment was substantive or non-substantive. In performing this analysis, the BLM relied on Section 6.9.2, Comments, in the BLM NEPA Handbook H-1790-1 to determine what constituted a substantive comment.

A substantive comment does one or more of the following:

- Questions, with a reasonable basis, the accuracy of the information or analysis in the EIS
- Questions, with a reasonable basis, the adequacy of the information or analysis in the EIS
- Presents reasonable alternatives other than those in the Draft EIS that meet the purpose of and need for the proposed action and addresses significant issues
- Questions, with a reasonable basis, the merits of an alternative or alternatives
- Causes changes in or revisions to the proposed action
- Questions, with a reasonable basis, the adequacy of the planning process itself

Additionally, the BLM's NEPA handbook identifies the following types of substantive comments:

- Comments on the Adequacy of the Analysis—Comments that express a professional disagreement with the conclusions of the analysis or assert that the analysis is inadequate are considered substantive; they may or may not lead to changes in the Final EIS. Interpretations of analyses should be based on professional expertise. Where there is disagreement within a professional discipline, a careful review of the various interpretations is warranted. In some cases, public comments may necessitate a reevaluation of analytical conclusions. If, after reevaluation, the BLM Authorized Officer responsible for preparing the EIS does not think that a change is warranted, the response should provide the rationale for that conclusion.
- Comments That Identify New Impacts, Alternatives, or Mitigation Measures—Public comments on a Draft EIS that identify impacts, alternatives, or mitigation measures that the draft did not address are considered substantive. This type of comment requires the BLM Authorized Officer to determine if it warrants further consideration; if so, he or she must determine if the new impacts,

new alternatives, or new mitigation measures should be analyzed in the Final EIS, in a supplement to the Draft EIS, or in a completely revised and recirculated Draft EIS.

- Disagreements with Significance Determinations—Comments that directly or indirectly question, with a reasonable basis, determinations on the significance or severity of impacts are considered substantive. A reevaluation of these determinations may be warranted and may lead to changes in the Final EIS. If, after reevaluation, the BLM Authorized Officer does not think that a change is warranted, the BLM's response should provide the rationale for that conclusion.

Comments that failed to meet the above description were considered non-substantive.

After publishing the Draft EIS on December 20, 2018, the initial 45-day public comment period to receive comments on the Draft EIS was extended by an additional 30 days. After this extension, the public comment period officially ended on March 13, 2019. The BLM received written comments by mail, fax, email, the online comment form via ePlanning, and handwritten and verbal testimony at public meetings.

The BLM held public meetings during the comment period in North Slope communities, Anchorage, Fairbanks, and Washington, DC. Pursuant to ANILCA Section 810(a)(1) and (2), the BLM also conducted a hearing in Kaktovik to gather comments regarding potential impacts on subsistence use resulting from the alternatives considered in the Draft EIS. In order to capture all relevant comments, court reporters were made available in all meeting locations for attendees to provide verbal testimony if they desired. In Fairbanks, Anchorage, and Washington, DC, additional court reporters were made available to individuals who wished to provide one-on-one testimony. The BLM set up comment stations with computers at these three meetings for those who wished to submit comments electronically. A list of the meetings and meeting dates are provided below.

- February 4, 2019: Fairbanks
- February 5, 2019: Kaktovik
- February 6, 2019: Utqiagvik
- February 7, 2019: Fort Yukon
- February 9, 2019: Arctic Village
- February 10, 2019: Venetie
- February 11, 2019: Anchorage
- February 13, 2019: Washington, DC

Comments received covered a wide spectrum of thoughts, opinions, ideas, and concerns. The BLM recognizes that commenters invested considerable time and effort to submit comments on the Draft EIS. The agency developed a comment analysis method to ensure that all comments were considered, as directed by NEPA regulations. This systematic process ensured the BLM tracked and considered all substantive comments.

On receipt, each comment letter was assigned an identification number and logged into a database that allowed the BLM to organize, categorize, and respond. The BLM coded substantive comments from each letter to appropriate categories, based on content, and the link to the commenter was retained. The categories generally follow the sections presented in the Draft EIS, though some related to the planning process or editorial concerns.

The BLM grouped comments similar to each other together and prepared one response for each group of similar comments. The responses were crafted to respond to the comments and to note if a change to the EIS was warranted.

The BLM received a total of 1,066,803 comment letter submissions; 3,709 of these were considered unique submissions, and 1,063,094 were part of form letter campaigns (discussed further, below, in **Section S.1.1**). Many comments received throughout the comment analysis process expressed personal opinions or preferences, had little relevance to the adequacy or accuracy of the Draft EIS, or represented commentary on management actions that are outside the scope of the EIS. These commenters did not provide specific information to assist the BLM in making a change to the existing action alternatives, did not suggest new alternatives, and did not take issue with methods used in the Draft EIS; the BLM did not address these comments further in this document.

The BLM read, analyzed, and considered all comments of a personal or philosophical nature and all opinions, feelings, and preferences for one element or one alternative over another. Because such comments were not substantive, the BLM did not respond to them. It is also important to note that, while the BLM reviewed and considered all comments, none were counted as votes. The NEPA public comment period is neither an election nor does it result in a representative sampling of the population. Therefore, public comments are not appropriate to be used as a democratic decision-making tool or as a scientific sampling mechanism.

Subject matter experts reviewed comments that recommended additional studies, data, or scientific literature to be incorporated into the analysis; new information and citations were incorporated into the Final EIS as appropriate. Comments citing editorial changes to the document were reviewed and incorporated. The Final EIS has been technically edited and revised to fix typos, missing references, definitions, and acronyms and provides other clarifications as needed.

S.1.1 Letter Campaigns

Several organizations and groups held standardized letter campaigns to submit comments during the public comment period for the Draft EIS. Through this process, their constituents were able to submit the standard letter or a modified version of the letter indicating support for the group's position on the BLM management actions. Individuals who submitted a modified standard letter generally added new comments or information to the letter or edited it to reflect their main concerns. The BLM received 1,063,094 form letter campaign letters, most of which were identical to the master letter. Modified letters with unique substantive comments were given their own submission number and were coded appropriately.

S.1.2 Response to Comments on BLM's Interpretation of 2,000-Acre Facility Limit in Section 20001(c)(3) of the Tax Cuts and Jobs Act of 2017 (Public Law 115-97)

I. Background

Section 20001 of the Tax Cuts and Jobs Act of 2017 (PL 115-97) directs the Secretary of the Interior, acting through the BLM, to establish and administer a competitive oil and gas program for leasing, developing, producing, and transporting oil and gas in and from the Coastal Plain in the Arctic National Wildlife Refuge. In doing so, the amount of allowable production and support facilities is limited by Section 20001(c)(3), which states the following:

SURFACE DEVELOPMENT—In administering this section, the Secretary shall authorize up to 2,000 surface acres of Federal land on the Coastal Plain to be covered by production and support

facilities (including airstrips and any area covered by gravel berms or piers for support of pipelines) during the term of the leases under the oil and gas program under this section.

To facilitate the impact analysis, in Section 1.9.1 of the Draft EIS, the BLM provided its proposed interpretation of Section 20001(c)(3). It requested public comment on its interpretation as part of the overall public comment period for the Draft EIS. The BLM received a few dozen substantive comments on the proposed interpretation, submitted by a broad range of commenters, including other government agencies, nonprofit environmental organizations, a tribe and a tribal entity, a group of scientists, and various individuals. The BLM considered these public comments in finalizing the interpretation, which in turn is used in the impact analysis in the Final EIS.

The final interpretation is substantially the same as the proposed interpretation in most respects; however, in response to public comments, the BLM has changed its interpretation of gravel mines that supply mineral materials for construction and maintenance of oil and gas facilities; the agency now treats them as support facilities that count against the 2,000-acre facility limit.

The BLM also added language to help clarify that production and support facilities constructed under right-of-way grants are counted in the same manner as they would be if constructed under the rights acquired under oil and gas leases.

All other changes to Section 1.9.1 in the Final EIS are non-substantive, including removing language describing the BLM's rationale for its interpretation, which is now included in the discussion that follows.

II. Discussion of the Final Interpretation and Responses to Comments on the Proposed Interpretation in the Draft EIS

Facility Footprint vs. Greater Disturbance Area

Some commenters suggested that the 2,000-acre limit should apply to all land that is disturbed or otherwise affected by oil and gas activities, not just the footprint of constructed facilities. In this regard, commenters suggested counting against the 2,000-acre limit that land indirectly affected by the construction and operation of facilities and by oil and gas activities generally, such as geophysical exploration.

In its proposed interpretation, the BLM explained that the limitation does not apply to surface disturbance that is indirectly related to or resulting from applicable facilities. This is because those lands are not "covered by [the facilities themselves]," as that phrase is used in Section 20001(c)(3) of PL 115-97. The BLM stands by its interpretation in this regard and adds that for the same reason, land affected by general oil and gas activities, separate and apart from the footprint of applicable production and support facilities, also does not count against the 2,000-acre limit.

Section 20001(c)(3) makes clear that the limit applies only to the area of those lands directly "covered by" production and support facilities. There is no discernible intent in Section 20001(c)(3) to count lands indirectly affected by facilities, such as lands adjoining airstrips, roads, pipelines, or facilities on gravel pads that may be affected by such conditions as fugitive dust, noise, oil spills, or air emissions emanating from such facilities.

As the analysis in the Final EIS notes, such indirect impacts can extend far from the facilities themselves. For example, in areas that experience high winds, the fugitive dust emitted from a single 5,000-foot gravel airstrip could be deposited on approximately 2,000 acres of surrounding vegetation. If the BLM were to adopt the commenters' suggestion, the entire 2,000-acre limit could be reached with the construction and operation of a single airstrip; this would preclude any other oil and gas facilities throughout the Coastal

Plain. In addition to being at odds with the plain language of Section 20001(c)(3), it is unreasonable to conclude that Congress intended such an interpretation.

Reclaimed Acreage

Several commenters suggested that the 2,000-acre limit should apply to the cumulative total acreage of all production and support facilities authorized throughout the life of the Coastal Plain oil and gas program; that is, the acreage of fully reclaimed land previously containing such facilities would nonetheless continue to count against the 2,000-acre limit. In support, commenters stated that the BLM's "at any given time" interpretation of crediting reclaimed acreage against the 2,000-acre limit could result in the entire Coastal Plain being developed. This, the commenters claim, would be at odds with Congress's intent to substantially limit impacts associated with oil and gas facilities.

In this regard, one commenter described a potential repeating cycle of covering up to 2,000 acres of land with production and support facilities, then reclaiming it. This cycle would be repeated until virtually all federal land in the Coastal Plain had been covered by production and support facilities.

Commenters also called into question the efficacy of reclamation, noting that in the Arctic it can take substantially longer to reclaim land to its prior functionality, compared with other areas. They stated that land that has been subject to oil and gas development can never be returned to an undisturbed wilderness state.

In its proposed interpretation, the BLM explained that it was applying the 2,000-acre limit to the total acreage of production and support facilities covering federal land at any given time. This is because the qualifying language "during the term of the leases" in Section 20001(c)(3) of PL 115-97 indicates Congress intended a time limit. Under this interpretation, the acreage of fully reclaimed land previously containing such facilities would no longer count against the 2,000-acre limit.

Having considered the points raised by the commenters and found them to be ineffective, the BLM stands by its interpretation of the statute in this regard.

Standard rules of statutory interpretation provide that all of the language in a statute is to have meaning and effect; however, had Congress intended to apply the 2,000-acre limit to the cumulative total of all production and support facilities that may ever be authorized on federal lands, the language "during the term of the leases under the oil and gas program under this section" contained at the end of Section 20001(c)(3) of the Act would be superfluous. The BLM's interpretation gives that language meaning and effect. In doing so, it uses a common dictionary definition of the word "during," meaning "at a particular point in the course of." Under this definition, the limit is interpreted to apply at any particular point in the course of the BLM's implementation of the oil and gas program; that is, at any point during the program, no more than 2,000 acres of federal land could be covered by production and support facilities.

The commenters' argument that the BLM's interpretation could result in much or virtually all of the Coastal Plain being covered by production and support facilities is unfounded and unreasonable. Given the way oil and gas programs ultimately develop, it is not possible to have unending cycles of covering up to 2,000 acres with facilities, reclaiming the land, and covering up 2,000 additional acres, as one commenter suggested. Instead, the most likely scenario is just the opposite, even assuming that the Coastal Plain would be substantially leased and developed. It would involve perhaps only one round of the cover-reclaim-cover cycle. Under this scenario, only some of the first 2,000 acres of land covered by production and support facilities would be reclaimed in time for that "recycled" acreage to be used by subsequent developments.

According to the reasonably foreseeable development scenario described in the EIS (**Appendix B**), the Coastal Plain program could last approximately 85 years, from the first lease sale to the completion of the abandonment and reclamation process of the last oil and gas facilities. Given that most North Slope production facilities remain in operation for about 30 to 40 years (**Appendix B** provides a range of approximately 10 to 50 years), no production would be expected in at least the first 8 years following the first lease sale. Moreover, in order for the acreage to be reused for a new development, the last reclamation would have to be completed by about 60 years after the first lease sale. Because of these factors, it is likely that there would be time for only one round of the cover-reclaim-cover cycle.

Additionally, some facilities may last the entire life of the oil and gas program, such as pipelines and access roads that support the broader Coastal Plain program area. The acreage of land covered by such facilities would not be subsequently available for reuse by facilities; thus, even if there were a complete round of the cover-reclaim-cover cycle, it would likely not result in a full 2,000 acres being “recycled” and made available for subsequent development.

Accordingly, even assuming a robust leasing and development scenario, under the BLM’s interpretation, it is likely that substantially less than 4,000 cumulative acres of land would be covered by production and support facilities over the life of the oil and gas program; thus, under the BLM’s interpretation, only a tiny fraction of the 1,563,500 acres of federal land comprising the Coastal Plain that commenters argue could be covered by facilities.

The BLM agrees with the commenters that reclamation to the point of returning full habitat function can take longer in the Arctic than elsewhere; however, until reclaiming land with production and support facilities is determined to be adequate, the acreage of such facilities would continue to count against the 2,000-acre limit. Also, while it is true that once development occurs the land can never be returned to an undisturbed wilderness state, when production and support facilities are removed and land is fully reclaimed, it can once again contain wilderness values. Under such a scenario, it could qualify for congressional wilderness designation under the Wilderness Act.

Elevated Facilities

Some commenters suggested that the BLM should count all the land under elevated pipelines and structures against the 2,000-acre limit, not just those portions of the facilities that come in contact with the ground. In this regard, commenters noted that, in addition to causing direct impacts where they make contact with the ground, elevated facilities can cause indirect impacts on areas under and near the elevated portions of the facilities; this can inhibit wildlife movement. For instance, one commenter stated that elevated pipelines might affect snow accumulation depths, surface drainage characteristics, wind velocities, and sunlight penetration, resulting in changes in habitat and wildlife access in areas under and near pipelines.

Under its proposed interpretation, the BLM explained that it was applying the 2,000-acre limit to only those portions of elevated facilities that touch the land’s surface. Having carefully considered the points raised by the commenters, the BLM is standing by its initial interpretation. BLM bases its interpretation on Section 20001(c)(3) of PL 115-97, which explicitly includes in the 2,000-acre limit “piers for support of pipelines.” This demonstrates that Congress intended to count only those portions of elevated pipelines that touch the ground, which are the piers that hold up elevated pipelines. Had Congress intended to include the entire width and length comprising elevated pipelines, in Section 20001(c)(3) it would not have called out only a portion of elevated pipelines—the piers—as applying against the 2,000-acre limit.

By extension, the BLM assumes that Congress would have given similar treatment to elevated structures, such as drill pads and processing facilities, had those been specifically addressed in Section 20001(c)(3); however, oil and gas operators no longer commonly use elevated structures on Alaska's North Slope.

Further, as discussed above, Section 20001(c)(3) makes clear that the 2,000-acre limit applies only to those lands directly "covered by" production and support facilities, or the facility footprint, and not adjoining lands indirectly affected by facilities, or the greater disturbance area. In this regard, changes in snow accumulation depths, surface drainage characteristics, wind velocities, and sunlight penetration in areas under and near the elevated portions of pipelines are indirect impacts not caused by the pipeline's footprint on the land. As noted above, such indirect impacts can affect land far from the facilities themselves.

Buried Pipelines

One commenter requested that the BLM clarify how the 2,000-acre limit applies to buried pipelines. The BLM did not address this specific question in its proposed interpretation. Although most pipelines on Alaska's North Slope are elevated, in certain applications all, or more commonly certain segments of a pipeline, are sometimes buried, such as those at road and river crossings. Since the entire portion of buried pipeline segments touches the land, the entire two-dimensional area, the width and length, of buried pipeline segments would be counted against the 2,000-acre limit.

Snow and Ice Facilities

Some commenters suggested that the BLM should count against the 2,000-acre limit any facilities constructed with snow and ice, such as snow trails and ice roads and ice pads. Commenters noted that ice roads and ice pads can adversely affect wildlife and ecology. One commenter stated that while ice roads may not adversely affect vegetation, wildlife can be affected by traffic, noise, and other human activity associated with ice road operations. Another commenter stated that ice road construction requires large quantities of freshwater, drawn from lakes and rivers, and can leave residual impacts beyond the winter season. Yet another commenter suggested, incorrectly, that ice roads and pads "destroy habitat as thoroughly as [gravel] drilling structures."

In its proposed interpretation, the BLM explained that facilities constructed with snow and ice have a fleeting existence, melting away in the summer and leaving the tundra surface largely undisturbed; thus, not counting them against the 2,000-acre limit is consistent with the time limit intended by Congress. Land containing such facilities would be fully reclaimed to its prior function after the snow and ice melt away, without any remedial action required by the operator.

The BLM also noted that including snow and ice facilities would make Congress's clear purpose—establishing an oil and gas program on the Coastal Plain—impracticable. Temporary ice roads and pads are used extensively in Alaska North Slope oil and gas operations. This avoids the substantial environmental impacts associated with similar facilities constructed with gravel. Given their extensive use, ice roads and pads supporting exploration alone could exceed the 2,000-acre limit, leaving no acreage remaining for oil and gas developments in the Coastal Plain; thus, including their acreage would make development impracticable and at odds with congressional intent.

Drawing water for ice road construction can temporarily lower water levels in lakes and rivers, and ice road operations can disturb nearby wildlife, as discussed above; even so, the 2,000-acre limit is not intended to apply to lands in the greater disturbance area that experience such indirect impacts from production and support facilities. Instead, the limit applies only to that portion of land comprising the facility footprint—that land experiencing a direct loss of habitat from being covered by the facility. Although habitat underlying ice

roads and pads temporarily loses its function until such time that the ice melts away, unlike facilities constructed with gravel or other fill material, ice roads and pads do not result in a loss of habitat.

The BLM stands by its initial interpretation.

Gravel Mines

In its proposed interpretation, the BLM excluded gravel mines from the definition of production and support facilities and thus did not apply the 2,000-acre limit to gravel mines. In support, the agency stated that gravel mines supply raw materials for constructing oil and gas facilities; but, similar to mills that supply steel for construction of pipelines and other facilities, they are not themselves oil and gas facilities.

Several commenters suggested that the 2,000-acre limit should apply to gravel mines. They stated that the BLM's steel mill analogy was flawed. Their rationale is that gravel mines would be located in the Coastal Plain, whereas steel mills would not. One commenter noted that desalinization plants would fall within the definition of production and support facilities, notwithstanding their purpose to supply water to other oil and gas facilities.

Another commenter noted that excluding gravel mines from the definition of production and support facilities was inconsistent with the BLM's own definition of "facility;" that is, something that is built, installed, or established to serve a particular purpose, here, the development, production, and transportation of oil and gas in and from the Coastal Plain. The commenter noted that gravel mines would be established to serve the particular purpose of supplying gravel for oil and gas facility roads and pads constructed in the Coastal Plain. Another commenter noted that gravel mines completely denude the landscape of vegetation, effectively removing habitat for all animals using it.

The BLM generally agrees with the points raised by the commenters. For the reasons stated by the commenters, the agency has changed its definition of production and support facilities to include gravel mines that supply mineral materials for construction and maintenance of oil and gas facilities. Accordingly, the BLM is now counting gravel mines against the 2,000-acre facility limit.

Tracking and Enforcement of Facility Acreage

A few commenters asked the BLM to explain how it would track and enforce the 2,000-acre limit.

Required Operating Procedure (ROP) 33 requires operators to submit to the BLM Authorized Officer detailed GIS data for all oil and gas facilities within 6 months of construction completion. The BLM intends to use the data to calculate the amount of acreage covered by production and support facilities. It would continually and cumulatively track the acreages for all such facilities on federal lands throughout the Coastal Plain. BLM authorizations for constructing production and support facilities would contain acreage limits for those facilities. At no time would the BLM issue authorizations that allow the cumulative 2,000-acre limit to be exceeded.

During field inspections and when reviewing the GIS data submitted under ROP 33, the BLM would determine whether the facility footprints are within the authorized acreage limits. If an operator exceeds its limits, the BLM would take appropriate action to promptly bring the operator back into compliance.

Under ROP 35, on completion of facility operations, operators must submit for the BLM's approval an abandonment and reclamation plan. The plan must contain steps to ensure ecosystem restoration of the land's previous hydrological, vegetation, and habitat condition. After the BLM determines that completed reclamation under an approved plan is adequate and in compliance with the plan, it would subtract the

associated facility acreage from the total cumulative footprint of all production and support facilities that count against the 2,000-acre limit.

S.2 HOW TO READ THIS VOLUME

The BLM assigned a letter number to every unique communication received during the Draft EIS public comment period. The following tables contain all substantive comments with the BLM's responses; they are organized by the category that comments regarded. Commenter names and applicable organization or agency are provided for letter submissions that did not request that their information be withheld. Complete transcripts of public meetings and copies of all substantive comment letters are available on the BLM's project ePlanning website, which can be accessed through: www.blm.gov/alaska/coastal-plain-eis.

This page intentionally left blank.

S.3 SUBSTANTIVE PUBLIC COMMENTS AND BLM RESPONSES

S.3.1 Acoustic Environment

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
1.	Dennis	Higgs	—	37688	5	Acoustic Environment	no information is provided for the complexities of sound propagation underwater.	Section 3.2.3 has been updated to include information on sound propagation under water. Impacts of underwater noise on aquatic species and marine mammals are described in Sections 3.3.2 and 3.3.5 of the Draft and Final EISs, respectively.
2.	Dennis	Higgs	—	37688	6	Acoustic Environment	Exploration and construction over ice would have complex effects on the underwater acoustic environment and could transmit quite effectively through the ice and into underlying unfrozen water, including in coastal environments. As the report notes there are overwintering habitats adjacent to expected pile driving sights and these extremely loud construction noises could transmit quite effectively through the ice and into these overwintering water bodies, with potentially deleterious effects.	Section 3.2.3 has been updated to include information on sound propagation under water. Impacts of underwater noise on aquatic species and marine mammals are described in Sections 3.3.2 and 3.3.5 of the Draft and Final EISs, respectively.
3.	Dennis	Higgs	—	37688	10	Acoustic Environment	The only sound measurements provided in the DEIS are for sound levels in air relative to human exposures (dBA). The DEIS completely ignores the large advances made in the science of underwater sound in the last 10 years.	Section 3.2.3 has been updated to include information on sound propagation under water. Impacts of underwater noise on aquatic species and marine mammals are described in Sections 3.3.2 and 3.3.5 of the Draft and Final EISs, respectively.

S. Public Comments and BLM Responses (Acoustic Environment)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
4.	Withheld	Withheld	—	68965	57	Acoustic Environment	28. Chapter 3; section 3.2.3, page 3-21. Acoustic Environment Effects. The analysis provided does not include any consideration of effects to the freshwater or marine acoustic environment associated with construction and operation of the seawater treatment plant and the barge landing and storage facilities, as well as boat traffic described in the hypothetical development scenario. These acoustic effects on human receivers should be included here (noting that effects to terrestrial wildlife and marine wildlife are described in subsequent sections).	Section 3.2.3 has been updated to discuss impacts from marine-related sources included in the hypothetical development scenario, including seawater treatment plants and barge loading and offloading. The hypothetical development scenario is applicable to the program area; speculation on the location and level of marine vessel traffic and icebreaking is beyond the scope of this analysis. Direct and indirect impacts cannot be analyzed on a site-specific basis within this EIS, but they are analyzed for the program area generally based off the hypothetical development scenario.
5.	Brook	Brisson	Trustees for Alaska	98269	150	Acoustic Environment	Second, the DEIS fails to conduct acoustic modeling of all development scenarios to accurately forecast foreseeable noise impacts. This can be accomplished through existing methodologies. ⁷⁴⁷ [47 E.g., Keyel et al. 2017; Keyel et al. 2018.]	Acoustic modeling of all development scenarios to accurately forecast foreseeable noise impacts is out of scope for this programmatic level of analysis, but it may be performed during site-specific analyses of future project-specific development proposals.

6.	Brook	Brisson	Trustees for Alaska	98270	163	Acoustic Environment	The general section on noise in the DEIS addresses impacts resulting from ground-based operations and aircraft, but it fails to address shipping and icebreaking noise impacts at all. While there is some discussion of shipping-related noise later in the DEIS, its exclusion from this section inappropriately suggests it is not an important consideration. The general section should be revised to include at least an overview of shipping noise impacts, including those associated with icebreaking.	Section 3.2.3 has been updated to discuss impacts from marine-related sources included in the hypothetical development scenario, including seawater treatment plants and barge loading and offloading. The hypothetical development scenario is applicable to the program area; speculation on the location and level of marine vessel traffic and icebreaking is beyond the scope of this analysis. Direct and indirect impacts cannot be analyzed on a site-specific basis within this EIS, but they are analyzed for the program area generally based off the hypothetical development scenario.
7.	Withheld	Withheld	World Wildlife Fund	81184	22	Acoustic Environment	More generally, shipping-related noise is not comprehensively addressed, and where it is addressed in a piecemeal fashion, such as in the marine mammal section, it understates the potential impacts and inappropriately concludes that they will be minimal. These represent major substantive gaps in BLM's analysis. The revised draft EIS should include a substantial and realistic discussion of icebreaking noise, shipping, and construction noise impacts near the program area and along the marine shipping route, and an analysis of the impact of icebreaking on sea ice habitat loss and alteration and subsistence.	Section 3.2.3 has been updated to discuss impacts from marine-related sources included in the hypothetical development scenario, including seawater treatment plants and barge loading and offloading. The hypothetical development scenario is applicable to the program area; speculation on the location and level of marine vessel traffic and icebreaking is beyond the scope of this analysis. 8.	Withheld	Withheld	World Wildlife Fund	81184	21	Acoustic Environment	Relatedly, there is no recognition of icebreaking noise and other disturbance on marine mammals. Studies document impacts of icebreaking by ships on Arctic cetaceans. For instance, beluga whales have been deflected by icebreaker noise and have left the area with active icebreaking for as long as two days thereafter. Ringed and bearded seals hauled out on ice showed avoidance behavior when an icebreaking vessel was more than 1 kilometer away, and icebreakers can also adversely affect ice-breeding seals during pupping and lactation periods through direct collision or separation of mothers and pups. Studies also document the impacts of icebreaking on Arctic ice habitat by crushing or displacing ice used by ice-breeding nursing seal pups. Noise and Arctic ice habitat disturbances from icebreaking are not addressed anywhere in the DEIS, and these omissions represent a major substantive gap.	The EIS describes impacts from marine-related sources included in the hypothetical development scenario. The hypothetical development scenario is applicable to the program area; speculation on the location and level of icebreaking is beyond the scope of this analysis. Direct and indirect impacts cannot be analyzed on a site-specific basis within this EIS, but they are analyzed for the program area generally based off the hypothetical development scenario.
9.	Withheld	Withheld	World Wildlife Fund	81184	20	Acoustic Environment	The draft EIS contains several important gaps in its evaluation of the scope and impacts of underwater noise generated by shipping activities associated with the proposed development of the Coastal Plain. For example, the impacts of noise in general and on fish, birds, marine mammals, and subsistence focus heavily on noise-generating activities within or near the program area. As a result, they largely fail to address shipping noise along the entire 1,600-nm marine barge route and its resulting impacts on wildlife, habitat, and subsistence activities throughout the many important marine areas along that route (The International Maritime Organization (IMO) has	Section 3.2.3 has been updated to discuss impacts from marine-related sources included in the hypothetical development scenario. The hypothetical development scenario is applicable to the program area; speculation on the location and level of marine vessel traffic and icebreaking is beyond the scope of this analysis. Direct and indirect impacts cannot be analyzed on a site-specific basis within this EIS, but they are analyzed for the program area generally based off the hypothetical development scenario.

15.	Brook	Brisson	Trustees for Alaska	98269	149	Acoustic Environment	<p>First, the affected acoustic environment in the DEIS is deficient because it fails to identify an adequate baseline using accurate data on background ambient noise levels in the project area. In our scoping comments, we highlighted the need for BLM to gather sufficient baseline soundscape data for areas within and throughout the Coastal Plain.⁷⁴³ That baseline data should have then been utilized in a noise impact study, including modeling of all development scenarios. Instead of gathering new data sufficient to establish an accurate and current baseline, BLM utilized data from the 2010 background acoustic monitoring study at Point Thomson.⁷⁴⁴ Data collected nearly a decade ago outside the Coastal Plain does not constitute “a comparable description of existing acoustic environment in the program area,” as the DEIS claims. ⁷⁴⁵ The Point Thomson study measured noise levels adjacent to the northwestern border of the Refuge, not the ambient noise levels within and throughout the Coastal Plain.⁷⁴⁶ Moreover, Point Thomson is closer to the Prudhoe Bay complex, so ambient noise levels are likely to be different than those in the Refuge. Without first establishing an adequate baseline for this program area, BLM cannot effectively evaluate the impacts of oil and gas development on the soundscape of the Coastal Plain.</p>	<p>The gathering of baseline ambient noise level data is beyond the scope of this programmatic-level EIS. Because the hypothetical development scenario represents a level of development and not the actual locations of future project elements, no noise modeling was undertaken. Noise analyses will occur at the project level once specific projects have been proposed. Baseline ambient noise information would be gathered at that time to more accurately reflect actual background conditions; noise analyses, which may include modeling, would reflect actual development proposals.</p>

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
18.	Brook	Brisson	Trustees for Alaska	98269	151	Acoustic Environment	The actual impacts analysis includes confusing and conflicting statements. For instance, it states that there would be no potential impacts common to all alternatives, but then goes on to state that the acoustic impacts would be similar under all the action alternatives, but less extensive in NSO areas under Alternatives C and D.748 The DEIS does not provide support for the assertion that noise impacts would be limited or nonexistent in NSO areas, which would still be affected by aircraft, seismic operations, vehicle use, and potentially intense ground-based development where NSO stipulations are waived.	The BLM has rewritten Section 3.2.3, Impacts Common to All Alternatives, to state that the nature and type of impacts would be similar across action alternatives. Impacts in no surface occupancy (NSO) areas have been updated under each alternative to describe that the impacts of noise sources outside the NSO areas could have noise impacts in NSO areas.
19.	—	—	Alaska Department of Natural Resources	94102	57	Acoustic Environment	32 Chapter 3.2.3, Alt. B, Page 3-20 Supplement analysis -Noise In the last paragraph on this page, the text indicates there would be no sources of sound from ground-based equipment in areas with No Surface Occupancy (NSO). However, as essential pipeline and road crossings in NSO areas in Lease Stipulation 1, and barge landings or docks in Lease Stipulation 4 are permitted within these areas in Alternative B on a case-by-case basis, sound from industrial activities would be generated. The text needs to be corrected to account for these potential noise sources.	The BLM has updated the impacts analysis in Section 3.2.3 in the Final EIS to account for changes in lease stipulations between the Draft and Final EISs.
20.	Dr. Julianne Lutz	Warren	—	74344	3	Acoustic Environment	Noise-no research on consequences of aircraft, harvesters	The impacts of aircraft noise were discussed for each alternative in Section 3.2.3 of the Draft EIS; additionally, impacts of aircraft noise were addressed in Section 3.3, Biological Resources, of the Draft EIS. Impacts on harvesters were discussed under Section 3.4.3, Subsistence Uses and Resources.

21.	Joseph	McCarthy	—	82657	4	Acoustic Environment	During the acoustic analysis, this report assumes a “highly conservative” estimate for increasing airfield traffic in Kaktovic Airport (3-21), yet the report uses “highly optimistic” assumptions elsewhere. If the report uses highly optimistic assumptions for the development scenario, it must use the corresponding threshold for acoustic considerations and airport traffic. The higher airport and associated acoustic impact may effect the dwindling polar bear population more than this report anticipates. Acoustic effects must be determined under the same “highly optimistic” threshold used for the development scenario.	As described on page 3-2 of the Draft EIS, the BLM has strived to minimize the chance that the resultant impact analysis will understate potential impacts; therefore, the hypothetical development scenarios are intended to represent optimistic, high-production, successful discovery in a situation of favorable market prices. These highly optimistic production forecasts are intended to show a higher level of production, and therefore an upper bound of impacts. As such, these optimistic production levels present a conservative estimate of impacts throughout the EIS, including for the acoustic analysis.
22.	Withheld	Withheld	—	87744	1	Acoustic Environment	During the acoustic analysis, this report assumes a “highly conservative” estimate for increasing airfield traffic in Kaktovic Airport (3-21), yet the report uses “highly optimistic” assumptions elsewhere. If the report uses “highly optimistic” assumptions for the development scenario, it must use the corresponding level for acoustic considerations and airport traffic that would result from abundant resources.	As described on page 3-2 of the Draft EIS, the BLM has strived to minimize the chance that the result and impact analysis will understate potential impacts; therefore, the hypothetical development scenarios are intended to represent optimistic, high-production, successful discovery in a situation of favorable market prices. 23.	Tim	Whitehouse	PEER	95601	4	Acoustic Environment	<p>Aircraft disturbance of subsistence resources and activities is an issue that involves noise, but is one that is not solely attributable to acoustic factors. Relevant non-acoustic factors include all of those listed above for wildlife and for people. Because of the importance of non-acoustic factors, potential impacts of development-related noise on subsistence resources and activities cannot be assessed only on the basis of acoustic metrics and must be considered in relation to non-acoustic factors as well. For example, BLM staff have noted that subsistence hunters' concern with aircraft disturbance in and near NPR-A is affected by the high degree of uncertainty and unpredictability about where aircraft will be, and therefore by hunters' inability to foresee and avoid aircraft disturbance when engaged in subsistence pursuits (BLM 2017). The spatial unpredictability of aircraft disturbance contrasts with other development-related disturbances that are predictably associated with gravel roads, pads, and other forms of fixed infrastructure. The information needed to address this issue is a rigorous, interdisciplinary understanding of the effects of aircraft disturbance (including acoustic factors and contextual non-acoustic factors) on subsistence resources, users, and activities. * Long-term acoustic monitoring to determine actual development-related impacts on the acoustic environment, determine the need for noise-mitigation measures, evaluate the effectiveness of such measures following implementation, and support adaptive management. What information is currently</p>	<p>Page 3-18 of the Draft EIS acknowledges non-acoustical factors that can affect human and nonhuman receptors. The BLM has added the unpredictability of aircraft noise to this discussion in the Final EIS. The sources of information cited were examined, and information was added to Section 3.2.3 of the Final EIS where applicable.</p>

23. (cont.)	(see above)	(see above)	(see above)	(see above)	(see above)	(see above)	<p>their dens will be disturbed by the type of petroleum-related activities measured here, providing those activities do not take place within 100 m of the den." But there remains a lack of information about noise levels that are most likely to cause bears to abandon dens, and variation among individual bears also is a factor. There have been instances in which bears have denned immediately adjacent to industrial infrastructure and stayed in the den for the full term. There also have been instances in which dens were abandoned early due to nearby disturbances such as ice-road construction (T. Atwood, pers. comm., 2/13/2018). On the topic of aircraft disturbance of subsistence activities, Stinchcomb (2017) concluded on the basis of a meta-analysis of published literature that "...no peerreviewed literature has addressed the conflict between low-flying aircraft and traditional harvesters in Arctic Alaska" despite extensive evidence that such conflicts are widespread. She speculated that "...the scale over which aircraft, rural communities, and wildlife interact limits scientists' ability to determine causal relationships and therefore detracts from their interest in researching the human dimension of this social-ecological system." Christensen and Christensen (2009) reported results of surveys conducted to determine experiences and preferences of visitors to the Arctic Refuge. Although no survey questions addressed the issue of noise per se, several questions addressed visitor experiences of and preferences for aircraft use for particular types of activities. In addition to the Point Thomson EIS and the forthcoming</p>	(see above)

23. (cont.)	(see above)	(see above)	(see above)	(see above)	(see above)	(see above)	BLM Supplemental EIS for the GMT-2 project, other relevant information sources include impact analyses, stipulations, and best management practices included in the Integrated Activity Plan (IAP) for NPR-A (BLM 2013). Although the IAP did not address noise as a specific issue topic, noise was a factor considered in analyses conducted for several topics related to wildlife and subsistence. The Record of Decision (ROD) for the IAP includes several specific requirements for permitted aviation activities (see Best Management Practice F1, ROD pages 65-67; also see BLM 2017) that are intended to avoid, minimize, or mitigate aircraft disturbances on wildlife and subsistence activities. These include spatial and seasonal buffers, in addition to minimum flight altitudes (contingent on flight safety considerations). * Long-term acoustic monitoring. No long-term monitoring has been established in the 1002 Area for the purpose of detecting future changes in acoustic conditions and attributing such changes to particular activities including those associated with oil and gas exploration and development.	(see above)

28.	Brook	Brisson	Trustees for Alaska	98269	149	Acoustic Environment	<p>First, the affected acoustic environment in the DEIS is deficient because it fails to identify an adequate baseline using accurate data on background ambient noise levels in the project area. In our scoping comments, we highlighted the need for BLM to gather sufficient baseline soundscape data for areas within and throughout the Coastal Plain.⁷⁴³ That baseline data should have then been utilized in a noise impact study, including modeling of all development scenarios. Instead of gathering new data sufficient to establish an accurate and current baseline, BLM utilized data from the 2010 background acoustic monitoring study at Point Thomson.⁷⁴⁴ Data collected nearly a decade ago outside the Coastal Plain does not constitute “a comparable description of existing acoustic environment in the program area,” as the DEIS claims. ⁷⁴⁵ The Point Thomson study measured noise levels adjacent to the northwestern border of the Refuge, not the ambient noise levels within and throughout the Coastal Plain.⁷⁴⁶ Moreover, Point Thomson is closer to the Prudhoe Bay complex, so ambient noise levels are likely to be different than those in the Refuge. Without first establishing an adequate baseline for this program area, BLM cannot effectively evaluate the impacts of oil and gas development on the soundscape of the Coastal Plain.</p>	<p>The gathering of baseline ambient noise level data is beyond the scope of this programmatic-level EIS. Because the hypothetical development scenario represents a level of development and not the actual locations of future project elements, no noise modeling was undertaken. Noise analyses will occur at the project level once specific projects and locations have been proposed. Baseline ambient noise information would be gathered at that time to more accurately reflect actual background conditions; noise analyses, which may include modeling, would reflect actual development proposals.</p>

S.3.2 Air Quality

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
1.	—	—	United States Fish and Wildlife Service	97942	205	Air Quality	The DEIS states that the location, timing, and level of future oil and gas development on the Coastal Plain is unknown at this time and that a qualitative air analysis is being performed. In the other Alaska projects mentioned in this section, quantitative analyses have been performed using a low, medium, and high projected level of development. This type of air analysis has provided informative data to the decision makers and the public. Additionally, further project specific air analysis can tier off of the quantitative air analysis. We recommend that Appendix B., Reasonably Foreseeable Development Scenario for Oil and Gas Resources, which quantifies the most likely unconstrained projected oil and gas baseline development scenario for the Coastal Plain, be used as a basis for a quantitative air analysis and to serve as a general estimate to determine the air quality impacts due to leasing and development.	Unlike specific development projects, where the location, timing, and scope of activities are understood, at this leasing stage, such information is absent. These factors are key to performing useful quantitative air quality analysis or modeling. Given the absence of this information at the leasing stage, such quantitative analysis or modeling would not be helpful to a decision maker at this stage. Since limited information exists to estimate air quality impacts for all action alternatives, site-specific analysis will be performed at the time a project is proposed to determine actual impacts at sensitive receptor locations and to identify any measures necessary to reduce impacts on air quality.

S. Public Comments and BLM Responses (Air Quality)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
2.	Brook	Brisson	Trustees for Alaska	98269	144	Air Quality	<p>Even setting aside the failure to analyze or condition leasing on a comprehensive set of mitigations, the DEIS is deficient because BLM failed to conduct the modeling necessary to adequately analyze air quality impacts, compare alternatives, and support conclusions about compliance with the Clean Air Act. BLM is required to independently estimate the emissions inventory, model air pollution impacts associated with each of the action alternatives, and compare these results to the baseline of Alternative A.728 The absence of modeling deprives the public and decision makers from understanding the air quality impacts of an oil and gas program and evaluating the potential tradeoffs and differences between alternatives - including between Alternative A and the action alternatives. Air quality modeling is a necessary tool for assessing future air pollutant impacts under NEPA and supporting BLM's conclusion that oil and gas activities would be unlikely to exceed health-based National Ambient Air Quality Standards and thresholds set to protect against adverse impacts to air quality related values. A quantitative modeling assessment of the air quality impacts from the alternative development scenarios, based on modeling of emissions associated with the specific assumptions for the development Alternatives - including the location and density of development - would be needed in order to understand whether or not impacts would be greater under certain alternatives for some pollutants, in some locations. BLM's failure to conduct modeling renders the DEIS deficient.</p>	<p>Unlike specific development projects, where the location, timing, and scope of activities are understood, at this leasing stage, such information is absent. These factors are key to performing useful quantitative air quality analysis/modeling. Given the absence of this information at the leasing stage, such quantitative analysis and modeling would not be helpful to a decision maker. The well counts and overall production levels are not anticipated to vary among the action alternatives.</p>

3.	Jill	Nogi	Environmental Protection Agency	71634	1, 2, 3, 4	Air Quality	<p>Based on our review, one of our primary concerns is that the analysis does not adequately assess the potential cumulative impacts to air quality and air quality related values from implementing an oil and gas leasing program within the Coastal Plain. The document relies upon a qualitative, rather than quantitative, air quality analysis, and supports this decision largely upon an assertion that " ... a quantitative analysis would be highly speculative and result in a worst-case scenario outcome." The EPA disagrees with this statement, as representative, quantitative analysis is commonly conducted for NEPA analyses at the oil and gas planning stage, and information is currently available to conduct such an analysis to support informed decision making for oil and gas leasing in the Coastal Plain. Another concern is that the qualitative analysis relies upon comparison to other recent air quality analyses conducted by BLM and BOEM for oil and gas development in the Alaskan arctic region, including the Greater Mooses Tooth-2 project, stating, "Potential emissions from future development proposals are anticipated to be of a type and scale evaluated in the GMT-2 Final SEIS ... "</p> <p>This may be true of individual projects in the Coastal Plain, but the total potential future development is assumed to be significantly larger than GMT-2, as specified in Table 3-3 (21 to 143 million barrels annually, compared to 4.6 million barrels annually by GMT -2). Consequently, the total potential emissions are expected to be far greater than GMT - 2, possibly up to 30 times higher (if emissions are assumed to scale linearly with annual oil production). This difference in scope demonstrates that the DEIS is too narrowly focused</p>	<p>As described in the Draft EIS, the BLM is undertaking the Cumulative Alaska North Slope Air Quality Regional Model to assess the cumulative effects of BLM-authorized oil and gas development throughout the North Slope, including on the Coastal Plain. This study will expand on the Bureau of Ocean Energy Management (BOEM) study to provide an up-to-date assessment of the potential cumulative effects of North Slope onshore and offshore oil and gas development on air quality and air quality related values (AQRVs) in the region. The BLM anticipates that this model will provide the foundation for future updated NEPA analyses. Because the BLM expects that the growth of oil and gas activities on the North Slope will continue for many years, the model will be updated periodically, pending funding availability, to reflect actual development rates and locations. This will allow the BLM, other federal land managers, and the state to monitor the effects oil and gas development on air quality and AQRVs so that appropriate measures can be put in place to minimize the impacts on these resources as needed. The modeling study would not be tied to a specific NEPA effort; rather, it would be used to inform future oil and gas-related NEPA analyses on the North Slope. The first modeling study is expected to be completed in 2020, well before development begins in the program area.</p>

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
3. (cont.)	(see above)	(see above)	(see above)	(see above)	(see above)	(see above)	<p>on future project-specific impacts, rather than on the potential cumulative impacts of the proposed leasing program overall. Further, as acknowledged in the DEIS, the cumulative air quality analyses conducted previously by BLM and BOEM did not include oil and gas development in the Coastal Plain, and therefore are not relevant to an analysis of the potential cumulative impacts to air quality within the program area. These issues further support our recommendation that an adequate assessment of the potential cumulative impacts to air quality and AQRVs is still needed in the EIS. To support informed decision-making regarding areas to offer for oil and gas leasing and the terms and conditions to be applied, we continue to recommend that the EIS consider air pollutant emissions likely to occur on the leases, and the potential impacts to air quality and air quality related values from these emissions. Although additional air quality analysis may be required prior to authorization of future activity in the program area, per Required Operating Procedure 6 (pg. 2-17), such project-specific analyses would only be conducted on a case-by-case basis and would not be of an appropriate scope and scale to assess the cumulative impacts of the overarching Coastal Plain leasing program. We continue to recommend that the BLM convene an air quality technical workgroup to discuss an appropriate methodology for a quantitative air quality analysis to support this planning-level decision, beginning with development of an emissions inventory.</p>	(see above)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
4.	Jill	Nogi	Environmental Protection Agency	71634	14, 15	Air Quality	<p>Air Quality Related Values: The document concludes, based on past analyses, that future development projects in the Coastal Plain are unlikely to result in violation of the air quality standards and air quality related values. We recommend that this statement be amended to indicate that future projects are unlikely to significantly impact AQRVs in Class I areas. We are concerned that significant impacts to AQRVs could occur in the Arctic National Wildlife Refuge itself. The document directs attention to the nitrogen deposition impacts of the GMT-2 project on the Arctic Refuge (0.025 kilograms/hectare-year). This value significantly exceeds the 0.010 kg/ha-yr deposition analysis threshold for nitrogen, established by the Federal Land Managers in the FLAG 2010 4 guidance document. Given that the GMT-2 project is located over 100 miles away from the Arctic Refuge, and GMT-2 emissions are much less than the total potential emissions of projects within the Coastal Plain (based on a comparison of annual oil production in Table 3-3), nitrogen deposition impacts from future development could be a concern, and warrant analysis in the EIS. We understand that high levels of acid deposition could possibly result in damage to vegetation, and the wildlife that depend on this vegetation, within the Arctic Refuge. Our review finds that the DEIS does not identify the possibility or provide a sufficient evaluation of these potential significant impacts, and we recommend that a more robust evaluation of regional acid deposition impacts be conducted for the proposed leasing program, based on reasonable assumptions of emissions from future projects. The evaluation should offer sufficient</p>	<p>The BLM agrees with and has revised the Final EIS to indicate that ARQVs in Class I areas are not expected to be affected significantly because of the distance from the program areas to the nearest such area. In terms of impacts on the Arctic National Wildlife Refuge, the purpose of Federal Land Managers' Air Quality Related Values Work Group Report (FLAG) is twofold: (1) to develop a more consistent and objective approach for the federal land managers to evaluate air pollution effects on public AQRVs in Class I areas, including a process to identify those resources and any potential adverse impacts, and (2) to provide state permitting authorities and potential permit applicants consistency on how to assess the impacts of new and existing sources on AQRVs in Class I areas, especially in the review of Prevention of Significant Deterioration (PSD) of air quality permit applications. The Arctic National Wildlife Refuge is a Class II area; therefore, the threshold is not applicable. Acid deposition impacts from site-specific projects may be analyzed in subsequent NEPA analyses when the location, timing, and scope of activities are understood; these are absent at the leasing stage.</p>

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
4. (cont.)	(see above)	(see above)	(see above)	(see above)	(see above)	(see above)	analysis to determine whether acid deposition impacts from oil and gas development could pose a risk to protected vegetation and wildlife within the Refuge.	(see above)
5.	Jill	Nogi	Environmental Protection Agency	71634	9, 10	Air Quality	We continue to recommend that the BLM convene an air quality technical workgroup, in accordance with the "Memorandum of Understanding Regarding Air Quality Analyses and Mitigation for Federal Oil and Gas Decisions through the National Environmental Policy Act Process" signed by the EPA, U.S. Department of Agriculture, and U.S. Department of Interior on June 11, 2011, which applies to federal decisions relating to on-shore oil and gas planning, leasing, or field development. We recommend that the technical workgroup discuss the preparation of a quantitative air quality analysis. According to the MOU, the first step in such an analysis would be to develop an emissions inventory based upon the reasonably foreseeable development scenario. For planning level analyses, the MOU suggests developing a range of scenarios (e.g., low, medium, high), which addresses the concern expressed in the DEIS that a quantitative analysis would be "worst-case." We continue to recommend that the technical workgroup then use the emissions inventory to determine the appropriate next steps in the analysis.	Section V.C.1. of the Memorandum of Understanding in part states, "When the Lead Agency determines through NEPA scoping, the air quality or AQRVs will be significantly impacted by a proposed action, the Lead Agency will convene a technical workgroup for that proposed action composed of the Agencies to provide advice about the analysis." Before initiating the EIS, the BLM considered whether the action may result in significant impacts on air quality or AQRVs, and determined it would not; therefore, the air quality technical workgroup was not convened. Further, the analysis in the Draft EIS is consistent with this determination. Unlike specific development projects, where location, timing, and scope of activities are understood, at this leasing stage, such information is absent. These factors are key to performing useful quantitative air quality analysis or modeling. Given the absence of this information at the leasing stage, such quantitative analysis or modeling would not be helpful to a decision maker.

Given the absence of this information at the leasing stage, such quantitative analysis or modeling would not be helpful to a decision maker at this stage. Since limited information exists to estimate air quality impacts for all action alternatives, a site-specific analysis will be performed at the time a project is proposed to determine actual impacts at sensitive receptor locations and to identify any measures necessary to reduce impacts on air quality.

The air quality impacts do not vary across the action alternatives.
20.	Brook	Brisson	Trustees for Alaska	81368	78	Air Quality	Air quality modeling is the only way to evaluate how emissions sources will impact air quality aside from direct monitoring, which is only able to measure real-time pollution levels at the location of the monitoring device. BLM must prepare a modeling analysis of the direct, indirect, and cumulative impacts on air quality that could occur under the various alternatives considered for the leasing DEIS. For each alternative, a comprehensive emissions inventory should be developed and used as input to an air quality dispersion modeling analysis in order to fully assess the impacts on air quality throughout the region from an oil and gas program on the Coastal Plain.	Unlike specific development projects, where the location, timing, and scope of activities are understood, at this leasing stage, such information is absent. These factors are key to performing useful quantitative air quality analysis or modeling. Given the absence of this information at the leasing stage, such quantitative analysis or modeling would not be helpful to a decision maker. The air quality impacts do not vary across the action alternatives.

21.	Brook	Brisson	Trustees for Alaska	81368	81	Air Quality	Pollutant levels that are lower than the NAAQS are not necessarily without risk for all individuals. And many of EPA's air quality standards are set to protect against short-term exposures that can cause harm, meaning even visitors to the Coastal Plain can be adversely impacted by exposures to hourly and daily pollution levels (e.g., of ozone, NO ₂ , SO ₂ , and particulate matter). The maximum emission rates from sources over the averaging times of the standard for which impacts are being assessed should be modeled.	Unlike specific development projects, where the location, timing, and scope of activities are understood, at this leasing stage, such information is absent. These factors are key to performing useful quantitative air quality analysis or modeling. Given the absence of this information at the leasing stage, such quantitative analysis or modeling would not be helpful to a decision maker. The air quality impacts do not vary across the action alternatives.
22.	Megan	Williams	o.b.o. Trustees for Alaska	81368	82	Air Quality	The modeling analysis should be based on meteorological input data according to EPA's Guideline on Air Quality Models. See, e.g., Section 8.4 of EPA's Guideline on Air Quality Models at 40 C.F.R. Part 51, Appendix W.	Unlike specific development projects, where the location, timing, and scope of activities are understood, at this leasing stage, such information is absent. These factors are key to performing useful quantitative air quality analysis/modeling. Given the absence of this information at the leasing stage, such quantitative analysis or modeling would not be helpful to a decision maker. The air quality impacts do not vary across the action alternatives.
23.	Megan	Williams	o.b.o. Trustees for Alaska	81368	83	Air Quality	For the NAAQS analysis, appropriate background concentrations reflective of current air quality in the area should be added to the modeling results.	Unlike specific development projects, where the location, timing, and scope of activities are understood, at this leasing stage, such information is absent. These factors are key to performing useful quantitative air quality analysis or modeling. Given the absence of this information at the leasing stage, such quantitative analysis or modeling would not be helpful to a decision maker. The air quality impacts do not vary across the action alternatives.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
24.	Brook	Brisson	Trustees for Alaska	81368	73	Air Quality	A quantitative modeling assessment of the air quality impacts from the Alternative development scenarios, based on modeling of emissions associated with the specific assumptions for the development Alternatives - including the location and density of development - would be needed in order to understand whether or not impacts would be greater under certain Alternatives for some pollutants, in some locations. Absent such an assessment, BLM has not demonstrated and cannot demonstrate that its Alternatives ensure no significant air quality impacts and full compliance with the Clean Air Act (CAA).	Unlike specific development projects, where the location, timing, and scope of activities are understood, at this leasing stage, such information is absent. These factors are key to performing useful quantitative air quality analysis or modeling. Given the absence of this information at the leasing stage, such quantitative analysis or modeling would not be helpful to a decision maker. The air quality impacts do not vary across the action alternatives.
25.	Withheld	Withheld	—	68965	56	Air Quality	27. Chapter 3; section 3.2.2, page 3-16 to 3-17, Air Quality Cumulative Effects. This analysis is entirely inadequate. As presented, the analysis appears to refer to past EIS analyses like that for the GMT2 project as the best available baseline, and then goes on to say that no cumulative effects analysis for air quality that includes the Coastal Plain has been done, but studies are being developed. The purpose of this EIS is to present that cumulative analysis, now, using current best available information. You can't simply say, "We're working on it," and claim that as a meaningful cumulative effects analysis.	See the response to AIR-3 regarding cumulative effects.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
26.	Withheld	Withheld	—	96867	2	Air Quality	3-17 "As described above, the cumulative analyses for the GMT2 Final SEIS and the BOEM Arctic Air Quality Modeling Study did not account for proposed oil and gas development in the Coastal Plain, and therefore the potential cumulative effects of future oil and gas activities are not fully known at this time. As described by ROP 6, the direct, indirect, and cumulative effects of proposed oil and gas development proposals would be analyzed at the time of a specific project proposal to fully assess the effect of Coastal Plain development on air resources." Unacceptable to leave this for the future.	See the response to AIR-3 regarding cumulative effects.
27.	Carolyn	Alkire	Key-Log Economics o.b.o. The Wilderness Society	81368	92	Air Quality	BLM must perform a cumulative analysis of air quality impacts that could occur under all of the alternatives, including the no-action alternative. Specifically, the cumulative analysis must include impacts from all existing sources and reasonably foreseeable sources of air emissions that could impact the same area impacted by the proposed alternatives.	See the response to AIR-3 regarding cumulative effects.
28.	Brook	Brisson	Trustees for Alaska	81368	94	Air Quality	BLM must include a quantitative analysis of the cumulative impacts to air quality and air quality related values of an oil and gas program on the Coastal Plain along with all other existing and reasonably foreseeable future sources of air pollution in the area.	See the response to AIR-3 regarding cumulative effects.

32.	Steven	Amstrup	Polar Bears International	81368	95	Air Quality	It's critical that BLM, in carrying out its commitments under the terms of the "Memorandum of Understanding Regarding Air Quality Analyses and Mitigation for Federal Oil and Gas Decisions through the National Environmental Policy Act Process," ¹⁶ (air quality MOU) convene a technical air quality work group, to include signatory agencies and relevant State agencies (e.g., Alaska Department of Environmental Conservation (ADEC)), to collectively agree upon a modeling protocol and review results. BLM's failure to utilize the expertise of these agencies to ensure air quality modeling conducted as part of this NEPA analysis thoroughly and accurately discloses the effects of all phases of oil and gas development on air quality on the Coastal Plain raises serious questions as to scientific integrity and transparency of this NEPA process.	Section V.C.1. of the Memorandum of Understanding in part states, "When the Lead Agency determines through NEPA scoping, the air quality or AQRVs will be significantly impacted by a proposed action, the Lead Agency will convene a technical workgroup for that proposed action composed of the Agencies to provide advice about the analysis." Before initiating the EIS, the BLM considered whether the action may result in significant impacts on air quality or AQRVs, and determined it would not; therefore, the air quality technical workgroup was not convened. Further, the analysis in the Draft EIS is consistent with this determination. Unlike specific development projects, where the location, timing, and scope of activities are understood, at this leasing stage, such information is absent. These factors are key to performing useful quantitative air quality analysis or modeling. Given the absence of this information at the leasing stage, such quantitative analysis or modeling would not be helpful to a decision maker.

33.	Jill	Nogi	Environmental Protection Agency	71634	13	Air Quality	We also note that EPA comments on other oil and gas development projects, such as GMT-2, indicated that 1-hour N02 concentrations at the fence line were of sufficiently high levels to warrant a closer look to determine if they were above the National Ambient Air Quality Standards. For example, GMT-2 modeling demonstrated 1-hour N02 impacts very near to the 1-hour N02 NAAQS under all scenarios. Given the greater emissions expected from development in the Coastal Plain as compared to GMT-2, there is the possibility that N02 impacts from such Coastal Plain projects could exceed the N02 NAAQS or create a Prevention of Significant Deterioration increment exceedance. We recommend that the Coastal Plain EIS focus on the need for a robust air quality analysis for all future projects rather than relying upon these qualitative comparisons.	See the responses to AIR-1 through AIR-3 regarding the methodology used for the Coastal Plain EIS. As described by ROP 6, which has been updated in the Final EIS, quantitative NEPA analyses will be performed when site-specific proposal applications are submitted to the BLM. The BLM's Alaska North Slope Air Quality Regional Model will model National Ambient Air Quality Standards (NAAQS) concentrations and PSD increments; it will provide an ongoing assessment of air quality conditions in the North Slope and at sensitive locations such as at the Arctic National Wildlife Refuge.
34.	Jill	Nogi	Environmental Protection Agency	71634	17	Air Quality	Other Air Quality Comments: The document discusses the potential increase in air traffic around the city of Kaktovik. We recommend that potential impacts to air quality and health for residents of Kaktovik be addressed in the analysis.	The BLM has added a qualitative discussion of the potential impacts from the increase in air traffic at Kaktovik to Section 3.2.2 of the Final EIS.
35.	Julia	Wagner	—	83570	8	Air Quality	When the air in the other parts of the Coastal Plain is being contaminated by the development industry facilities, contamination of the land and the waters of the whole plain will occur by precipitation, as stated in the DEiS itself: „These post-lease activities would emit air pollutants from a variety of sources during exploration, development, and production. These pollutants could affect air quality and AQRVs on the Coastal Plain and in nearby areas.” (3-12)	Deposition is described on page 3-12 of the Draft EIS. As noted by the commenter, post-lease activities would emit air pollutants and potentially contribute to deposition effects in the Coastal Plain.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
36.	Natalie	Dawson	—	81061	7	Air Quality	<p>Air quality: Has not been adequately performed in NPR-A, will need to take place over length of time encompassing and beyond all activities around oil and gas leasing and drilling; required under NEPA to have quantitative AQ and AQRV analyses prior to development on federal lands including the Coastal Plain; this modeling needs to include near-field monitoring (AERMOD) and far field monitoring (NSRAQM); also needs to include worst-case predictions of air quality monitoring; this monitoring should not be done by industries that are part of development or subsidiaries, because of conflicts of interest. It should be done by outside organizations such as ACAT and local communities with capacity for funding built into the costs of the lease sales; analyses for NPR-A lands are out-of-date and timeline and costs are not accurate for what is necessary in the 1002 Coastal Plain; for each stage of development specific project descriptions should include: number, size and location of wells, number of pads, estimates of air emissions, number and locations of roads, specific and auxillary equipment use, supplemental power, construction activity, geographic proximity of sensitive resources, topography and emissions magnitude.</p>	<p>The adequacy of analysis in the National Petroleum Reserve in Alaska (NPR-A) is outside the scope of this EIS; however, the BLM has an updated Integrated Activity Plan EIS for the NPR-A that has included a non-industry-prepared quantitative analysis of air quality and AQRVs. This analysis was prepared with input from cooperating agencies and members of the air quality technical working group convened pursuant to the 2011 Air Quality MOU. Cooperating agencies and working group participants reviewed the methodology and work products for this analysis..</p>

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
37.	Megan	Williams	o.b.o. Trustees for Alaska	81368	72	Air Quality	Depending on where the lease sales occur and the density of development, it's possible that greater impacts to human health and air quality related values will result under the different Alternatives. If, under certain Alternatives, more concentrated development were to occur closer to the Native Village of Kaktovik or areas with more concentrated recreational or subsistence uses, for instance, it would be important for BLM to evaluate and disclose the potential for greater air quality impacts to those areas in the DEIS.	Based on currently available information and the uncertainties described in Appendix B (page B-7), it is difficult to ascertain at this time the location or concentration of development that may occur under each alternative; however, because not all scenarios in the alternatives may have the same impact, the BLM has added a qualitative discussion of potential air impacts, based on density and proximity of development to areas of interest, to the Final EIS.
38.	Steven	Amstrup	Polar Bears International	81368	74. 75	Air Quality	The scope of BLM's analysis for the DEIS should include all reasonably foreseeable impacts from exploration (including pre-leasing seismic surveying), development, production, and reclamation activities. It is important that BLM evaluate the impacts to air quality and air quality related values from the various activities associated with all program phases and consider the overlapping impacts from all emissions sources that could reasonably occur at the same time. For example, the combined impacts of exploration, development (construction), production, and reclamation activities must be evaluated in parallel if these activities could be reasonably assumed to occur simultaneously on the Coastal Plain in any given year. It's possible seismic surveying and exploratory drilling activities have the potential to generate short-term emissions at an intensity that could produce localized ambient concentrations of short-term NO2 and particulate matter (PM) in excess of the NAAQS.	Please see the responses to AIR-1 through AIR-3 regarding the scope of analysis for the Coastal Plain Draft EIS. For the reasons described in Appendix B of the Draft EIS (page B-7), including the uncertainties surrounding the amount and location of technically and economically recoverable oil, it is difficult to estimate at this time what the pace of development would be and therefore what activities would overlap at a given time or in a given year. Site-specific proposals for seismic surveying, exploration, and development will include a more detailed level of NEPA analysis, including a cumulative analysis that takes into account other activities in the project area.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
39.	Carolyn	Alkire	Key-Log Economics o.b.o. The Wilderness Society	81368	76	Air Quality	BLM also states that, “[t]he seismic survey activities evaluated in the BOEM emissions inventory report (BOEM 2014, page III-1) would be similar in scale to seismic survey activities on the Coastal Plain (Brumbaugh pers comm 2018).” ⁶ However, BOEM’s 2014 emissions inventory is for offshore survey activities (e.g., including marine survey vessels and support vessels, icebreakers, etc.) and therefore does not account for emissions from heavy vehicle traffic, ground or air re-supply activity, generator engines needed to sustain large camps, fuel storage tanks, and rubber tracked vibrators needed for onshore seismic survey operations. BLM cannot rely on BOEM’s offshore impact analysis as representative of onshore seismic survey and exploration activities on the Coastal Plain.	The BOEM emissions inventory report included an emissions inventory for offshore seismic surveys in the outer continental shelf areas and an emissions inventory for onshore seismic surveys in North Slope oil and gas fields. The Draft EIS text referenced in BOEM 2014, page III-1 describes the onshore sources included in the emissions inventory, which include the sources referenced in the comment. As such, the referenced BOEM text is appropriate for comparison to potential seismic survey activities that would occur on the Coastal Plain.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
40.	Jill	Nogi	Environmental Protection Agency	71634	11	Air Quality	We are aware that the BLM is making progress toward completing a North Slope Regional Air Quality Model and recommend that the technical workgroup consider whether this model could be utilized in the quantitative air quality analysis to efficiently support decision making for the Coastal Plain Leasing Program.	The North Slope Air Quality Regional Model is being prepared to support management actions affecting the NPR-A, the North Slope, Prudhoe Bay, and other oil and gas-producing areas such as the Coastal Plain. The model is being developed with input from the air quality technical workgroup. It will model air quality and AQRV impacts as oil and gas development progresses over time, which will support decision-making for oil and gas-related actions throughout the North Slope, including actions in the Coastal Plain. While this model will not be available for this Leasing EIS, it is anticipated to be completed in 2020 and will be available to support future oil and gas development proposals. As described in Table B-3 of Appendix B in the Final EIS, the first exploration action is not anticipated to occur until 7 years after the first lease sale.

S. Public Comments and BLM Responses (Air Quality)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
41.	Megan	Williams	o.b.o. Trustees for Alaska	81368	96	Air Quality	BLM mentions in the DEIS that it "is undertaking its own study, the Cumulative Alaska North Slope Air Quality Regional Model, to assess the cumulative effects of BLM-authorized oil and gas development on the North Slope, including on the Coastal Plain." ¹⁷ According to the DEIS, BLM intends for this modeling effort to inform future oil and gas-related development on the North Slope. Importantly, BLM indicates that, "the model would be updated periodically to reflect actual development rates and locations, allowing the BLM, other federal land managers, and the state to monitor the effects oil and gas development is having on air quality and AQRVs so that appropriate measures can be put in place to minimize the impact on these resources as needed." ¹⁸ The results of this analysis are needed prior to finalizing the DEIS for an oil and gas program on the Coastal Plain and BLM must provide an opportunity for the public to review and comment on the analysis prior to incorporating the results into a final action on the oil and gas program on the Coastal Plain.	The North Slope Air Quality Regional Model is being prepared to support management actions affecting the NPR-A, the North Slope, Prudhoe Bay, and other oil and gas-producing areas. While it will inform future NEPA analyses throughout the North Slope, it is not intended to be associated with any single NEPA action, such as this Leasing EIS.

42.	Megan	Williams	o.b.o. Trustees for Alaska	81368	109	Air Quality	In order to accurately reflect changing conditions and improved estimation techniques, BLM should commit to updating the Cumulative Alaska North Slope Air Quality Regional Model analysis every three years. This will allow BLM to: (1) periodically evaluate advances in mitigation technologies and operating practices in order to better inform future decisions on leasing development; and (2) establish Best Management Practices / Stipulations that are based on the latest science. Examples of this approach include: (1) Utah BLM's Air Resource Management Strategy (ARMS); ⁶⁷ and (2) Colorado BLM's Comprehensive Air Resource Protection Protocol (CARPP), which commits to periodic review (no less than every three years) of the associated Colorado Air Resource Management Modeling Study (CARMMS), originally completed in January 2015 and updated two times since then, including most recently in August 2017. ^{68,69}	The Alaska North Slope Air Quality Regional Model is being designed to function similarly to the regional modeling studies referenced in the comment, including performing updates every 3 to 5 years as new input data become available, subject to funding availability. This will allow the BLM to monitor air quality conditions as development on the North Slope proceeds over time.
43.	Tim	Whitehouse	PEER	95601	11	Air Quality	Far-field (North Slope Regional Air Quality Modeling - NS RAQM) and Near-field modeling (AERMOD) will need to be modified to incorporate the Arctic 1002 area, through extension of a current BLM contract, a new agency contract, or with additional agency personnel.	The North Slope Regional Air Quality Modeling study will incorporate the 1002 Area in its model domain area.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
44.	Megan	Williams	o.b.o. Trustees for Alaska	81368	97	Air Quality	BLM must complete an analysis to determine how much of the incremental amount of air pollution allowed in clean air areas (i.e., PSD increment) has already been consumed in the affected area and how much additional increment consumption will occur due to the proposed oil and gas program on the Coastal Plain. Without this analysis, the BLM is not adequately ensuring that air quality will not deteriorate more than allowed under the CAA.	It is outside the scope of the BLM's authority to perform PSD increment consumption analyses; regulatory authority for such analyses is with the Alaska Department of Environmental Conservation (ADEC). The BLM's Alaska North Slope Air Quality Regional Model will compare PSD model results with PSD increments to inform decision makers. The first modeling study is expected to be completed in 2020; the model will be updated every 3 to 5 years, pending funding availability, to provide an ongoing assessment of air quality conditions in the North Slope and at sensitive locations such as the Arctic National Wildlife Refuge.
45.	Steven	Amstrup	Polar Bears International	81368	98	Air Quality	BLM did not address the prevention of significant deterioration of air quality	It is outside the scope of the BLM's authority to perform PSD increment consumption analyses; regulatory authority for such analyses is with the ADEC. The BLM's Alaska North Slope Air Quality Regional Model will compare PSD model results with PSD increments to inform decision makers. The first modeling study is expected to be completed in 2020; the model will be updated every 3 to 5 years, pending funding availability, to provide an ongoing assessment of air quality conditions in the North Slope and at sensitive locations such as the Arctic National Wildlife Refuge.

46.	Brook	Brisson	Trustees for Alaska	81368	98	Air Quality	in the DEIS except to say that it is unlikely that a future project-specific proposal on the Coastal Plain would exceed an PSD increment. ⁵⁹ And as noted previously, BOEM's analysis of new oil and gas sources shows that a sizable portion of the PSD Class II increments (e.g., for PM _{2.5}) would already be consumed in the Arctic National Wildlife Refuge 1002 area and the Arctic National Wildlife Refuge Wilderness Area.	As noted by the commenter, the Draft EIS stated that future project-specific proposals on the Coastal Plain would be unlikely to exceed a project-level PSD increment. The Draft EIS further stated that because air quality conditions at the time of future project proposals would be different than air quality conditions today and because oil and gas development on the North Slope is expected to increase and contribute to cumulative air quality impacts over time, each project-specific NEPA analysis would require a determination of potential direct, indirect, and cumulative impacts on air quality and AQRVs. This would include a comparison of modeled results with PSD increments. In addition, the BLM's Alaska North Slope Air Quality Regional Model will compare PSD model results with PSD increments to inform decision makers. The first modeling study is expected to be completed in 2020; the model will be updated every 3 to 5 years, pending funding availability, to provide an ongoing assessment of air quality conditions in the North Slope and at sensitive locations such as the Arctic National Wildlife Refuge. The model is being developed with input from BOEM, the ADEC, the United States Fish and Wildlife Service (USFWS), and other stakeholders.

47.	Steven	Amstrup	Polar Bears International	81368	99	Air Quality	<p>None of the Lease Stipulations in the DEIS address air quality. And none of the Required Operating Procedures (ROPs) - with the exception of ROP 5, which includes a provision that all oil and gas operations (vehicles and equipment) that use diesel fuels must use ultra-low sulfur diesel, as defined by EPA60 - include enforceable requirements to address air quality. Specifically, ROP 6 - to Prevent unnecessary or undue degradation of the lands and protect health - includes the following discretionary provisions:</p> <p>a. The BLM Authorized Officer may require baseline ambient air monitoring for any pollutant of concern, as determined by BLM b. The BLM may require monitoring for the life of the project, depending on the project magnitude, location, and other measures as identified by BLM c. The BLM may require an emissions inventory d. The BLM may require an emissions reduction plan / operator-committed measures e. The BLM may require air quality modeling f. The BLM will require additional mitigations measures to address any modeled exceedances of NAAQS/AAQS or levels of concerns for AQRVs g. The BLM may require changes in activities, within the scope of BLM's authority, to minimize or reduce impacts through additional emission control strategies if air monitoring indicates that project-related emissions are causing or contributing to NAAQS exceedances or degrading the lands⁶¹</p>	<p>Lease stipulations are not the appropriate protection tool for all resource programs; lease stipulations are generally applied to protect on-the-ground resources such as waterbodies or sensitive habitat areas. For this program, ROPs were deemed the appropriate tool for managing air quality protection over the life of oil and gas development in the Coastal Plain. The ROP 6 elements were developed in coordination with the State of Alaska as the provisions that would be applied to future development proposals to ensure that specific projects would not have an adverse impact on air quality. Because not every provision would need to be applied for every development proposal in order to assess or protect air quality, the ROP language was written as reflective of what may be required at each application stage and serves to inform BLM staff and industry of what provisions may be required for project approval. The decision on what provisions will be required will be determined at the time of application and will depend on the timing, location, and scale of the proposal and the results of project-specific air quality analyses. That said, the BLM has modified ROP 6 in the Final EIS to align with the ROP for the NPR-A Integrated Activity Plan (IAP) EIS, which is now under development. This ROP lays out the anticipated requirements for future NEPA air analysis more clearly, and it aligns the requirements across the two program areas to provide certainty to developers about future requirements and assurances to agencies and the public that air</p>

47. (cont.)	(see above)	(see above)	(see above)	(see above)	(see above)	(see above)	(see above)	quality will be considered and protected across all stages of oil and gas development.
48.	Carolyn	Alkire	Key-Log Economics o.b.o. The Wilderness Society	81368	105	Air Quality	BLM should rigorously explore and objectively evaluate reasonable measures to avoid PM10 and PM2.5 impacts from an oil and gas program, including: (1) the use of dust suppression practices on all unpaved roads; (2) applying Tier 4 engine technology that includes a diesel particulate filter (DPF); and (3) requiring all diesel vehicles to use DPF technology. Reasonable alternatives to reduce PM emissions that BLM should rigorously explore and objectively evaluate also include reducing the pace and intensity of development and using remote monitoring systems to reduce the extent of on-site inspections and associated mobile source emissions.	ROP 5 of the Draft EIS requires the use of low sulfur diesel fuel. Other measures to reduce or avoid particulate emissions will be applied at the project-level stage based on the results of a site-specific NEPA analysis by the BLM or as conditions of approval in permits issued by the ADEC, Division of Air Quality.
49.	Steven	Amstrup	Polar Bears International	81368	106	Air Quality	BLM should rigorously explore and objectively evaluate reasonable measures to avoid unacceptable health risks from near field HAPs concentrations and ozone and climate impacts caused by the proposed alternative(s), including: (1) prohibiting venting and flaring except in emergencies; (2) the application of high-efficiency compressor technologies and practices; and (3) advanced leak detection and repair protocols.	Specific measures to reduce or avoid pollutant emissions will be applied at the project-level stage based on the results of a site-specific NEPA analysis by the BLM or as conditions of approval in permits issued by the ADEC, Division of Air Quality.

50.	—	—	Alaska Department of Natural Resources	94102	40	Air Quality	15 Chapter 2, Section 2.2, Page 2-18, Table 2-2 Non-applicability of proposed air quality requirements The information for all the alternatives discussed under Require Operating Procedure 6 "Prevent unnecessary or undue degradation of the lands and protect health" discusses BLM requirements for air quality. This information neglects to mention that ADEC has regulatory authority under the Clean Air Act for air quality permitting. Item "f." in this section states that "If the air quality analysis show potential future exceedances of National Ambient Air Quality Standards (NAAQS) or Alaska Ambient Air Quality Standards (AAAQS) or impacts above certain levels of concerns for AQRVs, the BLM would require air quality mitigation measures and strategies within its authority and in consultation with local, State, federal, and tribal agencies with responsibility for managing air resources, in addition to regulatory requirements and proponent committed emissions reduction measures and for emission sources not otherwise regulated by the ADEC or EPA." It is not clear what is meant by BLM air quality mitigation measures and strategies within its authority. In the specific context of Air Quality Related Values (AQRVs), such as visibility, the impacts over certain levels of concern for AQRVs only exist when an emission source is located within a reasonable distance of federal lands with a Class 1 air quality designation, such as national parks. The closest Class 1 lands are in Denali National Park 526 miles away.	The BLM must ensure that BLM-authorized activities comply with the Clean Air Act and all applicable federal, state, tribal, and local air quality laws and regulations. ROP 6, which was developed in coordination with the State of Alaska, is intended to help the BLM meet its responsibilities under the Clean Air Act as well as under the Federal Land Policy and Management Act, the NEPA, the Wilderness Act, and the National Wildlife Refuge System Administration Act, all of which guide the BLM's management of air resources.

51.	Tim	Whitehouse	PEER	95601	7	Air Quality	<p>What do we need to know and why regarding Air Quality Monitoring and Analysis? ? Air Quality (AQ) and Air Quality Related Values (AQRV) analyses will be required for oil and gas exploration and development in the 1002 Area of the Arctic National Wildlife Refuge (NWR). ? The legal basis for performing AQ and AQRV analyses for industrial activities that may affect federal lands and for operating in the Arctic NWR come from: ? Clean Air Act (CAA), ? National Environmental Protection Act (NEPA), ? Federal Land Policy Management Act (FLPMA), ? Refuge Improvement Act and the Wilderness Act, ? Alaska National Interest Lands Conservation Act (ANILCA), and ? Arctic NWR Comprehensive Conservation Plan (CCP). ? Guidance and Policy regarding AQ and AQRV analysis can be found in the: ? Federal Land Managers' Air Quality Related Values Work Group (FLAG) Phase I Report-Revised (2010), and ? Memorandum of Understanding among the U.S. Department of Agriculture, U.S. Department of the Interior, and U.S. Environmental Protection Agency, Regarding Air Quality Analyses and Mitigation for Federal Oil and Gas Decisions through the National Environmental Policy Act Process (June 23, 2011). ? Sensitive resources: The Arctic Refuge 1002 area is at the eastern end of the Arctic Coastal Plain, and therefore has similar resources to the NPR-A e.g., lichens and moss, which are important caribou forage during winter and migration. Lichens and moss are particularly sensitive to air pollution. Additionally, the Arctic Refuge coastal plain has: ? Adjacent designated Wilderness which could be degraded by exploration and</p>	<p>The BLM notes that this comment reproduces the contents of an internal USFWS and BLM data needs memorandum developed at the start of this EIS. The BLM used the information in these data needs memorandums to inform the EIS alternatives development process; however, not all of the issues identified in the data memorandums were applicable to this Leasing EIS process. Data gaps and resource assessments prepared by the USFWS and BLM discuss the entirety of the oil and gas development process in the 1002 Area, from leasing to full build-out. Data needs will continue to be assessed, and data will be collected to inform NEPA analyses required for site-specific development proposals. Appendix Q addresses each of the data gaps and resource assessments addressed by the data needs memorandum</p> <p>The summary of air quality and air quality-related values background information, including the legal basis and sensitive resources, are noted. Appendix D of the Draft EIS described the primary laws and regulations applicable to the leasing action. The BLM identified sensitive resources that could be affected and evaluated impacts on these resources in Chapter 3 of the Draft EIS, in the applicable sections. Potential construction and operational activities of hypothetical development scenarios under each alternative were described in Appendix B and analyzed in Chapter 3 of the Draft EIS. 52. (cont.)	(see above)	(see above)	(see above)	(see above)	(see above)	(see above)	NO2 impacts for seismic and exploratory drilling. ? Longer-term: Current projects in NPR-A, including GMT-1 and GMT-2 have existing near- and far-field AQ and AQRV analyses, but these would need to be expanded in scope and include location-specific ambient air quality data. What are key information gaps? ? A clear project description that details the Reasonable Foreseeable Development (RFD). With the RFD estimate, additional high, medium or low projection are created to characterize the future potential development. For each stage (exploration, construction/drilling, production), project descriptions need to include: ? number, size, and highest probability location of wells ? number of pads ? estimates of air emissions ? number and location of roads ? specific and auxiliary equipment used ? supplemental power used (fuel, storage) ? control technologies used ? construction activity and equipment used ? geographic proximity of sensitive resources ? topography ? emission magnitude ? Additions to current near-field and far-field modeling to include the Arctic 1002 area. ? Ambient air quality monitoring in the Arctic 1002 area and downwind (minimum of NAAQS, PM2.5, and Prevention of Significant Deterioration (PSD)) to address cumulative impacts and support accurate modeling.	(see above)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
53.	Tim	Whitehouse	PEER	95601	12	Air Quality	Establish long-term NAAQS ambient monitoring stations in or near Arctic 1002 area and downwind in sensitive areas, including monitoring and study sites.	The ADEC, Air Quality Division; the North Slope Borough; and the BLM and USFWS are evaluating the potential for providing additional monitoring stations on the North Slope. In particular, the BLM is currently developing a contract scope of work to establish a long-term air quality monitoring station in Kaktovik. The station would collect year-round air pollutant data that would be used to support BLM decision-making related to land use planning, and compliance and reasonably foreseeable future land use authorizations.
54.	Harry K.	Brower Jr.	North Slope Borough	95612	24	Air Quality	However, it appears that BLM has not considered the impacts of gas flaring associated with oil and gas exploration and production in its analysis of outdoor air quality. We suggest that BLM include and analyze the potential effects associated with this emissions source.	Evaluating the impacts of flaring is beyond the scope of this programmatic-level EIS, which is to evaluate the impacts of leasing and not site-specific future development activity. This type of analysis would be performed during a site-specific NEPA analysis at the time a development application is submitted.
55.	Harry K.	Brower Jr.	North Slope Borough	95612	25	Air Quality	BLM also should consider the relationship between outdoor air quality and any corresponding impacts on indoor air quality.	The effects on indoor air quality are outside the scope of this programmatic-level EIS.

S. Public Comments and BLM Responses (Air Quality)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
56.	Harry K.	Brower Jr.	North Slope Borough	95612	26	Air Quality	<p>addition, baseline air quality data are needed for Kaktovik and the Coastal Plain in order to monitor the effects of development on air quality. These baseline data must be obtained before construction activities begin. We suggest that monitoring stations be constructed in: (1) Kaktovik; (2) in the portion of the Coastal Plain where development might occur; and (3) downwind of possible development.</p>	<p>The suggestion of where to place monitoring stations is noted. The BLM is currently developing a contract scope of work to establish a long-term air quality monitoring station in Kaktovik. The station would collect year-round air pollutant data that would be used to support BLM decision-making related to land use planning, and compliance and reasonably foreseeable future land use authorizations. The data would support air analyses for future oil and gas development on the Coastal Plain by providing baseline air quality information to the BLM, the general public, and the community against which impacts from development can be assessed. This would be done by comparing the data with data or modeling analyses from the sites after development has commenced.</p>
57.	Harry K.	Brower Jr.	North Slope Borough	95612	27	Air Quality	<p>We encourage BLM to require air monitoring for hazardous air pollutants, such as benzene, in addition to the criteria air pollutants, in order to more closely analyze possible effects of emissions on human health.</p>	<p>ROP 6 describes air quality-related protective measures that the BLM would impose on applicants during the permitting process. The type of monitoring required would be determined through an analysis performed at the site-specific level when a development application is submitted; it would depend on a variety of factors, such as the location and scale of the proposal, including the proximity to sensitive receptors.</p>

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
58.	Harry K.	Brower Jr.	North Slope Borough	95612	29	Air Quality	We suggest that the federal government increase funding to the Alaska Department of Environmental Conservation to allow this agency to set up monitoring stations in the Coastal Plain as part of the State of Alaska's Ambient Air Monitoring Network Plan.	Funding decisions are outside the scope of this EIS; however, it should be noted that the BLM is currently developing a contract scope of work to establish a long-term air quality monitoring station in Kaktovik. It is anticipated that the BLM and USFWS would provide funding, while ADEC would provide technical expertise in monitoring, data review and interpretation, and community outreach, including potentially displaying real-time data on its air quality data website.
59.	Kevin	Kane	Sierra Club, Western Watersheds	96216	4	Air Quality	You do not have air particulate measurements for the entire area. This must be collected for an entire year as baseline data for future comparisons before there is exploration.	As described in ROP 6(a), "prior to submittal of an application to develop a CPF, production pad/well, airstrip, road, gas compressor station, or other potential air pollutant emission source (hereafter called project), the BLM Authorized Officer may require the project proponent to provide a minimum of 1 year of baseline ambient air monitoring data for any pollutant of concern, as determined by the BLM." These data would be used to support a site-specific NEPA analysis of each proposal.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
60.	Withheld	Withheld	—	68965	54	Air Quality	25. Chapter 3; section 3.2.2, page 3-13, Air Quality. The effects analysis for Alternative A, the no-action alternative, includes the statement, "Local and regional air emission sources, described above under Affected Environment, would continue to contribute air pollutants at levels commensurate with the increase or decrease in these emission sources over time." Does this mean that no trends in air quality are reasonably certain to occur across the time interval when leased areas on the Coastal Plain might be in some phase of the program? In order to make the effects analysis of Alternative A to be useful as a comparative baseline it needs to include meaningful analysis of environmental trends likely to impact the Coastal Plain for the term of the proposed action. If no trends in air quality can be discerned, the factors that contribute to uncertainty should be described. It is meaningless to state that air pollutants in the area may go up or down depending on whether pollutant generating activities go up or down. Please make your analysis of Alternative A as a control as meaningful as possible, for the Air Quality resource, and all other resources analyzed.	The BLM has revised Section 3.2.2, No Action Alternative, to better describe likely trends under Alternative A.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
61.	Withheld	Withheld	—	68965	55	Air Quality	26. Chapter 3; section 3.2.2, page 3-16, Air Quality. Please consider referring to the hypothetical development scenario here and explaining in greater detail why using this scenario to analyze air quality effects does not reveal differences among the action alternatives. Because this is the first effects analysis encountered by readers of the draft EIS, we arrive here with the reasonable expectation that the hypothetical development scenario will be central to all effects analyses. Beginning with an unusual case in which the hypothetical development scenario is not informative requires explanation.	The hypothetical development scenarios and changes in Chapter 2, Alternatives, have been examined. The BLM has described potential differences among alternatives in the Final EIS.
62.	Jill	Nogi	Environmental Protection Agency	71634	18	Air Quality	We recommend adding a "form of standard" column to Table 3-6 Average Air Pollutant Monitoring Values, to describe how each design value was calculated.	The BLM has revised Section 3.2.3 as suggested in the Final EIS.
63.	Allen E.	Smith	—	74324	10	Air Quality	fails to adequately show how air quality will be protected.	The steps that would be taken to assess air quality impacts and determine appropriate mitigations are described in ROP 6, contained on pages 2-17 to 2-19 of the Draft EIS. The BLM has updated ROP 6 in the Final EIS to better delineate the actions, and the order of the actions, that will be required of the BLM and project proponents in assessing the potential for impacts and any required mitigation and monitoring for future project development proposals.

S. Public Comments and BLM Responses (Air Quality)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
64.	Withheld	Withheld	—	83698	2	Air Quality	there should have been downstream analyses for air quality (pg. 3-10)	Analysis of air quality impacts from downstream combustion of oil and gas produced on the 1002 Area is outside the scope of this document. The downstream use and location of produced oil and gas are highly speculative and therefore not reasonably measurable. Section 3.2.1, Climate and Meteorology, of the Draft EIS estimated downstream greenhouse gas emissions using the BOEM Greenhouse Gas Lifecycle model (pages 3-7 to 3-9).
65.	—	—	Alaska Department of Natural Resources	94102	56	Air Quality	31 Chapter 3, Page 3-13 Justify analysis - inconsistencies The last sentence in paragraph five on this page notes that "Future development proposals on the Coastal Plain are anticipated to be similar in scope to the GMT2 project described and analyzed in the GMT2 Final SEIS (BLM2018a)." This appears to conflict with the discussion of GHG emissions on page 3-6 of this chapter which notes that the Coastal Plain GHG emissions could represent approximately 9 to 59 times the estimated oil production of the GMT2 development. Please clarify.	The intent of this sentence was that individual development proposals were anticipated to be similar in scope to GMT2 rather than representative of total development on the Coastal Plain, though the BLM recognizes that the GMT2 project was for one satellite pad and not the full suite of emissions sources, such as a central processing facility (CPF). The BLM has deleted the referenced sentence from the Final EIS for direct and indirect impacts, and the limitations on the use of GMT2 in the cumulative analysis has been disclosed.
66.	Withheld	Withheld	—	94547	5	Air Quality	How will air quality be affected?	Section 3.2.2 of the Draft EIS provided an overview of the assumed direct, indirect, and cumulative impacts on air quality from opening the 1002 Area to oil and gas development. See also responses to AIR-1 through AIR-3.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
67.	Steven	Amstrup	Polar Bears International	81368	77	Air Quality	And in addition to exploration, development, and production activities, BLM must also assess potential impacts to air quality and air quality related values from the reclamation phase of the program, e.g., short-term and localized impacts from backfill operations, transport of materials (including loading and unloading), storage, heavy vehicle use, ground-disturbing maintenance activities, etc.	A bullet on reclamation has been added to Section 3.2.2 of the Final EIS.

S.3.3 Alternatives

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
1.	Jane	Heisler	—	54194	4	Range of Alternatives	Why does the Draft EIS envision leasing the majority of the Arctic Refuge Coastal Plain to oil and gas corporations, going far beyond what was required in the Tax Act?	Alternative D2 has been modified to offer 800,000 acres for leasing.
2.	Withheld	Withheld	—	55209	1	Range of Alternatives	all the action alternatives in the draft EIS offer much more acreage than required by the Tax Act, which was only 400,000 acres for each sale.	Alternative D2 has been modified to offer 800,000 acres for leasing.
3.	Randy	Oliver	—	56583	1	Range of Alternatives	Required Operating Procedure 35 b. Before final abandonment, land used for oil and gas infrastructure-including well pads, production facilities, access roads, and airstrips-would be restored to ensure eventual restoration of ecosystem function and meet minimal standards to restore general wilderness characteristics. Why only "minimal standards"?	Operators would be required to submit a reclamation plan that satisfies the objective. At the earliest feasible time, the operator shall reclaim the area disturbed, except to the extent necessary, by taking reasonable measures to prevent or control on-site and off-site damage of the federal lands. Text under Alternative D has been edited.
4.	Randy	Oliver	—	56583	2	Range of Alternatives	Required Operating Procedure 40 Objective: Minimize cultural and resource conflicts. I see no provision of enforcement, nor penalties for noncompliance.	As noted under ROP 40, section i, the BLM has authority under 43 CFR 3163 to issue assessments and penalties for non-compliance with oil and gas operational requirements.

S. Public Comments and BLM Responses (Alternatives)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
5.	Randy	Oliver	—	56583	4	Range of Alternatives	Required Operating Procedure 46 Objective: Minimize impacts on marine mammals from vessel traffic. Can there be a requirement for propeller guards in order to protect marine mammals?	The level of specificity for this would be determined at the project-level authorizations. Site-specific analyses, including those associated with infrastructure in support of oil and gas development, can more realistically be provided when the BLM receives an application to permit such infrastructure. The Leasing EIS makes no decisions on such infrastructure, except to prohibit it in specified areas of particularly high value surface resources under some alternatives.
6.	Randy	Oliver	—	56583	6	Range of Alternatives	Water impoundment in a flooded pit would likely remain unfrozen near the bottom, creating a thaw bulb around and beneath the pit, which may cause the excavation walls to slough and deposit material into the pit Should there be a maximum allowable depth specified?	The level of specificity related to pit depth would be determined at the project-level authorizations. Site-specific analyses, including those associated with infrastructure in support of oil and gas development, can more realistically be provided when the BLM receives an application to permit such infrastructure. The Leasing EIS makes no decisions on such infrastructure, except to prohibit it in specified areas of particularly high value surface resources under some alternatives.
7.	Randy	Oliver	—	56583	7	Range of Alternatives	Hordeum jubatum is a salt-tolerant species with extreme cold tolerance and is capable of invading a range of Coastal Plain ecosystems, including coastal-influenced plant communities. It thus has some potential to spread along with development in the program area. If this species is not palatable to local birds or mammals, do eradication measures need to be specified?	As noted under ROP 43, future site-specific authorizations would require an invasive species management plan.
8.	Randy	Oliver	—	56583	8	Range of Alternatives	Re birds: BMPs of eliminating guy wires, reducing tower heights, and shielding lighting would reduce the risk of collisions with facilities in the program area. Are these BMPs spelled out and enforced?	ROP 26 addresses exterior lighting. ROP 27, which focuses on minimizing impacts on bird species, addresses guy wires and towers. The enforcement of ROPs is tied to authorizations.

S. Public Comments and BLM Responses (Alternatives)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
9.	Joan	Norberg	Yukon Conservation Society	57318	5	Range of Alternatives	Industrial activities during nesting and rearing season will destroy some nests, kill some hatchlings and disturb countless other birds. Therefore, YCS respectfully recommends that no activity be permitted during the nesting and rearing seasons for migratory birds.	All future authorizations would be required to comply with the Migratory Bird Treaty Act and would need to meet objectives of ROPs designed to avoid impacts on ground-nesting birds.
10.	Joan	Norberg	Yukon Conservation Society	57318	6	Range of Alternatives	YCS respectfully recommends that no activity take place in the 1002 lands during caribou calving season and that all traces of infrastructure be removed each year prior to calving season.	Removal of infrastructure each year is unrealistic for oil and gas programs.
11.	Withheld	Withheld	—	58633	1	Range of Alternatives	It does not show the sprawling nature of oil development under the different action alternatives on a map which would allow the public to visualize and comment on the extensive nature of the development. The public has a right to full disclosure of the impacts that would result from each of the alternatives.	At the leasing stage it is unknown as to where leases will be issued, where exploration will occur, and, if oil and gas resources are discovered in economic quantities, where development would occur. Accordingly, a spatial depiction could mislead the public into assuming the developments would occur in the depicted areas.
12.	Carolyn	Monteith	—	58750	2	Range of Alternatives	ROP 34 USE OF AIRCRAFT FOR PERMITTED ACTIVITIES (page 2-31) General comment: The ROP is vague and allows for modification of actions after a resource has been impacted. The draft EIS does not address the damage to the resources from these actions. Specifically, Section a states, in part, "Land users would submit an aircraft use plan as part of an oil and gas exploration or development proposal, which includes a plan to monitor flights and includes a reporting system for subsistence hunters to easily report flights that disturb subsistence harvest. The plan would address strategies to minimize impacts on subsistence hunting and associated activities, including the number of flights, type of aircraft, and flight altitudes and routes, and would also include a plan to monitor flights. Proposed aircraft use plans would be reviewed by the appropriate Alaska Native or subsistence organization.	ROP 34a requires submittal of an aircraft use plan associated with project-specific activities, which would analyze impacts from aircraft. Reviews of these plans by Alaska Native or subsistence organizations could allow for up-front mitigations. The BLM has added additional discussion of potential impacts from aircraft to Section 3.3.4.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
12. (cont.)	(see above)	(see above)	(see above)	(see above)	(see above)	(see above)	<p>Consultations with these same agencies would be required if unacceptable disturbance is identified by subsistence users. Adjustments, including possible suspension of all flights, may be required by the BLM Authorized Officer, if resulting disturbance is determined to be unacceptable. (emphasis added). This after the fact modification of the use of aircraft acknowledges damage to the resource, and the EIS does not include the impacts of this damage. Section b of the ROP 34 reads "Use of aircraft, especially rotary wing aircraft, would be kept to a minimum near known subsistence camps and cabins or during sensitive subsistence hunting periods (spring goose hunting, summer caribou, and fall moose hunting) and when recreationists are present." The provision "kept to a minimum" allows as many flights as deemed necessary, and these flights will damage the resources. Again, the draft EIS does not include the impacts of these damages. Section d of ROP 34 reads "Minimize the number of helicopter landings in caribou calving ranges from May 20 through June 20." This ROP allows helicopter landings in caribou calving ranges during the critical time period. The damage to the resource is not included in the draft EIS. Section e of ROP 34 reads "Pursuing running wildlife is hazing. Hazing wildlife by aircraft pilots is prohibited, unless otherwise authorized. If wildlife begins to run as an aircraft approaches, the aircraft is too close, and the operator must break away." This ROP acknowledges that aircraft will likely fly too close to wildlife, and only after the wildlife have been disturbed will the aircraft operator be required to "break away". The damage to the resource is not adequately addressed in the draft EIS.</p>	(see above)

S. Public Comments and BLM Responses (Alternatives)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
13.	Julie	Mages	—	62224	1	Range of Alternatives	On page 2-6 under Lease Stipulation 3, the document states “ Because the subsurface flow paths to perennial springs are unknown and could be disturbed by drilling or fracking, use buffer areas around the major perennial springs that support fish populations in which no leasing is permitted.” How will this be accomplished? The requirement is for the lesee to conduct studies... how long does a study like this need to be run to ensure that they are not disrupting flow? What is the definition of a “buffer area?” This requirement/standard is vague and if not clearly defined could negatively impact springs that are so important to the wildlif refuge.	Buffer areas are identified spatially on Maps 2-2, 2-4, and 2-6 in the Draft EIS. Specific parameters and studies for oil and gas projects would be determined when those authorizations are granted.
14.	Julie	Mages	—	62647	1	Range of Alternatives	Seven times in the document the term “Major Construction” is utilized. This term is extremely important as it limits acitivities in order to preserve natural animal movements, etc. However, there is nowhere in the document that the definition is clearly defined. Will this be addressed on a case-by-case basis? Reccommend adding clarifying language.	Clarifications have been made in the text of Chapters 2 and 3.
15.	Martha	Raynolds	—	67039	11	Range of Alternatives	Lease Stipulation 6 says they will, “manage to ensure unhindered movement of caribou through the area, especially the S-SE portion (calving grounds).” This is not possible under Alternatives A, B or C. The Terrestrial Mammal section says “Using these schematic footprints and extrapolating to a 2,000-acre maximum gravel footprint, it estimated the total acres of potential disturbance and displacement is 633,000 acres (45% of area).”	Text of the note associated with Lease Stipulation 6 has been edited for clarity.

S. Public Comments and BLM Responses (Alternatives)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
16.	Martha	Raynolds	—	67039	16	Range of Alternatives	Lease Stipulation 8's purpose is poorly written: "Objective: To protect key surface resources and subsistence resources/activities resulting from permanent oil and gas development and associated activities in areas used by caribou during post-calving and insect-relief periods." This should be more clearly written.	Text has been edited for clarity.
17.	Martha	Raynolds	—	67039	17	Range of Alternatives	Required Operating Procedure 8 & 9 will require current fish studies, as the information does not exist to meet the Objective, "Maintain natural hydrologic regimes and populations of, and adequate habitat for, fish, and aquatic invertebrates." These studies will have to be completed before the EIS can adequately summarize the impacts or specify appropriate Required Operating Procedures. Who will pay for this? The responsibility for funding these studies should be clearly stated.	This Leasing EIS will not result in the authorization of any on-the-ground activities. Accordingly, the environmental baseline will be preserved throughout the lease sale process. Any on-the-ground activities will require additional NEPA analysis. At that time, the BLM will determine which baseline studies may be necessary.
18.	Martha	Raynolds	—	67039	18	Range of Alternatives	Required Operating Procedure 10: To meet the objective for this ROP, all grizzly and polar bear dens would need to be identified. This is not possible. Some of the methods, such as collaring bears, could cause more disturbance and mortality than the oil & gas impacts they are trying to avoid. Also, who is going to pay for this effort? The responsibility for funding these studies should be clearly stated.	The requirements listed support the objective of the ROP. Locating polar bear dens is part of authorizations received from the USFWS; the State of Alaska does not have a requirement to locate grizzly bear dens. Any required studies prior to on-the-ground activities would be the responsibility of the operator or the authorizing agency. Established techniques used by the USFWS to identify dens, such as collaring, den detection surveys, aerial and handheld forward looking infrared (FLIR), and scent-trained dogs, would be utilized. It is acknowledged that capturing bears does harass the animals; however, the USFWS will utilize all management tools at its disposal to locate dens.

S. Public Comments and BLM Responses (Alternatives)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
19.	Martha	Raynolds	—	67039	19	Range of Alternatives	Required Operating Procedure 35: This objective is not realistic or possible, "Ensure ongoing and long-term reclamation of land to its previous condition and use." In fact, later in the document (p3-57), that is recognized, it says, "Reclamation has not been proven for gravel removal in the arctic environment once operations have ceased." There is no clear statement of bonding requirements.	The BLM believes that the objective is appropriate. Operators would be required to submit a reclamation plan that satisfies the objective of the ROP. Bonding would be determined and required with the specific oil and gas authorization (43 CFR 3134; the BLM would also apply these NPR-A regulations to the Coastal Plain).
20.	Joelle	Buffa	—	67158	2	Range of Alternatives	Alternatives B, C, and D contain no stipulations or mitigating measures to protect nesting shorebirds. Lease Stipulation 4 (Page 2-7), whose purpose is to "Protect fish and wildlife habitat, including that for waterfowl and shorebirds, " only restricts oil/gas development in a miniscule subset of shorebird habitat along the coast. And even in this small portion of the vast (unprotected) shorebird habitat, only oil drill pads are restricted- but infrastructure that supports the drill pads could be permitted. The vast majority of shorebird nesting, resting and migration habitat would be available for oil and gas leasing and untold habitat destruction without protection or mitigating measures.	Lease Stipulation 9 requires an impact and conflict avoidance and monitoring plan, which would address the protection of waterfowl and shorebirds and prevent loss or alteration of important bird habitat. Additional site-specific analyses would be completed for project-level authorizations.
21.	Withheld	Withheld	—	69490	1	Range of Alternatives	put a moratorium on this development until the price of an oil barrel rises to a new high, above \$145 (reached in 2008). That is not a stringent test, if we do not take into account inflation since 2008. Presently, the price is about \$45.	The BLM is required to implement an oil and gas leasing program on the Coastal Plain per PL 115-97, regardless of oil prices.

S. Public Comments and BLM Responses (Alternatives)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
22.	Brett	Mayer	American Canoe Association	69778	2	Range of Alternatives	The Hulahula River is within the proposed leasing zone, and there is nothing in the EIS or leasing stipulations that requires recreational access to rivers or anywhere within the leasing area.	Recreational access would be maintained. Lease Stipulation 4 includes minimizing impacts on recreation. Under Alternative D, Lease Stipulation 1 identifies NSO around the Hulahula River; right-of-way (ROW) authorizations would require additional analysis for resources (including recreation access) before the authorization was granted.
23.	Withheld	Withheld	—	70934	4	Range of Alternatives	BLM should explain why Kimikpowruk (Pokok Bay) which often has lots of Dollies at its mouth in the summer has not been included as an area with setbacks?	Lease Stipulation 4 includes Pokok Bay within the identified NSO area under Alternative B; protections for this area would be more restrictive under other action alternatives.
24.	Withheld	Withheld	—	70934	5	Range of Alternatives	Stipulation 3 Section e- There are significant Aufeis fields on the Aichilik River. This resource should be given consideration in Alternative D. Justification for omitting this should be given.	Lease Stipulation 1 provides additional protections for the Aichilik River, including the aufeis fields.
25.	Withheld	Withheld	—	70934	6	Range of Alternatives	Stipulation 4 - Public access and navigation should be preserved. It would be good to add a provision allowing all travelers, whether Native or non-native, to continue to be able to travel along the coast without fear of arrest. I know several people who have tried to paddle the central Beaufort Coast who have been detained by private security in the oil fields.	Public access points could be maintained; however, if an area is leased, there are rights that go along with the lease that could restrict travel. An NSO in coastal and lagoon areas would maintain public access (even on stream setbacks) as long as all applicable permits are in place.
26.	Withheld	Withheld	—	70934	7	Range of Alternatives	Stipulation 5- a. It is concerning that this list of areas is incomplete and that there is an avenue for exemptions and administrative action to circumvent important environmental regulation. Angun Creek, the Lower Canning, Brownlow Pt Area, Jago Bitty and other suitable habitat should be included. Justification for their omission should be provided and justified.	An area excluded from the list under Lease Stipulation 5 does not mean that it would be omitted from compliance with existing federal and state laws and regulations that must be adhered to. Operators are required to submit a written request for an exception, waiver, or modification and information demonstrating that (1) the factors leading to the inclusion of the stipulation in the lease have changed sufficiently to make the protection provided by the lease stipulation no longer needed or (2)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
26. (cont.)	(see above)	(see above)	(see above)	(see above)	(see above)	(see above)	(see above)	the proposed operation would not cause unacceptable impacts. The criteria for approval of exceptions, waivers, and modifications should be supported by NEPA analysis, and may require site-specific environmental review. Requests should contain, at a minimum, a plan that includes related on-site or off-site mitigation efforts to adequately protect affected resources; data collection and monitoring efforts; and timeframes for initiation and completion of construction, drilling, and completion operations. The operator's request may be included in an Application for Permit to Drill, Notice of Staking, Sundry Notice, or letter. The BLM may also proactively initiate the process. During the review process, BLM coordination with other local, state, or federal agencies (e.g., Alaska Department of Fish and Game [ADFG], North Slope Borough (NSB), and local governments) should be undertaken, as appropriate, and documented. The BLM also will consult with the federal surface management agency (e.g., USFWS). Approval or disapproval is made by the Authorized Officer, and the decision is documented. If the waiver, exception, or modification is approved, any necessary mitigation is also documented. The applicant is then provided with a written notification of the decision. See Instruction Memorandum 2008-032 and 43 CFR 3101.1-4 for additional details.

27.	Withheld	Withheld	—	70934	8	Range of Alternatives	Stipulation 6 - July 20 is a reasonable date for the end of insect season with the current climate and phenology. What metric would be used to monitor the suitability of this date as climate changes and the need for insect avoidance changes? Further there is mention of "Heavy Equipment" page 2-11, BLM should define this term. And should show data that indicates a threshold for disturbance related to the size of vehicles? Does this limit heavy truck traffic?	Heavy equipment has been defined in the glossary. Exceptions, waivers, and modifications provide an effective means of applying "adaptive management" techniques to oil and gas leases and associated permitting activities to meet changing circumstances. The BLM or operators can initiate adaptive management modifications. See Instruction Memorandum 2008-032 and 43 CFR 3101.1-4 for additional details.
28.	Withheld	Withheld	—	70934	9	Range of Alternatives	Stipulation 6 for alternative B and C uses the term "ensure unhindered movement", Given the data furnished by ADF&G reports on the reactions of WAH animals to the Red-dog road, How can you ensure "unhindered" movement while building roads and pipelines? Data suggest that a significant portion of that herd alters behavior when encountering roads and traffic.	The BLM has edited text of the note associated with Lease Stipulation 6 for clarity.
29.	Withheld	Withheld	—	70934	10	Range of Alternatives	Stipulations 6-8, Generally speaking the bulk of the caribou related stipulations seem absurd, impractical, impossible to enforce, maddening to adhere to for people working in the fields and with dubious benefit to the caribou. While the general idea of reducing disturbance during critical times of year is good there needs to be more emphasis on creating substantial spatial buffers around areas that caribou use. Data for identifying calving areas should extend beyond the usual dataset and also include the fossil antler record as established by Wald et al. This is a more accurate and robust sample of which areas are important to the PCH and CAH.	If calving is not occurring in the Coastal Plain in a given year, then the operator may apply for a waiver, exception, or modifications. Operators are required to submit a written request for an exception, waiver, or modification and information demonstrating that (1) the factors leading to the inclusion of the stipulation in the lease have changed sufficiently to make the protection provided by the lease stipulation no longer needed or (2) the proposed operation would not cause unacceptable impacts. The criteria for approval of exceptions, waivers, and modifications should be supported by NEPA analysis, and may require site-specific environmental review. Requests should contain, at a minimum, a plan that includes related on-site or off-site mitigation efforts to adequately protect affected

(see above)	(see above)	(see above)	(see above)	(see above)	(see above)	(see above)	resources; data collection and monitoring efforts; and timeframes for initiation and completion of construction, drilling, and completion operations. The operator's request may be included in an Application for Permit to Drill, Notice of Staking, Sundry Notice, or letter. The BLM may also proactively initiate the process. During the review process, BLM coordination with other local, state, or federal agencies (e.g., ADFG, NSB, and local governments) should be undertaken, as appropriate, and documented. The BLM will also consult with the federal surface management agency (e.g., USFWS). Approval or disapproval is made by the authorized Officer, and the decision is documented. If the waiver, exception, or modification is approved, any necessary mitigation is also documented. The applicant is then provided with a written notification of the decision. See Instruction Memorandum 2008-032 and 43 CFR 3101.1-4 for additional details.
30.	Withheld	Withheld	—	70934	11	Range of Alternatives	Operating procedure #12, There should be a requirement to remove Ice Bridges rather than giving options to slot, or breach.	This is standard industry practice on the North Slope. Site-specific conditions may warrant one approach over another during future analyses associated with project-level authorizations.
31.	Withheld	Withheld	—	70934	12	Range of Alternatives	Operating procedur #23-g, Does not address access for hunters into oil fields. What is the plan for development and hunting to coexists? Can hunters use roadways for snowmachine or ATV travel? How close to a pad is the public permitted? Buffer around roads and pipelines for shooting? Different rules for Kaktovik residents and other Alaskans? There is conflicting information in this document and no clear answers anywhere.	Roads that support oil and gas activities are not open to the public, with the exception of subsistence users and local residents. The BLM is required to provide access to subsistence users, and to require operators to consult with local communities and prohibit workers from recreational hunting activities.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
32.	Withheld	Withheld	—	70934	13	Range of Alternatives	Procedure #34 a. Section B, There is no Moose Hunt in 26C.	Text has been edited for clarity.
33.	Withheld	Withheld	—	70934	13	Range of Alternatives	Section C, Given the frequently foggy conditions in the area it would be appropriate to mandate IFR capabilities and other aircraft navigation technology to ensure that aircraft can operate above minimum altitude for the majority of flights. BLM should also consult with a legal team to determine if it has the regulatory authority to regulate aircraft operations. c. Section D, "minimize" is insufficient. The number of flights needs to be quantified, and residents should be informed of limit.	The Federal Aviation Administration (FAA) has jurisdiction to determine which flight rules would apply for all flights. The BLM does not have regulatory authority to dictate flight rules. At the lease sale stage, there is inadequate information to establish quantitative flight limits.
34.	Withheld	Withheld	—	70934	14	Range of Alternatives	Procedure #43, Vehicle cleaning should be mandatory. The spread of invasive plants from the haul-road is inevitable without a strict and concerted effort. BLM should develop the protocol and enforce it.	The plan submitted by the operator under this ROP would detail the process for vehicle cleaning.
35.	Withheld	Withheld	—	70934	15	Range of Alternatives	Procedure #46- Ledyard Bay, The inclusion of this section makes one wonder if BLM is sufficiently familiar with the geography of the area to responsibly be tasked with administering the leases. Ledyard Bay is several hundred miles west of the Arctic Refuge and the reason for including this section is not clear. Perhaps this section was cut and paste from another EIS??	Ledyard Bay was part of the analysis of the marine transit route identified in the hypothetical development scenario. Text of ROP 46 has been edited for clarity.
36.	Withheld	Withheld	—	70934	31	Range of Alternatives	Page 3- 92, States that glacial river deltas may grow. This is patently false. Declines in glacial mass in the Brooks Range indicate that glaciers will provide less water and sediment to the Hulahula, Jago and Okpilak Rivers in the near future. Changes in hydrology and depositional environments will cause these important deltas to shrink rather than grow, further limiting an already scarce and valuable habitat. NSO or other measures should be taken to protect habitat in these river deltas along with the Canning River Delta.	Text has been edited.

S. Public Comments and BLM Responses (Alternatives)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
37.	Withheld	Withheld	—	70934	37	Range of Alternatives	Page 3 - 173 in regards to public access and ROP 38, Would roads in the project area be open to the public? If so has this been widely publicized on the North-slope? How will safety and security concerns be handled in the future? Without a determination on these issues it is very hard to predict the effects of development. Based on statements in the Recreation Section where BLM predicts that recreation will increase because of road access it would appear that there is an assumption that public access will be granted.	Roads that support oil and gas activities are not open to the public, with the exception of subsistence users and local residents. The BLM is required to provide access to subsistence users, and to require operators to consult with local communities (through development of a subsistence access plan) and prohibit workers from recreational hunting activities.
38.	Withheld	Withheld	On behalf of 312 scientists	71076	4	Range of Alternatives	The DEIS is seriously flawed in that it does not describe and commit to a transparent, publically-accessible, intensive, comprehensive monitoring plan that will both precede and extend beyond the life of any oil and gas activity on the Coastal Plain.	Monitoring plans will be tailored to the specific location of development and resources or activity being monitored; it is not practicable to develop a template that would cover all resources, activities, and requirements for this EIS.
39.	Heather	Mirczak	—	71628	1	Range of Alternatives	The first of my concerns are in the parcel size and expansive nature of the proposed leases. It is my understanding that the required acreage is 400,000 for each sale, but the proposals offer much greater acreage. I am opposed to this and would like to know why.	Alternative D2 has been modified to offer 800,000 acres for leasing.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
40.	Jill	Nogi	Environmental Protection Agency	71634	5	Range of Alternatives	We are also concerned that the range of alternatives does not include leasing programs with a surface area impact of fewer than 2,000 acres. The authorizing legislation for this action, the Tax Cuts and Jobs Act of 2017, requires the Secretary of the Interior to “authorize up to 2,000 surface acres of Federal land on the Coastal Plain to be covered by production and support facilities.” Section 20001 of Public Law No. 115-97 (Dec. 22, 2017) (emphasis added). We therefore believe that a range of alternatives that includes leasing programs with fewer impacted acres is appropriate and would allow for the meaningful comparative analysis called for by the Council on Environmental Quality regulations implementing NEPA.	The BLM has revised Section 1.9.1 to identify the production and support facilities that would count toward the 2,000-acre limit, which now includes gravel mines. Rationale as to why certain facilities may not be included is contained in Section S.1.2 of this Appendix.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
41.	Jill	Nogi	Environmental Protection Agency	71634	6	Range of Alternatives	<p>We are concerned that the each of the alternatives assumes that surface disturbance impacts would total the 2,000-acre cap imposed by the Tax Act. This is driven in turn by the purpose and need statement, in which the BLM defined the purpose and need such that all alternatives must include 2,000 acres of surface disturbance. The language of the Tax Act, however, would appear to support both a broader purpose and need statement and a broader range of alternatives, stating that “the Secretary shall authorize up to 2,000 surface acres of Federal land on the Coastal Plain to be covered by production and support facilities.”¹ In addition, assuming the Tax Act mandates a 2,000-acre leasing program, a potential conflict with federal law does not necessarily render an alternative unreasonable, although such conflicts must be considered. Rather, alternatives that are outside the scope of what Congress has approved or funded must still be evaluated in the EIS if they are reasonable.² We therefore believe that the EIS should analyze a broader range of surface disturbances, up to and including 2,000 acres. This would allow for a meaningful comparative analysis of impacts and better educate both the decision maker and the public, as contemplated by the CEQ NEPA regulations.³</p>	<p>The BLM has revised Section 1.9.1 to identify the production and support facilities that would count toward the 2,000-acre limit, which now includes gravel mines. Rationale as to why certain facilities may not be included is contained in Section S.1.2 of this Appendix. Given that Congress explicitly established this protective facility acreage limit, any interpretation by the BLM to reduce the limit for a given alternative would be inconsistent with the Tax Act.</p>

S. Public Comments and BLM Responses (Alternatives)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
42.	Jill	Nogi	Environmental Protection Agency	71634	7	Range of Alternatives	We also recommend that the BLM consider expanding the way in which alternatives respond to the purpose and need. For example, the alternative analysis could evaluate and disclose ways in which a volume of oil comparable to that anticipated in the reasonably foreseeable development baseline could be extracted with reduced surface impact. By doing so, a more meaningful analysis of a full range of alternatives, including mitigating measures to reduce impacts, may be possible, in accordance with NEPA.	This level of specificity would be determined during the project-level authorization. Site-specific analyses, including those associated with infrastructure and different technologies in support of oil and gas development, can more realistically be provided when the BLM receives an application to permit such infrastructure.
43.	Jill	Nogi	Environmental Protection Agency	71634	39	Range of Alternatives	Mitigation Chapter 2 of the DEIS lists Stipulations and Required Operating Procedures proposed to be applied to future activities in the program area under each alternative to protect sensitive resources. Where the analysis of environmental consequences in Chapter 3 identifies potential adverse impacts, we recommend that the EIS discuss the extent to which the proposed Stipulations and Required Operating Procedures will mitigate those impacts. If additional mitigation may need to be applied at the project stage to reduce impacts, we recommend that the EIS discuss available mitigation measures, including identifying any mitigation that will be required through future permitting mechanisms.	The alternatives were developed through identification of mitigation measures for protection of the numerous resources within the Coastal Plain. The mitigation measures, which are comprised of proposed lease stipulations and ROPs, vary by each action alternative. This is to provide differing levels of protection for the numerous resources, while complying with all purposes of the Refuge.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
44.	Katherine	Trisolini	Loyola Law School	74278	1	Range of Alternatives	As the DEIS explains, the no action alternative was included for comparison purposes only because it would not meet Congress' mandate to develop a leasing program, leaving on alternatives B, C, and D as possible options. Yet among these three the agency does not include an option that reduces impacts by offering the minimum area of this pristine land for lease consistent with PL 115-97, a particularly important approach in this case because the no action alternative cannot be selected. Alternatives B and C both offer the entire project area for leasing, a total of 1,563,500 acres, vastly exceeding the minimum land area that Congress directed the agency to include. While Alternative D reduces the total area offered, it still significantly exceeds the minimum acreage required by Congress, offering 1,037,200 acres for lease. At most, Congress required the agency to open 800,000 acres. Given that the leasing program is designed to operate in two phases, areas not leased in the first offering could be included in the 400,000 minimum for the second stage, thus making the mandated area even smaller.	Alternative D2 has been modified to offer 800,000 acres for leasing.
45.	Katherine	Trisolini	Loyola Law School	74278	2	Range of Alternatives	Instead of considering an alternative that minimizes total surface area disturbance, the EIS includes only alternatives that include the maximum area permitted by Congress to be disturbed. [DEIS 3-26 ("All the action alternatives assume a surface disturbance area of approximately 2,000 acres from future oil and gas exploration, development and production, not including the gravel pits.")]	The BLM has revised Section 1.9.1 to identify the production and support facilities that would count toward the 2,000-acre limit, which now includes gravel mines Rationale as to why certain facilities may not be included is contained in Section S.1.2 of this Appendix.

46.	Katherine	Trisolini	Loyola Law School	74278	4	Range of Alternatives	The unsupported assumption that the Act authorized gravel mining in ANWR significantly expands impacts beyond those that would be anticipated with 2000 acres of surface disturbance authorized by Congress. Moreover, the agency does not offer any alternatives that without the additional surface disturbance from gravel mining. (DEIS 3-26 ["All the action alternatives would include potential development of a gravel mine or mines, . . . The surface of the gravel mines would total approximately 300 acres for each action alternative (not included in the 2,000-acre limit on surface disturbance).])	The BLM has revised Section 1.9.1 to identify the production and support facilities that would count toward the 2,000-acre limit, which now includes gravel mines. Rationale as to why certain facilities may not be included is contained in Section S.1.2 of this Appendix..
47.	Katherine	Trisolini	Loyola Law School	74278	6	Range of Alternatives	Even if the Act could be interpreted somehow to permit alternatives that include 300 acres of surface disturbance from gravel mining beyond Congress' 2000 acre limit, the Bureau has a duty under NEPA to consider an alternative that does not add additional acres of gravel mining operations within the project area. The Bureau should include an alternative that either includes the mining within the area of surface area maximum or better yet, one that does not include gravel mining within the project area at all.	The BLM has revised Section 1.9.1 to identify the production and support facilities that would count toward the 2,000-acre limit, which now includes gravel mines. Rationale as to why certain facilities may not be included is contained in Section S.1.2 of this Appendix.

48.	Richard	Edwards	—	74281	9	Range of Alternatives	The Draft EIS is defective in that it fails to consider the "No Action" alternative as implementable. NEPA requires full consideration of a reasonable range of alternatives, most importantly including no action.	The No Action Alternative is fully analyzed in the EIS as Alternative A, as a baseline requirement of NEPA. Section 20001 of the Tax Act precludes selection of Alternative A in a Record of Decision. The regulations require the analysis of the No Action Alternative even if the agency is under a legislative command to act. This analysis provides a benchmark, enabling decision makers to compare the magnitude of environmental effects of the action alternatives. It is also an example of a reasonable alternative outside the jurisdiction of the agency, which must be analyzed (Section 1502.14(c); CEQ CEQ's Forty Most Asked Questions Concerning CEQ's NEPA [Question #3]). All action alternatives are designed to meet the purpose and need, and to account for all purposes of the Arctic National Wildlife Refuge.

49.	Richard	Edwards	—	74281	10	Range of Alternatives	NEPA requires consideration of alternatives “that are practical or feasible” and not solely “whether the proponent or applicant likes or is itself capable of carrying out a particular alternative”; in fact, 11[a]n alternative that is outside the legal jurisdiction of the lead agency must still be analyzed in the EIS if it is reasonable.” Because there is no development alternative that can protect the Coastal Plain, the Draft EIS must be revised to address the no-action alternative as a potentially implementable action.	The No Action Alternative is fully analyzed in the EIS as Alternative A, as a baseline requirement of NEPA. Section 20001 of the Tax Act precludes selection of Alternative A in a Record of Decision. The regulations require the analysis of the No Action Alternative even if the agency is under a legislative command to act. This analysis provides a benchmark, enabling decision makers to compare the magnitude of environmental effects of the action alternatives. It is also an example of a reasonable alternative outside the jurisdiction of the agency, which must be analyzed (Section 1502.14(c); CEQ’s Forty Most Asked Questions Concerning CEQ’s NEPA [Question #3]). All action alternatives are designed to meet the purpose and need, and to account for all purposes of the Arctic National Wildlife Refuge.

50.	Richard	Edwards	—	74281	11	Range of Alternatives	<p>The BLM's justification for eliminating a least acreage alternative is entirely arbitrary and capricious, as follows: a) The BLM purports to follow the text of Section 20001(c)(3) and where there is no text (rapid "reclamation", etc.), create interpretations that maximize flexibility. Section 20001 is quite clear in its requirement to offer only lands with high hydrocarbon potential---no creative interpretation required. Section 20001(c)(3) can certainly be read to conclude that Congress did not intend for low and medium potential areas to be offered for lease. In a rational world, the disconnect between minimum lease acreage and the reality of on-site conditions would have been reconciled---instead of being ignored in this hastily assembled, industry drafted legislation. b) The argument that leasing alternative acreage does not matter since "actual potential development area would be much less with the 2,000-acre limitation on surface disturbance" is invalid. Once again, this argument leads the uninformed reader toward the false assumption that only 2,000 acres will be disturbed. By the Draft EIS's own admission, Irretrievable and irreversible resource impacts from site disturbance will occur and only increase in scope and extent as lease acreage increases. The complete folly behind this "2,000-acre facility limit" has been addressed above in this letter. c) Perhaps most significantly, BLM's argument that Alternatives D1 and D2 (1,037,000 acres) are "close enough" is completely ludicrous. This defective conclusion essentially equates over two-hundred thousand acres of fragile Coastal Plain to rounding error. The formative legislative intent behind the creation of this Refuge and BLM's mission are entirely violated by such an argument.</p>	<p>Section 1.9.1 describes those facilities that will be counted against the 2,000 acres. The BLM will use facility data in the form of ArcGIS-compatible shapefiles obtained under ROP 33 to track facility acreage to assure continued compliance with the Tax Act limit. ROP 35 requires the development of a BLM-approved abandonment and reclamation plan. Under all alternatives, ROP 35 requires restoration to the land's previous hydrological, vegetation, and habitat condition.</p>

51.	Richard	Edwards	—	74281	13	Range of Alternatives	In this defective Draft EIS, BLM fails to even analyze the lower boundary of the Responsible Official's action alternative decision space. What is the action alternative with the lowest potential to adversely impact the smallest acreage over both the short and long-term?	Alternative D2 has been revised to offer 800,000 acres of land for leasing. Every action alternative analyzes up to 2,000 acres of development.
52.	Lisa	Baraff	Northern Alaska Environmental Center	74306	4	Range of Alternatives	Given that P.L. 115-97 Sec. 20001 allows for the first lease sale within 4 years and a subsequent lease within 7 years of the Act, BLM should consider this EIS for only the first lease sale and conduct a subsequent EIS for the second sale, reevaluated based on acreage that leased in the first sale.	Similar to the methods used for the NPR-A IAP EIS, this EIS analyzes multiple lease sales. Such an alternative would have impacts similar to alternatives already analyzed. The BLM would expect little to no difference in impacts under such an alternative. This is because lands that were offered but not leased in the first sale are unlikely to be leased in a second sale a few years later given that exploration is unlikely to substantially advance during that time period.
53.	Allen E.	Smith	—	74324	3	Range of Alternatives	First, the DEIS fails to provide an adequate range of reasonable alternatives. All three alternatives offered allow full oil and gas development and do not meet the lease sale and development limits to occupy only 2,000 acres set by Congress in PL 115-97 by including only well sites and excluding all other collateral infrastructure requirements for leasing.	Alternative D2 has been revised to offer 800,000 acres of land for leasing. Every action alternative analyzes up to 2,000 acres of development.

54.	Renae	Smith	Counsel for Environmental Protection	74336	4	Range of Alternatives	BLM ostensibly explains its refusal to consider the minimum lease acreage alternative, as specified by Congress, simply by noting that there are only approximately 427,900 acres of high hydrocarbon potential (HCP), and thus, "low and medium HCP areas must be made available, in addition to the high HCP areas, for the two lease sales to meet the 800,000-acre minimum under PL 115-97." ⁵⁵ Inexplicably, BLM fails to explain why this requires development of more than the minimum acreage directed by Congress. Indeed, lack of sufficient high HCP acreage to meet the Congressional minimum cuts against more expansive development, and instead supports focused development of the minimum required acreage with the highest potential. Thus, BLM utterly fails to provide a reasonable explanation to justify its elimination of the minimum acreage alternative in violation of NEPA. ⁵⁶	Alternative D2 has been modified to offer 800,000 acres for leasing.
55.	Renae	Smith	Counsel for Environmental Protection	74336	5	Range of Alternatives	and low potential. In this way, elimination of the minimum acreage alternative improperly narrows the range of considered alternatives by failing to consider the minimum acreage allowed by Congress. BLM should consider this reasonable alternative in detail. BLM's explanation that alternatives D1 and D2 are "similar in concept" to the minimum alternative is also unreasonable when each of those alternatives would lease approximately 237,000 acres more than the minimum acreage alternative-an increase of more than 25 percent. BLM's elimination of the minimum acreage alternative thus resulted in detailed analysis only of alternatives with greatly expanded acreage, which necessarily include greater areas of medium	Alternative D2 has been modified to offer 800,000 acres for leasing.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
56.	Rena	Smith	Counsel for Environmental Protection	74336	21	Range of Alternatives	In addition to analyzing the program's revenue generation potential, BLM should develop and consider an alternative that delays any lease sales until additional economic data make much more certain that leases sales will maximize revenue generation and oil prices will result in production and royalty payments. Offering lease sales when oil prices are well below the estimated \$78 to \$90 per barrel breakeven oil price could completely undermine the Leasing Program's revenue generation potential by suppressing lease sales price and diminishing the acreage successfully leased. 120 A delayed leasing alternative would also allow BLM to obtain the information necessary to take NEPA's required hard look at the environmental impacts of its proposed Leasing Program. Just yesterday, PEER, an environmental organization, released several "Resource Assessments" in which U.S. Fish and Wildlife Service staff and technical experts from a number of other federal agencies, including BLM, identified "research gaps" in the data necessary to inform the EIS process. 121 These data gaps appear to include important baseline information for water resources, migratory bird populations, polar bears, and caribou. 122 Without this information, BLM cannot comply with NEPA's requirement to make an informed decision. 123 As a result, BLM must seriously consider an alternative that delays leasing until BLM obtains the information necessary to take a hard look at the environmental consequences of its decision. At a minimum, BLM should delay lease sales until the latest time directed by the Tax Cuts and Jobs Act. 124	The BLM is required to implement an oil and gas leasing program on the Coastal Plain per PL 115-97, regardless of oil prices. Data gaps and resource assessments prepared by the USFWS are specific to the entirety of an oil and gas leasing program (beyond the leasing phase that this EIS is focused on). It is highly likely that more data collection would be required prior to completion of NEPA analyses for site-specific activities.

57.	Eric	Walsh	Government of Canada	74346	35	Range of Alternatives	Chapter 2 - Alternatives Outlines 3 alternatives (not including the no development alternative); however, all alternatives are in excess of 800,000 acres and maximize the 2000-acre surface disturbance rule. Could have been a wider range of alternatives presented and an 800,000 acre alternative.	Alternative D2 has been modified to offer 800,000 acres for leasing.
58.	Withheld	Withheld	—	75257	1	Range of Alternatives	The range of alternatives is inadequate. Limiting the scope of evaluation to developing between 66% and 100% of the coastal plain completely ignores the possibility that the 2000 acres of surface development could be concentrated in a small area, meet the letter of PL 115-97, and limit the impact to 0.125% of the Arctic Plain. Other alternatives need to be developed to move the range in this direction.	Alternative D2 has been modified to offer 800,000 acres for leasing.
59.	Withheld	Withheld	ikpeagvik Iñupiat Corporation	75577	2	Range of Alternatives	most Alternatives put forth in the actual draft document do not appear to be designed to lead to robust lease sales. We also do not believe they are compatible with the Tax Act since they will not lead to a “competitive oil and gas program for the leasing, development, and transportation of oil and gas in and from the Coastal Plain.” The included Alternatives in fact appear likely to make it prohibitive to ultimately develop on a lease.	All action alternatives are designed to meet the purpose and need, and to account for all purposes of the Arctic National Wildlife Refuge. See Section 3.4.7.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
60.	DJ	Schubert	Animal Welfare Institute	75588	3	Range of Alternatives	There are other reasonable alternatives that BLM failed to consider that would serve the BLM's stated purpose and need for the oil and gas leasing program. PL 115-97 requires that at least two lease sales be held by December 22, 2024, and that each sale offer for lease at least 400,000 acres of the highest high carbon potential ("HCP") lands within the Coastal Plain. ¹ This total of 800,000 acres constitutes approximately 51 percent of the Coastal Plain's total acreage of approximately 1,563,500 acres. Yet the alternatives analyzed in the DEIS would open a substantially higher amount of acreage for lease. The minimum acreage proposed to be offered for lease is 1,037,200 acres under Alternatives D1 and D2, or 66 percent of the Coastal Plain, while the maximum acreage proposed to be offered under Alternatives B and C is 1,563,500 acres, or 100 percent of the Coastal Plain.	Alternative D2 has been modified to offer 800,000 acres for leasing.
61.	DJ	Schubert	Animal Welfare Institute	75588	4	Range of Alternatives	BLM's summary rejection of alternatives that would lease between 800,000 acres to approximately 1,000,000 acres is arbitrary and capricious.	Alternative D2 has been modified to offer 800,000 acres for leasing.
62.	DJ	Schubert	Animal Welfare Institute	75588	8	Range of Alternatives	In light of this, BLM is legally required to adequately consider alternatives that would offer a lower amount of acreage for lease	Alternative D2 has been modified to offer 800,000 acres for leasing.
63.	Andrew	Ogden	—	75704	3	Range of Alternatives	it is noteworthy that all the action Alternatives offer much more acreage than the 400,000 acres required by the Tax Act for each lease sale. The excessive lease offerings provided in the action Alternatives clearly exceed the more modest phased approach Congress intended in the Tax Act.	Alternative D2 has been modified to offer 800,000 acres for leasing.

S. Public Comments and BLM Responses (Alternatives)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
64.	Lin	Davis	—	75891	7	Range of Alternatives	The DEIS does not discuss ways of minimizing the area to be leased, developed and drilled. Careful readers of the EIS have noted that the list of four DEIS alternative all grab more acres for development than are required by the Tax Act regarding lease sales. Only 400,000 acres are required by the Tax Act but Alternative D grabs 1 million acres or 66% of the Coastal Plain. This confuses the public.	Alternative D2 has been modified to offer 800,000 acres for leasing.
65.	Chandra	Turner	Inuvialuit Game Council	75904	38	Range of Alternatives	Proceeding with the project vs. not proceeding at all is not an option considered by the DEIS. This appears to be because BLM considers the Tax Cuts and Jobs Act of 2017, Public Law 115-97 (PL 115-97) to be binding, thus disqualifying the 'no action' alternative (Alternative A). Alternatives B through D2 do not consider delaying the program but they do consider timing, scale and components of the proposed activities.	All action alternatives are designed to meet the purpose and need, and to account for all purposes of the Arctic National Wildlife Refuge. See Section 3.4.7.
66.	Cherise	Gaffney	Alaska Oil and Gas Association, and American Petroleum Institute	79893	6	Range of Alternatives	Alternatives C, D1, and D2 do not meet the DEIS's Purpose and Need. The DEIS sets forth four development alternatives, all of which would impose significant limitations and conditions on future development and BLM decision-making. The DEIS asserts that all four of these alternatives would meet the Purpose and Need-i.e., to "establish and administer a competitive oil and gas program for the leasing, development, production, and transportation of oil and gas in and from the Coastal Plain."57 In fact, however, Alternatives C, 54 DEIS at 1-5. 55 43 C.F.R. § 46.120(c) (providing for use of existing environmental analysis for subsequent action upon determination that it adequately assesses the environmental effects of the proposed action and reasonable alternatives); see U.S. Dep't of Interior, BLM, National Environmental Policy	All action alternatives are designed to meet the purpose and need, and to account for all purposes of the Arctic National Wildlife Refuge. Additional text has been added.

66. (cont.)	(see above)	(see above)	(see above)	(see above)	(see above)	(see above)	Act Handbook, H-1790-1, § 5.1 (Jan. 30, 2008) (instructing officials to review existing environmental documents and answer several questions geared at determining whether a prior document adequately analyzes a proposed action). 56 See DEIS at 1-5. 57 Id. at 2-1. Ms. Nicole Hayes March 13, 2019 Page 18 of 36 18 99959215.12 0078439-00052 D1, and D2 would drastically restrict future development options and constrain BLM's future decision-making authority, effectively precluding establishment of a reasonable, competitive oil and gas program in the Coastal Plain. Alternative C would allow surface occupancy on just 40% of the area offered for leasing. Alternatives D1 and D2 would remove 33% of the Coastal Plain from the leasing program entirely and then allow surface occupancy on only 32% of the remaining lands. By comparison, while BLM removed large areas from the NPR-A leasing area for mitigation purposes, the preferred alternative still made 11.8 million contiguous acres available to surface occupancy leasing-over 18 times the number of surface acres that would be available to leasing under Alternative C and 36 times the number of surface acres that would be available under Alternative D.58 Moreover, the interplay of the linear North-South trending river, stream, and delta setbacks with the areal nature of lagoon setbacks and broad NSO restrictions effectively fragments the remaining accessible surface areas, compounding the impracticability of surface occupancy restrictions.	(see above)

67. (cont.)	(see above)	(see above)	(see above)	(see above)	(see above)	(see above)	Alternatives that do not meet a proposal's Purpose and Need are not reasonable, and should not be analyzed in the FEIS.61	(see above)
68.	Deana	Lemke	Porcupine Caribou Management Board	80214	16	Range of Alternatives	The draft EIS does not describe the expected implementation or effectiveness of mitigations. The mitigation measures in the draft EIS are deficient as they fail to provide adequate evidence that they will reduce or eliminate the impacts of the proposed development on the PCH. The draft EIS also fails to specify how impacts of development on the PCH will be measured and monitored over time. Metrics for effectiveness must be established to determine the efficacy of mitigation measures as well as to establish the need to adapt the project design and implementation based on evidence. A monitoring program described and approved by the Porcupine Caribou Technical Committee (PCTC) and overseen by an independent body should be required. The program should be expected to assess pre-development conditions and determine post-development impacts and the effectiveness of mitigations. The deficiency of scientifically proven mitigations for the Central Arctic caribou herd and a lack of confidence in their efficacy is a prime example of inadequate pre- and post-development assessment and monitoring (Russell & Gunn 2019).	Discussion of Russell and Gunn (2019) was added to Section 3.3.5. Effectiveness will be monitored to the extent practicable (or as required by the Record of Decision [ROD]) and can be adjusted if necessary. Herd monitoring will continue. This Leasing EIS will not result in the authorization of any on-the-ground activities. Accordingly, the environmental baseline will be preserved throughout the lease sale process. Any on-the-ground activities will require additional NEPA analysis. At that time, the BLM will determine which baseline studies may be necessary.

69.	Deana	Lemke	Porcupine Caribou Management Board	80214	18	Range of Alternatives	While the leasing program is required by the Tax Cuts and Jobs Act of 2017 (Public Law 115-97), the PCMB notes that there is no need to lease the entire program area to comply with the law. PL 115-97 requires two lease sales with each sale offering for lease at least 400,000 acres of the highest hydrocarbon potential lands (ES-1). Alternatives B and C offer 1,563,500 acres for lease. Alternatives D1 and D2 offer -1,037,200 acres for lease (ES-3). The PCMB supports the highest level of protection possible in the 1002 area and recommends that the alternatives be adjusted to reflect, at most, the minimum leasing area required by law (800,000 acres). In addition, the draft EIS does not provide assurances that lease stipulations related to surface occupancy and timing restrictions will remain in place over time. The only way of ensuring areas that are important to the PCH are excluded from development is not to lease them in the first place.	Alternative D2 has been modified to offer 800,000 acres for leasing.
70.	Deana	Lemke	Porcupine Caribou Management Board	80214	34	Range of Alternatives	Benchmarks & Criteria Avoiding or minimizing activities that would significantly disrupt ... behavior patterns of the Porcupine Caribou Herd would involve appropriate mitigations Established References International agreement on conservation of PCH Russell & Gunn 2019 Draft EIS deficiency The draft EIS states what the planned mitigations for the presence of caribou will be via Required Operating Procedures but there is no mention of how lease operators are to monitor for or have advance awareness of the imminent arrival or presence of caribou. Expectations for on-site monitoring programs or relationships with government biologists who manage PCH satellite location data are not mentioned.	Management and monitoring plans should be developed in consultation with appropriate federal, state, and NSB regulatory and resource agencies (as stated in ROPs). Additional monitoring plan requirements will be dependent on site-specific proposals.

71.	Steven	Amstrup	Polar Bears International	81368	71	Range of Alternatives	Meteorological Monitoring Station, approximately 110 miles west of the Coastal Plain boundary.2 It is imperative that BLM establish a comprehensive monitoring network within the program area to provide baseline data for an adequate analysis of reasonably foreseeable air quality impacts associated with an oil and gas program and to facilitate tracking of air quality impacts and adaptive management to ensure air quality protection throughout the Coastal Plain. Baseline data must be collected and made publicly available in a revised draft EIS, to ensure that the agency's evaluation of impacts is scientifically sound, reasonable alternatives are considered, and all necessary mitigation measures are evaluated. Beyond establishing baseline air quality monitoring data, however, BLM must complete a more comprehensive, quantitative modeling analysis of future development in this DEIS in order to prevent significant impacts throughout the Coastal Plain (as opposed to taking corrective action after a significant impact is identified by an air quality monitor).	This Leasing EIS will not result in the authorization of any on-the-ground activities. Accordingly, the environmental baseline will be preserved throughout the lease sale process. Any on-the-ground activities will require additional NEPA analysis. At that time, the BLM will determine which baseline studies may be necessary.
72.	Carolyn	Alkire	Key-Log Economics o.b.o. The Wilderness Society	81368	103	Range of Alternatives	Reasonable alternatives that BLM should consider in order to eliminate or mitigate any exceedance of established air quality thresholds include but are not limited to: (1) managing the pace, location, and intensity of development; (2) employing control techniques; or (3) a combination of the two. Failure to consider such alternatives, including the reasonable measures described below, renders the DEIS's range of alternatives inadequate and BLM's conclusions that its oil and gas development program will satisfy the Clean Air Act invalid.	ROPs 5 and 6 contain requirements for future phases of development that will satisfy Clean Air Act requirements.

73.	Allison	Athens	—	81746	1	Range of Alternatives	We strongly urge BLM and the Secretary of Interior to reconsider the elimination of the alternative that would have only offered the minimum number of acres for lease mandated by Congress, alongside reconsidering the fact that the 2,000 acres surface disturbance allowance in the statute is a ceiling not a floor.	Alternative D2 has been modified to offer 800,000 acres for leasing. Section 20001(c)(3) of the Tax Act states, "the Secretary shall authorize up to 2,000 surface acres." Any interpretation by the BLM to modify the limit for a given alternative would be inconsistent with the Tax Act.
74.	Allison	Athens	—	81746	4	Range of Alternatives	BLM states that it considered, but ultimately did not include, an alternative that would have limited the number of acres available for the lease sale at the minimum 800,000 acres required by the statute for the two lease sales. BLM does not explain why offering a maximum of 800,000 acres for two lease sales does not meet the statutory mandate	Alternative D2 has been modified to offer 800,000 acres for leasing.
75.	Allison	Athens	—	81746	5	Range of Alternatives	There is no reason that BLM has to offer all 2,000 acres (or any of the acres) in surface disturbance suggested by the statute, given that the statute only sets a ceiling for surface disturbance. This is not a reasonable interpretation in light of the Coastal Plain being part of a Wildlife Refuge, a place which is supposed to be for the conservation of species for the American public to appreciate and enjoy for generations to come. BLM can include a 2,000-acre surface facility limitation in the lease sale requirements and BLM can also include a requirement that 0 surface acres be disturbed, given that there is no minimum requirement for how much acreage must be available for disturbance. BLM can impose a 0 acre NSO on the two 400,000-acre leases and still conform to the statutory mandate. BLM has given no reasons for why it has not considered the minimum offering for lease sale with a maximum protection of surface area. BLM has the authority to make this alternative part of the EIS and it is unreasonable not to.	Alternative D2 has been modified to offer 800,000 acres for leasing. Section 20001(c)(3) of the Tax Act states, "the Secretary shall authorize up to 2,000 surface acres." Any interpretation by the BLM to modify the limit for a given alternative would be inconsistent with the Tax Act.

76.	Withheld	Withheld	Native Village of Venetie Tribal Government	81748	2	Range of Alternatives	NEPA requires the BLM to "[r]igorously explore and objectively evaluate all reasonable alternatives." ⁹ The range of alternatives the BLM presents and evaluates in the DEIS is woefully inadequate. Rather than exploring a reasonable range of alternatives, the BLM presents variations on a single alternative. Though the Tax Cuts and Jobs Act of 2017 (Tax Act) requires that the Secretary of Interior offer at least 400,000 acres for leasing, ¹⁰ none of the alternatives in the DEIS would offer less than one million acres. Two of the alternatives would make the entire Program Area available for leasing. And only one alternative would not offer portions of the Coastal Plain for leasing "to protect biological and ecological resources." ¹¹ The different stipulations and required operating procedures applicable under each alternative do not constitute a reasonable range of alternatives. The same, or similar, stipulations and required operating procedures apply to all of the alternatives. Under every alternative, the stipulations and required operating procedures are subject to waiver, exception, or modification by the BLM, further undermining any substantive difference in the alternatives.	Alternative D2 has been modified to offer 800,000 acres for leasing. The fact that impacts on a specific resource are similar across all action alternatives does not, per se, indicate that the range of alternatives is not reasonable under NEPA.

S. Public Comments and BLM Responses (Alternatives)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
77.	Withheld	Withheld	Native Village of Venetie Tribal Government	81748	3	Range of Alternatives	All of the alternatives in the DEIS prioritize development over other values, such as ecological, cultural, and subsistence resources. While the Tax Act requires the BLM to offer oil and gas leases, it does not revoke the conservation priorities of the management of the Arctic National Wildlife Refuge. Throughout the NEPA process, the Tribes have raised with the BLM the critical importance of the Coastal Plain to the Porcupine Caribou Herd for calving and post-calving. The Tribes have also explained the significant adverse impacts development in the Coastal Plain would have on the herd and the Tribes. Ignoring these concerns, the BLM has failed to consider an alternative that provides meaningful protections for the Porcupine Caribou Herd's calving and post-calving habitat. BLM has also failed to adequately explain why it didn't consider such an alternative.	All action alternatives are designed to meet the purpose and need, and to account for all purposes of the Arctic National Wildlife Refuge. All action alternative address Porcupine caribou herd (PCH) calving and post-calving protections to some extent.
78.	Withheld	Withheld	Native Village of Venetie Tribal Government	81748	4	Range of Alternatives	Furthermore, the BLM's development, evaluation, and selection of alternatives is inadequate because the DEIS does not incorporate the information, analyses, and findings from other statutorily-mandated review processes, such as Section 106 of the NHPA. The Council for Environmental Quality's (CEQ) NEPA regulations require: "To the fullest extent possible, agencies shall prepare draft environmental impact statements concurrently with and integrated with environmental impact analyses and related surveys and studies required by . . . the [NHPA]."	All statutory obligations have been met, and will continue to be met through the EIS process. All relevant information obtained through the EIS process, and up to signing of the ROD, will be incorporated as appropriate.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
79.	Withheld	Withheld	Native Village of Venetie Tribal Government	81748	147	Range of Alternatives	The BLM's development and selection of alternatives has not been carried out in accordance with other statutory obligations. ⁸⁶ For example, the NHPA implementing regulations require the BLM to "ensure that the section 106 process is initiated early in the undertaking's planning, so that a broad range of alternatives may be considered during the planning process for the undertaking." ⁸⁷ The BLM initiated the Section 106 process well after it developed and selected the alternatives. Indeed, the BLM has yet to conduct a single Section 106 consultation with the Native Village of Venetie Tribal Government, Arctic Village Council, or Venetie Village Council.	All statutory obligations have been met, and will continue to be met through the EIS process. The BLM initiated consultation for the Section 106 process on April 23, 2018. The BLM is working with the Advisory Council on Historic Preservation (ACHP), State Historic Preservation Officer (SHPO), USFWS, and consulting parties (which include all interested tribal governments, Alaska Native Claims Settlement Act (ANCSA) corporations, and local governments) in development of a programmatic agreement for Section 106 compliance.

S. Public Comments and BLM Responses (Alternatives)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
80.	Withheld	Withheld	Native Village of Venetie Tribal Government	81748	148	Range of Alternatives	Thus, the Section 106 process has had no effect on the development of alternatives. Therefore, the alternatives discussed in the DEIS fail to take into account effects to historic properties, including cultural landscapes such as Iizhik Gwats'an Gwandaii Goodlit. None of the alternatives represent any effort by the BLM to avoid, minimize, or mitigate adverse effects to historic properties. As the Section 106 implementing regulations make clear: "The [BLM] shall consult with the SHPO[] and other consulting parties, including Indian tribes . . . , to develop and evaluate alternatives or modifications to the undertaking that could avoid, minimize, or mitigate adverse effects on historic properties."88 Furthermore, the DEIS's section on alternatives fails to address how the Section 106 process will inform the ongoing development and selection of alternatives. The alternative development analysis presented in Figures 29-33 demonstrates that the BLM's Anchor Field concept is wholly inadequate and misleading. Because the BLM based its analysis on this flawed concept, the DEIS failed to adequately consider the impacts of potential development in the Program Area.	In developing the EIS action alternatives, the BLM considered means to protect all key resources, including cultural resources. A primary component of alternatives development was providing for protection of the area the Gwich'in identify as Iizhik Gwats'an Gwandaii Goodlit through protection of the caribou calving and post-calving areas. Additional mitigation measures that further avoid, minimize, or mitigate adverse effects on historic properties may be incorporated in the ROD or as part of the programmatic agreement for Section 106 compliance.
81.	Ruth	Wood	—	83199	6	Range of Alternatives	The other alternatives all offer more than the 400,000 acres in each of 2 lease sales required by the Tax Bill. BLM did not look at any minimal alternative. Given the amount of opposition to any lease sales, BLM must include two minimal alternatives of 400,000 acres each, but currently it does not	Alternative D2 has been modified to offer 800,000 acres for leasing.

S. Public Comments and BLM Responses (Alternatives)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
82.	Henrik	Kulmala	—	83333	1	Range of Alternatives	The BLM appears to have exceeded their mandate by offering larger tracts than mandated by a public law which negated the protected status of the ANWR. They also appear to have ignored the stipulation that the areas being considered have the highest potential for hydrocarbon discovery. These regions have not been explored sufficiently to define the most likely regions to produce hydrocarbons.	Based off best available information, the action alternatives maximize the areas with the highest hydrocarbon potential (HCP); action alternatives balance areas with the highest HCP with surface resource protection. Because there are only an estimated 427,000 acres of high HCP, in order to get to an 800,000-acre lease sale, areas in medium HCP and low HCP would also need to be included in the lease sale (while still balancing resource protections). Alternative D2 has been modified to offer 800,000 acres for leasing.
83.	Henrik	Kulmala	—	83333	7	Range of Alternatives	Drilling is generally prohibited in rivers, lakes, or on floodplains, with an exemption allowed by the BLM Case Officer. ⁹ Such drilling is too sensitive to be allowed based on the judgement of a single individual and should be subject to approval by a board of individuals including some not associated with the BLM. There is no mention made in the document of fines, levies, or penalties for disobeying the rules and regulations. These need to be defined in advance and must be severe enough as to discourage improper actions and activities. The cost of disobeying a requirement must be more than a symbolic slap on the wrist or a fine that is less expensive than doing the job per guidelines and operating procedures. ⁹ 2-24: On a case-by-case basis, the BLM Authorized Officer may consider exploratory drilling in floodplains of fish-bearing rivers and streams.	As noted under ROP 40 (section i), the BLM has authority under 43 CFR 3163 to issue assessments and penalties for non-compliance with oil and gas operational requirements. The BLM considers performance-based stipulations and ROPs that allow managers to practice adaptive management to ensure that the objectives identified in the EIS are met. This allows the Authorized Officer the ability to tailor requirements to take account of the evolving understanding of the environment and changing technology and techniques at the time of application for a permit.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
84.	Withheld	Withheld	WWF-Canada	85059	20	Range of Alternatives	Finally, the three action alternatives BLM proposes in the draft EIS do not present a reasonable range sufficient to analyze differences in impacts to polar bears, since all of the action alternatives assume the entire Coastal Plan will be open to seismic exploration. The BLM must address all these issues in a revised draft EIS.	Appendix B explains the different types of seismic exploration that are analyzed in the EIS. Seismic exploration can be done across the full area of the Coastal Plain, even if an area is not available for lease. Site-specific NEPA analysis would be done for any proposed seismic explorations, which would analyze potential impacts on polar bears. The range of impacts related to polar bears for this EIS is discussed in Section 3.3.5.
85.	Elizabeth	Ballard	—	90951	13	Range of Alternatives	The stipulations for protecting cliff-nesting raptors are arbitrary and unlikely to achieve the intended result. A stipulation that may be intended to protect cliff-nesting raptors from disturbance does not appear adequate and is not adequately analyzed in the DEIS. The DEIS notes that raptors are more easily disturbed by human activities than other birds, concluding that “falcons, hawks, and eagles . . . reacted at greater distances [than 656 feet].” ¹⁸ But the DEIS does not contain a mitigation measure that directly addresses impacts to cliff-nesting raptors from human disturbance.	ROPs 25, 30, and 31 all provide protections for cliff-nesting raptors. Lease Stipulations 4 and 9 provide additional protections even though they are not specifically designed to protect cliff-nesting raptors.
86.	Elizabeth	Ballard	—	90951	15	Range of Alternatives	ROP 30 further requires a “hydrological study that indicates no potential impact on the integrity of river bluffs” prior to “extraction of sand or gravel from an active river or stream channel,” ²² but does not explain whether this activity would itself disturb nesting raptors.	It is acknowledged that scientific study and monitoring activities could cause disturbance to animals; the authorizing agency will take all factors into consideration when evaluating a site-specific proposal, and actions will still need to meet the objective of the ROP.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
87.	Elizabeth	Ballard	—	90951	16	Range of Alternatives	The ROP designed to mitigate aircraft disturbance to raptors similarly does not explain how operators will identify raptor nests.	ROP 34 discusses aircraft use plans that would be submitted. It is not up to the aircraft operator to identify raptor nests. During the application for permit to drill (APD), a flight plan would be submitted containing the number of proposed flights. The associated NEPA analysis would identify areas requiring protections related to raptor nests. Site-specific conditions may warrant one approach over another during future analysis associated with project-level authorizations.
88.	Elizabeth	Ballard	—	90951	22	Range of Alternatives	The DEIS arbitrarily uses the lease stipulations for caribou to apply supposed mitigation measures to Snow Geese. Using stipulations for caribou to apply to snow geese is inappropriate and arbitrary. In comparison, regulations applicable to the Arctic National Wildlife Refuge apply specifically to snow geese. ³⁷	Lease stipulations and ROPS designed to protect one resource may also provide protections for additional resources. The benefits or detriments associated with meeting that objective would be analyzed in project-specific NEPA analyses.
89.	Elizabeth	Ballard	—	90951	23	Range of Alternatives	First, the DEIS does not explain where and when barging and screening would occur.	The hypothetical development scenario is applicable to the program area, and speculation beyond where marine vessel traffic would go is beyond the scope of this analysis. Direct and indirect impacts associated with barging and screening cannot be analyzed on a site-specific basis within this EIS, but they are analyzed for the program area generally based off the hypothetical development scenario.
90.	Elizabeth	Ballard	—	90951	27	Range of Alternatives	The DEIS has not analyzed impacts to loons due to a reduction in fish from the loss of deepwater lakes. The area of high-oil potential occurs on a part of the landscape dominated by nonwetland tundra. The DEIS does not explain where and how oil and gas development activities will obtain the water necessary for building ice infrastructure and supporting production phases.	Impacts on loons due to a possible reduction in fish prey are discussed on page 3-94 of the Draft EIS. Water sources for ice infrastructure and supporting production phases are discussed on page 3-58 of the Draft EIS. Lease Stipulations 1 and 3, and ROP 9 (in general) have standards for water recharge and conditions in which surface water can be used for ice construction.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
91.	Elizabeth	Ballard	—	90951	29	Range of Alternatives	The DEIS uses an arbitrary buffer zone as a way to protect eiders. The DEIS ascribes a buffer of 656 feet (about 200 meters) in order to “Avoid and reduce temporary impacts on productivity from disturbance near Steller’s or spectacled eider nests.” ⁴³ The DEIS also appears to use this same buffer to analyze impacts to all bird species. ⁴⁴ But the DEIS does not do a good job explaining why this buffer is appropriate specifically for eiders, nor does the DEIS explain why this buffer is appropriate for all species. The DEIS does not use complete and appropriate science to determine an appropriate buffer for eiders. But the DEIS does not explain why it arbitrarily chose 656 feet as the appropriate buffer for eiders and for all birds in the project area.	The buffer described is a standard buffer width used by agencies. If mitigation measures apply to multiple resources regardless of objective, the benefits or detriments associated with that objective will be analyzed.
92.	Elizabeth	Ballard	—	90951	32	Range of Alternatives	The description of the barge “route” referenced in the DEIS ⁵³ is wholly inadequate for analyzing the impacts of marine vessel traffic on seabirds and other marine animals. Barges are very likely to be a big component of any oil and gas development in the project area, and the DEIS completely fails to analyze this potential for a very large increase of vessel traffic along the route and in the coastal zone of the project area. More vessels along the route will mean more risk of oil spills, more noise introduced into the marine environment, more ship strikes on marine wildlife, and more hazards for marine birds. ⁵⁴ The DEIS completely lacks the information necessary for the public to understand impacts to seabirds and other marine wildlife along the vessel traffic route.	The hypothetical development scenario anticipates two vessels per year on average. The hypothetical development scenario is applicable to the program area, and speculation beyond where marine vessel traffic would go is beyond the scope of this analysis. Direct and indirect impacts associated with vessel traffic cannot be analyzed on a site-specific basis within this EIS, but they are analyzed for the program area generally based off the hypothetical development scenario.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
93.	Elizabeth	Ballard	—	90951	33	Range of Alternatives	Moreover, the mitigation measures for seabirds are missing, inadequate, or arbitrary. Lease Stipulation 9 would purportedly protect coastal zones to varying degrees, but under Alternative B would only require a mitigation plan but would not actually prevent any infrastructure in the coastal area, and Alternatives C and D would allow for barges, docks, spill response areas, and pipelines. ⁵⁵ This stipulation would therefore not address impacts that occur on the vessel route from Dutch Harbor.	Lease Stipulation 4 identifies nearshore marine and barrier island habitats as NSO areas. Additionally, the hypothetical development scenario is applicable to the program area, and speculation beyond where marine vessel traffic would go is beyond the scope of this analysis. Direct and indirect impacts on seabirds are analyzed generally for the program area based off the hypothetical development scenario; the discussion for seabirds can be found in Section 3.3.3.
94.	Elizabeth	Ballard	—	90951	37	Range of Alternatives	The mitigation measures identified in the DEIS do not appear to address the likely impacts to the MPA. As articulated in paragraphs above, it is difficult to ascertain the location, duration, and level of impacts that could occur in the MPA. But the lease stipulation involving coastal areas would only require a plan under Alternative B; and would allow for barges, storage areas, and pipelines in coastal zones under Alternatives C and D. ⁶¹	Lease stipulations and ROPs designed to protect one resource also may provide protections for additional resources. The varying protections remain in order to analyze a reasonable range of alternatives under NEPA.
95.	Withheld	Withheld	—	92034	3	Range of Alternatives	The DEIS fails to uphold BLM's legal obligations to offer an adequate range of alternatives. The DEIS offers only three alternatives, all of which allow full oil and gas development. These alternatives fail to adhere to the limits for development and lease sales set by Tax Act. Additionally, the proposed alternatives fail to protect the stated purposes and biological resources of the Arctic Refuge. The DEIS does not offer reasonable alternatives to the proposed oil and gas leasing, nor does it sufficiently analyze the impacts of the alternatives.	All action alternatives are designed to meet the purpose and need, and to account for all purposes of the Arctic National Wildlife Refuge. Alternative D2 has been modified to offer 800,000 acres for leasing.

97.	Victor	Joseph	Tanana Chiefs Conference	92086	3	Range of Alternatives	The ROPs need to include an adaptive management process that institutes protocols for monitoring project activities during and following construction, along with monitoring throughout the life of the project(s). An adaptive management procedure for Arctic Refuge leasing should include consultations with the cooperating agencies and their advisors, or authorized agents, as appropriate.	Exceptions, waivers, and modifications provide an effective means of applying “adaptive management” techniques to oil and gas leases and associated permitting activities to meet changing circumstances. The BLM considers performance-based stipulations and ROPs that allow managers to practice adaptive management to ensure the objectives identified in the EIS are met. This allows the Authorized Officer the ability to tailor requirements to take account of the evolving understanding of the environment and changing technology and techniques at the time of application for a permit. The BLM or operators can initiate adaptive management modifications. See Instruction Memorandum 2008-032 and 43 CFR 3101.1-4 for additional details.
98.	Ruth	Wood	—	92475	2	Range of Alternatives	The Draft EIS does include a No Drill Alternative, but then states that the Draft EIS will ignore it because it conflicts with the Tax Bill that requires leasing. That is a false conclusion, and led to BLM ignoring its duty to adequately analyze the No Drill Alternative.	The No Action Alternative is fully analyzed in the EIS as Alternative A, as a baseline requirement of NEPA. Section 20001 of the Tax Act precludes selection of Alternative A in a Record of Decision. The regulations require the analysis of the No Action Alternative even if the agency is under a legislative command to act. This analysis provides a benchmark, enabling decision makers to compare the magnitude of environmental effects of the action alternatives. It is also an example of a reasonable alternative outside the jurisdiction of the agency, which must be analyzed (Section 1502.14(c); CEQ’s Forty Most Asked Questions Concerning CEQ’s NEPA [Question #3]). All action alternatives are designed to meet the purpose and need, and to account for all purposes of the Arctic National Wildlife Refuge.

99.	Ruth	Wood	—	92475	5	Range of Alternatives	The other alternatives all offer more than the 400,000 acres in each of 2 lease sales required by the Tax Bill. BLM did not look at any minimal alternative. Given the amount of opposition to any lease sales, BLM must include two minimal alternatives of 400,000 acres each, but currently it does not.	Alternative D2 has been modified to offer 800,000 acres for leasing.
100.	Withheld	Withheld	Government of the Northwest Territories	92862	19	Range of Alternatives	The GNWT recommends the BLM provide a definition of "reclaimed" that is consistent with the majority of the purposes for which the Arctic National Wildlife Refuge was established under section 303 of the Alaska National Interest Lands Conservation Act of 1980 (ANILCA). The definition of reclaimed should consider the return to functional habitat and the return of the land to a pre-disturbance state, consistent with ROP 35.	The term has been added to the glossary. Under all alternatives, ROP 35 requires restoration to the land's previous hydrological, vegetation, and habitat condition.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
101.	Withheld	Withheld	Government of the Northwest Territories	92862	32	Range of Alternatives	<p>Comment(s) In its analysis of alternatives, the BLM only considers the option of having in total more than 2,000 acres of surface occupation over the lifetime of the project, although other less impactful options are available to it and would do much to inform the assessment of the potential environmental impacts of this project if considered. Unlike the 800,000 acre minimum mandate for leasing, the 2,000-acre limit is a maximum, not a minimum, allowing the BLM to consider options in which only 2,000 acres or fewer than 2,000 acres are occupied in total over the lifetime of the project.</p> <p>Recommendation Given that the impacts on the wildlife protected by the ANWR resulting from the destruction of surface habitat is the primary significant environmental impact from this proposal to mitigate, surface occupancy seems like the key aspect of this project to minimize as a means of mitigating this most significant impact. Therefore, the GNWT recommends options that do this should be considered within the EIS. Further, to the extent that the EIS (e.g. at s. 1.9.1) asserts that allowing less than a rolling 2,000 acres of surface occupancy renders the program not economically viable, it offers no evidence in support of this assertion. The GNWT recommends the EIS explore options in which different, necessarily lesser, amounts of land are occupied in total under the program and must also provide quantitative data on the differences in impacts among the different options.</p>	<p>Section 20001(c)(3) of the Tax Act states “the Secretary shall authorize up to 2,000 surface acres.” Any interpretation by the BLM to modify the limit for a given alternative would be inconsistent with the Tax Act. As stated in Section 1.9.1, the BLM interprets the language “during the term of the leases” in Section 20001(c)(3) of PL 115-97 as indicating Congress intended a temporal limit. Under this interpretation, the reclaimed acreage of federal land formerly containing production and support facilities would no longer count toward the 2,000-acre limit, which has been revised to include gravel mines.</p>

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
102.	Withheld	Withheld	Government of the Northwest Territories	92862	33	Range of Alternatives	<p>A BLM officer may grant a waiver, exception, or modification of a stipulation through the permitting process but it is not clear what criteria will be used to determine when a waiver, exception or modification is appropriate or how the lessee and/or regulator will monitor their development to determine if the waiver, exception or modification is having an adverse impact on wildlife and involves additional mitigation. The US General Accounting Office has questioned the consistency and rationale of how BLM waives lease stipulations and operating conditions and concluded that “Without sufficiently detailed documentation of inspections and effective use of data from inspections, BLM is unable to fully assess the effectiveness of its best management practices policy to mitigate environmental impacts”. USGAO (2017).³ The level of certainty regarding mitigations decreases with the possibility that a waiver, exception, or modification of a stipulation can occur. Recommendation The GNWT recommends the BLM include in the EIS an analysis of BLM rationale to waive lease stipulations and an evaluation of impact and effectiveness. The GNWT recommends the BLM develop a policy for exceptions and modifications to lease stipulations. The GNWT recommends the rationale supporting each future waiver, exception or modification of a stipulation for a lease in the Coastal Plain be documented and made publicly available. The GNWT recommends the lessees be required to undertake follow up monitoring to determine if the waiver, exception or modification of a stipulation is having an adverse impact on wildlife. If an adverse impact is</p>	<p>The BLM has edited text in Chapter 2 to provide clarifications around the waiver, exception, and modification process. The objectives of ROPs would still need to be met before a waiver, exception, or modification could be granted.</p>

S. Public Comments and BLM Responses (Alternatives)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
102. (cont.)	(see above)	(see above)	(see above)	(see above)	(see above)	(see above)	discovered the BLM should consider reversing the waiver, exception or modification of that stipulation.	(see above)
103.	Withheld	Withheld	Government of the Northwest Territories	92862	34	Range of Alternatives	Based on the combination of the following sections from the draft EIS it is clear that the No-Surface-Occupancy (NSO) section on the western most section of the Coastal Plains would need to have pipelines and likely a road through it. This is not clearly identified on the maps in the draft EIS: No-Surface-Occupancy (NSO): An area that is open for mineral leasing but does not allow the construction of surface oil and gas facilities in order to protect other resource values. However, "On a case-by case basis, essential pipeline and road crossings would be permitted through setback areas." "Future oil production would use existing North Slope infrastructure, including the Trans-Alaska Pipeline System (TAPS)." Recommendation The GNWT recommends the BLM clarify in the EIS that, at a minimum, No-Surface-Occupancy (NSO) in the western portion of the Coastal Plain is not possible under any of the described alternatives.	PL 115-97 requires that the BLM authorize right-of-ways (ROWs) for essential roads and pipeline crossings. Even in an NSO area, a ROW could still be authorized. This has been clarified in Chapter 2.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
104.	Withheld	Withheld	Government of the Northwest Territories	92862	38	Range of Alternatives	The timing limitation associated with Lease Stipulation 6, Alternative D2 states "If caribou arrive on the calving grounds before May 20, or if they remain in the area past July 20 in significant numbers (greater than approximately 10 percent of the estimated calving cow population or 1,000 during insect-relief periods), major construction would be suspended." It is unclear how close 10% of cows or 1000 caribou would need to be in order to have mitigation remain in place. The effectiveness of this mitigation cannot be assessed until the terms "major construction activities" or "remain in the area" are defined. The enforcement of this mitigation is also made more difficult without a clear definition of those two terms. Recommendation The GNWT recommends "major construction activities" and "remain in the area" be clearly defined. Given the importance of the program area to PCH, these terms need to be well defined to provide certainty to operators and regulators on when activities must be suspended.	The term "major construction activities" has been defined in the glossary. As noted in footnote 1 of Table 2-3, appropriate federal, state, and local agencies will be coordinated with as appropriate, and can convene to reassess methodologies as techniques change.

S. Public Comments and BLM Responses (Alternatives)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
105.	Withheld	Withheld	Government of the Northwest Territories	92862	39	Range of Alternatives	Lease stipulation 6 and 7 both require that major construction activities using heavy equipment, but not drilling from existing production pads, would be suspended under various circumstances. The effectiveness of these Lease Stipulations requires baseline information and the integration of monitoring and mitigation that results in adaptive management with respect to caribou mitigations. Recommendation The GNWT recommends the BLM provide studies or evidence to demonstrate that suspending major construction activities while still allowing drilling and activities is an effective mitigation measure. If evidence does not clearly support the effectiveness of this mitigation the lease stipulation should be changed to include the suspension of major construction, drilling, and other project activities (maintenance activities, traffic, etc.) from existing production pads. The GNWT recommends the BLM develop a framework that includes a clear list of activities that would be suspended, the triggers for their suspension, and the means of determining that the triggers are being addressed in the event that calving or post-calving caribou enter a conservatively established buffer zone around infrastructure, roads, and work sites.	The term "heavy equipment" has been added to the glossary.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
106.	Withheld	Withheld	Government of the Northwest Territories	92862	40	Range of Alternatives	The GNWT recommends the BLM require the operator to monitor PCH responses to a suspension of major construction activities while continuing drilling under Lease Stipulation 7 and adaptively manage their operations should PCH exhibit a negative response to drilling.	Operators are required to submit a written request for an exception, waiver, or modification and information demonstrating that (1) the factors leading to the inclusion of the stipulation in the lease have changed sufficiently to make the protection provided by the lease stipulation no longer needed or (2) the proposed operation would not cause unacceptable impacts. The criteria for approval of exceptions, waivers, and modifications should be supported by NEPA analysis, and may require site-specific environmental review. Requests should contain, at a minimum, a plan that includes related on-site or off-site mitigation efforts to adequately protect affected resources; data collection and monitoring efforts; and timeframes for initiation and completion of construction, drilling, and completion operations. The operator's request may be included in an Application for Permit to Drill, Notice of Staking, Sundry Notice, or letter. The BLM may also proactively initiate the process. During the review process, BLM coordination with other local, state, or federal agencies (e.g., ADFG, NSB, and local governments) should be undertaken, as appropriate, and documented. The BLM also will consult with the federal surface management agency (e.g., USFWS). Approval or disapproval is made by the Authorized Officer, and the decision is documented. If the waiver, exception, or modification is approved, any necessary mitigation is also documented. The applicant is then provided with a written notification of the decision. See Instruction Memorandum 2008-032 and 43 CFR 3101.1-4 for additional details.

S. Public Comments and BLM Responses (Alternatives)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
107.	Withheld	Withheld	Government of the Northwest Territories	92862	41	Range of Alternatives	The GNWT recommends the BLM require a wildlife management and monitoring plan that identifies how they will monitor the PCH and adaptively manage their operations based on the effectiveness of their mitigations.	Heavy equipment has been defined in the glossary. Exceptions, waivers, and modifications provide an effective means of applying “adaptive management” techniques to oil and gas leases and associated permitting activities to meet changing circumstances. The BLM or operators can initiate adaptive management modifications. See Instruction Memorandum 2008-032 and 43 CFR 3101.1-4 for additional details.
108.	Withheld	Withheld	Government of the Northwest Territories	92862	42	Range of Alternatives	To ensure that the intent of the timing limitation is maintained and a precautionary approach is taken, the GNWT recommends adding the underlined text in italics: “...the resource agencies. The BLM Authorized Officer may only extend, and not decrease, the time limit on the suspension of activities. The intent of this requirement...” If this recommended wording is not adopted the criteria to be considered when changing the suspension dates should be provided in this lease stipulation.	Operators are required to submit a written request for an exception, waiver, or modification and information demonstrating that (1) the factors leading to the inclusion of the stipulation in the lease have changed sufficiently to make the protection provided by the lease stipulation no longer needed or (2) the proposed operation would not cause unacceptable impacts. The criteria for approval of exceptions, waivers, and modifications should be supported by NEPA analysis, and may require site-specific environmental review. Requests should contain, at a minimum, a plan that includes related on-site or off-site mitigation efforts to adequately protect affected resources; data collection and monitoring efforts; and timeframes for initiation and completion of construction, drilling, and completion operations. The operator’s request may be included in an Application for Permit to Drill, Notice of Staking, Sundry Notice, or letter. The BLM may also proactively initiate the process. During the review process, BLM coordination with other local, state, or federal agencies (e.g., ADFG, NSB, and local governments) should be undertaken, as appropriate, and

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
108. (cont.)	(see above)	(see above)	(see above)	(see above)	(see above)	(see above)	(see above)	documented. The BLM will also consult with the federal surface management agency (e.g., USFWS). Approval or disapproval is made by the Authorized Officer, and the decision is documented. If the waiver, exception, or modification is approved, any necessary mitigation is also documented. The applicant is then provided with a written notification of the decision. See Instruction Memorandum 2008-032 and 43 CFR 3101.1-4 for additional details.
109.	Withheld	Withheld	Government of the Northwest Territories	92862	43	Range of Alternatives	Lease Stipulation 7 has the following Requirement/Standard: a. The following ground and air traffic restrictions would apply to permanent oil and gas-related roads in the areas and time periods indicated: i) Within the calving habitat area, from May 20 through June 20, traffic speed should not exceed 15 miles per hour when caribou are within 0.5 mile of the road... The lessee should submit with the development proposal a vehicle use plan that considers these and any other mitigation. Recommendation Estimating distances unassisted can be subjective. The GNWT recommends that during the calving period roads within calving habitat be closed and operations suspended. If this recommendation is not accepted the GNWT recommends the vehicle use plan clearly outline how a distance of 0.5 miles is to be estimated or determined by drivers. The impact of darkness or poor weather on the determination of the 0.5 mile limit should also be addressed in the vehicle use plan. The GNWT recommends the vehicle use plan direct the lessee to install additional signage along roads to alert drivers when caribou are in an area. Wildlife should always have the right of way on	Traffic in areas with calving caribou would be minimized or eliminated as possible through the vehicle use plan, which could include recommendations such as periodic markers every 0.5 miles, personnel training, or speed restrictions during extreme weather (i.e., fog).

S. Public Comments and BLM Responses (Alternatives)

109. (cont.)	(see above)	(see above)	(see above)	(see above)	(see above)	(see above)	roads. The GNWT recommends a plan be developed to determine the effectiveness of the mitigations.	(see above)
110.	Withheld	Withheld	Government of the Northwest Territories	92862	44	Range of Alternatives	Lease Stipulation 7 has a Requirement/Standard that states "The following ground and air traffic restrictions would apply to permanent oil and gas- related roads in the areas and time periods indicated..." The restrictions that follow are not related to air traffic, with the possible exception of the suggestion that the lessee limit trips. Recommendation The GNWT recommends the BLM provide air traffic restrictions for this lease stipulation or link the lease stipulation to ROP 34 - Use of Aircraft for Permitted Activities. Low level flights over calving habitat during calving should be banned.	Text has been edited in ROP 34 for clarity.
111.	Withheld	Withheld	Government of the Northwest Territories	92862	45	Range of Alternatives	The timing limitation for Alternative C and D states that "Sections of road would be evacuated whenever an attempted crossing by a large number of caribou (approximately 100 or more) appears to be imminent." It is not clear why the threshold was set at 100 caribou or how the operator would determine that caribou wish to cross the road or that the crossing is imminent. It is also not clear how effective this mitigation will be.	Additional text has been added to Lease Stipulation 8.

S. Public Comments and BLM Responses (Alternatives)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
112.	Withheld	Withheld	Government of the Northwest Territories	92862	46	Range of Alternatives	The GNWT recommends the lessee's vehicle use plan (or other management plan) provide clear direction on how a driver should determine a crossing is imminent. The GNWT recommends the lessee be required to monitor crossing deflection rates and crossing success rates and adaptively manage their operations if it is found that caribou are avoiding crossing the road. The GNWT recommends the BLM provide a rationale on why 100 caribou was chosen as the threshold and provide supporting evidence that this mitigation will be effective, especially for large aggregates of Porcupine caribou ("super groups").	The vehicle use plan developed by the lessee could include recommendations specific to caribou road crossings. Additional text has been added to Lease Stipulation 8.
113.	Withheld	Withheld	Government of the Northwest Territories	92862	47	Range of Alternatives	ROP 4 directs the lessee, operator or contractor to prepare and implement bear-interaction plans. "The plans would include specific measures identified in the current United States Fish and Wildlife Service (USFWS) Polar Bear Mitigation Plan and would be adapted as needed for grizzly bears." Recommendation The GNWT recommends the BLM provide direction on how measures in the USFWS Polar Bear Mitigation Plan should be adapted for grizzly bears.	The bear interaction plan would be approved by the USFWS, but it is the operator's document as part of the MMPA Letter of Authorization for incidental take (ITR/LOA). It is not within the BLM's authority to provide direction on how measures would be adapted for grizzly bears.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
114.	Withheld	Withheld	Government of the Northwest Territories	92862	48	Range of Alternatives	ROP 17 states that "Construction of a gravel road for permanent oil and gas facilities would be prohibited for exploratory drilling. Use of a previously constructed road or pad may be permitted if it is environmentally preferred." Permanent oil and gas facilities are defined in the draft EIS as "Production facilities, roads, airstrips, production pads, docks, seawater treatment plants, and other structures associated with oil and gas production, that occupy land for more than one winter season. Material sites and seasonal facilities, such as ice roads, are excluded, even when the pads are designed for use in successive winters." Allowing the construction of a gravel road to a non-permanent oil and gas facility could result in multiple gravel roads being constructed that have no destination or result in a lessee claiming that a facility will be in use for only one season even if they know differently in order to build a road. Recommendation The GNWT supports the inclusion of this ROP. However, the GNWT recommends the mitigation could be strengthened by removing reference to "permanent oil and gas facilities."	Text has been edited in Chapter 2 as recommended.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
115.	Withheld	Withheld	Government of the Northwest Territories	92862	50	Range of Alternatives	<p>ROP 23 requires a vehicle use management plan to be developed by the lessee/operator/contractor. The management plan would minimize or mitigate displacement during calving and would avoid, to the extent feasible, delays to caribou movements and vehicle collisions during the midsummer insect season, with traffic management following industry practices. Recommendation The GNWT recommends the vehicle use management plan include an adaptive management component. The GNWT recommends the vehicle management plan avoid delays to caribou movements and vehicle collisions at all times, not just during the midsummer insect season. The GNWT recommends a regional database be made available, so overall impacts can be monitored. The BLM Officer, State of Alaska, relevant wildlife management authorities in Canada including the Government of the Northwest Territories, and the Porcupine Caribou Management Board should have access to monitoring data.</p>	<p>The BLM has revised ROP 23 to remove the phrase "during the midsummer insect season." The vehicle use plan will work to minimize additional impacts. Sharing of management monitoring data would be initiated by the relevant wildlife management authorities and is outside the scope of this EIS.</p>

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
116.	Withheld	Withheld	Government of the Northwest Territories	92862	52	Range of Alternatives	<p>The objective of ROP 33 is to “Provide information to be used in monitoring and assessing wildlife movements during and after construction.” The information that is required under ROP 33 is related to the location of project infrastructure. It is unclear how information on the infrastructure will be used to assess wildlife movements during and after construction or who would be undertaking the monitoring and assessment of wildlife movements. Information collected under this ROP has value to various management authorities in Canada. Recommendation The GNWT recommends the ROP 33 be revised to include details on who will be undertaking monitoring and assessing wildlife movements during and after construction. Information should also be added to ROP 33 to outline how adaptive management will be incorporated into the project design and operations if the assessment shows that wildlife movement is being adversely impacted by the project. The GNWT recommends baseline information on wildlife movements and results from any project monitoring, such as monitoring results from the vehicle use plan, be provided to the BLM Authorized Officer, State of Alaska, relevant wildlife management authorities in Canada and the Porcupine Caribou Management Board.</p>	<p>The BLM has the ability to manage adaptive management principals by modifying requirements of ROPs through the waiver, exception, or modification process as needed (IM 2008-032 Attachment 1, page 5—the BLM or operators can initiate adaptive management modifications). Sharing of management monitoring data, if appropriate, would be initiated by the relevant wildlife management authorities and is outside the scope of this EIS. Federal, state, and local wildlife management agencies would evaluate data provided under ROP 33 to assess wildlife movements.</p>

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
117.	Withheld	Withheld	Government of the Northwest Territories	92862	53	Range of Alternatives	The timing restriction associated with the number of helicopter landings under Alternative B and C is limited to May 20 through June 20. The timing restrictions are expanded to May 20 to July 20 under Alternative D. The Coastal Plain lands are extremely important in the post-calving insect relief period, in addition to the calving period, and the behavior of large aggregations around infrastructure is unknown (Russell and Gunn 2019). For these reasons the GNWT suggest that the calving and post calving periods from May 20 to July 20 be included in all Alternatives.	The suggestion described in this comment is within the range of alternatives considered in this EIS.
118.	Withheld	Withheld	Government of the Northwest Territories	92862	54	Range of Alternatives	ROP 42 prohibits the chasing of wildlife with ground vehicles. ROP 42 should be strengthened to include for distances for yielding the right of way to wildlife on roads. An example for caribou from the Ekati mine in the NWT: Distance of Caribou from the Road Speed Guideline (m = metre; km/h = kilometres per hour): · less than 100 m driver to remain stopped · 100 to 200 m driver to proceed at 20 km/h · 200 to 500 m driver to proceed at 40 km/h · 500 m or more driver to proceed at 60 km/h Recommendation The GNWT recommends the Standard in ROP 42 be expanded to yielding the right of way to all wildlife on roads and ground vehicles should remain away from any wildlife, where possible. These distances should be clearly defined.	The vehicle use management plan identified in ROP 23 (section g) will contain this level of specificity.

119.	Withheld	Withheld	Government of the Northwest Territories	92862	55	Range of Alternatives	The BLM states in section 2.3 of the draft EIS that an alternative that would make only 800,000 acres available for lease sales would also be similar in concept to Alternatives D1 and D2 (which consider leasing approximately 1,037,200 acres). Based on this the BLM eliminated the alternative where only 800,000 acres would be made available for leasing from detailed analysis. The GNWT believes the option to make only 800,000 acres of land available for lease sales is not substantially similar in design to other Alternatives and does not meet any of the other criteria for exclusion from detailed analysis. The BLM also stated that the actual potential development area would be much less than 800,000 acres with the 2,000-acre limitation on surface disturbance and that was a factor in not evaluating the 800,000 acres option. This is irrelevant, as PL 115-97 does not state that the total potential development area must be 800,000 acres. Also, the Tax Act only mandates the lease of the 800,000 acres with the best hydrocarbon potential - it does not mandate the proposed categories (which are not defined in the EIS) of hydrocarbon potential land, nor does it mandate the lease of all lands within a certain category. The alternative analyzed in the EIS with the smallest proposed acreage to lease is roughly 200,000 acres or approximately 25%, higher than this minimum. To the extent that the EIS claims that a lease of 800,000 acres of the highest hydrocarbon potential land is not economically viable, it offers no data or analysis justifying this conclusion. There is no stated project purpose, identified need or legal requirement to lease more than the 800,000 acres required by PL 115-97. The most conservative interpretation of section 20001 of PL	Alternative D2 has been modified to offer 800,000 acres for leasing.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
119. (cont.)	(see above)	(see above)	(see above)	(see above)	(see above)	(see above)	115-97 should be put forward as a possible alternative because it is feasible, meets the requirements set out in PL 115-97, is substantially different in design to Alternative A-D, would lead to a different outcome than the other Alternatives and does not meet any of the criteria listed above for exclusion of analysis. An alternative that considers only 800,000 acres for lease would be consistent with the conservation needs (generally) of species covered by international agreements. Given NEPA's mandate at s. 102(C)(ii) to speak to any adverse impact which cannot be avoided, the analysis offered in this EIS does not make it clear what the actual minimum, truly unavoidable impact of this program is because the alternatives it offers do not consider the range of factors and mitigations as detailed in these comments or the minimum leasing scenario mandated by the Tax Act. This would also not seem to be precluded by the "purpose and need" of the EIS as articulated within this EIS. Such analysis and minimum impact should be contained within the EIS.	(see above)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
120.	Withheld	Withheld	Government of the Northwest Territories	92862	56	Range of Alternatives	<p>The GNWT recommends a supplemental EIS to include an Alternative based on section 20001(c) of PL 115-97, and that consists of the following:</p> <ul style="list-style-type: none"> · One lease sale in 2021 of 400,000 acres of land that has the highest potential for the discovery of hydrocarbons. If the entire 400,000 acres of land is not leased during the first sale the unleased land quantum will not be put up for sale again or added to the 400,000 acres that is required for lease sale in 2024 (i.e., the second sale will not be 400,000 acres plus the unleased land amount from the first sale). · A second lease sale in 2024 of 400,000 acres of land that has the highest potential for the discovery of hydrocarbons. · There will be only two lease sales. This is different from the draft EIS Alternatives that contemplate more than two lease sales, as described in Section 1.8 of the draft EIS. · Provide certainty on which 400,000 acres of land will be put up for lease. · Seismic activity would only occur in the blocks of land being considered for leasing. · Consider conservative ROP and lease stipulations, similar to those presented in Alternative D. The GNWT also requests that BLM to supply data and/or rationale as to why it considered the 800,000-acre option not to be economically viable, or to alter its conclusion if it is unable to provide such data. The GNWT also recommends that the BLM eliminate its three categories of HCP land and focus on its analysis on a set volume of best HCP land (e.g. best 800,000 acres or another number). The 800,000-acre option should consider all additional factors recommended herein and elsewhere establishing a true minimum impact alternative for this proposal. 	<p>Alternative D2 has been revised to offer 800,000 acres of land for leasing. The suggested alternative would have impacts similar to alternatives already analyzed. The BLM would expect little to no difference in impacts under such an alternative. This is because lands that were offered but not leased in the first sale are unlikely to be leased in a second sale a few years later given that exploration is unlikely to substantially advance during that time period. The BLM has added additional text to Section 2.3.</p>

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
121.	Withheld	Withheld	Government of the Northwest Territories	92862	72	Range of Alternatives	Lease Stipulation 9 for Alternative C does not permit a central processing facility within one mile inland of the coast (or two miles inland under Alternative D). In the central portion of the Coastal Plain, the land is Native conveyed and not part of the area where these lease stipulations apply. The quantitative analysis by Russell and Gunn 2019 shows that the area where the PCH is most likely to come within one mile of the coast is just west of the Native conveyed land, near Collison Point. It is unclear from text in Lease Stipulation 9 and page 3-119 if there technically could be a central processing facility within one mile of the coast on native lands and the cumulative impacts of this. Recommendation The GNWT recommends, as part of the cumulative impact assessment, the BLM conduct a quantitative analysis to evaluate the potential effectiveness of Lease Stipulation 9 for the PCH (and CAH) should a central processing facility be constructed on Native conveyed lands.	Additional analysis of Lease Stipulation 9 has been added to Section 3.3.4.
122.	Withheld	Withheld	Chevron U.S.A. Inc.	92880	2	Range of Alternatives	We are concerned the alternatives defined in the DEIS do not meet the Purpose and Need of the Leasing Program, given the significant extent to which access could be limited through NSO, setbacks and noleasing stipulations. We find the DEIS does not create a record for why such access limiting requirements are necessary	All action alternatives are designed to meet the purpose and need, and to account for all purposes of the Arctic National Wildlife Refuge. Additional text has been added.

S. Public Comments and BLM Responses (Alternatives)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
123.	Malkolm	Boothroyd	CPAWS Yukon Chapter	94061	8	Range of Alternatives	The BLM provides no information on how decisions to waive, exempt or modify stipulations would be made, whether opportunities for public participation would be offered, or what oversight would occur.	Operators are required to submit a written request for an exception, waiver, or modification and information demonstrating that (1) the factors leading to the inclusion of the stipulation in the lease have changed sufficiently to make the protection provided by the lease stipulation no longer needed or (2) the proposed operation would not cause unacceptable impacts. The criteria for approval of exceptions, waivers, and modifications should be supported by NEPA analysis, and may require site-specific environmental review. Requests should contain, at a minimum, a plan that includes related on-site or off-site mitigation efforts to adequately protect affected resources; data collection and monitoring efforts; and timeframes for initiation and completion of construction, drilling, and completion operations. The operator's request may be included in an Application for Permit to Drill, Notice of Staking, Sundry Notice, or letter. The BLM may also proactively initiate the process. During the review process, BLM coordination with other local, state, or federal agencies (e.g., ADFG, NSB, and local governments) should be undertaken, as appropriate, and documented. The BLM will also consult with the federal surface management agency (e.g., USFWS). Approval or disapproval is made by the Authorized Officer, and the decision is documented. If the waiver, exception, or modification is approved, any necessary mitigation is also documented. The applicant is then provided with a written notification of the decision. See Instruction Memorandum 2008-032 and 43 CFR 3101.1-4 for additional

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
123. (cont.)	(see above)	(see above)	(see above)	(see above)	(see above)	(see above)	(see above)	details. Additional text has been added for clarification in Chapter 2. Public involvement requirements are in IM 2008-032, Attachment 1, and would be adhered to.
124.	Bernadette	Demientieff	Gwich'in Steering Committee	94080	41	Range of Alternatives	Stipulation 6 seeks to protect habitat of both the Porcupine and Central Arctic Herds by minimizing disturbance and hindrance of movements. ⁸⁴ However, for its requirements and standards, it simply points to ROP 23 for Alternatives B and C, with only the addition of suspension of major construction activities using heavy equipment for a short period under Alternative D. This means that this stipulation does not provide any independent protection for caribou movements across the Coastal Plain. (It is unclear what "major construction activity" means.) Stipulation 7 seeks to protect the "PCH primary calving habitat area." However, BLM has not supported the delineation of that area in the DEIS with any level of robust scientific justification.	Lease Stipulation 6 provides additional protections on top of ROP 23 for caribou under Alternative D2. The suggestion described in this comment is within the range of alternatives considered in this EIS. The BLM has added the definition of "major construction activity" to the glossary. PCH primary calving habitat area is identified in the note of Lease Stipulation 7. The Draft EIS maps incorrectly identify these kernels as concentrated calving areas; they were based on 95 percent kernel contours. The BLM has corrected this in the Final EIS.
125.	Alice	Levine	—	94086	4	Range of Alternatives	All of the action alternatives offer considerably more acreage than is required by the Tax Act. The DEIS gives no reason why it is offering 66 to 100 percent of the 1.56 million-acre Coastal Plain for leasing purposes in the action alternatives, when Congressional direction only stipulated "at least" 400,000 acres be offered-just 25 percent of the total program area.	Alternative D2 has been modified to offer 800,000 acres for leasing.

S. Public Comments and BLM Responses (Alternatives)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
126.	—	—	Alaska Department of Natural Resources	94102	2	Range of Alternatives	Alternatives D-1 and D-2 do not account for the known data gap because they eliminate the southeastern part of the Coastal Plain from oil and gas leasing entirely. Without the ability to lease, companies are unlikely to expend resources conducting exploratory seismic surveys in the unleaseable areas, thus eliminating a valuable opportunity to update assessments of the subsurface resource potential using current technology. BLM should clarify in the Final EIS that Alternatives D1 and D2 were carried forward for detailed analysis but were ultimately determined to be inconsistent with the Tax Act because of these issues and therefore cannot be selected as the preferred alternative.	All action alternatives are designed to meet the purpose and need, and are compliant with PL 115-97.
127.	—	—	Alaska Department of Natural Resources	94102	21	Range of Alternatives	This section also needs to recognize that ANILCA established the Mollie Beattie Wilderness Area on the Refuge, which included establishing specific boundaries. Applying a wilderness area buffer that extends beyond that boundary into the Coastal Plain and applies wilderness area protections, such as NSOs, beyond the wilderness area boundaries is inconsistent with ANILCA (Page 3-217).	Since the NSO area identified along the boundary of the Mollie Beattie Wilderness Area would not establish a withdrawal, conservation system unit, or similar area, it is not precluded by Section 1326 of ANILCA.
128.	Withheld	Withheld	—	94436	3	Range of Alternatives	The DEIS fails to uphold BLM's legal obligations to offer an adequate range of alternatives. The DEIS offers only three alternatives, all of which allow full oil and gas development. These alternatives fail to adhere to the limits for development and lease sales set by Tax Act. Additionally, the proposed alternatives fail to protect the stated purposes and biological resources of the Arctic Refuge. The DEIS does not offer reasonable alternatives to the proposed oil and gas leasing, nor does it sufficiently analyze the impacts of the alternatives.	Alternative D2 has been modified to offer 800,000 acres for leasing.

S. Public Comments and BLM Responses (Alternatives)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
129.	Jason	Schwartz	Institute for Policy Integrity	94627	6	Range of Alternatives	alternatives D1 and D2 are very similar to each other, in some cases presenting identical stipulations or very minor differences between them, and so BLM has failed to meaningfully assess a range of reasonable alternatives.	The fact that impacts on a specific resource are similar across all action alternatives does not, per se, indicate that the range of alternatives is not reasonable under NEPA. In addition, Alternative D2 has been modified to offer 800,000 acres available for leasing.
130.	Jason	Schwartz	Institute for Policy Integrity	94627	8	Range of Alternatives	BLM also failed to consider other possible stipulations that would protect the fragile ANWR ecosystem and reduce other environmental effects, such as: * More stringent time restrictions with respect to critical habitat; * More stringent stipulations concerning land use disturbance, such as more nosurface occupancy stipulations; * More stringent stipulations concerning seismic exploration surveys	The BLM considered all suggestions for stipulations that would protect the Arctic National Wildlife Refuge ecosystem. The alternatives were developed through identification of mitigation measures for protection of the numerous resources within the Coastal Plain. The mitigation measures, which are comprised of proposed lease stipulations and ROPs, vary by each action alternative to provide differing levels of protection for the numerous resources, while complying with all purposes of the Refuge.

S. Public Comments and BLM Responses (Alternatives)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
131.	Matthew	DePaolis	—	95032	2	Range of Alternatives	Second, pursuant to the requirements set forth in 42 U.S.C. 4331, the DEIS does not fully describe the ramifications of allowing the issuance of drilling leases in the Arctic Refuge. The DEIS must take into account all direct and indirect effects of granting the lease, as it is not reasonable to say the lease would be granted without the drilling eventually occurring. In accordance with NEPA, alternatives must be discussed. However, the DEIS does not realistically look at 'Alternative A', the no-action alternative. The DEIS claims that this alternative is not considered, just included as a reference, citing that it is outside the scope of the stated aims. However, this is because the stated aims of the project are too narrow. By defining the project as "oil and gas leases in the arctic refuge" there has been no space for a reasonable alternative of not issuing the leases to be considered. Only by expanding the scope to something in the interest of the American public, whether that is "expanding the United States oil production" or "reducing the dependence of the United States on foreign oil" can a true alternative to this project be considered.	The No Action Alternative is fully analyzed in the EIS as Alternative A, as a baseline requirement of NEPA. Section 20001 of the Tax Act precludes selection of Alternative A in a Record of Decision. The regulations require the analysis of the No Action Alternative even if the agency is under a legislative command to act. This analysis provides a benchmark, enabling decision makers to compare the magnitude of environmental effects of the action alternatives. It is also an example of a reasonable alternative outside the jurisdiction of the agency, which must be analyzed (Section 1502.14(c); CEQ's Forty Most Asked Questions Concerning CEQ's NEPA [Question #3]). All action alternatives are designed to meet the purpose and need, and to account for all purposes of the Refuge.
132.	Brook	Brisson	Trustees for Alaska	96981	17	Range of Alternatives	Moreover, it is unclear when BLM will grant acreage to companies. These types of decisions are important for project developers and will have implications for their development timelines since ensuring adequate acreage available for development will be essential. For example, will BLM grant the acreage: ? Following lease sales to successful bidders? ? When BLM approves development plans? ? When permits are secured? ? When construction begins?	This information will be provided in the Detailed Statement of Sale issued prior to each lease sale. Additional text has been added to Section 3.2.6.

S. Public Comments and BLM Responses (Alternatives)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
133.	Brook	Brisson	Trustees for Alaska	96981	19	Range of Alternatives	The BLM identified various lease stipulations or required operating procedures in the EIS, but all of these can be waived, exempted, or modified. Accordingly, they are insufficient to serve as an enforcement mechanism for the development limitation...However, the EIS lacks a no surface occupancy stipulation applicable to all acreage of the Coastal Plain. In fact, there are no specific stipulations in Chapter 2 that indicate there will be a limitation on surface disturbance or that provide a general notice to the lessors that BLM may require a cessation of surface disturbing activities should the acreage limits be achieved. These types of stipulations must be included in every lease and permit issued to make it clear that BLM and the leaseholders are beholden to these limitations when issuing a lease.	Clarifying text has been added to Chapter 2 related to the waiver, exemption, and modification process. Additional information related to surface-disturbing activities will be provided in the Detailed Statement of Sale issued prior to each lease sale.
134.	Brook	Brisson	Trustees for Alaska	96981	20	Range of Alternatives	At a minimum, BLM must be very clear in its lease terms that it is not granting any rights to lessees to conduct any oil and gas activities and that BLM retains full authority to outright prohibit oil and gas activities on any lease issued at any time during the lease term. This is contrary to how BLM currently describes leases. ⁷⁴ BLM also acknowledges that its authority to deny activities on leases is conditioned on what is in the actual lease terms. ⁷⁵ But without a clear restriction and reservation of rights, BLM could be in the position it now finds itself in the NPRA, where it has granted leases that, according to the agency, do not allow it to reject proposals and prohibit activities. ⁷⁶ If BLM does not identify an enforcement mechanism and clearly retain the authority to prohibit activities on any leases it may grant, BLM cannot ensure that it will comply with the 2,000-acre limitation.	Leases will state that the BLM cannot approve development in excess of the 2,000-acre limit. Section 1.9.1 describes those facilities that will be counted against the 2,000 acres. The BLM will use facility data in the form of ArcGIS-compatible shapefiles obtained under ROP 33 to track facility acreage to assure continued compliance with the Tax Act limit.

135.	Brook	Brisson	Trustees for Alaska	96981	21	Range of Alternatives	BLM has indicated that it intends to rely on use of temporary facilities (on snow and ice) and reclamation so that once some acreage has been disturbed, it can be deemed only temporarily disturbed or reclaimed and then new acreage can be disturbed. As explained above, this interpretation cannot carry forward. And as explained below, reclamation of Arctic tundra and ecosystems is notoriously challenging and long-term. BLM must establish systems to ensure there has not been damage below snow and ice. Further, there must be inspection standards in place to verify reclamation before those acres can be accepted. Using operator "reclamation plans" is not sufficient. A separate review of the ground multiple years later (given the slow speed at which Arctic ecosystems regenerate) must be required before these acres can be deemed reclaimed for purposes of permitting additional surface disturbance.	Section 1.9.1 describes those facilities that will be counted against the 2,000 acres. The BLM will use facility data in the form of ArcGIS-compatible shapefiles obtained under ROP 33 to track facility acreage to assure continued compliance with the Tax Act limit. A reclamation plan would be approved by the BLM Authorized Officer (as noted in ROP 35). Approved plans would provide the standard by which full reclamation is deemed achieved. The BLM would conduct inspections of ice and/or snow recovery to ensure resources are not damaged and are in compliance with the terms and conditions of the authorized activity.
136.	Brook	Brisson	Trustees for Alaska	96981	30	Range of Alternatives	The draft EIS's range of alternatives is inadequate for multiple reasons. The draft EIS fails to analyze many reasonable alternatives and proposals submitted by the public at scoping. ¹¹¹ This includes minimized lease acreage; deferred leasing; alternatives with non-waivable stipulations, best management practices, and required operating procedures; alternatives that do not allow development until specific FWS findings are made; alternatives that preclude future development or only permit contiguous development; and economics-based alternatives. ¹¹² These recommendations are not reflected in BLM's three action alternatives.	Alternative D2 has been modified to offer 800,000 acres for leasing. Alternatives that were not carried forward for analysis are discussed in Section 2.3.

137.	Brook	Brisson	Trustees for Alaska	96981	36	Range of Alternatives	While the Tax Act sets out one development-oriented statutory purpose for the Coastal Plain, it preserves the other protective purposes and mandates. BLM is obligated "to reconcile the two, if possible, and to give effect to each." ¹²¹ The agency can do this only if it develops one or more alternative approaches to a leasing program to maximize protection of the biophysical environment and other wilderness characteristics of the Coastal Plain. Alternatives can accomplish this by minimizing and phasing the acreage leased, by reducing the area of surface disturbance, by proposing more restrictive and non-waivable lease provisions, by deferring leasing or implementation, or through a combination of these approaches. Because the draft EIS includes no such alternatives, and fails to provide rational, legally-sufficient reasons for that failure, as elaborated below, it is deficient under NEPA and must be revised and reissued.[¹²¹ Fed. Trade Comm'n v. A.P.W. Paper Co., 328 U.S. 193, 202 (1946).]	Alternative D2 has been modified to offer 800,000 acres for leasing. Alternatives that were not carried forward for analysis are discussed in Section 2.3.
138.	Brook	Brisson	Trustees for Alaska	96981	39	Range of Alternatives	No alternative considers making 800,000 acres available and none considers leasing in a phased approach that reduces total acreage ultimately leased below that level because areas offered initially and not leased may be included in the second 400,000-acre sale. Both of those alternatives need development and study in a revised DEIS.	Alternative D2 has been modified to offer 800,000 acres for leasing. Alternatives that were not carried forward for analysis are discussed in Section 2.3.

139.	Brook	Brisson	Trustees for Alaska	96981	40	Range of Alternatives	In the first place, it is patently wrong that BLM needed to include areas with medium and low hydrocarbon potential to meet the 800,000-acre minimum required by the Tax Act.143 Even were it the case that the Tax Act required leasing of 800,000 acres, that would not require inclusion of all medium potential areas, let alone any low potential ones. BLM is required to offer "those areas that have the highest potential for the discovery of hydrocarbons."144 BLM states that 427,900 acres have high potential, 658,400 acres have medium potential, and 477,200 acres have low potential.145 BLM then states that to reach the 800,000 minimum acreage, it must make acreages within low and medium potential areas available.146 If there are 427,900 acres of high potential areas, BLM would only need to identify 372,100 acres of medium potential areas, about 57% of them, to reach 800,000 acres, and no acreage in the low-potential areas. The acres identified of medium potential areas must also be the acreage identified as having the highest potential within this category.	Alternative D2 has been modified to offer 800,000 acres for leasing. Based off best available information, the action alternatives maximize the areas with the highest HCP while balancing with surface resource protection. Because there are only an estimated 427,000 acres of high HCP, in order to get to an 800,000-acre lease sale, areas in medium HCP and low HCP would also need to be included (while balancing resource protections).

140.	Brook	Brisson	Trustees for Alaska	96981	41	Range of Alternatives	<p>Equally fatal to BLM's justification, the agency is not required to affirmatively lease 800,000 acres, only to offer that acreage in two lease sales.¹⁴⁸ Notably, though, in recent bidding for federal on-shore oil and gas leases on the North Slope, BLM sold only 6% of the acreage offered, and none estimated as having high potential for hydrocarbon development.¹⁴⁹ This it is highly unlikely that the agency will sell all, or even most, of its initial offering. Under the terms of the Tax Act, it is very likely that BLM would then be required to re-offer in the second lease sale any unsold high-potential acres up to 400,000, as being among "those areas that have the highest potential for the discovery of hydrocarbons."¹⁵⁰ The second lease sale could readily offer for lease few, or conceivably no, additional acres to the initial 400,000 acres offered. In short, not only does the Tax Act not require BLM to lease more than 800,000 acres, it makes it possible to lease far less. This phased approach is one that the agency must develop into a full alternative, consider, and disclose the impacts from in a revised draft EIS,¹⁵¹ consistent with the Tax Act and the numerous other legal obligations that apply to an oil and gas program.</p>	<p>Such an alternative would have impacts similar to alternatives already analyzed. The BLM would expect little to no difference in impacts under such an alternative. This is because lands that were offered but not leased in the first sale are unlikely to be leased in a second sale a few years later given that exploration is unlikely to substantially advance during that time period.</p>

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
141.	Brook	Brisson	Trustees for Alaska	96981	42	Range of Alternatives	It is no answer, as BLM states, 152 that the Tax Act limits certain kinds of surface-disturbing activities within the Coastal Plain to 2,000 acres. In the first place, BLM has discretion to limit such activities to far fewer than 2,000 acres - and for obvious environmental reasons needs to consider alternatives that do so. In the second, all of BLM's action alternatives allow the same level of development - the full 2,000 acres. Even if the full 2,000 acres were needed for any leasing program (based on BLM's erroneous interpretation), increasing leased acreage beyond the minimum statutorily required would occasion impacts from numerous other activities. Developing greater lease acreage necessarily entails more equipment, man hours, vehicle trips, ice road traffic, barging, coastal landings, pipeline miles and similar undertakings that affect the environment. It also likely occasions more exploratory activity, such as seismic surveying.	Section 20001(c)(3) of the Tax Act states "the Secretary shall authorize up to 2,000 surface acres." Any interpretation by the BLM to modify the limit for a given alternative would be inconsistent with the Tax Act.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
142.	Brook	Brisson	Trustees for Alaska	96981	43	Range of Alternatives	The third reason the draft EIS asserts for failing to consider alternatives that lease 800,000 (or fewer) acres is that it would be "similar in concept to Alternatives D1 and D2, which make only 1,037,200 acres available for lease sales." ¹⁵³ But either version of alternative D would offer 237,200 acres, almost 30%, more in the Coastal Plain for leasing than an alternative offering only 800,000 acres. ¹⁵⁴ ...BLM's proffered reasons for not analyzing acreage minimizing alternatives are arbitrary and capricious, and its failure to assess them violates NEPA's requirement to evaluate a reasonable range of alternatives. Similarly, BLM's statement that an 800,000-acre alternative would be similar in concept to Alternative D is faulty because it is based on the premise that only acreage numbers would be different, and that BLM need not offer any additional and different protections. Alternatives could be meaningfully different if BLM offers meaningfully different protections. Additionally, this fails to account for the fact that under BLM's three action alternatives (including the two variations under Alternative D), there are only two acreage amounts offered.	Alternative D2 has been modified to offer 800,000 acres for leasing.
143.	Brook	Brisson	Trustees for Alaska	96981	52	Range of Alternatives	The draft EIS ignores the need to protect the resources of the Refuge from climate change by tailoring lease terms that would delay or stagger the extraction and combustion of the leased oil and gas to mitigate the effect on stimulating demand. The draft EIS does not even provide any discussion of why it did not consider such an alternative, despite comments raising the need to evaluate such alternatives. ¹⁶⁰	Operators are required to explore and develop the oil and gas resources of leased areas per 43 CFR 3130. Alternatives that were not analyzed in detail are included in Section 2.3.

S. Public Comments and BLM Responses (Alternatives)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
144.	Brook	Brisson	Trustees for Alaska	96981	55	Range of Alternatives	Similar reasoning also applies to delaying approvals to conduct activities connected with exploration and development of leases. Once a lease is issued, the BLM still has to evaluate and issue approvals for on-the-ground activities associated with exploration and development and can condition exploration and development based on specific circumstances being met. After an approval is issued, activities may proceed that may harm the resources of the Coastal Plain. Delaying exploration and development will avoid immediate harm and provide an opportunity to consider new data and technology. BLM should consider an alternative to suspend leases, which permits the agency to toll the terms of leases, as well as the obligations of leaseholders to make rental payments. BLM has used this authority to suspend leases in the interest of conservation of natural resources, which the agency defines as both preventing harm to the environment and preventing loss of mineral resources.	As noted under ROP 40 (section i), the BLM has authority under 43 CFR 3163 to issue assessments and penalties for non-compliance with oil and gas operational requirements.
145.	Brook	Brisson	Trustees for Alaska	96981	56	Range of Alternatives	BLM has the ability and obligation to undertake an analysis of the benefits of delaying leasing, which can be both qualitative and quantitative. Given the importance and vulnerability of the Coastal Plain of the Arctic Refuge, these alternatives, which were proposed at scoping, were reasonable, distinguishable from the alternatives considered in the Draft EIS and should have been analyzed.	Operators are required to explore and develop the oil and gas resources of leased areas per 43 CFR 3130. Alternatives that were not analyzed in detail are included in Section 2.3.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
146.	Brook	Brisson	Trustees for Alaska	96981	74	Range of Alternatives	Additionally, BLM does not describe or analyze the difference between the stipulations and ROPs, and if they are treated by the agency differently or will have different impacts. For example, Lease stipulation 6 refers to ROP 23 for its requirements. What does this mean for how BLM will apply them? Also, the term "BMPs" is sometimes used but it is unclear what they are or how BLM will incorporate them into the program. For example, the draft EIS states, "the frequency of spills would be limited by BMPs." 221 BMPs must be explained and required, and their effectiveness demonstrated, for BLM to reach such conclusions.	The BLM has removed references to best management practices. The lease stipulations and ROPs are part of the alternatives analyzed in Chapter 3.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
147.	Brook	Brisson	Trustees for Alaska	96981	75	Range of Alternatives	Without any criteria for granting waivers, exceptions and modifications, there is not reliability or foreseeability as to how and when the stipulations will be applied, resulting in little certainty that the stipulations will protect fish, wildlife, water, air, vegetation or wilderness. The lack of sideboards on granting waivers, exceptions and modifications also renders a NEPA analysis that relies on their effectiveness deficient, since their continued application depends on the unfettered discretion of the BLM authorized officer. The U.S. Government Accountability Office has opined that BLM's failure to have consistent standards or practices in waiving lease stipulations and operating procedures means that the effectiveness cannot be measured: "[W]ithout sufficiently detailed documentation of inspections and effective use of data from inspectors, BLM is unable to fully assess the effectiveness of its best management practices polity to mitigate environmental impacts."226	Operators are required to submit a written request for an exception, waiver, or modification and information demonstrating that (1) the factors leading to the inclusion of the stipulation in the lease have changed sufficiently to make the protection provided by the lease stipulation no longer needed or (2) the proposed operation would not cause unacceptable impacts. The criteria for approval of exceptions, waivers, and modifications should be supported by NEPA analysis, and may require site-specific environmental review. Requests should contain, at a minimum, a plan that includes related on-site or off-site mitigation efforts to adequately protect affected resources; data collection and monitoring efforts; and timeframes for initiation and completion of construction, drilling, and completion operations. The operator's request may be included in an Application for Permit to Drill, Notice of Staking, Sundry Notice, or letter. The BLM may also proactively initiate the process. During the review process, BLM coordination with other local, state, or federal agencies (e.g., ADFG, NSB, and local governments) should be undertaken, as appropriate, and documented. The BLM will also consult with the federal surface management agency (e.g., USFWS). Approval or disapproval is made by the Authorized Officer, and the decision is documented. If the waiver, exception, or modification is approved, any necessary mitigation is also documented. The applicant is then provided with a written notification of the decision. See Instruction Memorandum 2008-032 and 43 CFR 3101.1-4 for additional details.

148.	Brook	Brisson	Trustees for Alaska	96981	76	Range of Alternatives	While the ROPs similarly lay out requirements that apply to a variety of resources, the language on page 236 of the draft EIS for conditions permitting a waiver of ROP 46 implies that ROPs are also subject to waivers, exceptions and modifications, rendering them similarly questionable as a “basis for analyzing the potential impacts of the alternatives in this Leasing EIS.” Moreover, the language in the draft EIS should be clearer that any and all applicable ROPs must be included in permits to drill. The current language provides that: Any applicant requesting authorization for an activity from the BLM will have to address the applicable ROPs in one of the following ways: ? Before submitting the application (e.g., performing and documenting subsistence consultation or surveys) ? As part of the application proposal (e.g., including in the proposal statements that the applicant will meet the objective of the ROP and how the applicant intends to achieve that objective) ? As a term imposed by the BLM in a permit228 This language implies that an operator could merely “address” ROPs in an application and not have the applicable requirements incorporated as legal requirements in a permit to drill that would be apparent in applicable NEPA review by the public and easily enforceable by the BLM. All ROPs must be incorporated into all relevant permits, just as all applicable lease stipulations must be incorporated into leases.	All ROPs will be incorporated into all relevant permits, just as all applicable lease stipulations must be incorporated into leases. See Section 2.2.5.
149.	Brook	Brisson	Trustees for Alaska	96981	77	Range of Alternatives	In order to rely on lease stipulations, BLM must set out narrowly prescribed waivers, exceptions and modifications to lease stipulations that are based on very specific criteria; having no sideboards, as the draft EIS currently proposes is not acceptable. Additional conditions governing waivers, exceptions and modifications that we	Operators are required to submit a written request for an exception, waiver, or modification and information demonstrating that (1) the factors leading to the inclusion of the stipulation in the lease have changed sufficiently to make the protection provided by the lease stipulation no longer needed or (2)

149. (cont.)	(see above)	(see above)	(see above)	(see above)	(see above)	(see above)	propose include: ? Overall, one-time exceptions should be the preferred approach where relief is sought from protective stipulations, such that the safeguards prescribed in the stipulations will remain in place for the majority of oil and gas leases. If the BLM determines that a waiver or modification is more appropriate for any stipulation, the reasons for such decisions will be documented. ? Waivers, exceptions and modifications should only be granted from no surface occupancy (NSO) stipulations after a 30-day public notice and comment period. ? The U.S. Fish and Wildlife Service should have the opportunity to submit information for consideration prior to granting waivers, exceptions, or modifications to address its expertise, surface management obligations, and potential impacts on any listed species. ? Finally, it is critical that BLM track waivers, exceptions, and modifications requested and those granted, and make that information available to the public on a quarterly basis. These records will provide important insight into how the stipulations are being applied and the potential impact of waivers, exceptions, and modifications on the overall function of the EIS. This information will also allow BLM to determine if the availability of or criteria for granting waivers, exceptions and modifications needs to be further narrowed in order to ensure sufficient protection for affected species. ? ROPs should not be subject to waiver, exception, or modification and justification should be provided as to the use of any reason that an ROP would not apply.	the proposed operation would not cause unacceptable impacts. The criteria for approval of exceptions, waivers, and modifications should be supported by NEPA analysis, and may require site-specific environmental review. Requests should contain, at a minimum, a plan that includes related on-site or off-site mitigation efforts to adequately protect affected resources; data collection and monitoring efforts; and timeframes for initiation and completion of construction, drilling, and completion operations. The operator's request may be included in an Application for Permit to Drill, Notice of Staking, Sundry Notice, or letter. The BLM may also proactively initiate the process. During the review process, BLM coordination with other local, state, or federal agencies (e.g., ADFG, NSB, and local governments) should be undertaken, as appropriate, and documented. 150.	Brook	Brisson	Trustees for Alaska	96981	107	Range of Alternatives	<p>BLM's proposed mitigation measures in the required operating procedures and lease stipulations are also insufficient to address impacts to permafrost and soils. Outside of the very limited provisions that relate to off-road travel, the reader is left with effectively no indication what measures BLM will implement to prevent or mitigate against the full range of potential impacts to soil and permafrost resources. ROP 11 indicates ground operations would be allowed when soil temperatures at 12 inches below the tundra surface reach 23 degrees Fahrenheit and snow depths are an average of 9 inches, or 3 inches of snow water equivalent, whichever is less. The strong winds, varied topography, and variable snow depths on the Coastal Plain are likely to make it difficult for find routes with consistent or adequate snow cover to prevent impacts from activities like seismic exploration. Assuming those parameters are adequate to prevent any possibly significant harm, they cannot do that if only an average snow depth is used to determine when ground operations will be allowed. "Generally, low amounts of winter snowfall, strong winter winds, and the hilly terrain in the 1002 Area combine to create substantial areas of very thin and unpredictable snow."793 Thus, even when snow depth was at its greatest recorded extent, in 2018, "vast areas of [the Coastal Plain] were snow free."794 Nor does ROP 11 even explain how and where these measurements will be taken, and how often. Snow coverage can change throughout the season, even overnight.</p>	<p>ROP 11's objective was developed to mitigate against impacts on soils and permafrost. If the resources experience impacts to the point where the objective can no longer be met, then the BLM can proactively initiate the waiver, exception, or modification process to modify the ROP. See Instruction Memorandum 2008-032 and 43 CFR 3101.1-4 for additional details.</p>

151.	Brook	Brisson	Trustees for Alaska	96981	108	Range of Alternatives	<p>ROP 11 also doesn't adequately account for different vegetation types with these default depths. Allowing ground operation at an average of 9 inches of snow depth puts vulnerable tussock tundra habitat at risk of damage.795 Some tussock vegetation stands 18 inches tall when measured from the adjacent ground surface. If snow depth is insufficient to cover the tops of the tallest tussock vegetation, tussock vegetation may be crushed or sheared off during operations. Tussock vegetation that is crushed or sheared off dies, often replaced by different vegetation. This process can take 5 or more years, leaving the ground surface vulnerable to subsidence caused by a change in surface albedo, hydrology, and evapotranspiration. BLM needs to ensure snow depths cover the tops of the tallest tussock vegetation at sufficient depths. Similarly, shrubby vegetation is vulnerable to damage when not fully covered by snow. Ground operation should not be allowed in areas with shrubby vegetation unless snow depths are sufficient to cover the tops of shrubby vegetation. Ground operation will not be permitted on steep slopes with shrubby vegetation.</p>	<p>The standard used in Alternatives B and C are used by ADNR. The varying protections remain in order to analyze a reasonable range of alternatives under NEPA.</p>

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
152.	Brook	Brisson	Trustees for Alaska	96981	110	Range of Alternatives	ROP 11 includes a provisions stating that "[i]ce roads would be designed and located to avoid the most sensitive and easily damaged tundra types as much as practicable." BLM should delete "as much as practicable" from this provision. Sensitive and easily damaged tundra is often located along stream banks where shrubby vegetation is common. Allowing ice road construction across shrubby stream bank vegetation for practicability risks damaging and/or killing vegetation in a location where soils are especially vulnerable to subsidence and erosion. It may not be "practicable" to avoid such vegetation at stream crossings, thus risking irreversible erosion and subsidence that could have long-term impacts on water quality.	Avoidance of sensitive resources will be part of the project design. The Authorized Officer will review and approve on a project-specific basis. Site-specific actions will be analyzed under separate NEPA. However, in some cases, it may not be practical to avoid sensitive resources.
153.	Brook	Brisson	Trustees for Alaska	96981	111	Range of Alternatives	Standard g in ROP 11 indicates snow fences may be used in areas of low snow to increase snow depths within an ice road or snow trail route. Snow fences are an effective means to accumulate snow for the purpose of building snow roads, but snow accumulation may cause significant changes to surface hydrology, permafrost thermal stability, and to vegetation communities. Snow accumulation behind snow fences delays the melt period by 1-3 weeks and sometimes 4_8 weeks,798 causing changes to soil temperature, soil moisture, nutrient cycling, and vegetation communities. Subsidence has been documented as well.799 BLM should modify ROP 11 so snow fences must be removed immediately following construction of a snow road. Excess snow accumulated by snow fences must be excavated or pushed to decrease snow depths to that found in surrounding tundra.	The BLM has modified text in ROP 11. Snow fences would be maintained during operation of the road to maintain integrity of the road if necessary.

154.	Brook	Brisson	Trustees for Alaska	96981	124	Range of Alternatives	BLM appears to rely on its characterization of gravel mines as being outside of the 2,000-acre surface facility limit in order to avoid fully analyzing the impacts of mining on the surface resources of the Coastal Plain. BLM needs to fully account for the total number of acres that could be directly and indirectly impacted from gravel mining used to support the oil and gas program as part of the 2,000 acres. ⁸³⁶ The EIS characterizes gravel mines as equivalent to a mill that supplies steel for construction of other materials. ⁸³⁷ This makes no sense. Gravel mines will be used to supply the gravel that is directly used to build the roads and pads for any oil and gas developments, and are therefore integrally related support facilities.	Section 1.9.1 has been revised to identify the production and support facilities that would count toward the 2,000-acre limit, which now includes gravel mines. Rationale as to why certain facilities may not be included is contained in Section S.1.2 of this Appendix.
155.	Brook	Brisson	Trustees for Alaska	96981	127	Range of Alternatives	Despite recognizing that these impacts exist to areas surrounding gravel mines, BLM makes no attempt to quantify that disturbance. BLM only acknowledges the direct footprint of mining itself as being between approximately 308-315 acres, ⁸⁴⁵ but does not quantify or even discuss the indirect and far broader range of impacts to the sensitive ecosystems surrounding these mines. Additionally, BLM notes that multiple material sources are expected to be used, but does not analyze impacts from multiple gravel mines, which would have a much greater impact on the Coastal Plain than a single mine.	Section 1.9.1 has been revised to identify the production and support facilities that would count toward the 2,000-acre limit, which now includes gravel mines. Rationale as to why certain facilities may not be included is contained in Section S.1.2 of this Appendix.

S. Public Comments and BLM Responses (Alternatives)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
156.	Brook	Brisson	Trustees for Alaska	96981	129	Range of Alternatives	BLM must explain how allowing gravel mining in streams would be subject to stipulations. Lease Stipulation 1 contained in the draft EIS, which is meant to protect water quality, purports to restrict "permanent oil and gas facilities" within certain setbacks,848 but BLM has arbitrarily and improperly defined gravel mines as being outside of the definition of oil and gas facilities, so it does not appear that this stipulation would apply to limit gravel mining in NSO areas and river corridors. Though it would seem gravel mining should be considered a "major construction activity" under Lease Stipulation 7,849 BLM's failure to discuss this or any other stipulation in its analysis for gravel mining in Chapter 3 raises doubt that it would apply. BLM must clarify which, if any, lease stipulations apply to gravel mining, and formulate new and additional protections that are expressly applicable to gravel mining activities on the Coastal Plain.	Gravel mines are now considered in the 2,000-acre limit. Accordingly, they have been added to applicable lease stipulations. The BLM has defined the terms "permanent oil and gas facilities" and "major construction activity" in the glossary.
157.	Karimah	Schoenhut	Sierra Club	97751	7	Range of Alternatives	The DEIS explicitly states that BLM considers the no action alternative to be one that it cannot lawfully adopt, and that it is presenting it only for the purposes of a basis of comparison. Yet BLM has totally failed to consider any other alternatives that would be consistent with providing a benefit to polar bears, or even maintaining the level of benefits provided by the current management plan for the Refuge. BLM has also totally failed to consider any alternative that would avoid additive cumulative effects that become "problematic" for the species. 5 All of the action alternatives it contemplates would have that effect, and yet the DEIS does not even attempt to address whether there are possible action alternatives that could avoid "problematic" consequences for the species.	The fact that impacts on a specific resource are similar across all action alternatives does not, per se, indicate that the range of alternatives is not reasonable under NEPA. Lease stipulations and ROPs are designed for resource protection, including polar bears. In addition, ESA and MMPA consultation would occur prior to any on-the-ground activity.

158.	Karimah	Schoenhut	Sierra Club	97751	9	Range of Alternatives	The DE IS fails to consider any alternative that would defer emissions by delaying production on leases. Nor does it consider any alternatives that would require lessees to provide compensatory mitigation via carbon offsets. This failure violates NEPA's procedural requirement to evaluate alternatives.	Operators are required to explore and develop the oil and gas resources of leased areas per 43 CFR 3130. Alternatives that were not analyzed in detail are included in Section 2.3.
159.	Anon	M	—	97937	5	Range of Alternatives	create leasing options of smaller acreage, closer to the 400,000 mandated.	Alternative D2 has been modified to offer 800,000 acres for leasing.
160.	Christy	Stebbins	—	97980	2	Range of Alternatives	The DEIS gives no reason why it is offering 66 to 100 percent of the 1.56 million-acre Coastal Plain for leasing purposes in the action alternatives, when Congressional direction only stipulated "at least" 400,000 acres be offered-just 25 percent of the total program area.	Alternative D2 has been modified to offer 800,000 acres for leasing.

161.	Katherine	Trisolini	—	98002	1	Range of Alternatives	<p>Although the discussion of alternatives is considered to be the heart of the NEPA process, the Bureau has failed to include an alternative that minimizes impacts. Congress directed the agency to develop a leasing program with a minimum of 400,000 acres area-wide offered in each lease sale and a maximum of 2000 surface acres to be covered by production and support facilities. [TITLE II SEC. 20001 (C) 1 (B)i (The Secretary shall offer for lease under the oil and gas program under this section- (I) not fewer than 400,000 acres area-wide in each lease sale"); CID ii (3) ("SURFACE DEVELOPMENT.-In administering this section, the Secretary shall authorize up to 2,000 surface acres of Federal land on the Coastal Plain to be covered by production and support facilities (including airstrips and any area covered by gravel berms or piers for support of pipelines) during the term of the leases under the oil and gas program under this section.")] Instead of considering alternatives with a lower total acreage offered in lease sales, the agency proposes to offer much more land than necessary, significantly exceeding the minimum directed by Congress. Meanwhile, the EIS reviews only alternatives that use (and in fact exceed) the maximum surface acreage coverage.</p>	Alternative D2 has been modified to offer 800,000 acres for leasing.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
162.	Katherine	Trisolini	—	98002	2	Range of Alternatives	As the DEIS explains, the no action alternative was included for comparison purposes only because it would not meet Congress' mandate to develop a leasing program, leaving on alternatives B, C, and D as possible options. Yet among these three the agency does not include an option that reduces impacts by offering the minimum area of this pristine land for lease consistent with PL 115-97, a particularly important approach in this case because the no action alternative cannot be selected. Alternatives B and C both offer the entire project area for leasing, a total of 1,563,500 acres, vastly exceeding the minimum land area that Congress directed the agency to include. While Alternative D reduces the total area offered, it still significantly exceeds the minimum acreage required by Congress, offering 1,037,200 acres for lease. At most, Congress required the agency to open 800,000 acres. Given that the leasing program is designed to operate in two phases, areas not leased in the first offering could be included in the 400,000 minimum for the second stage, thus making the mandated area even smaller. By examining and potentially adopting a program that offers no more acreage than necessary, the Bureau could drastically reduce environmental impacts while meeting the purpose of the law. Because the DEIS fails to include such an option, it does not provide a "reasonable range of alternatives" as required by NEPA.	Alternative D2 has been modified to offer 800,000 acres for leasing.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
163.	Katherine	Trisolini	—	98002	14	Range of Alternatives	The Bureau must provide minimum requirements now that cannot be waived and should describe specific standards for the exercise of future discretion to change lease requirements. Otherwise, many of these conditions could be waived for individual leases, creating cumulative impacts that were not anticipated in this DEIS. These standards and uncertain options leave too much guesswork.	Operators are required to submit a written request for an exception, waiver, or modification and information demonstrating that (1) the factors leading to the inclusion of the stipulation in the lease have changed sufficiently to make the protection provided by the lease stipulation no longer needed or (2) the proposed operation would not cause unacceptable impacts. The criteria for approval of exceptions, waivers, and modifications should be supported by NEPA analysis, and may require site-specific environmental review. Requests should contain, at a minimum, a plan that includes related on-site or off-site mitigation efforts to adequately protect affected resources; data collection and monitoring efforts; and timeframes for initiation and completion of construction, drilling, and completion operations. The operator's request may be included in an Application for Permit to Drill, Notice of Staking, Sundry Notice, or letter. The BLM may also proactively initiate the process. During the review process, BLM coordination with other local, state, or federal agencies (e.g., ADFG, NSB, and local governments) should be undertaken, as appropriate, and documented. The BLM will also consult with the federal surface management agency (e.g., USFWS). Approval or disapproval is made by the Authorized Officer, and the decision is documented. If the waiver, exception, or modification is approved, any necessary mitigation is also documented. The applicant is then provided with a written notification of the decision. See Instruction Memorandum 2008-032 and 43 CFR 3101.1-4 for additional details.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
164.	Pamela	Miller	—	98116	5	Range of Alternatives	Operating procedures that aren't leasing stipulations would not be within a lease. But even if they are within a lease, the EIS says they can be waived. It does not provide any kind of meaningful criteria about how they could -- by what provisions they could be waived, accepted or exempted, all of which are ways to say that -- that there would -- could be occupancy. Furthermore, the occupancy only applies to certain permanent facilities. It does not appear to apply to gravel mines. It does not apply to water reservoirs that might be dug in rivers. It does not apply to 3-D seismic activities, winter exploratory drilling or even summer exploratory drilling. If they did that without it being a -- well, it's unclear for exploratory drilling. No surface occupancy doesn't affect the ability for airplanes and helicopters to land and take off, and there are no timing restrictions for exploratory drilling operations, geophysical seismic -- geomagnetic operations involving low level aircraft flights or other things that may take place even in caribou calving grounds, much less the post-calving grounds.	Gravel mines are now considered part of the 2,000-acre facility limit. Accordingly, they have been added to applicable lease stipulations.
165.	Valanne	Glooschenko	—	98147	2	Range of Alternatives	The draft EIS is deficient in many respects, particularly the draft EIS continues four action alternatives for leasing and drilling, but none of these alternatives minimizes the area to be leased.	Alternative D2 has been modified to offer 800,000 acres for leasing.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
166.	Brook	Brisson	Trustees for Alaska	98269	2	Range of Alternatives	On the one hand, BLM asserts for purposes of Alternative D that it would close 476,600 acres of caribou calving habitat to lease sales, but would still allow seismic activity over the entire program area.270 First, BLM should not allow seismic activities in areas that are not subject to leasing. Areas that are off limits for purposes of leasing should also be off limits for purposes of seismic exploration.	Development of this EIS is specific to implementing the oil and gas leasing program, and decisions resulting from this EIS would be limited to a lease sale. Seismic exploration can be done absent a lease (a lease is not required). Even if areas are not available for lease, companies may conduct seismic exploration there. Separate NEPA analysis would be completed for all seismic exploration applications, which would analyze the site-specific impacts.
167.	Brook	Brisson	Trustees for Alaska	98269	69	Range of Alternatives	The DEIS does not discuss any means to ensure that oil and gas infrastructure development is consolidated and avoids duplicative or unnecessary infrastructure such as excessive gravel road mileage through lack of coordination among fields, multiple CPFs owned by different companies, etc. When unnecessary infrastructure is built through lack of planning and oversight by BLM, the infrastructure footprint is not minimized and environmental impacts are greater than they would otherwise be. The DEIS states that "operators would enter agreements to share road and pipeline infrastructure, where feasible,"473 but offers no mechanism to ensure that sharing occurs, e.g., through required coordination of development plans by multiple operators. BLM should ensure there is an administrative means that minimizes the overall footprint of the infrastructure beyond relying only on the 2,000 acre limit.	ROP 21 requires the minimization of the development footprint, including collocation and facility sharing where appropriate.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
168.	Brook	Brisson	Trustees for Alaska	98269	70	Range of Alternatives	Because multi-phase (i.e., oil, gas and produced water) pipelines are not well-regulated either by the federal government or by the state, there is a need for a new ROP addressing pipeline safety for these lines. Releases from multi-phase lines in remote, sensitive parts of the Arctic Refuge would be particularly damaging to the environment as compared to spills that have been analyzed near Prudhoe Bay infrastructure. BLM should include an ROP that requires annual smart-pigging (i.e., inline inspection) of multi-phase pipelines to detect wall thinning and reduce the likelihood of releases. Moreover, BLM should ensure that a ROP for pipelines includes specifics on the performance capabilities of leak detection systems and the required locations of shut-off valves to prevent sizeable releases into surface waters.	The level of specificity for pipeline capabilities would be determined at the project-level authorization. Site-specific analyses, including those associated with infrastructure in support of oil and gas development, can more realistically be provided when the BLM receives an application to permit such infrastructure. The Leasing EIS makes no decisions on such infrastructure, except to prohibit it in specified areas of particularly high value surface resources under some alternatives.
169.	Brook	Brisson	Trustees for Alaska	98269	71	Range of Alternatives	Additionally, BLM should include an ROP that requires staging of emergency response equipment at key locations on the Coastal Plain to allow responders to rapidly address oil pipeline spills, including for pipelines that do not have roads that parallel them.	At the time of a site-specific proposal, the operator will be required to submit a spill response plan based on the statutes, regulations, and guidelines of the EPA, ADEC, and the Alaska Oil and Gas Conservation Commission, as well as policy guidelines of the BLM. This plan would include information on the staging of emergency response equipment as it relates to the site-specific proposal.
170.	Brook	Brisson	Trustees for Alaska	98269	74	Range of Alternatives	BLM needs to work with USGS' seismic experts to review aftershock and other more recent data compiled since August 2018 and reassess the likelihood of seismic risk in the region. That reassessment should occur now, to inform this EIS. BLM then must ensure, through ROPs, that all oil and gas infrastructure is designed and constructed to address that risk.	Future oil and gas development would be required to comply with state and federal safety standards, including applicable seismic design requirements. Section 3.2.5, Geology and Minerals, reflects current information regarding earthquakes in the program area.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
171.	Brook	Brisson	Trustees for Alaska	98269	85	Range of Alternatives	BLM should also remove the provision that allows it to grant exceptions to any reclamation requirements. The circumstances under which BLM could potentially waive this requirement are unclear in the EIS and appear to completely negate the meaningfulness of any reclamation requirements. There is no circumstance under which BLM should be able to grant exceptions to these reclamation requirements.	Operators are required to submit a written request for an exception, waiver, or modification and information demonstrating that (1) the factors leading to the inclusion of the stipulation in the lease have changed sufficiently to make the protection provided by the lease stipulation no longer needed or (2) the proposed operation would not cause unacceptable impacts. The criteria for approval of exceptions, waivers, and modifications should be supported by NEPA analysis, and may require site-specific environmental review. Requests should contain, at a minimum, a plan that includes related on-site or off-site mitigation efforts to adequately protect affected resources; data collection and monitoring efforts; and timeframes for initiation and completion of construction, drilling, and completion operations. The operator's request may be included in an Application for Permit to Drill, Notice of Staking, Sundry Notice, or letter. The BLM may also proactively initiate the process. During the review process, BLM coordination with other local, state, or federal agencies (e.g., ADFG, NSB, and local governments) should be undertaken, as appropriate, and documented. The BLM will also consult with the federal surface management agency (e.g., USFWS). Approval or disapproval is made by the Authorized Officer, and the decision is documented. If the waiver, exception, or modification is approved, any necessary mitigation is also documented. The applicant is then provided with a written notification of the decision. See Instruction Memorandum 2008-032 and 43 CFR 3101.1-4 for additional details.

S. Public Comments and BLM Responses (Alternatives)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
172.	Brook	Brisson	Trustees for Alaska	98269	87	Range of Alternatives	BLM should require that permafrost core samples be taken at a site at sufficient intervals to calculate the volume of massive and pore ice in the underlying permafrost. Seeding with grass is unacceptable; entities should use locally collected seeds of forbs and sedges or sprig with willows. BLM also needs to account for and provide a long-term plan that addresses where gravel would be placed after field closure, particularly in light of concerns about contamination.	The site-specific NEPA analysis and authorization would include a reclamation plan, which would include revegetation (see ROP 35).
173.	Brook	Brisson	Trustees for Alaska	98269	90	Range of Alternatives	BLM needs to include clear standards that companies will need to meet to ensure areas are fully restored. The cursory statements BLM included in ROP 35 are unobtainable and too vague to give any indication of where and how areas will be restored, over what timeframe, and to what standards. These standards need to be specific, measurable, achievable, reasonable, and time-bound. (Regardless, ROP 35 should be extended to require a bond to cover abandonment.)	Bonding requirements are specific to leases; these will be dealt with during site-specific authorizations. The specificity of a reclamation plan would be developed after site-specific project impacts have been identified.

S. Public Comments and BLM Responses (Alternatives)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
174.	Brook	Brisson	Trustees for Alaska	98269	91	Range of Alternatives	To justify relying on reclamation as lessening environmental impacts in a NEPA document, BLM needs to incorporate standards into the lease terms to ensure there are clear, achievable obligations for companies to undertake restoration of any impacted areas. BLM should incorporate far more detailed criteria related to restoration standards, including information on the timing of implementation, monitoring methods that will be used to determine success, how any contamination issues will need to be addressed, how companies will restore adjacent areas that have been impacted by dust or other contaminants, and more. BLM's statement that areas would be restored to ensure "eventual" restoration and meet "minimal standards" to restore wilderness provides little assurance that these areas will ever be restored to a level that returns them to anything close to their original condition or functions, or that ensures companies will actually be required to meet any objective, clear standards.	Under all alternatives, ROP 35 requires a plan that will achieve restoration to the land's previous hydrological, vegetation, and habitat condition.
175.	Brook	Brisson	Trustees for Alaska	98269	92	Range of Alternatives	In addition to incorporating more stringent standards and clear obligations for reclamation in the leases, BLM should include formal criteria governing the financial assurances necessary to ensure sufficient funding for restoration and reclamation. BLM should mandate bonding at the time it issues the leases.	Oil and gas leasing regulations (43 CFR 3104) require that the operator on the ground shall be covered by a bond prior to commencement of surface-disturbing activities related to drilling operations on a federal oil and gas lease (see Section 3.5 of the Draft EIS).

S. Public Comments and BLM Responses (Alternatives)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
176.	Brook	Brisson	Trustees for Alaska	98269	96	Range of Alternatives	BLM also needs to modify ROP 24d. It currently has no gravel mine reclamation specifications. Gravel mine reclamation and associated land rehabilitation can be particularly difficult. Many mines on the North Slope are reclaimed by turning the former pit into deep water fish habitat. Not only does this result in a rather unnatural-looking square lake, but offers little in the way of replacing the habitat loss displaced by the mine. Gravel mines are one of the few available sources of tundra sod. ...Tundra sod must be cut and preserved using the most current techniques and should be reused on tundra rehabilitation sites.	Under all alternatives, ROP 35 requires restoration to the land's previous hydrological, vegetation, and habitat condition.
177.	Brook	Brisson	Trustees for Alaska	98269	140	Range of Alternatives	Baseline levels of air quality must be established prior to allowing development on the Coastal Plain. In the absence of a baseline monitoring data record that is representative of ambient air conditions on the Coastal Plain, BLM should ensure that quality-assured monitoring data are collected within the program area in accordance with EPA and State data quality criteria and that the data are made available to the public, prior to allowing development on the Coastal Plain. ⁷²⁴ Establishment of a comprehensive monitoring network within the program area will help serve as a backstop to track and ensure air quality protection throughout the Coastal Plain and to help identify areas of concern with regard to air impacts.	This Leasing EIS will not result in the authorization of any on-the-ground activities. Accordingly, the environmental baseline will be preserved throughout the lease sale process. Any on-the-ground activities will require additional NEPA analysis. At that time, the BLM will determine which baseline studies may be necessary.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
178.	Brook	Brisson	Trustees for Alaska	98269	141	Range of Alternatives	The DEIS fails to analyze or condition leasing on a comprehensive set of required, measurable, and enforceable mitigations to ensure there will be no significant impacts to air quality associated with leasing and development of the Coastal Plain.725 BLM's failure to include specific, enforceable mitigation measures makes it unclear how the agency will ensure there will be no significant impacts to air quality - i.e., that development will not adversely impact human health and the natural environment and will not result in significant deterioration of air quality as required by the Clean Air Act. None of the Lease Stipulations address air quality, and the BLM's Required Operating Procedures 5 and 6 do not adequately address air quality and are largely discretionary. Monitoring does not mitigate against impacts to air quality, and BLM should not conflate these requirements.	ROPs 5 and 6 are the baseline standards. Additional mitigation measures would be applied during the project-level phase as appropriate.
179.	Brook	Brisson	Trustees for Alaska	98269	142	Range of Alternatives	The failure to analyze sufficient mitigation measures also violates NEPA, which requires BLM to consider reasonable alternatives to eliminate or mitigate adverse impacts to air quality. As BLM expressly acknowledges, the potential impacts to air quality under all of the action alternatives would be identical - demonstrating that the range of alternatives is insufficient.727	The fact that impacts to a specific resource are similar across all action alternatives does not, per se, indicate that the range of alternatives is not reasonable under NEPA.

S. Public Comments and BLM Responses (Alternatives)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
180.	Brook	Brisson	Trustees for Alaska	98269	143	Range of Alternatives	BLM must put forth an alternative that ensures no significant air quality impacts and full compliance with the Clean Air Act. This would include one that fully considers whether there will be unacceptable health risks associated with criteria and hazardous air pollutant impacts, significant cumulative visibility impacts, or significant deterioration of air quality. BLM should use modeling to determine what specific mitigation measures and pace / location / intensity of development will be needed to ensure BLM's actions will not cause or contribute to violations of the National Ambient Air Quality Standards or adverse impacts to air quality related values, and then BLM must include those measures as enforceable mitigation measures in the DEIS.	ROPs 5 and 6 provide protections at the leasing stage for air quality. Any future actions or activities are required to comply with CAA and meet NAAQS. Modeling of air quality impacts at a leasing phase is highly speculative due to the lack of specificity of what, where, and when development may occur.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
181.	Brook	Brisson	Trustees for Alaska	98270	1	Range of Alternatives	<p>ROP 10 also requires a sound source verification test in advance of seismic survey work to measure the distance of vibroseis3 sound levels through grounded ice to the 120 decibels (dB) re 1 ?Pa threshold in open water. The distance will be used to buffer all on-ice seismic survey activity operations from any open water or ungrounded ice throughout the project area.1586 BLM fails to explain the basis for the 120 dB threshold. Its apparent premise - that staying below this threshold will avoid impacts to seals - does not appear to be supported by the best available science. Instead, contextual factors such as subject behavioral state, spatial orientation of source and receiver, subject motivation or familiarity with a sound source, and similarity of noise to potential predators strongly influence response probability across a range of noise levels.1587 BLM must consider the contextual factors relevant for ringed seals near the coastal plain, including the likely unfamiliarity with industrial noise sources, and must explain the basis for establishing a 120 dB threshold.</p>	The BLM has edited text in Chapter 2 for clarity.

182.	Brook	Brisson	Trustees for Alaska	98271	21	Range of Alternatives	<p>Additionally, the lease stipulations do not protect water resources from over withdrawal. Lease Stipulation 1 protects water quality, not water quantity. Lease Stipulation 2 purports to protect water quantity, but because its requirements are the same as ROP 9, they are insufficient for the reasons described below. Also, both Lease Stipulation 2 and 3 are limited in the geographic area or specific resources that they would apply to. This leaves much of the water resources on the Coastal Plain without protections. Lease Stipulation 9 is aimed at protecting coastal areas. While this will protect some aspects of water resources of the Coastal Plain, it does not ensure protection of water quantity or limit water withdrawals. BLM must consider lease stipulations to protect water quantity.</p>	<p>ROP 9 provides protections at the leasing stage for water quantity and quality. Any future actions or activities are required to receive the appropriate authorizations for water withdrawals. A determination of specific water withdrawals and impacts on water quantity cannot be made until site-specific development activities are proposed.</p>
183.	Brook	Brisson	Trustees for Alaska	98271	22	Range of Alternatives	<p>BLM also states that required operating procedures 3, 4, 9, 10, 12, 13, 17, 20, 24, and 26 would minimize impacts to water resources.⁸⁸⁷ These measures are inadequate to protect water quantity from the impacts of water withdrawals for oil and gas activities. ROP 3 is aimed at water quality, not quantity. ROPs 4 and 10 are for polar bears and do not address water resources. ROP 9 allows water withdrawals of a percentage of unfrozen or available water based on fish species, but BLM does not explain or justify how it arrived at the percentages.⁸⁸⁸ Without that critical information, it is unclear if the ROP will in fact protect water resources generally and water quantity in particular. It also makes modeling and monitoring completely discretionary, further limiting BLM's ability to understand the impacts of water use and regulate it effectively. ROP 12 protects water drainage patterns by limiting how components are</p>	<p>Lease stipulations and ROPs designed to protect non-water resources may also provide protections for water resources. ROP 9 provides protections at the leasing stage for water quantity and quality. Any future actions or activities are required to receive the appropriate authorizations for water withdrawals. A determination of specific water withdrawals and impacts on water quantity cannot be made until site-specific development activities are proposed.</p>

183. (cont.)	(see above)	(see above)	(see above)	(see above)	(see above)	(see above)	constructed but does not otherwise protect water quantity or ensure there will not be adverse impacts from water withdrawals. ROP 13 addresses fish and aquatic habitat, but not water quantity. ROP 17 prohibits the construction of a gravel road for exploratory drilling. While this should be required, we also note that that means that ice or snow roads will be used, which will lead to impacts on water resources, not lessen them. This ROP, therefore, does not provide protections for water quantity. ROP 20 is geared at maintaining fish passage by prohibiting development in various areas and habitats. This does not ensure that sufficient water quantity will be available in rivers and streams sufficient for fish passage. ROP 24 concerns the location of gravel mines to protect various resources, but again, it does not directly ensure protection of water quantity. ROP 26 concerns birds and is unrelated to water resources.	(see above)
184.	Brook	Brisson	Trustees for Alaska	98271	42	Range of Alternatives	BLM must precisely describe relevant terms and the scientific methodologies for implementing each LS/ROP. The following terms in LS 1, 2, 3, 4 and ROP 8, 12, 16, 19, 20, 22 are not adequately or scientifically defined for each river or stream where LS or ROPs apply: > Active floodplain > Floodplain > River delta > 50, 100, 200 year flood for CP rivers > Ordinary high-water mark > Essential pipeline/road crossings > Natural flow of rivers > Disrupt flow from perennial springs > Free passage for anadromous fish > Maintain natural runoff processes	These terms apply generally to all rivers and streams. Terms requiring further definition have been added to the glossary.

185.	Brook	Brisson	Trustees for Alaska	98271	43	Range of Alternatives	<p>Lease stipulations and ROPs do not meet objectives with allowable exceptions in alternatives B, C, D. If exceptions within the following LS and ROPs are implemented, the action of the exception will negate the overall objective of the ROP because there are no defined limits associated with each exception action. 1. Lease stipulation 1: No defined parameters associated with the allowable exception to building pipelines, roads or facilities in river deltas. Permeant pipelines, roads or industrial facilities within the flood plain will negate the objective of the LS. 2. Lease stipulation 3: The requirement/standard is not possible and will be ineffective since karst spring source water has a long residence time and short-term studies will not ensure drilling would not disrupt perennial springs. 3. Required operating procedure 8: No defined parameters associated with the allowable exception to remove ice from rivers. Due to no limit on river ice extraction, the ROP's exception negates the objective. Without first defining terminology and then conducting long term hydrologic monitoring, is not possible to quantify whether the objective can be met. 4. Required operating procedure 9: Optional water level and quality monitoring does not allow for adequate or scientific assessment of impacts. 5. Required operating procedure 11: No defined limitations on the surfaces on which roads and industrial operations can operate. Terrain with high erosion potential due to slope and surficial geology is necessary to include within the ROP or objective will not be met. 6. Required operating procedure 12: Requirement/standard described will not necessarily meet the ROP objective. The listed procedures only</p>	<p>Operators are required to submit a written request for an exception, waiver, or modification and information demonstrating that (1) the factors leading to the inclusion of the stipulation in the lease have changed sufficiently to make the protection provided by the lease stipulation no longer needed or (2) the proposed operation would not cause unacceptable impacts. The criteria for approval of exceptions, waivers, and modifications should be supported by NEPA analysis, and may require site-specific environmental review. Requests should contain, at a minimum, a plan that includes related on-site or off-site mitigation efforts to adequately protect affected resources; data collection and monitoring efforts; and timeframes for initiation and completion of construction, drilling, and completion operations. The operator's request may be included in an Application for Permit to Drill, Notice of Staking, Sundry Notice, or letter. The BLM may also proactively initiate the process. During the review process, BLM coordination with other local, state, or federal agencies (e.g., ADFG, NSB, and local governments) should be undertaken, as appropriate, and documented. 185. (cont.)	(see above)	(see above)	(see above)	(see above)	(see above)	(see above)	<p>provide some necessary protective measures and do not cover the suite of crossing structure impacts. Need to also require annual at-site monitoring or there will be no way to determine impacts. 7. Required operating procedure 16: No defined parameters associated with the allowable exception of BLM authorized drilling in floodplains of fish-bearing rivers and streams will negate the ROP objective. Drilling will change water quality due to the quantity of water required for drilling and discharged water. 8. Required operating procedure 19: No scientific evidence documented in the DEIS to support adequacy of 500ft buffer to meet its objective. 9. Required operating procedure 20: Appropriate entities not defined (e.g., USWFS, NMFS) and expertise not defined. Lack of clarity on the ROP could negate the ROP from meeting its objective. 10. Required operating procedure 22: No defined parameters associated with the culvert installation potentially void ROP objective. Terms within the DEIS such as "necessary", "smaller streams", "fish", "restricting fish passage", "natural flow" and "adversely affecting natural flow" need to be defined and detailed methodology needs to be described. Stream crossing methods are out of date (20+years old) and new information on impacts of culverts on fish and aquatic species needs to be considered (e.g., Maitland et al. 2016). 11. Required operating procedure 28: Lacustrine and riverine geomorphic and ecological classification need to be included in the ROP in order to identify and protect important habitat for aquatic invertebrates and all fish species.</p>	<p>activities are required to receive the appropriate authorizations. Additional project-specific requirements to meet objectives cannot be identified until site-specific development activities are proposed. The 500-foot buffer identified in ROP 19 is standard practice on state and federal lands in Alaska for the past 30 years. Text has been added to ROP 20. Stream crossing methods in ROP 22 are specific to the Arctic environment and utilize current relevant data. Bridge and culvert design will be analyzed through project-specific NEPA analysis.</p>

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
186.	Brook	Brisson	Trustees for Alaska	98271	44	Range of Alternatives	<p>The DEIS fails to include any scientifically justified rationale, backed by empirical data, to explain the proposed width of stream buffers. Within the DEIS there are major scientific data gaps revolving around the width of stream buffers, and extensive scientific evidence needs to be provided to described why values where chosen and why certain rivers and streams were not included. To adequately support its stream buffers, BLM must provide peer-reviewed scientific evidence to demonstrate the following: > How was river buffer width determined and what scientific evidence was used to determine appropriate width to meet lease stipulation objective? ? Why do certain rivers not have buffers and what scientific evidence was used to determine river buffer width necessary to meet lease stipulation objectives? ? Why do all lower order streams not have a buffer and what scientific evidence was used to determine the appropriateness of this decision? > Does the lack of stream buffers on lower order streams negate protective objectives of higher order streams due to the fact that they are connected hydrologically? > How was aufeis/karst spring buffer width determined and what scientific evidence was used to determine appropriate width to meet objective? > What is the state of science around aufeis flow paths, habitat use of fish and invertebrates across seasons? In short, BLM's proposed lease stipulations and ROPs appear arbitrary, lack scientific support and necessary detail, and will likely be ineffective in preventing or mitigating adverse impacts to fish and aquatic species.898</p>	<p>Buffer widths were determined through coordination with cooperating agencies, government-to-government and ANCSA consultation, and recommendations from agency subject matter experts to protect the wide range of resources in those areas. The widths vary among the alternatives to facilitate analysis of the different management options. See Sections 3.2.10 and 3.3.2 for discussions of aufeis and fish and invertebrate habitat use.</p>

187.	Brook	Brisson	Trustees for Alaska	98271	90	Range of Alternatives	<p>The stipulations for protecting cliff-nesting raptors are arbitrary, insufficiently analyzed, and unlikely to achieve the intended result. The DEIS notes that raptors are more easily disturbed by human activities than other birds, concluding that “falcons, hawks, and eagles . . . reacted at greater distances [than 656 feet].”⁹⁸³ But the DEIS does not contain a mitigation measure that directly addresses impacts to cliff-nesting raptors from human disturbance. Lease Stipulation 1 comes closest and includes the objective to “[m]inimize the loss of raptor habitat” by limiting infrastructure along rivers within 2, 1, or 0.5 miles of various rivers in the project area.⁹⁸⁴ But the DEIS only describes the buffer for raptors as more than 656 feet, without providing more specific information. It is therefore impossible to analyze whether these distances are adequate to protect cliff-nesting habitat or to protect raptors from disturbance without a clearer understanding of the buffer distance these raptors need. Furthermore, the exceptions to Lease Stipulation 1 will swallow the rule, as pipelines and roads are allowed on a case-by-case basis.⁹⁸⁵</p>	<p>Lease stipulations and ROPs designed to protect one resource may also provide protections for additional resources. Lease Stipulations 4 and 9, and ROPs 25, 30, and 31 provide protections for cliff-nesting raptors. Exceptions, waivers, and modifications provide an effective means of applying “adaptive management” techniques to oil and gas leases and associated permitting activities to meet changing circumstances. The BLM or operators can initiate adaptive management modifications. See Instruction Memorandum 2008-032 and 43 CFR 3101.1-4 for additional details.</p>

188.	Brook	Brisson	Trustees for Alaska	98271	91	Range of Alternatives	An ROP intended to protect cliff-nesting raptors from gravel mining is arbitrary and lacks adequate explanation. ROP 30 has the objective to “[p]revent or minimize the loss of nesting habitat for cliff-nesting raptors” by prohibiting the removal of “greater than 100 cubic yards of bedrock outcrops, sand, or gravel from cliffs displaying evidence of raptor nests.” ⁹⁸⁶ This differs slightly from a similar mitigation measure in the 2013 IAP for the NPRA, which holds that “Removal of greater than 100 cubic yards of bedrock outcrops, sand, and/or gravel from cliffs shall be prohibited” ⁹⁸⁷ without requiring evidence of nesting. The ROP does not explain how operators would determine whether there is evidence of raptors, or whether a trained biologist would be necessary to make such a determination. This ROP also runs afoul of the buffer mentioned elsewhere in the DEIS, ⁹⁸⁸ given that approaching the cliffs to assess gravel resources could disturb raptors.	The BLM has edited text in Chapter 2 for clarity.
189.	Brook	Brisson	Trustees for Alaska	98271	92	Range of Alternatives	ROP 30 further requires a “hydrological study that indicates no potential impact on the integrity of river bluffs” prior to “extraction of sand or gravel from an active river or stream channel,” ⁹⁸⁹ but does not explain whether this activity would itself disturb nesting raptors. The agency apparently designed ROP 30 to protect cliff-nesting raptors but this ROP will risk causing disturbance and does not provide enough evidence that it will limit the destruction of nesting habitat.	The ROP objective is to protect against the loss of nesting habitat for cliff-nesting raptors; it does not address disturbance of individual birds.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
190.	Brook	Brisson	Trustees for Alaska	98271	93	Range of Alternatives	The ROP designed to mitigate aircraft disturbance to raptors similarly does not explain how operators will identify raptor nests. ROP 34 requires aircraft to maintain at least 1,500 feet altitude when within half a mile of identified raptor nesting sites. But neither the ROP nor analysis elsewhere in the DEIS explain how crews or operators will identify raptor nests, nor whether a trained biologist is needed to properly identify sites	ROP 34 (section a) discusses aircraft use plans that would be submitted. It is not up to the aircraft operator to identify raptor nests. During the APD, a flight plan would be submitted containing the number of proposed flights. The associated NEPA analysis would identify areas requiring protections related to raptor nests.
191.	Brook	Brisson	Trustees for Alaska	98271	99	Range of Alternatives	The mitigation measures to address impacts to shorebirds in river deltas are inadequate and arbitrary. The DEIS notes that shorebirds in river deltas could be impacted from development. For example, when discussing road disturbance, the DEIS says "Fall migration-staging flocks may also be subject to disturbance and displacement, such as shorebirds in river deltas." ¹⁰⁰³ The DEIS then appears to rely on the lease stipulations riparian setbacks to address any impacts to shorebirds and other birds. ¹⁰⁰⁴ But these setbacks appear inadequate for protecting shorebirds. Lease Stipulation 1 applies generally to protecting wildlife habitat and prohibits roads and pipelines in riparian areas, but allows exceptions on a case-by-case basis. ¹⁰⁰⁵ Any rehabilitation of gravel infrastructure may be beneficial for waterbirds, ¹⁰⁰⁶ but these efforts are not likely to mitigate impacts to shorebirds. ¹⁰⁰⁷ The broad exception in Lease Stipulation 1 that would apply across the alternatives therefore belies the conclusions that the larger setbacks in Alternatives C and D make these options more protective. ¹⁰⁰⁸ The DEIS fails to analyze impacts to shorebirds in river deltas and the mitigation measure will not address these impacts.	The BLM has added text to Section 3.3.4 discussing impacts on shorebirds, including in river deltas.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
192.	Brook	Brisson	Trustees for Alaska	98271	103	Range of Alternatives	First, the DEIS does not explain where and when barging and screeding would occur. The DEIS notes that screeding (scraping the seafloor) could impact waterbirds feeding in lagoons and coastal areas.1019 The DEIS notes that these activities could occur in Camden Bay,1020 but does not limit barging and screeding to this one location. The DEIS offers a conclusory statement that "impacts from screeding are expected to be of short duration and would occur in localized areas."1021	The hypothetical development scenario is applicable to the program area, and speculation beyond where marine vessel traffic would go is beyond the scope of this analysis. Direct and indirect impacts cannot be analyzed on a site-specific basis within this EIS, but they are analyzed for the program area generally based off the hypothetical development scenario.
193.	Brook	Brisson	Trustees for Alaska	98271	106	Range of Alternatives	The DEIS uses an arbitrary buffer zone as a way to protect eiders. The DEIS ascribes a buffer of 656 feet (about 200 meters) in order to "[a]void and reduce temporary impacts on productivity from disturbance near Steller's or spectacled eider nests."1025 The DEIS also appears to use this same buffer to analyze impacts to all bird species.1026 But the DEIS does not explain why this buffer is appropriate specifically for eiders, nor does the DEIS explain why this buffer is appropriate for all species.	A 656-foot (200-meter) buffer is the standard USFWS buffer distance for protection of various species, including eiders. Buffer widths were determined through coordination with cooperating agencies, government-to-government and ANCSA consultation, and recommendations from agency subject matter experts.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
194.	Brook	Brisson	Trustees for Alaska	98271	108	Range of Alternatives	<p>The DEIS does not use complete and appropriate science to determine an appropriate buffer for eiders. The DEIS relies on Livezey et al. (2016) to support the idea that a buffer of 656 feet is appropriate for eiders and for all birds in the program area. But Livezey et al. (2016) is a compilation of data on the disturbance threshold for 49 species of nesting birds and 650 species of nonnesting birds. While this is one place to start the analysis on how disturbance could impact birds in the project area, it is not enough to rely on this compilation to apply specifically to eiders or even to all birds. First, it is not clear whether the data presented in Livezey et al. (2016) is applicable to Arctic birds; the agency should have used the database offered in this publication and conducted a new analysis using only Arctic species. Second, the DEIS additionally references disturbance studies on Arctic birds that indicate a zone of disturbance that is larger than 656 feet.¹⁰²⁷ The DEIS cites to Monda et al. (1994)¹⁰²⁸ which documented a buffer of 1640 feet for Tundra Swans; to Johnson et al. (2003) which documents a buffer of 4224 feet (0.8 miles) for unknown Arctic birds;¹⁰²⁹ and to Liebezeit et al. (2009)¹⁰³⁰ which documents a buffer of more than 16,000 feet (3.1 miles) for nesting Arctic passerines. But the DEIS does not explain why it arbitrarily chose 656 feet as the appropriate buffer for eiders and for all birds in the project area.</p>	<p>A 656-foot (200-meter) buffer is the standard USFWS buffer distance for protection of various species, including eiders. Buffer widths were determined through coordination with cooperating agencies, government-to-government and ANCSA consultation, and recommendations from agency subject matter experts.</p>

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
195.	Brook	Brisson	Trustees for Alaska	98271	111	Range of Alternatives	Moreover, the mitigation measures for seabirds are missing, inadequate, or arbitrary. Lease Stipulation 9 would purportedly protect coastal zones to varying degrees, but under Alternative B would only require a mitigation plan but would not actually prevent any infrastructure in the coastal area, and Alternatives C and D would allow for barges, docks, spill response areas, and pipelines. ¹⁰⁴¹ This stipulation would therefore not address impacts that occur on the vessel route from Dutch Harbor.	Lease stipulations and ROPs designed to protect one resource may also provide protections for different resources. The BLM does not have authority to regulate marine traffic outside the Coastal Plain. Impacts on seabirds associated with the marine vessel route are discussed in Section 3.3.3.
196.	Brook	Brisson	Trustees for Alaska	98271	172	Range of Alternatives	BLM needs to clearly specify where gravel mining will be allowed within or near the program area to allow evaluation of its impacts. It must then use that information in conjunction with the scientific evidence cited above to quantitatively evaluate the direct, indirect and cumulative impacts to caribou from gravel mining in or near the program area.	This level of specificity would be determined at the project-level authorization. Site-specific analyses, including those associated with infrastructure in support of oil and gas development, can more realistically be provided when the BLM receives an application to permit such infrastructure. The Leasing EIS makes no decisions on such infrastructure, except to prohibit it in specified areas of particularly high value surface resources under some alternatives.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
197.	Brook	Brisson	Trustees for Alaska	98271	191	Range of Alternatives	Lease stipulation 3 - Springs/Aufeis This stipulation acknowledges that aufeis “provides insect relief for caribou.”1331 Although the objective for Alternatives B and C states “[b]ecause the subsurface flow paths to perennial springs are unknown and could be disturbed by drilling or fracking, use buffer areas around the major perennial springs that support fish populations in which no leasing is permitted,”1332 neither alternative considers no leasing in those areas. This only occurs under Alternative D. BLM should operate according to its own recommendation and likewise make spring/aufeis habitat for fish, caribou and other organisms associated with perennial springs unavailable for leasing under Alternatives B and C.	In addition to Lease Stipulation 3, Lease Stipulation 1 provides additional protection to springs and aufeis (i.e., NSO under Alternatives B and C). The varying protections remain in order to analyze a reasonable range of alternatives under NEPA.
198.	Brook	Brisson	Trustees for Alaska	98271	192	Range of Alternatives	b. Lease stipulation 4 - Nearshore marine, lagoon, and barrier island habitats The objective for this stipulation includes protection of caribou insect relief areas among its purposes.1333 The stipulation prohibits certain types of infrastructure in coastal waters, lagoons and barrier islands, but provides a caveat that infrastructure “necessary for oil and gas activities” may be approved.1334 No guidance is given for what conditions would be deemed “necessary,” nor if there would be any limits placed on the amount or density of structures that could be approved by this process. This lack of certainty makes it unclear to what degree, if any, caribou coastal insect relief habitat will be protected over the long term. Restrictions need to be clearly specified and justified with the best-available scientific information.	Lease Stipulation 4 (section a) describes the infrastructure that may be necessary in nearshore areas. ROP 21 requires minimization of the development footprint. A project-specific NEPA analysis would be required for any development in the Coastal Plain and would be conducted by multiple agencies. Alternatives of a project-specific NEPA analysis would necessarily examine these potential means for reducing impacts on surface resources.

S. Public Comments and BLM Responses (Alternatives)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
199.	Brook	Brisson	Trustees for Alaska	98271	193	Range of Alternatives	Lease stipulation 4 - Nearshore marine, lagoon, and barrier island habitats Alternative D adds additional restrictions, including that - in coordination with prospective Refuge users or user groups - lessees, operators and contractors would "[d]esign and construct facilities to minimize impacts on subsistence uses, travel corridors, and seasonally concentrated fish and wildlife resources" and conduct daily operations in a way to "minimize impacts on...wildlife resources."1335 It is unclear (and not justified) why these provisions only apply to Alternative D. These are common-sense requirements that BLM should apply across all alternatives to reduce impacts to caribou, other wildlife, and subsistence and other users. Moreover, to ensure efficacy, the stipulation should include measurable standards to achieve the broad objective of minimizing impacts, supported by the best-available scientific information.	Other ROPs (e.g., ROPs 36 and 39) require facility siting and design to minimize impacts on subsistence activities under all alternatives.
200.	Brook	Brisson	Trustees for Alaska	98271	194	Range of Alternatives	c. Lease stipulation 6 - Caribou Summer Habitat We agree with the acknowledgement in this stipulation that "[a]ll lands in the Arctic Refuge Coastal Plain are recognized as habitat of the PCH and CAH and would be managed to ensure unhindered movement of caribou through the area."1336 Management to ensure unhindered movement is indeed an important goal to avoid negative consequences for caribou. Unfortunately, the stated objective of minimizing disturbance, hindrance and alteration of movement1337 is inconsistent with that important goal. We urge BLM to follow its own rationale stated in the note on this stipulation and to define the objective as ensuring unhindered movement of caribou through the Coastal Plain.	ROP 23 further addresses ways to minimize disruption of caribou movement and subsistence use through the Coastal Plain. The BLM has edited text of the note associated with Lease Stipulation 6 for clarity.

S. Public Comments and BLM Responses (Alternatives)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
201.	Brook	Brisson	Trustees for Alaska	98271	195	Range of Alternatives	Lease stipulation 6 - Caribou Summer Habitat It is important to note that due to the sensitivity to development of cows with young calves, as acknowledged in the DEIS,1338 it is likely impossible to ensure unhindered movement through developed areas. This reinforces the need for large areas sufficiently far away from infrastructure and activity where cows and calves are unlikely to be affected. BLM should demonstrate spatially and based on the best-available science where such areas will occur, taking into account that displacement effects from development will not stop at the boundary of an NSO or no leasing area.	ROP 23 further addresses ways to minimize disruption of caribou movement and subsistence use through the Coastal Plain. The BLM has edited text of the note associated with Lease Stipulation 6 for clarity.
202.	Brook	Brisson	Trustees for Alaska	98271	196	Range of Alternatives	Addition of timing limitations under Alternative D2 is important to improve protections to caribou and should be applied to the other alternatives. This addition states that timing limitations are intended "to restrict activities that would disturb caribou during calving and insect-relief periods."1339 Since the entire Coastal Plain may be used by caribou during calving and post-calving,1340 we urge that the description on page 2-12 be changed from: "If caribou arrive on the calving grounds before May 20..." to "If caribou arrive on the Coastal Plain before May 20..." This is necessary to ensure that the definition of "calving grounds" is not subject to interpretations that might reduce protections under the stipulation. Furthermore, as others have pointed out,1341 minimum requirements for the 'stop work plan' developed by the lessee should be specified in the DEIS to ensure plans will achieve their intended goal.	Text has been edited in Chapter 2 for clarity.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
203.	Brook	Brisson	Trustees for Alaska	98271	197	Range of Alternatives	<p>Finally, the caveat in the timing limitation description that states, "unless approved by the BLM Authorized Officer,"1342 is highly problematic. As written, no guidelines are given for when approval might be allowed, beyond "in consultation with the appropriate federal, state, and NSB regulatory and resource agencies."1343 Absent measurable standards and specific guidelines for when approval might be granted (e.g., no caribou detected within 20 km of facilities by both telemetry data and aerial surveys and telemetry records from collared caribou do not show caribou heading in the general direction of the project area), this caveat should be removed. Whatever guidelines are presented must be clearly supported by the best-available scientific information.</p>	<p>Operators are required to submit a written request for an exception, waiver, or modification and information demonstrating that (1) the factors leading to the inclusion of the stipulation in the lease have changed sufficiently to make the protection provided by the lease stipulation no longer needed or (2) the proposed operation would not cause unacceptable impacts. The criteria for approval of exceptions, waivers, and modifications should be supported by NEPA analysis, and may require site-specific environmental review. Requests should contain, at a minimum, a plan that includes related on-site or off-site mitigation efforts to adequately protect affected resources; data collection and monitoring efforts; and timeframes for initiation and completion of construction, drilling, and completion operations. The operator's request may be included in an Application for Permit to Drill, Notice of Staking, Sundry Notice, or letter. The BLM may also proactively initiate the process. During the review process, BLM coordination with other local, state, or federal agencies (e.g., ADFG, NSB, and local governments) should be undertaken, as appropriate, and documented. The BLM will also consult with the federal surface management agency (e.g., USFWS). Approval or disapproval is made by the Authorized Officer, and the decision is documented. If the waiver, exception, or modification is approved, any necessary mitigation is also documented. The applicant is</p>

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
203. (cont.)	(see above)	(see above)	(see above)	(see above)	(see above)	(see above)	(see above)	then provided with a written notification of the decision. See Instruction Memorandum 2008-032 and 43 CFR 3101.1-4 for additional details. The BLM has added additional text to Table 2-3.
204.	Brook	Brisson	Trustees for Alaska	98271	198	Range of Alternatives	Lease stipulation 7 - PCH Primary Calving Habitat Area Moreover, areas outside of the most commonly used concentrated calving areas can still be very important for caribou in some years, as described above. Protecting only the "primary calving area" as defined here will provide little protection in some years, potentially increasing calf mortality and threatening the caribou population. This is especially a concern if warming conditions under climate change leads to "a western shift in concentrated calving areas," as the DEIS indicates. ¹³⁴⁵ This possibility would render the strict definition of primary calving habitat given in Stipulation 7 ineffective. Instead, BLM should recognize the clear array of historic records showing that the entire Coastal Plain is important for calving over longer timeframes and seek to avoid disturbance and hindrance of movement across the entire Coastal Plain.	The EIS contains multiple lease stipulations and ROPs that are designed to avoid caribou disturbance and hindrance of their movement across the entire Coastal Plain.

S. Public Comments and BLM Responses (Alternatives)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
205.	Brook	Brisson	Trustees for Alaska	98271	200	Range of Alternatives	Lease stipulation 7 - PCH Primary Calving Habitat Area The added traffic restrictions in Stipulation 7 include speed limits when caribou are within half a mile of the road.1346 Caribou can travel very quickly, covering half a mile in a matter of minutes.1347 It is thus important to extend this boundary and to use multiple monitoring methods to manage vehicle activities. These should include: 1) daily review of location data from collared caribou to examine general movement patterns long before caribou contact roads, 2) daily or alternate day aerial reconnaissance flights in buffer areas near roads to provide more detailed location information, including of non-collared individuals, 3) road-based surveys to detect caribou proximity to roads. Traffic alteration must be started early and increasingly restricted as caribou near roads.	Along with Lease Stipulation 7, ROP 23 is designed to minimize disturbance to caribou movement. Traffic in areas with calving caribou would be minimized or eliminated as possible through the vehicle use plan, which could include recommendations such as daily review of location data, aerial reconnaissance flights, or road-based surveys.

S. Public Comments and BLM Responses (Alternatives)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
206.	Brook	Brisson	Trustees for Alaska	98271	201	Range of Alternatives	Lease stipulation 7 - PCH Primary Calving Habitat Area Also, although BLM acknowledges that "15 vehicles per hour or more has been shown to deflect caribou movements and delay road crossings,"1348 no limits on traffic volume are included her or in other stipulations and ROPs. BLM should conform to its own acknowledgement of impacts and restrict traffic below 15 vehicles per hour. Even these mitigation measures are unlikely to be ultimately effective, however, as the DEIS notes that "[s]ome level of displacement of calving caribou has been shown to occur even with low levels of traffic."1349 The high sensitivity of calving caribou to human disturbance and sustained shifts in CAH distribution away from development areas in spite of mitigation measures1350 indicate that the requirements specified in this stipulation are unlikely to remove disturbance and displacement of female caribou with young calves during calving.	Along with Lease Stipulation 7, ROP 23 is designed to minimize disturbance to caribou movement. Traffic in areas with calving caribou would be minimized or eliminated as possible through the vehicle use plan. Text has been added to Lease Stipulation 7.
207.	Brook	Brisson	Trustees for Alaska	98271	202	Range of Alternatives	Lease stipulation 7 - PCH Primary Calving Habitat Area Finally, while the stipulation states that "[t]he following ground and air traffic restrictions would apply,"1351 no air traffic restrictions are listed. These must be specified so that their utility can be evaluated.	Along with Lease Stipulation 7, ROP 23 is designed to minimize disturbance to caribou movement. Traffic in areas with calving caribou would be minimized or eliminated as possible through the vehicle use plan. Text has been added to Lease Stipulation 7.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
208.	Brook	Brisson	Trustees for Alaska	98271	203	Range of Alternatives	e. Lease stipulation 8 - PCH Post-Calving Habitat Area The note on Stipulation 8 defines the "PCH post-calving area" using the same guidelines used for the primary calving area in Stipulation 7.1352 This is again problematic and not supported in the DEIS with robust scientific justification. As is described above, the post-calving period is a crucial time for caribou when movement is critical to ensure access to sufficient forage while reducing the negative effects of insect harassment. Once again, areas outside of the most commonly used post-calving areas will still be important for caribou in some years. Thus, protections laid out in Stipulation 7 should be applied across the entire post-calving area - the full Coastal Plain - incorporating the recommendations we provided above.	Additional text has been added to Section 3.3.4 describing the definitions of the calving and post-calving habitat areas.
209.	Brook	Brisson	Trustees for Alaska	98271	204	Range of Alternatives	Lease stipulation 8 - PCH Post-Calving Habitat Area The concept of evacuating roads when attempted caribou crossings appear imminent is appropriate but details must be more clearly defined. For example, what qualifies as "appears to be imminent"?1353 Science-based guidance should be clearly stated. Also, what needs to be done for "evacuation"? Is this simply removing people and stopping vehicle movement or actually removing vehicles from the area? If the latter, how will vehicle removal be accomplished without further disturbing caribou?	Site-specific requirements such as these would be developed through a vehicle use management plan, as described in ROP 23 (section g).
210.	Brook	Brisson	Trustees for Alaska	98271	205	Range of Alternatives	Lease stipulation 8 - PCH Post-Calving Habitat Area Furthermore, what is the rationale for choosing "approximately 100 or more" caribou as the trigger for road evacuation? In the NPR-A IAP traffic is stopped "to allow a crossing by 10 or more caribou."1354	Additional text has been added to Lease Stipulation 8.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
211.	Brook	Brisson	Trustees for Alaska	98271	206	Range of Alternatives	<p>Lease stipulation 8 - PCH Post-Calving Habitat Area Nor does BLM provide a rationale for why the date range for evacuating roads begins June 15. This does not align within the post-calving period as displayed in Map 3-21, which starts earlier. This stipulation should have language similar to that in Stipulation 6 that allows the applicable dates to be adjusted in response to the presence of caribou within the program area. It is unclear who will make the evacuation decision, what the consequences will be of not following the protocol, and who will enforce consequences. These things need to be clarified to increase confidence in the ability of this stipulation to reduce impacts on caribou.</p>	<p>The requirements of the travel management plan identified in ROP 23 (section g) would cover these site-specific concerns. Operators are required to submit a written request for an exception, waiver, or modification and information demonstrating that (1) the factors leading to the inclusion of the stipulation in the lease have changed sufficiently to make the protection provided by the lease stipulation no longer needed or (2) the proposed operation would not cause unacceptable impacts. The criteria for approval of exceptions, waivers, and modifications should be supported by NEPA analysis, and may require site-specific environmental review. Requests should contain, at a minimum, a plan that includes related on-site or off-site mitigation efforts to adequately protect affected resources; data collection and monitoring efforts; and timeframes for initiation and completion of construction, drilling, and completion operations. The operator's request may be included in an Application for Permit to Drill, Notice of Staking, Sundry Notice, or letter. The BLM may also proactively initiate the process. During the review process, BLM coordination with other local, state, or federal agencies (e.g., ADFG, NSB, and local governments) should be undertaken, as appropriate, and documented. The BLM will also consult with the federal surface management agency (e.g., USFWS). Approval or disapproval is made by the Authorized Officer, and the decision is documented. If the waiver, exception, or modification is approved, any necessary mitigation is also documented. The applicant is</p>

211. (cont.)	(see above)	(see above)	(see above)	(see above)	(see above)	(see above)	(see above)	then provided with a written notification of the decision. See Instruction Memorandum 2008-032 and 43 CFR 3101.1-4 for additional details.
212.	Brook	Brisson	Trustees for Alaska	98271	207	Range of Alternatives	Lease stipulation 8 - PCH Post-Calving Habitat Area Finally, it is not specified why road evacuation standards are only specified for the timing limitation areas. Inclusion of road evacuation standards is common-sense and in line with past BLM action in the NPR-A. BLM should apply this standard across all action alternatives and across the entire program area. However, we note that this still is not likely to prevent all impacts in light of major documented effects of roads to calving caribou and summer movements recorded for the CAH.	Road evacuation standards would be covered under ROP 23 (section g) (across all alternatives).

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
213.	Brook	Brisson	Trustees for Alaska	98271	208	Range of Alternatives	<p>f. Lease stipulation 9 - Coastal Area The objective for this stipulation includes minimizing “the hindrance or alteration of caribou movement in caribou coastal insect-relief areas.”¹³⁵⁵ The requirement to implement a conflict avoidance and monitoring plan is appropriate; however additional details are needed about standards and requirements for such a plan to ensure effective adaptive management. The DEIS needs to state standards for monitoring plans, including use of measurable, science-based indicators, clear and scientifically-supported requirements for the frequency of data collection, and clear triggers for defining necessary conflict avoidance measures. Conflict avoidance measures should also be specified and include BLM authority to disapprove of or delay permitting decisions. Responsibility for developing and implementing the monitoring plan for effects of infrastructure and activities on the coastal habitats and subsistence should be assigned to USFWS, as the surface managing agency, rather than to the lessee. BLM should specify that prior to implementation, this plan must be reviewed and approved by the relevant state, federal, and North Slope Borough wildlife and subsistence officials. It should also be specified that the results and data from the report must be made publicly available, as described below under ROP 23.</p>	<p>Monitoring plans will be tailored to the specific location of development and the resources or activity being monitored; it is not practicable to develop a template that would cover all resources, activities, and requirements for this EIS. Sharing of management monitoring data (if appropriate) would be initiated by the relevant wildlife management authorities; it is outside the scope of this EIS. Federal, state, and local wildlife management agencies would evaluate data provided under ROP 33 to assess wildlife movements.</p>

214.	Brook	Brisson	Trustees for Alaska	98271	209	Range of Alternatives	Lease stipulation 9 - Coastal Area It is notable that the stipulation requires an impact and conflict avoidance and monitoring plan to be implemented "[b]efore beginning exploration or development."1356 As BLM is currently considering a pending permit application for 3D seismic exploration, BLM should require and make available a pre-exploration conflict avoidance plan as a condition on any permit approval.	The lease stipulations and ROPs identified in Chapter 2 only apply to leases. Seismic exploration can be done across the full area of the Coastal Plain, even if an area is not available for lease. Site-specific NEPA analysis would be done for any proposed seismic explorations.
215.	Brook	Brisson	Trustees for Alaska	98271	210	Range of Alternatives	g. ROP 18 This ROP states that "[a]ll roads must be designed, constructed, maintained, and operated to create minimal environmental impacts."1357 The BLM should note that achieving this standard with respect to caribou will often mean not building roads at all. Additional details need to be given and scientifically-justified to clarify what standards would meet the ROP objective.	This level of specificity would be determined at the project-level authorization. Site-specific analyses, including those associated with infrastructure in support of oil and gas development, can more realistically be provided when the BLM receives an application to permit such infrastructure.
216.	Brook	Brisson	Trustees for Alaska	98271	211	Range of Alternatives	h. ROP 21 Requirement h in this ROP calls for "[l]ocating facilities and other infrastructure outside areas identified as important for wildlife habitat."1358 BLM needs to clearly identify in the EIS which areas are importance for each species across each season to ensure this otherwise generalized ROP can be meaningfully implemented and to ensure the public has adequate information to assess its efficacy. As pointed out above, the definition given in the DEIS for important caribou calving habitat is insufficient and must be updated to conform with prevailing scientific knowledge. The entire Coastal Plain is important for caribou calving and post-calving habitat.	This level of specificity would be determined at the project-level authorization. Site-specific analyses, including those associated with infrastructure in support of oil and gas development, can more realistically be provided when the BLM receives an application to permit such infrastructure. The Leasing EIS makes no decisions on such infrastructure, except to prohibit it in specified areas of particularly high value surface resources under some alternatives.

217.	Brook	Brisson	Trustees for Alaska	98271	213	Range of Alternatives	. ROP 23 Tentative language in the ROP must be clarified. For example, it states that ramps or buried pipelines "may be required by the BLM Authorized Officer."1360 Under what conditions would this decision be made? What circumstances would trigger use of buried pipelines or ramps? This needs to be made clear and scientifically justified. Furthermore, BLM needs to explain how such features will be accounted for within the 2000 acre limit on surface disturbance.	This level of specificity would be determined at the project-level authorization. Site-specific analyses, including those associated with infrastructure in support of oil and gas development, can more realistically be provided when the BLM receives an application to permit such infrastructure. The Leasing EIS makes no decisions on such infrastructure, except to prohibit it in specified areas of particularly high value surface resources under some alternatives. Operators are required to submit a written request for an exception, waiver, or modification and information demonstrating that (1) the factors leading to the inclusion of the stipulation in the lease have changed sufficiently to make the protection provided by the lease stipulation no longer needed or (2) the proposed operation would not cause unacceptable impacts. The criteria for approval of exceptions, waivers, and modifications should be supported by NEPA analysis, and may require site-specific environmental review. Requests should contain, at a minimum, a plan that includes related on-site or off-site mitigation efforts to adequately protect affected resources; data collection and monitoring efforts; and timeframes for initiation and completion of construction, drilling, and completion operations. The operator's request may be included in an Application for Permit to Drill, Notice of Staking, Sundry Notice, or letter. The BLM may also proactively initiate the process. During the review process, BLM coordination with other local, state, or federal agencies (e.g., ADFG, NSB, and local governments) should be

217. (cont.)	(see above)	(see above)	(see above)	(see above)	(see above)	(see above)	(see above)	undertaken, as appropriate, and documented. The BLM will also consult with the federal surface management agency (e.g., USFWS). Approval or disapproval is made by the Authorized Officer, and the decision is documented. If the waiver, exception, or modification is approved, any necessary mitigation is also documented. The applicant is then provided with a written notification of the decision. See Instruction Memorandum 2008-032 and 43 CFR 3101.1-4 for additional details.
218.	Brook	Brisson	Trustees for Alaska	98271	214	Range of Alternatives	i. ROP 23 We agree with the requirement to perform a study of caribou movement specific to the PCH and CAH prior to authorization of construction.1361 However, it is important that such studies, as well as creation of an overarching plan for research and monitoring, be carried out by USFWS instead of industry. USFWS is responsible for establishing a long-term integrated baseline and monitoring program for fish and wildlife for the Arctic Refuges, which would include ensuring there is adequate baseline data and research on caribou populations and their habitats and movements to evaluate future impacts of the oil and gas program activities and infrastructure to caribou.1362 Similarly, agency scientists should conduct the required studies of caribou movement prior to authorization of construction to ensure that results are robust and made publicly available.	Requiring other federal agencies to do studies and monitoring is outside the scope of the EIS.

219.	Brook	Brisson	Trustees for Alaska	98271	215	Range of Alternatives	i. ROP 23 If a previous study conducted within the last 10 years is to be used instead of completing new research, it is important that the previous study and associated data be made available to the public prior to authorization by the BLM Authorized Officer (AO) to enable thorough review of the sufficiency of the study. A mechanism should be established for the public to provide input to the AO, with sufficient time included for review of the previous report and commenting.	The public will be able to provide input to the Authorized Officer through future site-specific NEPA processes associated with oil and gas projects. This Leasing EIS will not result in the authorization of any on-the-ground activities. Accordingly, the environmental baseline will be preserved throughout the lease sale process. Any on-the-ground activities will require additional NEPA analysis. At that time, the BLM will determine which baseline studies may be necessary.

220.	Brook	Brisson	Trustees for Alaska	98271	217	Range of Alternatives	<p>. ROP 23 Requirement g states that "traffic may be stopped throughout a defined area for up to 4 weeks, to prevent displacement of calving caribou,"1363 but it does not give more specific instances of less than a full closure, such as those seen in Stipulation 8. No justification is given for why a four-week maximum is listed for closure. This should be changed to read: "...throughout a defined area whenever necessary to prevent displacement of caribou." This recommended language not only removes the arbitrary 4-week deadline but also broadens the focus from just calving caribou, to reflect the importance of the post-calving and insect relief periods.</p>	<p>Operators are required to submit a written request for an exception, waiver, or modification and information demonstrating that (1) the factors leading to the inclusion of the stipulation in the lease have changed sufficiently to make the protection provided by the lease stipulation no longer needed or (2) the proposed operation would not cause unacceptable impacts. The criteria for approval of exceptions, waivers, and modifications should be supported by NEPA analysis, and may require site-specific environmental review. Requests should contain, at a minimum, a plan that includes related on-site or off-site mitigation efforts to adequately protect affected resources; data collection and monitoring efforts; and timeframes for initiation and completion of construction, drilling, and completion operations. The operator's request may be included in an Application for Permit to Drill, Notice of Staking, Sundry Notice, or letter. The BLM may also proactively initiate the process. 221.	Brook	Brisson	Trustees for Alaska	98271	218	Range of Alternatives	ROP 28 In order "to conserve important habitat types," this ROP requires "[u]se [of] ecological mapping as a tool to assess wildlife habitat before developing permanent facilities."1364 Creation of habitat maps is an important step toward "detailed analysis of development alternatives,"1365 however, BLM does not specify how the resulting map would be used or what guidelines or thresholds would be used to ascertain whether the goal of conserving important habitat types is met under future development proposals. This should be made clear.	The BLM will use ecological mapping to inform future decision-making related to development of alternatives on site-specific projects.
222.	Brook	Brisson	Trustees for Alaska	98271	219	Range of Alternatives	ROP 28 While, map preparation prior to approval of facility location and construction and ground-based wildlife surveys are commendable, the DEIS fails to include any guidelines to inform when and how BLM will determine if such surveys are "deemed necessary."1366 These must be clarified.	This level of specificity would be determined at the project-level authorization. Site-specific analyses, including those associated with infrastructure in support of oil and gas development, can more realistically be provided when the BLM receives an application to permit such infrastructure. The Leasing EIS makes no decisions on such infrastructure, except to prohibit it in specified areas of particularly high value surface resources under some alternatives.

223.	Brook	Brisson	Trustees for Alaska	98271	220	Range of Alternatives	<p>ROP 33 This ROP requires geospatial representations of new infrastructure be provided to BLM and the State of Alaska "to be used in monitoring and assessing wildlife movements during and after construction." 1367 This is a very important ROP and we appreciate BLM including it in the DEIS, along with inclusion of construction beginning and end dates as ancillary data. As much as possible, these dates should be provided for different components of the project to allow the finest scale analyses of construction impacts on wildlife movement. To fully achieve the objective of this ROP, we request that BLM specifically state in this ROP that provided geospatial data will be made publicly available. Furthermore, BLM should specify how it will integrate the resulting data into the USFWS monitoring plan described above. This must include how monitoring will inform management decisions, such as through establishing impact thresholds beyond which permitting will be stopped or increasing mitigation requirements.</p>	<p>Requiring other federal agencies to do studies and monitoring is outside the scope of the EIS. Data related to a site-specific proposal would be available to the public through that project's NEPA analysis.</p>

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
224.	Brook	Brisson	Trustees for Alaska	98271	222	Range of Alternatives	<p>ROP 34 This ROP seeks to “[m]inimize the effects of low-flying aircraft on wildlife” and people.1368 This is an important goal. However, the ROP must be strengthened and improved to meet its objective. First, requirement c specifies a minimum altitude of 1500 feet above ground level (agl) for flights over caribou calving range and near raptor nesting sites. Federal Aviation Administration guidance recommends a minimum altitude of 2000 feet agl over all National Wildlife Refuges and other noise-sensitive areas.1369 ROP 34 should be amended to align with this guidance and increase the minimum altitude to 2000 feet over the entire program area at all times. This will help meet the DEIS requirement to maintain the Refuge’s original purposes under ANILCA while also complying with the 2017 Tax Act.1370 It will also be consistent with the importance of the entire Coastal Plain for calving and post-calving habitat over time. It should be noted, however, that even incorporating this minimum requirement is unlikely to prevent impacts to caribou. Flight ceilings often are lower than 1500 feet agl, particularly during calving,1371 so there is concern that weather exceptions will increase the impact of aircraft on caribou despite the guidance of this ROP.</p>	<p>Based on existing studies, aircraft that maintain flight altitudes of 660 meters (2,000 feet) above ground level caused little or no disturbance to caribou during any season, and flight altitudes above 300 meters (1,000 feet) above ground level caused few strong responses by caribou (Shideler, R.T. 1986. Impacts of human developments and land use on caribou: A literature review. Volume II. Impacts of oil and gas development on the Central Arctic Herd. Alaska Department of Fish and Game Technical Report 86-3. Habitat Division. Juneau, Alaska). pagesThis clearly supports 1,500 feet being a reasonable elevation. Alternative D has been revised to 2,000 feet above ground level (agl) to analyze the difference.</p>
225.	Brook	Brisson	Trustees for Alaska	98271	223	Range of Alternatives	<p>ROP 34 Second, requirement d seeks to “[m]inimize the number of helicopter landings in caribou calving ranges from May 20 through June 20.”1372 Given the extreme importance of the calving period for population well-being and the sensitivity of cows with newborn calves to disturbance, this should be amended to prohibit all helicopter landings in calving grounds during this period.</p>	<p>Exceptions, waivers, and modifications provide an effective means of applying “adaptive management” techniques to oil and gas leases and associated permitting activities to meet changing circumstances. The BLM or operators can initiate adaptive management modifications. See Instruction Memorandum 2008-032 and 43 CFR 3101.1-4 for additional details.</p>

226.	Brook	Brisson	Trustees for Alaska	98271	224	Range of Alternatives	Third, the requirements under Alternative D expand the altitude and landing restrictions to include the post-calving period. This is necessary given the extreme importance of the post-calving period to caribou and their need to access high quality forage unhindered (see above). In light of this, these provisions should apply consistently across all action alternatives. Provisions should also be expanded to include the period where cows arrive on the calving ground. If animals are deflected and unable to reach the calving ground, the consequences will be as severe as if they were displaced from the calving ground. The start date should be extended to May 1st to accommodate this and language should be included, as is done with traffic effects above, to provide flexibility if migration timing alters with a changing climate.	The varying protections remain in order to analyze a reasonable range of alternatives under NEPA. Operators are required to submit a written request for an exception, waiver, or modification and information demonstrating that (1) the factors leading to the inclusion of the stipulation in the lease have changed sufficiently to make the protection provided by the lease stipulation no longer needed or (2) the proposed operation would not cause unacceptable impacts. The criteria for approval of exceptions, waivers, and modifications should be supported by NEPA analysis, and may require site-specific environmental review. Requests should contain, at a minimum, a plan that includes related on-site or off-site mitigation efforts to adequately protect affected resources; data collection and monitoring efforts; and timeframes for initiation and completion of construction, drilling, and completion operations. The operator's request may be included in an Application for Permit to Drill, Notice of Staking, Sundry Notice, or letter. The BLM may also proactively initiate the process. During the review process, BLM coordination with other local, state, or federal agencies (e.g., ADFG, NSB, and local governments) should be undertaken, as appropriate, and documented. The BLM will also consult with the federal surface management agency (e.g., USFWS). Approval or disapproval is made by the Authorized Officer, and the decision is documented. If the waiver, exception, or modification is approved, any necessary mitigation is also documented. The applicant is then provided with a written

226. (cont.)	(see above)	(see above)	(see above)	(see above)	(see above)	(see above)	(see above)	notification of the decision. See Instruction Memorandum 2008-032 and 43 CFR 3101.1-4 for additional details.
227.	Brook	Brisson	Trustees for Alaska	98271	225	Range of Alternatives	Requirement a mentions a plan with strategies that include aircraft types, flight altitudes and routes.1375 To enable more detailed and spatially-explicit studies of aircraft impacts in the Arctic Refuge, we request that BLM add a requirement to ROP 34 that specifies collection of geospatial aircraft data reporting the location, time, altitude, and aircraft type of each permitted flight within the program area. These data should be housed by the USFWS or another designated federal repository and made available to researchers to enable more complete analysis of aircraft use within the Coastal Plain and its effects on wildlife, subsistence hunters, and surface resources.	Data collection beyond the requirements of the aircraft use plan is outside the scope of the EIS. It is not within the BLM's authority to require other agencies to do studies and monitoring or house data. Sharing of management monitoring data (if appropriate) would be initiated by the relevant management authorities and is outside the scope of this EIS.
228.	Brook	Brisson	Trustees for Alaska	98271	226	Range of Alternatives	ROP 42 This ROP necessarily prohibits chasing wildlife, especially caribou, with ground vehicles.1376 The qualifier "with ground vehicles" should be deleted from the requirement language; chasing of wildlife with any type of vehicle should be prohibited.	ROP 34 (section e) discusses the hazing of wildlife as prohibited. Operators are required to comply with federal laws regardless of permit requirements.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
229.	Brook	Brisson	Trustees for Alaska	98271	237	Range of Alternatives	Brown bears den during the winter and can be disturbed by noise. ROP 10 requires a 0.5 mile buffer around occupied brown bear dens identified by the Alaska Department of Fish and Game (ADFG). But the DEIS sets forth no basis for this buffer to ensure that it is sufficiently protective, and no information to indicate what distance from an occupied brown bear den is safe for seismic activity to operate without disturbing the denning bear.1429	Reynolds et al. (1986) examined instrumented grizzly bears in NPR-A in relation to seismic activities. When seismic exploration vehicles were operating up to 0.8 kilometers (0.5 miles) from a denned bear, fluctuations in collar temperature and signal amplitude were recorded and mean heart rates appeared elevated. Bears apparently show increased heart rates during undisturbed conditions. The authors concluded if bears responded to noises associated with seismic exploration activities, effects on the bears were probably minimal. None of the radio-collared bears deserted their dens in response to seismic activities, and all emerged in spring with no observed deaths of accompanying offspring. See Reynolds, P.E., H.V. Reynolds, and E.H. Follmann. 1986. Responses of Grizzly Bears to Seismic Surveys in Northern Alaska. In: International Conference on Bear Research and Management. 6:169-175.

S. Public Comments and BLM Responses (Alternatives)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
230.	Brook	Brisson	Trustees for Alaska	98271	242	Range of Alternatives	Also, ROP 4 says that the lessee: would prepare and implement bear-interaction plans to minimize conflicts between bears and humans. These bear interaction plans would be developed in consultation with and approved by the USFWS and the Alaska Department of Fish and Game (ADFG). The plans would include specific measures identified in the current USFWS Polar Bear Mitigation Plan and would be adapted as needed for grizzly bears. This language is vague even for polar bears, and even worse for brown bears in terms of providing any assurance that mitigation measures would be effective, or that human-bear interactions related to oilfield development on the coastal plain would not cause significant adverse impacts to predators and prey.	The bear interaction plan would be approved by the USFWS, but it is the operator's document as part of the MMPA ITR/LOA. It is not within the BLM's authority to provide direction on how measures would be adapted for grizzly bears. Adaptation for grizzly bears falls within the authority of the Alaska Department of Fish and Game.
231.	Brook	Brisson	Trustees for Alaska	98271	248	Range of Alternatives	It completely ignores the Potential Biological Removal (PBR) level established for the SBS stock under the MMPA. PBR is defined as the maximum number of animals, not including natural mortalities, that may be removed from a marine mammal stock while allowing that stock to reach or maintain its Optimum Sustainable Population (OSP). ¹⁴⁵⁴ PBR for the SBS stock has most recently been calculated at 14, far below the average number of bears removed via annual harvest alone. ¹⁴⁵⁵ According to a recent FWS memorandum, with at least 33.2 bears removed from the SBS population annually compared to a PBR of 14, it is clear that "the ability of the population to reach OSP is [already] being compromised." ¹⁴⁵⁶ The DEIS neglects to consider this baseline information in its cursory evaluation of the status of the SBS stock or incorporate it into its cumulative effects analysis. As noted in the FWS	Human-caused mortality was described in the DEIS on p. 3-125 (5th paragraph, re. Native harvest) and on p. 3-140 (lethal take from oil and gas activities), but more information from the most recent USFWS Polar Bear Program annual report for 2017 (published in 2018) was added on p. 3-125 to quantify other categories of human-related mortality. The most recent estimate of PBR for the SBS stock is 14 animals, based on the minimum population estimate of 782 bears in the most recent draft stock assessment report by USFWS (82 FR 28526), which has not yet been finalized. This low PBR estimate underscores the importance of avoiding program-related mortality because the annual subsistence harvest alone approaches or exceeds PBR for this stock. A determination of negligible impact on the SBS stock of bears will be required for approval of the

S. Public Comments and BLM Responses (Alternatives)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
231. (cont.)	(see above)	(see above)	(see above)	(see above)	(see above)	(see above)	<p>memorandum, it is reasonable to assume that any additional lethal take from proposed seismic testing would additionally impact the SBS stock causing further adverse effects on annual rates of recruitment or survival.1457 Likewise, over the lifetime of an industrial oil field, from post-lease exploration, to infrastructure construction, oil and gas development and production, it is reasonable to assume that some additional level of lethal take will occur. 1455 FWS (draft) Polar Bear: Southern Beaufort Sea Stock Assessment (2017) at 11. Even using the 2010 minimum population estimate of 1397 SBS bears, PBR was calculated at 22 - also well below the mortality from harvest alone. FWS Polar Bear Stock Assessment 2010 at 3. 1456 U.S. Fish and Wildlife Service, Memo re: 1002 Coastal Plain Incidental Take Regulation Application, September 2018 at 3 available at https://assets.documentcloud.org/documents/5647572/Alaska-Memo.pdf Notably, while comparison to the PBR calculated by FWS demonstrates that oil and gas activities under the program are likely to cause impacts that the DEIS has failed to acknowledge, the PBR itself cannot rationally be used to show an acceptable take level in the context of a stock like the SBS population that is already experiencing such catastrophic decline.1458 1458 See March 2019 Amstrup Letter at 33.</p>	<p>Incidental Take Regulations (ITRs) currently being developed for the Arctic National Wildlife Refuge.</p> <p>The increasing likelihood of polar bear/human encounters was described in Draft EIS Section 3.3.5, but it does not automatically follow that mortality will increase accordingly, judging from the very low frequency of mortalities associated with Alaska oil and gas industry activity since the 1960s. That experience suggests that the number of industry-related mortalities that may occur from leasing in the program area are likely to be orders of magnitude lower than the direct removal of bears from the SBS stock through human harvest. The MMPA ITR/LOA process has been highly effective at reducing mortality over the last 3 decades in which it has been in effect, as has the separate authorization of intentional take through deterrence of bears that pose a human safety threat by specially trained personnel.</p>

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
232.	Brook	Brisson	Trustees for Alaska	98271	252	Range of Alternatives	<p>BLM's range of alternatives is inadequate.¹⁴⁶⁵ The three action alternatives do not present a reasonable range sufficient to analyze differences in impacts to polar bears. The EIS plainly states that “[a]ll the action alternatives would affect large areas of the designated terrestrial denning unit of critical habitat for polar bears; any facilities constructed within 20 miles of the coast would be located in that critical habitat unit.”¹⁴⁶⁶ Additionally, all of the action alternatives assume the entire Coastal Plain will be open to seismic exploration, which by itself may have lethal impacts on polar bears. The minor variations between the action alternatives do not offer a meaningful difference in impacts to polar bears and their critical habitat. For instance, under Lease Stipulation 5 in Alternative D, BLM would prohibit permanent oil and gas structures from being within 1 mile of the small portion of potential denning habitat located from the coastline to 5 miles inland on the Niguanak River, Katakturuk River, Marsh Creek, Carter Creek, and Sadlerochit River, and all associated tributaries.¹⁴⁶⁷ Similarly, under Alternative D, BLM would prohibit oil and gas “activities” within that same small portion of the denning habitat from October 30 through April 15.</p>	<p>The fact that impacts on a specific resource are similar across all action alternatives does not, per se, indicate that the range of alternatives is not reasonable under NEPA.</p>

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
233.	Brook	Brisson	Trustees for Alaska	98271	253	Range of Alternatives	The only rationale provided by BLM for protecting that portion of the denning habitat is that 37% of known historic dens in the Coastal Plain have been observed there, even though that area represents only 8.8% of the terrestrial denning critical habitat within the Coastal Plain. 1468 BLM provides no scientific basis to rely on the historical den occurrences to conclude that this portion of the suitable denning habitat is the only portion of the suitable denning habitat in the Coastal Plain that requires the protection conferred by Lease Stipulation 5. BLM does not explain whether the agency followed any scientifically sound approach to identifying areas within the suitable denning habitat that have a higher likelihood of den occurrence than other portions. For example, BLM does not explain or evaluate whether it has considered the effect of potential telemetry or survey biases, which may mean that density of denning in other areas is underestimated due to those areas being less accessible to researchers. Moreover, BLM has failed to explain whether or how it has taken climate change impacts into account, and how such impacts may shift preferred denning locations in the future compared to historically observed preferences.	The BLM worked with the USFWS, which used the most current data, to calculate and define the area of the denning habitat that appeared to be selected over other areas given the most current information of historical den sites (with full knowledge that den distributions will most likely shift in the future). The referenced information was not omitted. It is described on preceding pages in the Maternal Denning subsection of Section 3.3.5 (Draft EIS pages 3-127 and 3-128), as well as in the second paragraph following the bullet list on Draft EIS page 3-132; however, another element has been added to the bullet list for completeness.

S. Public Comments and BLM Responses (Alternatives)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
234.	Brook	Brisson	Trustees for Alaska	98271	254	Range of Alternatives	BLM should have evaluated impacts from oil and gas activities on all terrestrial denning critical habitat on the Coastal Plain, and considered measures to mitigate impacts to that broader geographic area. It also should have considered the impacts of alternative seismic exploration methods and sought to mitigate those impacts specifically.	Designated critical habitat for polar bears was described in Section 3.3.5, Affected Environment (Draft EIS pages 3-127 and 3-128). The BLM will require mitigation measures similar to current ITRs in the west where required mitigation is to avoid occupied dens by 1 mile, as described on Draft EIS page 3-134. Further, the EIS states that approximately 20 dens annually could be found in the Arctic Refuge and could be affected. The parts of Section 3.3.5 pertaining to polar bears describe in detail the population status of the SBS stock and the current and likely effects of climate change on their habitats, behavior, and demography.
235.	Brook	Brisson	Trustees for Alaska	98271	266	Range of Alternatives	BLM also failed to explore alternatives or mitigation measures to reduce spills and protect areas of particular importance to bears, like feeding and resting areas, summer refugia and winter denning areas.	The BLM has incorporated mitigation measures to minimize activity disturbance to polar bears in the EIS (see Chapter 2). Text has been added to Section 3.3.5 regarding increased risk of disease transmission where bears congregate, such as at whalebone piles, citing the PBCMP (USFWS 2016). Text has also been added regarding risk from marine spills in such areas.
236.	Brook	Brisson	Trustees for Alaska	98271	280	Range of Alternatives	Throughout its analysis, BLM improperly relies on conclusory statements about Incidental Take Regulations (ITRs) mitigating impacts to polar bears.1538 The agency fails to state that such ITRs would be required for this leasing program, nor does the EIS explain its assumptions for what specific mitigation measures it believes will be in place at which phase of oil and gas activities.	The BLM has removed or streamlined ITR wording for the Coastal Plain to explain that it is referring to the current ITRs in place west of the Coastal Plain. Verbatim mitigation, monitoring, and reporting text from the Beaufort Sea ITRs has been placed in Table 2-3 to tie into the current level of oversight that is required of operators working in polar bear country.

S. Public Comments and BLM Responses (Alternatives)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
237.	Brook	Brisson	Trustees for Alaska	98271	281	Range of Alternatives	The use of FLIR surveys and dogs to detect polar bear dens would not be required by the lease or by BLM; the DEIS says that they would be conducted "as stipulated by the LOAs and polar bear interaction plans that would be required."1539 But LOAs are not necessarily required, depending on circumstances, nor are polar bear interaction plans mandated to require the use of FLIR surveys or dogs. BLM must require the mitigation measures it is relying on to make any conclusions about impacts to polar bears. At present, the DEIS speculatively discusses mitigation measures that might be required or suggested by another agency, rather than mitigation measures it intends to impose. The DEIS fails to consider whether the measures actually will occur. It also fails to consider their efficacy, or lack thereof, as discussed above.	The BLM has removed or streamlined ITR wording for the Coastal Plain to explain that it is referring to the current ITRs in place west of the Coastal Plain. Verbatim mitigation, monitoring, and reporting text from the Beaufort Sea ITRs has been placed in Table 2-3 to tie into the current level of oversight that is required of operators working in polar bear country. All operators will be subject to regulations and stipulations under the ESA and MMPA. Site-specific oil and gas projects will require additional NEPA, MMPA authorization, and ESA consultation, at which time additional site-specific mitigation measures would be identified.
238.	Brook	Brisson	Trustees for Alaska	98271	282	Range of Alternatives	The EIS also relies on a buffer zone around known dens to mitigate noise disturbance.1540 However, such a buffer is ineffective if den-detection surveys are not mandated in the first place.1541 Notably, Alternatives B and C do not mandate pre-activity den-detection surveys for winter overland moves and seismic work.1542 Since polar bears do not return to the same exact den location each year, it is unclear how a current active den location would ever be "known" absent a pre-activity den-detection survey; and since dens are not visible to the naked eye, it is unclear how a den would be "observed" prior to disturbing it absent a den-detection survey using FLIR.	Surveys are a requirement of the USFWS to comply with the ESA and MMPA. All operators will be subject to regulations and stipulations under the ESA and MMPA.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
239.	Brook	Brisson	Trustees for Alaska	98271	283	Range of Alternatives	Further, even when pre-activity den-detection surveys are conducted, such a buffer will fail to protect dens that remain undetected due to the high failure rate of the den-detection method employed. Alternative D, while stating that den-detection surveys for winter overland moves and seismic work "would" be conducted by parties subject to the ROP, does not specify the methods to be employed, instead stating that the pre-activity den-detection survey would be conducted "in consultation" with FWS and/or NMFS.1544 It is not clear whether the term "consultation" is intended to mean the interagency consultation process required by ESA section 7, or merely that the party seek guidance from the other agencies. The DEIS thus leaves it to a future, possibly voluntary, process by another agency to decide what survey methods will be required while misleadingly indicating that FLIR-detection and the use of dogs will mitigate impacts.	Surveys are a requirement of the USFWS to comply with the ESA and MMPA. All operators will be subject to regulations and stipulations under the ESA and MMPA.
240.	Brook	Brisson	Trustees for Alaska	98271	284	Range of Alternatives	And as discussed above, BLM fails to provide any science to indicate that a one-mile buffer will protect denning bears from foreseeable noise impacts, especially seismic testing and pile-driving.	The 1-mile buffer is not specific to Stipulation 5. Rather, the 1-mile buffer is stipulated by the current ITRs around occupied maternal dens and is central to the no-disturbance buffer zone surrounding the barrier islands unit of designated critical habitat. The USFWS based the radius of this buffer on behavioral observations of polar bears in Svalbard, as explained on Draft EIS page 3-137. The potential destruction (direct loss) of potential denning habitat will be addressed in future NEPA evaluations of specific development proposals involving gravel mining and placement of construction of roads and pads. The Draft EIS accurately describes designated critical habitat and the

240. (cont.)	(see above)	(see above)	(see above)	(see above)	(see above)	(see above)	(see above)	<p>density and importance of maternal denning in the program area.</p> <p>Seismic exploration in the program area currently would be evaluated in a separate NEPA analysis. Both that activity and others considered under the leasing program will require new ITRs, supported by biological assessments and biological opinions that rely on negligible impact determinations under the MMPA and no-jeopardy findings under the ESA. Mortality data from the USFWS Polar Bear Program annual report for 2017 (USFWS 2018) show that industry activity in Alaska has had a substantially smaller impact (0.7 percent of 420 bears removed during 2008–2017) on the SBS stock than has the direct removal of bears through human harvest (90.7 percent; USFWS 2018).</p> <p>The impacts of underwater noise are discussed in depth in the Final EIS on Effects of Oil and Gas Activities in the Arctic Ocean (NMFS 2016). That document is incorporated by reference in the EIS.</p>
241.	Brook	Brisson	Trustees for Alaska	98271	285	Range of Alternatives	Also, BLM provides no buffer for non-denning bears, despite evidence indicating strong aversion reactions of non-denning bears, especially females and cubs, to industrial noise.	Distance setbacks for non-denning bears for aircraft and vessels have been incorporated into Table 2-3. In addition, timing limitations have been incorporated into some of the alternatives to separate activities and the use of habitat by non-denning bears, essentially creating "buffers."

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
242.	Brook	Brisson	Trustees for Alaska	98271	286	Range of Alternatives	Also, ROP 4 says the lessee/operator/contractor “would prepare and implement bear-interaction plans to minimize conflicts between bears and humans. These bear interaction plans would be developed in consultation with and approved by the USFWS and the Alaska Department of Fish and Game (ADFG). The plans would include specific measures identified in the current USFWS Polar Bear Mitigation Plan . . .” The DEIS does not cite to this Mitigation Plan or identify the specific measures, leaving them unexamined for efficacy. ROP 4 doesn’t require that all such measures be included. The FEIS should include the Mitigation Plan, identify the specific measures, and require that they all be included. Even that, though, would not constitute an actual evaluation of the impacts to polar bears from these interactions.	Mitigation plans are developed for specific projects that have not yet been proposed. Site-specific analyses, including those associated with infrastructure in support of oil and gas development, can more realistically be provided when the BLM receives an application to permit such infrastructure. The Leasing EIS makes no decisions on such infrastructure, except to prohibit it in specified areas of particularly high value surface resources under some alternatives.

S. Public Comments and BLM Responses (Alternatives)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
243.	Brook	Brisson	Trustees for Alaska	98271	289	Range of Alternatives	<p>The proposed Lease Stipulations and Required Operating Procedures include Lease Notice 1, which states that BLM would not approve any activity that may affect any listed species or critical habitat until it completes its obligations under applicable requirements of the ESA, including completion of any required procedure for conference or consultation.¹⁵⁴⁶ This provision cannot be properly categorized as a mitigation measure, as BLM is merely characterizing the legal requirements of ESA section 7 consultation. The ESA imposes a substantive obligation on federal agencies, but BLM does not explain how it will comply with those requirements at the lease sale stage.¹⁵⁴⁷ For instance, BLM should explicitly state whether the agency will consult with FWS before issuing leases on the Coastal Plain. BLM's attempts to frame its existing ESA obligations as a mitigation measure in its impacts analysis does not obviate BLM's responsibility to provide for measures that minimize and avoid impacts to polar bears.</p>	<p>To comply with Section 7(a)(2) of the ESA, the BLM began consulting with the USFWS and National Marine Fisheries Service (NMFS) early in the EIS process. Both provided input on issues, data collection and review, and alternatives development. The BLM is consulting with the USFWS and NMFS to identify ESA issues and to develop the draft biological assessment.</p>

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
244.	Brook	Brisson	Trustees for Alaska	98271	290	Range of Alternatives	Thus it is vitally important for the DEIS to consider, and for any future leases to clearly establish through their terms, whether BLM is retaining the authority to permanently and completely preclude surface disturbing activities, if necessary to protect a listed species, or whether BLM is merely retaining the authority to condition the access to oil and gas resources so as to reduce impacts to the listed species. Unless the lease terms do the former, BLM ostensibly would be giving away a critical component of its discretion - and the ability to protect polar bears from injury and disturbance -at the leasing stage.1550 The DEIS, and the ESA consultation that the DEIS claims is occurring now at the leasing stage, must consider the impact of BLM forsaking that discretion. If BLM is purporting to retain that full discretion, then it should do so unequivocally in the terms of the lease. If not, the DEIS and ESA consultation must evaluate the impacts accordingly.	To comply with Section 7(a)(2) of the ESA, the BLM began consulting with the USFWS and NMFS early in the EIS process. Both provided input on issues, data collection and review, and alternatives development. The BLM is consulting with the USFWS and NMFS to identify ESA issues and to develop the draft biological assessment. All future site-specific activities will require compliance with Section 7 of the ESA.
245.	Brook	Brisson	Trustees for Alaska	98271	292	Range of Alternatives	Even for leases that BLM describes in this DEIS as being "NSO," it is not clear from the DEIS whether BLM would retain the authority post-leasing to permanently preclude activities on areas immediately adjacent to the NSO areas that would be required to access the oil and gas associated with the NSO leases. In short, it is not clear what BLM means by "NSO" in this DEIS, and the agency should carefully explain whether it is retaining the authority to deny all development on the NSO lease permanently, or whether the "NSO" lease entails a right of access via adjacent areas, and therefore potential spill-over effects on the NSO areas themselves that BLM will not be able to entirely and permanently preclude after the leasing stage.	Section 20001(c)(2) of the Tax Act states the Secretary shall issue any rights-of-way or easements across the Coastal Plain for the exploration, development, production, or transportation necessary to carry out this section; therefore, if an operator were required to access resources that required a right-of-way within the Coastal Plain, prohibiting such access would not comply with the Tax Act. See Section 1.9.1 of the EIS for further explanation.

S. Public Comments and BLM Responses (Alternatives)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
246.	James	Warren	—	18479	3	New alternative proposed	<p>The Draft EIS reads in a very confusing manner in Section 2.3, ALTERNATIVES CONSIDERED BUT ELIMINATED FROM DETAILED ANALYSIS: "The BLM considered an alternative that would make only 800,000 acres available for lease sales, which is the minimum acreage necessary to comply with the requirement in Section 20001(c)(1) of PL 115-97 to hold not fewer than two lease sales, each of which offers not fewer than 400,000 acres of the areas having the highest potential for discovery of hydrocarbons. The best available information regarding hydrocarbon discovery potential in the Coastal Plain provides a rough estimate of 427,900 acres of high HCP, 658,400 acres of medium HCP, and 477,200 acres of low HCP. Acreages within low and medium HCP areas must be made available, in addition to the high HCP areas, for the two lease sales to meet the 800,000-acre minimum under PL 115-97. In addition, the actual potential development area would be much less with the 2,000-acre limitation on surface disturbance. This alternative would also be similar in concept to Alternatives D1 and D2, which make only 1,037,200 acres available for lease sales. For all these reasons, an alternative that considered only 800,000 acres available for leasing was eliminated from detailed analysis." This paragraph is a confusing set of assertions that do not make coherent sense. The requirement is to hold two sales of at least 400,000 acres. Since any sale of that minimum will have to reach beyond the high HCP acreage, why is it not possible to hold two sales of the minimum designated in the Tax Bill? The paragraph makes that sound impossible. Why? Second, the paragraph flatly states that the "actual</p>	<p>Alternative D2 has been modified to offer 800,000 acres for leasing. Section 20001(c)(3) of the Tax Act states "the Secretary shall authorize up to 2,000 surface acres." Any interpretation by the BLM to modify the limit for a given alternative would be inconsistent with the Tax Act.</p>

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
246. (cont.)	(see above)	(see above)	(see above)	(see above)	(see above)	(see above)	potential development area would be much less with the 2000-acre limitation on surface disturbance," but that is hedging the statement about the numbers of acres to be leased, as if it is an excuse for leasing more than 800,000 acres. (Note that how BLM is defining the 2000 acres of surface disturbance is itself problematic at best.) This "actual potential development" has no logical connection to the question of the number of acres to be leased. Third, the paragraph leaps to point out that D1 and D2 are the closest to the actual minimum requirement, as if they were the least number of acres BLM can possibly make available for lease sales. That is logically fallacious: you are drawing a foregone conclusion. In at least three ways, the question of alternatives considered but eliminated is logically flawed.	(see above)
247.	Russell	Peterson	—	25104	1	New alternative proposed	The alternatives section of the eis should be expanded to more fully identify the benefits of taking no action on this leasing proposal. Pursuing clean energy alternatives, including solar, wind and tidal/wave sources with advanced battery storage capabilities would be less costly, would advance the nation's objective of creating higher paying work opportunities, would avoid the proposal's adverse effects on global warming, and would also avoid the proposal's potential to adversely effect water and air quality, sensitive soils and endangered wildlife populations	The No Action Alternative is fully analyzed in the EIS as Alternative A, as a baseline requirement of NEPA. Section 20001 of the Tax Act precludes selection of Alternative A in a Record of Decision. The regulations require the analysis of the No Action Alternative even if the agency is under a legislative command to act. This analysis provides a benchmark, enabling decision makers to compare the magnitude of environmental effects of the action alternatives. It is also an example of a reasonable alternative outside the jurisdiction of the agency, which must be analyzed (Section 1502.14(c); CEQ's Forty Most Asked Questions Concerning CEQ's NEPA [Question #3]). All action alternatives are designed to meet the purpose and need, and to account for all purposes of the Arctic Refuge.

248.	Withheld	Withheld	—	48700	1	New alternative proposed	All action alternatives exceed the minimum acreage require by the tax act. Therefore I propose a new alternative, which would be at the minimum required acreage (400,000 per sale), as well as strictly obey the 2000 acre cap (with no credits gained for reclamation), including all infrastructure-related disturbance.	Alternative D2 has been revised to offer 800,000 acres of land available for lease.
249.	Withheld	Withheld	—	55397	2	New alternative proposed	Please provide some other alternatives with less land impacted (why not the minimum number of acres stated by the law?), larger wilderness buffers and ways to respect the rights and preferences of the Alaska Native communities affected.	Alternative D2 has been revised to offer 800,000 acres of land available for lease. There is no information suggesting that a larger wilderness buffer would be more protective to wilderness values. The USFWS recommended the current buffer width.
250.	Paul	Reichardt	—	55513	1	New alternative proposed	My fundamental concern is that BLM has failed to develop an Alternative that provides for the minimum leasing and subsequent potential development required under the Tax Act of 2017. BLM's rationale for opening over one million acres to leasing (Vol 2, pg 2-39), rather than the 800,000 required in the legislation, is unconvincing at best.	Alternative D2 has been revised to offer 800,000 acres of land available for lease.
251.	Chad	Hansen	—	56842	1	New alternative proposed	It contains four action alternatives for leasing and drilling, but none of these alternatives minimizes the area to be leased and drilled.	Alternative D2 has been revised to offer 800,000 acres of land available for lease.
252.	Withheld	Withheld	—	57191	1	New alternative proposed	This DEIS proposes a no action alternative and 3 alternatives. It is inadequate in that it does not address an alternative for the minimum requirement under the law—for two lease sales of 400,000 acres each, which is 20% less acreage available for leasing than the most restrictive alternative analyzed. The reason for not doing this analysis is not well explained. BLM should amend this DEIS to show that alternative.	Alternative D2 has been revised to offer 800,000 acres of land available for lease.
253.	Withheld	Withheld	—	58633	5	New alternative proposed	It contains four action alternatives for leasing and drilling, but none of these alternatives minimizes the area to be leased and drilled.	Alternative D2 has been revised to offer 800,000 acres of land available for lease.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
254.	Martha	Raynolds	—	67039	1	New alternative proposed	There is no minimal impact alternative presented or analyzed. The Tax Act requires leasing, and up to 2,000 acres of impact. But all the alternatives have maximum impact, with 2,000 acres of gravel fill placement plus all the additional impacts from gravel mines, seismic exploration, dust, thermokarst, altered drainage, etc., etc. The result is that Alternative D, with least area available for surface occupancy ends up with the most dense road network. In the EIS, BLM should include a minimal impact alternative, with no gravel fill allowed (just directional drilling from adjacent private lands), and one with only 1,000 acres of gravel placement allowed.	Alternative D2 has been revised to offer 800,000 acres of land available for lease. Section 20001(c)(3) of the Tax Act states “the Secretary shall authorize up to 2,000 surface acres.” Any interpretation by the BLM to modify the limit for a given alternative would be inconsistent with the Tax Act.
255.	Ronald	Yarnell	—	67164	4	New alternative proposed	The range of lower-impact alternatives is not sufficient. One of them should be to not do anything until closer to 2024. An additional alternative should include only the opening up of the high carbon potential area for seismic exploration. This area comprises 427,900 acres, more than is legally required. An EIS for the additional 400,000 acres could be done at a later date. There is nothing in the law that says anything over 400,000 acres has to be analyzed at this time.	Based off best available information, the action alternatives maximize the areas with the highest hydrocarbon potential (HCP); the action alternatives balance areas with the highest HCP with surface resource protection. Because there are only an estimated 427,000 acres of high HCP, in order to get to an 800,000-acre lease sale, areas in medium HCP and low HCP would also need to be included in the lease sale (while still balancing resource protections). Such an alternative (delaying leasing) would have impacts similar to alternatives already analyzed. The BLM would expect little to no difference in impacts under such an alternative. This is because lands that were offered but not leased in the first sale are unlikely to be leased in a second sale a few years later given that exploration is unlikely to substantially advance during that time period.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
256.	Christopher	Lutz	—	67596	1	New alternative proposed	The draft ANWREISonly lays out three options ("action alternatives") for leasing between two-thirds and all of the coastal plain's 1.5 million acres. Additional options that would lease smaller areas of the refuge should also be assessed, particularly areas that might have significantly less oil and gas drilling wildlife impact	Alternative D2 has been revised to offer 800,000 acres of land available for lease.
257.	Withheld	Withheld	—	68965	7	New alternative proposed	I recommend major revision and re-release of a revised draft EIS that has: *An adequate range of alternatives, including an appropriate least environmentally damaging practicable alternative	LEDPA is a requirement of the EPA Section 404(b)(1) guidelines under the CWA, and not applicable to this EIS. The fact that impacts on a specific resource are similar across all action alternatives does not, per se, indicate that the range of alternatives is not reasonable under NEPA.
258.	Withheld	Withheld	—	68965	16	New alternative proposed	I believe that a revised draft EIS that includes analysis of an appropriate least environmentally damaging practicable alternative would lead to the conclusion that this new action alternative should be the preferred alternative. This alternative could fulfill the requirements of PL 115-97 while minimizing impacts on local communities, as well as other Refuge resources and objectives.	LEDPA is a requirement of the EPA Section 404(b)(1) guidelines under the CWA, and not applicable to this EIS. The fact that impacts on a specific resource are similar across all action alternatives does not, per se, indicate that the range of alternatives is not reasonable under NEPA.

S. Public Comments and BLM Responses (Alternatives)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
259.	Withheld	Withheld	—	68965	18	New alternative proposed	<p>1. The range of alternatives in the draft EIS is inadequate. Current action alternatives call for oil and gas leasing on 66 to 100 percent of the coastal plain. Please develop and analyze an alternative that includes no more than 51 percent (2 times 400,000 acres as mandated in PL 115-97, divided by the 1,560,000 acre total area of the coastal plain) or less of the coastal plain as a least environmentally damaging practicable alternative. Alternative B represents a “bookend” alternative on the most impactful end of the spectrum, but the draft EIS does not include a corresponding least-impact bookend (both sub-alternatives D1 and D2 go beyond minimum requirements in PL 115-97). Given the high level of controversy surrounding drilling on the ANWR coastal plain, it would be appropriate to develop and fully analyze an alternative that is designed to be a least environmentally damaging practicable alternative. Decision makers need the information that would be generated by such an analysis in order to make a well informed selection of a preferred alternative.</p>	Alternative D2 has been revised to offer 800,000 acres of land available for lease.

S. Public Comments and BLM Responses (Alternatives)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
260.	Withheld	Withheld	—	68965	52	New alternative proposed	23. Section 2.3, page 2-39. From the perspective of offering decision makers an alternative that genuinely comports with the objectives of a least environmentally damaging practicable alternative, the BLM should develop an alternative that offers 800,000 acres for lease. In my opinion, the arguments offered in this section for why such an alternative was eliminated from further analysis appear arbitrary, particularly the contention that increasing the lease area by more than 200,000 acres, at least a 20 percent increase, is inconsequential. Not including an 800,000 acre alternative is a serious deficiency in this draft EIS (please see general comment (1) above).	Alternative D2 has been revised to offer 800,000 acres of land available for lease.
261.	Withheld	Withheld	—	69211	3	New alternative proposed	Consider as an alternative(s) expanding existing oil production facilities rather than disturbing the project area.	PL 115-97 directs the Secretary to implement an oil and gas leasing program within the Coastal Plain of the Arctic National Wildlife Refuge.
262.	Withheld	Withheld	—	69211	3	New alternative proposed	The document should discuss if and how other oil fields could be utilized and probably have a greater capacity to yield higher production amounts than the project area.	PL 115-97 directs the Secretary to implement an oil and gas leasing program within the Coastal Plain of the Arctic National Wildlife Refuge.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
263.	Curt	Leigh	—	69329	13	New alternative proposed	<p>the EIS is deficient because it evaluated a very limited range of alternatives and fails to identify mitigation or restoration measures that will prevent or restore the significant, long term adverse impacts on publically owned non hydrocarbon resources. The range of consideration for the action alternatives is limited to only those that maximize the opportunity to exploit the hydrocarbon reserves on the Coastal Plain. All of the action alternatives contemplate leasing all of the areas with high potential for hydrocarbon production. The number of acres to be disturbed is even the same in each action alternative. The difference seems to be the source of the surface disturbance. Surprisingly, Alternative D, which is identified as a caribou protection alternative, includes more road mileage and more satellite drill pads than the alternatives which claim to have fewer restrictions (EIS p.B-23). The EIS needs a broader range of action alternatives. There should be at least one action alternative which involve less than full exploitation of the hydrocarbon reserves, and there is no discussion or evaluation of waiting for future technological advancements in oil extraction that would allow hydrocarbon recovery without any surface disturbance.</p>	<p>Alternative D2 has been revised to offer 800,000 acres of area available for leasing. PL 115-97 requires a lease sale to be held within 4 years; options for extraction technology will be analyzed in future project-specific NEPA analyses.</p>

270.	Withheld	Withheld	—	72125	33	New alternative proposed	The Tax Act dictates that, “[t]he Secretary shall issue any rights-of-way or easements across the Coastal Plain for the exploration, development, production, or transportation necessary to carry out this section.” As such, the legislative direction limits BLM’s authority, “to approve, deny, or reasonably condition any proposed on the ground-disturbing activity.” This legislative direction restricts BLM project-level decision space for controlling site-specific actions. To ensure that fish and wildlife conservation and water protection purposes are achieved, development decisions will need to be limited in size and appropriately located such as that envisioned in proposed Alternatives W1 and W2.	Neither of the alternatives proposed would meet the various requirements of PL 115-97. The alternatives would not allow for access to the minimum of 400,000 acres of the highest hydrocarbon potential lands available in at least two lease sales (a total of 800,000 acres), even with current technologies using 6-mile directional drilling in ideal geological conditions. Additionally, the Secretary is required to authorize up to 2,000 surface acres for development.

271.	Katherine	Trisolini	Loyola Law School	74278	10	New alternative proposed	It is the intent of Congress in this Act to preserve unrivaled scenic and geological values associated with natural landscapes; to provide for the maintenance of sound populations of, and habitat for, wildlife species of inestimable value to the citizens of Alaska and the Nation, including those species dependent on vast relatively undeveloped areas; to preserve in their natural state extensive unaltered arctic tundra, boreal forest, and coastal rainforest ecosystems; to protect the resources related to subsistence needs; to protect and preserve historic and archeological sites, rivers, and lands, and to preserve wilderness resource values and related recreational opportunities including but not limited to hiking, canoeing, fishing, and sport hunting, within large arctic and subarctic wildlands and on freeflowing rivers; and to maintain opportunities for scientific research and undisturbed ecosystems. It is further the intent and purpose of this Act consistent with management of fish and wildlife in accordance with recognized scientific principles and the purposes for which each conservation system unit is established, designated, or expanded by or pursuant to this Act, to provide the opportunity for rural residents engaged in a subsistence way of life to continue to do so. (ANILCA § 3101) Because BLM's responsibility include preservation of these ecological and subsistence values, it must at least examine an alternative that minimizes the project's impact, particularly given that thus far it has come nowhere near to providing an option near the lowest level of spatial disturbance permitted by Congress.	Alternative D2 has been revised to offer 800,000 acres of land available for lease.

S. Public Comments and BLM Responses (Alternatives)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
272.	Richard	Edwards	—	74281	14	New alternative proposed	The Draft EIS must be revised to address a full range of alternatives. The lower bound of the Responsible Official's decision-space for action has not been addressed in this defective document. Specifically, this calls for analysis of at least one or both of the following alternatives: a) Alternative E: An alternative that incorporates a lease offering that equals the minimum acreage identified in Section 20001(c)(3) with the most restrictive management practices (800,000 acres). b) Alternative F: An alternative that incorporates a lease offering that meets the intent of the related text in Section 20001(c)(3) with the most restrictive management practices. This alternative would only include acres with high hydrocarbon potential (427,900 acres). At a minimum, BLM must fully analyze these lower bound action alternatives in order to inform the Responsible Official and the public of the consequences of the disconnect between the requirements of Section 20001(c)(3) and BLM's land management principles under FLPMA.	Alternative D2 has been revised to offer 800,000 acres of lands available for lease. Additionally, based off best available information, the action alternatives maximize the areas with the highest HCP; action alternatives balance areas with the highest HCP with surface resource protection. Because there are only an estimated 427,000 acres of high HCP, in order to get to an 800,000-acre lease sale, areas in medium HCP and low HCP would also need to be included in the lease sale (while still balancing resource protections).
273.	Richard	Edwards	—	74281	19	New alternative proposed	Additional ROP Needed Under Facility Design and Construction to Address STPs (DEIS, Chapter 2): The existing ROPs do not address any details regarding seawater treatment plants other than a reference to "co-location with other facilities when feasible". The reality is that, other than gravel mines, water provided by these plants is likely to be the most critical limiting factor in support of the proposed development. Proper plant-type selection, site-selection, design, construction and operation are essential to minimize the adverse impacts of these significant support facilities. The Draft EIS must be revised to include an additional ROP that addresses issues related to STPs.	This level of specificity would be determined at the project-level authorization. Site-specific analyses, including those associated with infrastructure in support of oil and gas development, can more realistically be provided when the BLM receives an application to permit such infrastructure. The Leasing EIS makes no decisions on such infrastructure, except to prohibit it in specified areas of particularly high value surface resources under some alternatives.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
274.	Heather	Mirczak	—	74303	1	New alternative proposed	Another alternative is to require that all construction activities and drilling are halted during the months of the year when the caribou are calving. As currently written the most restrictive option only halts "major construction activities" - not including drilling - for a single month during caribou calving. The bare minimum I find acceptable is that ALL versions of a lease agreement include a minimum of a single month restricting all construction and drilling activities.	The BLM has included multiple lease stipulations and ROPs to protect migrating caribou and their habitat (e.g., Lease Stipulations 6, 7, 8, and ROP 23). These were developed in collaboration with resource specialists with expertise in caribou behaviors as they relate to oil and gas development to ensure the objectives of the lease stipulations and ROPs are met.
275.	Heather	Mirczak	—	74303	2	New alternative proposed	One alternative is to limit the size of land leases to the 400,000 acre limit. More importantly is to limit the ongoing or expanded capacity of development that could accrue from the 2000 acre surface development limit that excludes ice roads, ice pads, elevated pipelines and gravel mines.	Alternative D2 has been revised to offer 800,000 acres of lands available for lease. Section 1.9.1 has been revised to identify the production and support facilities that would count toward the 2,000-acre limit, which now includes gravel mines. Rationale as to why certain facilities may not be included is contained in Section S.1.2 of this Appendix.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
276.	Lisa	Baraff	Northern Alaska Environmental Center	74306	2	New alternative proposed	BLM fails to consider a reasonable range of action alternatives as required under NEPA. Alternatives that should be considered and were not include minimized lease acreage, leasing deferrals, alternatives with non-waivable mitigation measures (e.g., stipulations, best management practices, and required operating procedures), and alternatives that prevent future development or only permit contiguous development. None of the action alternatives consider offering less than 1 million acres for leasing, even though each lease sale is only required to be 400,000 acres, for a total of 800,000 acres. Nor do the alternatives consider the likelihood that not all acreage offered for lease will sell and would then be rolled into subsequent sales, resulting in fewer total acres required to meet the stipulation that two lease sales of not less than 400,000 acres each occur within seven years of enactment of the Tax Cuts and Jobs Act of 2017 (P.L. 115-97 Sec. 20001).	Alternative D2 has been revised to include 800,000 acres of land available for lease. Alternatives considered but dismissed from detailed analysis have been added to Section 2.3. Such an alternative (leasing deferrals) would have impacts similar to alternatives already analyzed. The BLM would expect little to no difference in impacts under such an alternative. This is because lands that were offered but not leased in the first sale are unlikely to be leased in a second sale a few years later given that exploration is unlikely to substantially advance during that time period.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
277.	Matthew	Rexford	Kaktovik Inupiat Corporation	74331	6	New alternative proposed	<p>4. Include Co-management with Alaska Native Landowners and opportunities for Nativeowned land As an adjacent land owner, it is imperative that KIC be included in BLM's decision-making process and both BLM and Fish & Wildlife Service's (FWS) management of the 1002 Area. KIC's land is bordered by federally management land. This has resulted in restrictions placed on our shareholders' subsistence way of life and access that we strongly oppose. As we evaluate how oil and gas leasing is managed in the Coastal Plain, BLM must consider the unintended impacts their lease stipulations, required operating procedures, and management may impact adjacent Native owned land. KIC is concerned that similar to the barriers on subsistence, the restrictions placed on neighboring federally managed land may act as a blockade to development of Native owned resources. To avoid this outcome, BLM should commit to co-manage areas that are adjacent to Native-owned land, including coastal areas. Further, BLM should clarify that their restrictions, requirements, and stipulations do not apply to Native-owned land, including coastal areas and barriers islands, namely: Tapkaurak Spit, Jago Spit, Bernard Spit, Barter Island, Arey Island, and small unnamed shoals just offshore from west end of private mainland lands. Through close coordination, BLM can manage a responsible leasing program that is considerate of subsistence, our cultural way of life, the unique environment, and our wildlife and cultural resources.</p>	<p>The BLM does not have authority to enter into cooperative agreements for comanagement of surface resources in the Arctic National Wildlife Refuge because they are not BLM public lands under FLPMA 307(b). The BLM has added additional text to Section 1.4.</p>

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
278.	Renaë	Smith	Counsel for Environmental Protection	74336	10	New alternative proposed	minimum 800,000 acres specified in the Tax Cuts and Jobs Act and limit cumulative surface area development to 2,000 acres, including total acreage of ice roads, gravel mines that supply raw materials for construction of oil and gas facilities, any other surface disturbance indirectly related to or resulting from facility construction and use, as Congress intended. 68 None of the action alternatives in the DEIS satisfy these limits and as a result, any action alternative in the final EIS must be substantially revised before it would be a viable alternative for selection in the record of decision.	Alternative D2 has been revised to offer 800,000 acres of lands available for lease. Section 1.9.1 has been revised to identify the production and support facilities that would count toward the 2,000-acre limit, which now includes gravel mines., Rationale as to why certain facilities may not be included is contained in Section S.1.2 of this Appendix..
279.	Eric	Walsh	Government of Canada	74346	3	New alternative proposed	the dEIS did not present the viable and reasonable alternative of leasing the minimum area required in PL 115-97. All of the presented action alternatives (B, C, D1 and D2) propose to lease more than the minimum area (800,000 acres) legislated by Congress.	Alternative D2 has been revised to offer 800,000 acres of lands available for lease.
280.	Eric	Walsh	Government of Canada	74346	6	New alternative proposed	Section 2.3 (p. 2-39) of the dEIS provides the reasoning for not evaluating an action alternative that limits leasing to 800,000 acres of "those areas that have the highest potential for the discovery of hydrocarbons" (PL 115-97). However, this section of the dEIS provides no support that such an alternative was not feasible. The only reason discussed was that the current designation of hydrocarbon reserve potential in ANWR implies that there is not actually 800,000 acres of "high hydrocarbon potential" in the project area, and that some quantum of medium or low potential area must be leased to reach the total. However, aside from that statement of fact, there is no stated project purpose, identified need, or legal imperative provided to lease more than what the law requires.	Alternative D2 has been revised to offer 800,000 acres of lands available for lease.

S. Public Comments and BLM Responses (Alternatives)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
281.	Withheld	Withheld	—	75601	3	New alternative proposed	The EIS states that the No Action alternative will not be considered due to the requirement to implement the oil and gas leasing program consistent with PL 115-97. However, the alternative with the least environmental impact – Alternative D – would offer more than 1 million acres for lease, which is still far more area than required by PL 115-97. Alternatives that offer less area for lease, and thus have smaller footprint and correspondingly smaller environmental effect, should be considered.	Alternative D2 has been revised to offer 800,000 acres of lands available for lease.
282.	Rob	Cadmus	—	80946	1	New alternative proposed	Oil and gas leasing, exploration, and development are not compatible with the original purposes of the refuge, including preserving unique wildlife, wilderness, and recreational values. The alternatives presented do not balance the original purposes for the refuge with the direction given under the new Tax Act. For example, the action alternatives offer much more acreage than required by the Tax Act. Why is this? A wider range of alternatives are necessary to meet the standards set in the National Environmental Protection Act. This should include an alternative that reduces the area of lease sale and establishes higher standards for protection of fish and wildlife.	Alternative D2 has been revised to offer 800,000 acres of land available for lease. All action alternatives are designed to meet the purpose and need, and to account for all purposes of the Arctic National Wildlife Refuge. See Section 3.4.7.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
283.	Kristine	Benson	—	81668	3	New alternative proposed	The BLM should develop additional alternatives that result in smaller acreages of surface disturbance. The Congressional dictate was for a maximum of 2000 acres, so any smaller amount is allowed and is important to consider. To protect the wildlife and subsistence values of the Refuge, the smallest possible disturbance needs to be given equal consideration with major development alternatives. Develop an alternative with only 500 acres of surface disturbance and another with only 1000 acres. Likewise, in Section 2.3, the BLM attempts to justify the elimination of an alternative that would offer the minimum requirement of 800,000 acres. The rationale for elimination does not make sense. Such an alternative would be substantially different from Alternative D and it should be included in the DEIS. BLM needs to add this alternative to the Draft for public review.	Alternative D2 has been revised to offer 800,000 acres of lands available for lease. Section 20001(c)(3) of the Tax Act states “the Secretary shall authorize up to 2,000 surface acres.” Any interpretation by the BLM to modify the limit for a given alternative would be inconsistent with the Tax Act.
284.	Roberta	Joseph	Tr’ondek Hwech’in First Nation	81742	3	New alternative proposed	The draft EIS fails to provide a development alternative that meets minimum legal requirements Tr’ondëk Hwëch’in acknowledges that Sec. 20001 of PL 115-97 requires the sale of at least two leases by December 22, 2027, and that these leases must be a minimum of 400,000 acres each in areas with the highest hydrocarbon potential. Therefore, it is unclear why BLM did not provide an alternative which considered leasing only the minimum amount of land legally required under the Tax Act (i.e., 800,000 acres).	Alternative D2 has been revised to offer 800,000 acres of lands available for lease.

S. Public Comments and BLM Responses (Alternatives)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
285.	Robin	Stebbins	—	83751	1	New alternative proposed	There is no alternative that addresses the minimum lease area stipulated in PL 115-97, namely two leases of 400,000 acres. Since the legal directive is to manage 1002 lands as the wildlife refuge described in ANILCA 303 (2)(B), there should be an alternative with a lease area of 800,000 acres, and the maximally restrictive NSOs, CSUs, Tls and terms and conditions.	Alternative D2 has been revised to offer 800,000 acres of lands available for lease.
286.	Amy	Law	Government of Yukon	94076	30	New alternative proposed	The Government of Yukon recommends that a supplemental EIS is prepared which identifies action alternatives to meet, but not exceed, the 800,000 acre minimum lease area required by the Tax Act, Public Law 115-97.	Alternative D2 has been revised to offer 800,000 acres of lands available for lease.
287.	—	—	Alaska Department of Natural Resources	94102	94	New alternative proposed	Due to the limited data available to potential bidders, BLM must consider the possibility that the additional seismic data may reveal that the highest potential areas are different from what is currently mapped. The BLM must not speculate on where the resource may be located but instead build flexibility for future decision-makers by making the total acreage of the Coastal Plain available for oil and gas leasing	Based off best available information, the action alternatives maximize the areas with the highest HCP; action alternatives balance areas with the highest HCP with surface resource protection. Because there are only an estimated 427,000 acres of high HCP, in order to get to an 800,000-acre lease sale, areas in medium HCP and low HCP would also need to be included in the lease sale (while still balancing resource protections).
288.	Kennon	Meyer	—	94105	23	New alternative proposed	The Final EIS Must Include Additional Alternatives That Are More Protective NEPA requires that an EIS identify the full scope of direct, indirect, and cumulative impacts of a proposed action and determine whether there are less environmentally damaging ways to achieve the project purpose. For the reasons set forth below, the DEIS fails to satisfy these fundamental requirements. In addition to specifying the underlying purpose and need to which the agency is responding, an agency preparing an EIS must rigorously explore and objectively evaluate all reasonable alternatives, and for alternatives which were	All action alternatives are designed to meet the purpose and need, and to account for all purposes of the Arctic National Wildlife Refuge. See Section 3.4.7. Analysis of impacts on polar bears, recreation, and climate change can be found in Sections 3.3.5, 3.4.6, and 3.2.1, respectively.

S. Public Comments and BLM Responses (Alternatives)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
288. (cont.)	(see above)	(see above)	(see above)	(see above)	(see above)	(see above)	eliminated from detailed study, briefly discuss the reasons for their having been eliminated. ¹⁴¹ However, the alternatives proposed by the BLM fall short of this standard and as such must be reevaluated entirely. By failing to meaningfully evaluate the alternative's impacts on polar bears, the Refuge recreation, and national climate change, the DEIS fails to provide a meaningful range of alternatives. When preparing an EIS, federal agencies must consider all reasonable alternatives to the proposed action. ¹⁴² The analysis of alternatives is characterized as the heart of the environmental impact statement. ¹⁴³ Documents must concentrate on the issues that are truly significant to the action in question, rather than amassing needless detail. ¹⁴⁴ The CEQ regulations direct that an EIS "rigorously explore and objectively evaluate all reasonable alternatives, and for alternatives that were eliminated from detailed study, briefly discuss the reasons for their having been eliminated." ¹⁴⁵ This requires a "thorough consideration of all appropriate methods of accomplishing the aim of the action" and an "intense consideration of other more ecologically sound courses of action." ¹⁴⁶	(see above)
289.	Jason	Schwartz	Institute for Policy Integrity	94627	1	New alternative proposed	Among the alternatives that BLM should have considered are one or more environmentally-protective development scenarios that would lease only the minimum acreage mandated by the Tax Act, and scenarios that would impose more stringent and cost-benefit justified lease stipulations, timing restrictions, and infrastructure limitations.	Alternative D2 has been revised to offer 800,000 acres of lands available for lease.

S. Public Comments and BLM Responses (Alternatives)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
290.	Jason	Schwartz	Institute for Policy Integrity	94627	4	New alternative proposed	Given the environmental sensitivities of leasing and development in ANWR's Coastal Plain, BLM should have analyzed an alternative that would offer no more than 800,000 acres total for lease. BLM fails to provide a reasonable explanation for why it did not do so.	Alternative D2 has been revised to offer 800,000 acres of lands available for lease.
291.	Jason	Schwartz	Institute for Policy Integrity	94627	9	New alternative proposed	delayed leasing alternative-to delay the lease sales even beyond the statutory deadline, to perhaps 15 or 20 years in the future-is also a reasonable alternative for BLM to analyze given that such an alternative could generate more total revenue for the public from higher bids, lower production costs due to technology advances, and higher total royalties given resource price projections (with oil prices expected to rise through 2050, as explained below). NEPA requires consideration of alternatives "that are practical or feasible" and not solely "whether the proponent or applicant likes or is itself capable of carrying out a particular alternative"; in fact, "[a]n alternative that is outside the legal jurisdiction of the lead agency must still be analyzed in the EIS if it is reasonable."	PL 115-97 does not direct the Secretary to generate any particular amount of revenue from oil and gas leasing in the Coastal Plain. The act also requires a lease sale within 4 years. Delayed leasing is an alternative considered but dismissed from further analysis because it would be outside the legal mandate of PL 115-97 (see Section 2.3).
292.	Jason	Schwartz	Institute for Policy Integrity	94627	9	New alternative proposed	Moreover, BLM should also analyze an alternative that would place strict conditions on any future development of leases, such as delaying all development by any lease holders until more information on environmental, social, and economic uncertainties can be obtained, and placing stringent limitations on surface disturbance.	Delayed leasing is an alternative considered but dismissed from further analysis because it would be outside the legal mandate of PL 115-97 (see Section 2.3). Site-specific restrictions and analyses, including those associated with infrastructure in support of oil and gas development, can more realistically be provided when the BLM receives an application to permit such infrastructure. The Leasing EIS makes no decisions on such infrastructure, except to prohibit it in specified areas of particularly high value surface resources under some alternatives.

S. Public Comments and BLM Responses (Alternatives)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
293.	Jason	Schwartz	Institute for Policy Integrity	94627	10	New alternative proposed	It is unreasonable to BLM to base its entire analysis across all alternatives on an assumption of continuing favorable prices, when a framework exists-option value- to consider the value of waiting for more information in the face of great uncertainty over market prices. BLM can and should consider these price uncertainties by considering an option value alternative.	The Tax Act does not direct the Secretary to generate any particular amount of revenue from oil and gas leasing in the Coastal Plain.
294.	Harry K.	Brower Jr.	North Slope Borough	95612	36	New alternative proposed	BLM should include an ROP requiring oil and gas operators to use firefighting foam that does not contain PFAS chemicals.	The BLM has added additional text to ROP 2.
295.	Brook	Brisson	Trustees for Alaska	96981	31	New alternative proposed	The range of alternatives included in the analysis is also inadequate to facilitate informed decision making and public involvement. For instance, the range of alternatives does not include an alternative that makes fewer than 1 million acres available for leasing despite the fact that only 400,000 acres is required by law to be offered in each lease sale. Arctic lease sale experience counsels that much of the area offered is not ultimately bid on or leased, providing for consideration of a phased approach that re-offers unbid lands.	Alternative D2 has been revised to offer 800,000 acres of lands available for lease.
296.	Brook	Brisson	Trustees for Alaska	96981	32	New alternative proposed	Additionally, there is no alternative that caps surface infrastructure at fewer than 2,000 acres.	Section 2001(c)(3) of the Tax Act states "the Secretary shall authorize up to 2,000 surface acres." Any interpretation by the BLM to modify the limit for a given alternative would be inconsistent with the Tax Act. This alternative has been included in Section 2.3, Alternatives Considered but Dismissed From Further Analysis.

S. Public Comments and BLM Responses (Alternatives)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
297.	Brook	Brisson	Trustees for Alaska	96981	44	New alternative proposed	Relatedly, BLM assumes that the focus of development will occur in the Topset Play, which is expected to be the first anchor field discovered, 156 and which BLM states contains "over half of the recoverable undiscovered oil in the program area." 157 BLM should consider an alternative that looks specifically at leasing and development focused in this area, including considering leasing approaches and protective measures in this geographic focus. (BLM should include a map of the location of this play, given its significance.)	The Topset Play influenced how the high and medium HCP areas were defined. These areas were considered first for leasing under all action alternatives, while still balancing resource protections. The BLM has added a map to Appendix B that depicts this.
298.	Brook	Brisson	Trustees for Alaska	96981	45	New alternative proposed	BLM should also consider an alternative in which there is no central processing facility, production pads, gravel mines or other infrastructure constructed on the Coastal Plain. Oil and gas resources could be produced and/or transported via pipeline for processing at another location and gravel mining could occur outside of the Coastal Plain. Such an alternative could decrease impacts to surface resources on the Coastal Plain by limiting construction and human activity associated with oil and gas development processing.	PL 115-97 requires that the BLM implement an oil and gas leasing program within the Coastal Plain and authorize ROWs for essential roads and pipeline crossings. It would not be practicable to have an oil and gas program without the necessary oil and gas infrastructure.
299.	Brook	Brisson	Trustees for Alaska	96981	47	New alternative proposed	BLM should also consider an alternative where all lease stipulations and required operating procedures (ROPs) are not subject to waivers, exceptions, and modifications. This alternative would ensure that the protections ascribed to the stipulations could actually be relied upon to safeguard resources.	This alternative has been included in Section 2.3, Alternatives Considered but Dismissed From Further Analysis.

S. Public Comments and BLM Responses (Alternatives)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
300.	Brook	Brisson	Trustees for Alaska	96981	48	New alternative proposed	Conversely, since all stipulations and ROPs can be waived, excepted, or modified, BLM should analyze the impacts of the program based on granting these exemptions.	Not all stipulations can be waived, excepted, and/or modified. Operators are required to submit a written request for an exception, waiver, or modification and information demonstrating that (1) the factors leading to the inclusion of the stipulation in the lease have changed sufficiently to make the protection provided by the lease stipulation no longer needed or (2) the proposed operation would not cause unacceptable impacts. There are minimal standards that have to be adhered to in the lease stipulations and ROPs in order to still meet the objective.
301.	Brook	Brisson	Trustees for Alaska	96981	49	New alternative proposed	For instance, BLM should develop an alternative that encompasses the recommendations of the International Porcupine Caribou Board, as required under the International Agreement on the Conservation of the Porcupine Caribou Herd, and another designed to avoid or minimize aesthetic impacts based on the results of comprehensive visibility analysis. BLM should also consider a stipulation requiring compact siting of all oil and gas facilities and infrastructure, and mandating that any development be contiguous, even under the 2,000-acre limitation.	The BLM is complying with international agreements between the U.S. and Canadian governments. Section 1.9 (page 1-5 of the Draft EIS) talks about the 1987 International Agreement on the Conservation of the PCH. The objective of ROP 21 is to minimize impacts of the development footprint.
302.	Brook	Brisson	Trustees for Alaska	96981	50	New alternative proposed	Although the Tax Act directs BLM as to when lease sales should occur and the acreage to be offered in those sales, it does not mandate that leases be issued, nor does it limit what protective stipulations may be applied to the leases, or the timing of production. Consequently, BLM could and should have considered alternatives that would delay leasing or constrain the timing of extraction to reduce or eliminate the impact of the oil and gas program on climate change and account for principles of option or informational value.	Delayed leasing is an alternative considered but dismissed from further analysis because it would be outside the legal mandate of PL 115-97 (see Section 2.3).

S. Public Comments and BLM Responses (Alternatives)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
303.	Brook	Brisson	Trustees for Alaska	96981	54	New alternative proposed	BLM also should consider an alternative to delay leasing and/or lease implementation, based on applying the principles of option value or informational value, which provides for BLM to look at the benefits of delaying irreversible decisions. It is well-established that issuance of an oil and gas lease can be an irreversible commitment of resources.161 In the context of the Coastal Plain, there are significant considerations that would support delaying.	Delayed leasing is an alternative considered but dismissed from further analysis because it would be outside the legal mandate of PL 115-97 (see Section 2.3).
304.	Withheld	Withheld	—	97253	3	New alternative proposed	BLM should consider an alternative that leases only the minimum 400,000 acres to provide a fair comparison of the options.	Alternative D2 has been revised to offer 800,000 acres of lands available for lease.
305.	Ronald	Yarnell	—	98123	5	New alternative proposed	One of the things that I noticed looking through the maps and the alternatives is you are opening up areas not only of high potential -- only a third of the 1002 area or less is of high potential petroleum province. The rest is moderate or low potential. I think the law says that you have to open up 400,000 acres within, whatever it was, four years or something like that. And then you had to open up another 400,000 acres by 2025 or something. There should definitely be an alternative in here that opens up only the minimum necessary, the 400,000 acres. And that should be the western -- if -- Okay. I'm saying this under protest because I don't think any of the coastal plain, any of the 1002 area should be opened up for seismic testing or exploration. But if you are going to open any of it up, you should do the absolute minimum the law requires, the 400,000 acres, of which that would be most of the high potential oil province.	Alternative D2 has been modified to offer 800,000 acres for leasing. Based off best available information, the action alternatives maximize the areas with the highest HCP while balancing with surface resource protection. Because there are only an estimated 427,000 acres of high HCP, in order to get to an 800,000-acre lease sale, areas in medium HCP and low HCP would also need to be included (while balancing resource protections).

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
306.	Brook	Brisson	Trustees for Alaska	98270	110	New alternative proposed	This will necessarily require the development and analysis of alternatives designed to better protect the Coastal Plain's world-class recreational values - which are dependent on the area's natural, untouched landscape. Such alternatives might include, for instance: concentrating and strictly limiting leasing and development to certain lower-impact areas identified through a visibility analysis and careful examination of recreational use data; or including non-waivable stipulations for extensive NSO setbacks around river corridors, height restrictions on infrastructure, mandatory photo simulations of proposed facilities to inform future visual resource assessments, timing limitations during popular recreational months, mandatory development of monitoring and conflict avoidance plans in coordination with recreational groups, guides, and pilots, and other measures designed mitigate aesthetic and other impacts to recreation settings and opportunities.	Alternatives considered but dismissed from detailed analysis (e.g., an alternative with non-waivable stipulations) have been added to Section 2.3. Requirements for mandatory photography simulations, recreation-focused timing limitations, and stipulations related to height restrictions on infrastructure are highly speculative due to the lack of specificity of what, where, and when development may occur. This level of specificity would be determined at the project-level authorization. Site-specific analyses, including those associated with infrastructure in support of oil and gas development, can more realistically be provided when the BLM receives an application to permit such infrastructure.
307.	Brook	Brisson	Trustees for Alaska	98270	224	New alternative proposed	BLM should also consider a health-focused mitigation measure. BLM should adopt a measure that provides for health-focused coordination with communities, similar to what was done in ROP 36 for subsistence. ²⁰⁷⁹ Because Kaktovik data are limited and not publicly available, it is critical that such a mitigation measure requires the establishment of appropriate baseline data.	The BLM has responsibilities related to subsistence management and no such authorities related to health-focused mitigation. Section 3.4.11 (public health and safety) states, "HIAs are expected to be developed for future development projects that would require additional NEPA analysis."

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
308.	Brook	Brisson	Trustees for Alaska	98271	20	New alternative proposed	None of the action alternatives appear to prohibit water withdrawals or excavation of gravel mines for any lands in the program area, whether available for leasing or not, nor for areas subject to No Surface Occupancy. Gravel mines and water withdrawal operations in their entirety should be considered prohibited from areas not available for leasing and also in No Surface Occupancy zones during any season because they alter hydrological flows, impair water quality, and alter natural fisheries diversity as well as riparian and stream bank vegetation. Seismic operations would also have impacts on hydrological and water resources, and should not be allowed under any alternative in the areas unavailable for leasing or subject to No Surface Occupancy.	Section 1.9.1 has been revised to identify the production and support facilities that would count toward the 2,000-acre limit, which now includes gravel mines. Rationale as to why certain facilities may not be included is contained in Section S.1.2 of this Appendix. Appendix B explains the different types of seismic exploration that are analyzed in the EIS. Seismic exploration can be done across the full area of the Coastal Plain, even if an area is not available for lease. Site-specific NEPA analysis would be done for any proposed seismic explorations.

309.	Withheld	Withheld	—	48642	1	Suggestion for specific change to an alternative	Required Operating Procedure 23 f. Before the construction of permanent facilities is authorized (limited as they may be by restricted surface occupancy areas established in other lease stipulations), the lessee would design and implement and report a study of caribou movement, unless an acceptable study specific to the PCH and CAH has been completed within the last 10 years and approved by the BLM Authorized Officer. How will this study be used? There are already studies of caribou movement that show herds moving freely through this area and use as a critical habitat. Is that not enough to halt development? g. A vehicle use management plan would be developed by the lessee/operator/contractor and approved by the BLM Authorized Officer, in consultation with the appropriate federal, State, and NSB regulatory and resource agencies. The management plan would minimize or mitigate displacement during calving and would avoid, to the extent feasible, delays to caribou movements and vehicle collisions during the midsummer insect season, with traffic management following industry practices. Exactly how will the management plan accomplish this?	All studies required by lease stipulations and ROPs (including the caribou movement study noted under ROP 23 [section f]) will be used to inform future decision-making by the BLM for oil and gas activities within the Coastal Plain. The vehicle management plan noted under ROP 23 (section g) would not be approved by the BLM Authorized Officer unless it demonstrates it is designed to meet the objectives of minimizing or mitigating displacement of caribou.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
310.	Withheld	Withheld	—	55252	6	Suggestion for specific change to an alternative	The Alternatives and their alleged impacts rely, in part, on Required Operating Procedures (ROP). This DEIS should, but does not, explain the penalties for violating ROPs. How will the ROPs be enforced? How will they be monitored? The public and decisions-makers needs to know the answers to these questions in order to assess whether these ROPs provide any kind of meaningful environmental protections. Will they really deter certain corporate behaviors? What kind of penalties have been imposed in the past for violations of similar ROPS, and with what frequency? Given the environmental significance of the Coastal Plain of the Arctic National Wildlife Refuge, will there be additional monitoring and greater penalties for violating ROPs? If so, what will this involve? To meet NEPA, these questions need to be addressed in the EIS.	As noted under ROP 40 (section i), the BLM has authority under 43 CFR 3163 to issue assessments and penalties for non-compliance with oil and gas operational requirements.
311.	Paul	Reichardt	—	55513	3	Suggestion for specific change to an alternative	would like to see an Alternative D3 with an 800,000 acre limit	Alternative D2 has been revised to offer 800,000 acres of lands available for lease.
312.	Kathryn	Tilly	—	55683	2	Suggestion for specific change to an alternative	the draft EIS does quantify or describe mitigation measures for air and water pollution that would be generated by oil and gas drilling in the area.	Lease stipulations and ROPS designed to protect non-water resources may also provide protections for water resources. ROPs 5 and 6 describe mitigation measures focused on air resources. ROPs 2 (section d) and 9 provide protections at the leasing stage for water quantity and quality. A determination of additional mitigation measures for air and water pollution cannot be made until site-specific development activities are proposed.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
313.	Tim	Mayer	—	56678	4	Suggestion for specific change to an alternative	(pg 2-4 to 2-15) The ROPs presented in the DEIS do not consider impacts to water quantity under any of the alternatives. The ROPs are primarily stipulations on setbacks for oil and gas infrastructure. While these are important and necessary, they do not address the most substantive impacts to water quantity and they do not adequately address or protect the “necessary water quantity within the refuge” as stated in the refuge purposes. The DEIS and ROPs need to identify sources and quantities of water available for leasing and exploratory activities. The CRS study (2003) stated that only 8 lakes in the 1002 Area contained enough unfrozen water to build a mile or more of ice road and most of the rivers in the area were too shallow or too brackish to use. Furthermore, the lakes in the 1002 Area are not distributed evenly throughout the area, but are concentrated mainly near the Canning river, meaning water would need to be transported to other areas (FWS, 1996). This suggests there are some serious constraints on the location and availability of water, which need to be identified or discussed in the DEIS. If there is newer information or technology that counters this, it needs to be included in the DEIS as well.	A determination of specific water withdrawals and impacts on water quantity cannot be made until site-specific development activities are proposed. In addition, lease stipulations and ROPs designed to protect non-water resources may also provide protections for water resources.
314.	Withheld	Withheld	IRIS USArray	57852	3	Suggestion for specific change to an alternative	Recommended mitigation activities might include an ongoing program to monitor seismicity in conjunction with injection pressure records providing data that are open to the public. Sharing commercially developed seismic imaging of depths greater than, say, 4km, might identify faults prone to earthquakes to further delineate regions which should be cautious about injection.	Fluid injection-induced seismicity is addressed under Direct and Indirect Impacts in Section 3.2.5, Geology and Minerals. Sharing of monitoring data (if appropriate) would be initiated by the relevant authorities.

S. Public Comments and BLM Responses (Alternatives)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
315.	Withheld	Withheld	—	59376	12	Suggestion for specific change to an alternative	Could you integrate a bottom line assessment of the effectiveness of the proposed lease stipulations and operating procedures (qualitative or quantitative), based on past similar projects, to help reader understand whether any of these many measures would be effective?	A qualitative and quantitative analysis of the effectiveness of the lease stipulations and ROPs can be found in Chapter 3. To ensure effective mitigation measures were included in the alternatives, lease stipulations and ROPs were developed with cooperating agencies and resource experts knowledgeable in oil and gas development and activities. Many of the lease stipulations and ROPs are currently being used across the North Slope; they were modified as appropriate for the Coastal Plain, as determined by the resource experts.
316.	Eric	Biber	—	68365	2	Suggestion for specific change to an alternative	Operations should be restricted to periods when no disturbance of any kind would occur to existing polar bear and caribou populations.	Timing limitations were developed using best available science in conjunction with review by cooperating agencies and resource experts to minimize disturbance on polar bear and caribou populations.
317.	Withheld	Withheld	—	68965	12	Suggestion for specific change to an alternative	I recommend major revision and re-release of a revised draft EIS that has: *A system for tracking and disclosing surface disturbance acres	Section 1.9.1 describes those facilities that will be counted against the 2,000 acres. The BLM will use facility data in the form of ArcGIS-compatible shapefiles obtained under ROP 33 to track facility acreage to assure continued compliance with the Tax Act limit. ROP 35 requires the development of a BLM-approved abandonment and reclamation plan.
318.	Withheld	Withheld	—	68965	21	Suggestion for specific change to an alternative	The range of alternatives is also inadequate because alternatives were developed with a strong and appropriate focus on caribou summer habitat, but little apparent regard for the wide range of other important resource issues identified during scoping. In particular, the currently proposed action alternatives do not adequately address the program's adverse effects on subsistence use and environmental justice.	Lease stipulations and ROPs designed to protect specific resources may also provide protections for many other resources. For example, an objective of Lease Stipulation 1 is designed to minimize impacts on subsistence uses and activities, while also providing protections for many other resources, including water quality, cultural resources, and fish and wildlife habitat.

S. Public Comments and BLM Responses (Alternatives)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
319.	Withheld	Withheld	—	68965	26	Suggestion for specific change to an alternative	Regarding unconstrained exemptions, most of the lease stipulations in the action alternatives provide opportunities for the stipulation to be circumvented after further review of proposed case-by-case exemptions. Similarly, nearly all ROPs included in Table 2-2 include some sort of exemption provision that grants the BLM Authorized Officer the discretion to circumvent the requirement/standard and potentially jeopardize meeting the objectives of that ROP. I understand the need for an exemption process from the perspective of practical implementation of the program. But clear disclosure of the standards that must be met in order for an exemption to be granted is needed to reduce uncertainty about whether lease stipulations and ROP will in fact be implemented. The appearance or broad discretion to grant exemptions introduces considerable uncertainty surrounding the implementation fidelity and effectiveness of ROPs in limiting impacts, especially given the lack of emphasis of monitoring in the draft EIS. Please amend all Lease Stipulations and ROPs that include delegated discretionary authority to the BLM Authorized Officer with statements that describe, in as much detail as possible, the sideboards and limits on the Officer's discretion. Please develop and include in the draft EIS a process for public notification and involvement in the process of approving all non-emergency cases in which the BLM Authorized Officer is considering an exemption from any Lease Stipulation or ROP. Clearly, the BLM Authorized Officer will have great responsibility for the proper implementation of this program. Arguably, this Officer may have too much responsibility. To	Chapter 2 has been revised to clarify the waiver, exception, modification process, which includes a public notification process if appropriate. 43 CFR 3590.2 identifies the responsibility of the Authorized Officer. BLM Authorized Officers received their authorities through the delegation process within the agency.

319. (cont.)	(see above)	(see above)	(see above)	(see above)	(see above)	(see above)	reduce the potential for arbitrary or capricious exemptions, please provide in the revised draft EIS clear evidentiary and practical standards that would need to be met in order for a request for an exemption from a Lease Stipulation or an ROP to be considered warranted. These criteria would be useful for both lease applicants and would provide assurances to entities interested in environmental protection. Please also develop and include in the revised draft EIS a process for engaging a local oversight committee and panels of technical experts to provide recommendations to the BLM Authorized Officer regarding exemptions, as well as subsequent plans (see below). This local and technical input will improve decisions made by the BLM Authorized Officer and will help to reduce uncertainty surrounding the implementation process for Lease Stipulations and ROPs. Finally, given the important role of the BLM Authorized Officer in implementing this oil and gas program, please add to the introduction to Chapter 2 a clear and thorough explanation of the qualifications that make candidates eligible to serve as the BLM Authorized Officer.	(see above)

S. Public Comments and BLM Responses (Alternatives)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
320.	Withheld	Withheld	—	68965	27	Suggestion for specific change to an alternative	Regarding excessive reliance on subsequent planning efforts to minimize environmental impacts, the draft EIS calls for the subsequent development, review, and refinement of many management, mitigation, and resource protection plans. The draft EIS, however, does not describe who will create these plans or how the public might be involved in their development. These plans will play an important role in the day-to-day protection of natural, cultural, and social resources during implementation of the oil and gas program. The draft EIS needs to include assurances that these plans will include best-available measures, effective remedies, and meaningful penalties for non-compliance. Please include in the revised draft EIS a thorough description of the process for developing, approving, and implementing subsequent management, mitigation, and resource protection plans. This description should include who will be involved in developing these plans and the opportunities for public involvement that will be provided. Again, I recommend including in this process explicit mechanisms for gaining input from scientific societies with expertise in the respective disciplines covered in different plans. Involvement of scientific societies as collaborators in plan development or as peer reviewers could enhance inclusion of best available information and technology in these plans. I also recommend specifying which regulatory agencies will be invited to participate in development of each plan, and which of these agencies must be involved in order to develop an effective plan.	Where subsequent plans are required through the lease stipulations and ROPs, the BLM Authorized Officer's approval is contingent on appropriate coordination (see footnote 1, Table 2-3 of the Final EIS). The operator is to develop these plans.

S. Public Comments and BLM Responses (Alternatives)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
321.	Withheld	Withheld	—	68965	28	Suggestion for specific change to an alternative	Regarding monitoring and compliance, this is another essential tool for providing assurances that the program will be implemented as described. A robust program of implementation and effectiveness monitoring, reporting, and ongoing adaptive management of the program will be critical to ensuring that non-compliance is detected early and effective remedies are promptly implemented. The current draft EIS mentions subsequent development of monitoring and compliance plans, but provides no details about this process. I understand that the current programmatic draft EIS is not the place for articulating a detailed monitoring and compliance plan. But I recommend incorporating in the revised draft EIS an appendix that provides a description of the basic content of appropriate monitoring plans, with outlines and examples whenever possible. As I recommended for management, mitigation, and resource protection plans above, this description of monitoring and compliance plans should include who will be involved in developing these plans and the opportunities for public involvement that will be provided. Again, I recommend including in this process explicit mechanisms for gaining input from scientific societies and regulatory agencies with expertise in the respective disciplines covered in different monitoring and compliance plans. All of the plans discussed here require funding adequate to develop, refine, and implement them. In the case of monitoring and compliance plans, funding needs to include salary for staff to develop and carry out all aspects of the monitoring program. Funding for staff should include enforcement officers, operating in the field, who are charged with ensuring	Monitoring plans will be tailored to the specific location of development and resources or activity being monitored; it is not practicable to develop a template that would cover all resources, activities, and requirements for this EIS. Bonding would be determined and required with the specific oil and gas authorization (43 CFR 3134; the BLM would also apply these NPR-A regulations to the Coastal Plain).

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
321. (cont.)	(see above)	(see above)	(see above)	(see above)	(see above)	(see above)	<p>environmental compliance with the EIS and all subsequent management, mitigation, and resource protection plans. Presence of field-going enforcement staff is central to maximizing both the opportunity to coordinate with program operations staff to find creative solutions, and to increase the potential to detect and remedy non-compliance in a timely and effective way. I recommend that the pre-disturbance bond be used to guarantee adequate funding for the monitoring and compliance program. (Participating in the development, implementation, and monitoring of these plans will constitute a considerable workload for responsible staff within the BLM, but also the USFWS, NMFS and other regulatory agencies. Although not necessarily a topic for the draft EIS, I recommend careful consideration of the increased workload associated with administering this oil and gas program and beginning the process of hiring the additional manpower needed to ensure the planning and regulatory compliance aspects of this program are completed in a competent and timely manner (please see my specific comment 69 below for additional suggestions).)</p>	(see above)

322.	Withheld	Withheld	—	68965	31	Suggestion for specific change to an alternative	6. Weak or missing scientific support for design criteria in action alternatives. Many of the lease stipulations and required operating procedures in the draft EIS's action alternatives include numeric criteria, which is desirable from the perspective of monitoring and compliance. Most of these numeric criteria, however, are not supported with citations, a clear and logical rationale, or other evidence of a scientific basis or a history of implementation effectiveness. This leaves the impression that these numeric criteria are arbitrary and potentially ineffective. Please be explicit and transparent about the scientific basis underlying all numeric criteria and clearly identify when criteria are based on best professional judgement or a similar standard. For example, in Lease Stipulation 1, what is the scientific basis for the setback distances specified, and why are they applied only to surface occupancy and not other activities? What evidence supports these distances being effective for meeting Stipulation 1's objective? For criteria based on best professional judgement, please also provide a narrative rationale explaining why each criterion could be expected to meet the objectives for which it was specified.	If lease stipulations or ROPs apply to multiple resources, regardless of objective, the benefits or detriments associated with that objective will be analyzed. Buffer widths were determined through coordination with cooperating agencies, government-to-government and ANCSA consultation, and recommendations from agency subject matter experts to protect the wide range of resources within those areas.
323.	Withheld	Withheld	—	68965	35	Suggestion for specific change to an alternative	9. Table 2-2, page 2-4. Alternative D includes in its objective, "impacts on hunting and recreation; and impacts on scenic and other resource values." Presumably this was intended to mean, minimize impacts on hunting and recreation; and minimize impacts on scenic and other resource values. Please clarify. If in fact the objective of this alternative is to minimize impacts on these resources, increasing setbacks by the proposed amounts is unlikely to achieve this objective. On	No text changes; the intent is to minimize impacts on the specific resources. Additionally, setbacks were determined through coordination with cooperating agencies, government-to-government and ANCSA consultation, and recommendations from agency subject matter experts to protect the wide range of resources within those areas.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
323. (cont.)	(see above)	(see above)	(see above)	(see above)	(see above)	(see above)	<p>the flat terrain of the coastal plain, with low-growing vegetation, increasing setbacks by one or two miles will slightly reduce impacts to these resources, but impacts will still be considerable. The specified setbacks appear to be arbitrarily selected. What is the scientific rationale supporting the proposed setbacks? To effectively achieve an objective of minimizing impacts on hunting, recreation, and scenic resources, setbacks should be determined based on scientifically supported setback distances for these activities in similar environments. At a minimum, setbacks based on the visual and auditory features of the proposed development in the coastal plain could be devised analytically. For example, regarding visual impacts, including artificial lighting, the geographic range associated with the expected height of oil and gas program infrastructure could be used to calculate setbacks that would shield hunters and recreationist from views of program infrastructure. Similarly, for audible disturbance, the distance at which the noises generated by oil and gas development activities attenuate to ambient levels in still, cold air could be calculated. The noises likely to have the greatest sound pressure levels could be analyzed, including blasting, seismic testing, noise generated by aircraft and watercraft, as well as motorized ground-based equipment used for all prospecting, construction, and operations and maintenance activities. Following such an analysis, setback distances could be established that would alleviate impacts from the majority of visual and auditory stimuli.</p>	(see above)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
324.	Withheld	Withheld	—	68965	36	Suggestion for specific change to an alternative	Finally, setbacks in lease stipulation 1 are defined from the active floodplain (defined as “The flat area along a water body where sediments are deposited by seasonal or annual flooding; generally demarcated by a visible high water mark. Coastal plain rivers are very dynamic through time in their floodplains. Leases may be active for relatively long periods of time (i.e., greater than 20 years). In this context, consider specifying that any setbacks from the listed floodplain rivers begin at the edge of the historic floodplain as defined by historic channel scars detected using LIDAR (light detection and ranging) or other means. The geomorphic criteria for recognizing the historic floodplain is typically the presence of terraces at the edges of the geomorphic floodplain. Consider replacing references to the “active floodplain” in Alternative D with “historic floodplain.”	The term “active floodplain” is commonly used and more straightforward to define on the landscape.
325.	Withheld	Withheld	—	68965	37	Suggestion for specific change to an alternative	10. Table 2-2, ROP 1, page 2-16. Consider revising the Requirement/Standard to read: Areas of operation would be left clean of all debris at all times. This change would reduce the potential for debris or trash accumulations to develop that attract wildlife and produce a negative visual impact.	The lessee/operator/contractor would be required to follow the Waste Management Plan for all phases of exploration, development, and production as identified in ROP 2.
326.	Withheld	Withheld	—	68965	39	Suggestion for specific change to an alternative	12. Table 2-2, ROP 6, pages 2-17 to 2-18. The objective of this ROP includes prevention of undue or unnecessary degradation of the lands affected by oil and gas development. There appears to be an error of omission in that no applicable requirements/standards are given. The standards presented in Table 2-2 under this ROP appear to be associated with ROP 5.	Requirements and standards for ROP 6 are included on page 2-18 in the Draft EIS.

327.	Withheld	Withheld	—	68965	41	Suggestion for specific change to an alternative	13. Table 2-2, ROP 7, page 2-19. ROP 7 is about human health risks associated with contaminants in subsistence foods. The requirement/standard currently includes the following: "the BLM Authorized Officer may require changes in the operator's processes to reduce or eliminate emissions of the contaminant." Consider revising as follows; to reduce or eliminate emissions of the contaminant, including cessation of all operations at facilities producing the contaminants in question. After appropriate studies are completed, the remedies available to the BLM Authorized Officer to protect human health should be broad, decisive, and effective.	The BLM Authorized Officer has the discretion to require or authorize changes in operator activity if that activity does not meet the stated objectives.
328.	Withheld	Withheld	—	68965	42	Suggestion for specific change to an alternative	14. Table 2-2, ROPs 8 and 9, pages 2-19 to 2-20. ROPs 8 and 9 are about water use. Please add a requirement/standard specifying all water withdrawal methods employed on waterbodies found suitable for Wild and Scenic status according to the ANWR CCP must be conducted in ways that are consistent with Wild and Scenic status.	Where practicable and where actions do not conflict with PL 115-97, lease stipulations and ROPs are designed to protect Wild and Scenic River characteristics on rivers determined to be suitable.
329.	Withheld	Withheld	—	68965	44	Suggestion for specific change to an alternative	15. Table 2-2, ROP 10, pages 2-20 to 2-21. ROP 10 is about winter overland moves and seismic work. Alternative D, item (b) under this ROP specifies that a survey of polar bear dens and seal birthing lairs should be conducted before winter overland moves and seismic work. It does not specify, however, how the results of these surveys would be used. Please include a detailed procedure that clearly indicates how specific survey results may prompt specific changes in operation, potentially including delay of the proposed activity, deferral to subsequent winter seasons, or denial or cancellation of the proposed activity.	The survey is developed in consultation with the USFWS and NMFS. As a result of the consultation, measures would be developed to avoid and minimize impacts in accordance with the Endangered Species Act and MMPA.

330.	Withheld	Withheld	—	68965	45	Suggestion for specific change to an alternative	16. Table 2-2, ROPs 16 and 17, pages 2-24 to 2-25. These ROPs deal with exploratory drilling. The only requirements/standards offered here are concerned with exploratory drilling in streams and construction of temporary roads. Please supplement these ROPs with an explicit statement that cross references all of the other ROPs which also apply to exploratory drilling activities. Please also be explicit about how acres affected by exploratory drilling will be included in the accounting toward the 2,000 acre limit on ground disturbance.	ROPs are designed to mitigate for impacts associated with all phases of the leasing program, unless explicitly stated otherwise. Section 1.9.1 describes those facilities that will be counted against the 2,000 acres. The BLM will use facility data in the form of ArcGIS-compatible shapefiles obtained under ROP 33 to track facility acreage to assure continued compliance with the Tax Act limit.
331.	Withheld	Withheld	—	68965	46	Suggestion for specific change to an alternative	17. Table 2-2, ROPs 19 and 28. Both ROPs refer to permanent features of the oil and gas program. For example, ROP 19 refers to "permanent [italics added] oil and gas facilities, including roads, airstrips, and pipelines." Does the proposed action analyzed in this draft EIS contemplate permanent infrastructure, or is all of it subject to removal at the end of the lease period, with subsequent rehabilitation of disturbed areas. Is the assumed 70-year production timeline or the 130-year timeline to abandonment in Appendix B considered "permanent." Please clarify.	ROP 35 identifies requirements for returning land to its previous condition and use, which would include oil and gas infrastructure. See the definition of permanent oil and gas facilities in the glossary.
332.	Withheld	Withheld	—	68965	47	Suggestion for specific change to an alternative	18. Table 2-2, ROP 30, pages 2-29 to 2-30. Allowing up to 100 cubic yards of material to be removed from rock outcrops with evidence of raptor nesting is not an effective way to minimize loss of nesting habitat for cliff nesting raptors (the objective of this ROP). Please revise this standard to prohibit removal of any materials from outcrops with evidence of raptor nesting.	The BLM has edited text of this ROP for clarity.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
333.	Withheld	Withheld	—	68965	48	Suggestion for specific change to an alternative	The spatial information required in this ROP [ROP 33] as stated represents a solid starting point. The specific role, however, of the requested information in an integrated and comprehensive monitoring program is unclear. What specific questions or performance measures will this spatial data be used to address? How will the results of monitoring be used in ongoing modification and adaptive management of the oil and gas program? As indicated in my general comment, a comprehensive monitoring and compliance plan is perhaps the most important program element that will be the subject of a subsequent planning effort. The revised draft EIS should include more details about the likely structure and content of this monitoring plan that is based on examples of effective monitoring plans that have been implemented successfully in similar contexts.	The need for additional monitoring and/or studies will be determined at the project-specific level. ROP 33 does not preclude the BLM from requiring additional monitoring based on future NEPA analysis and site-specific authorizations.
334.	Withheld	Withheld	—	68965	49	Suggestion for specific change to an alternative	20. Table 2-2, ROP 35, page 2-32. Consider amending the requirement/standard to include gravel mines. Regardless of whether or not these features are counted toward the 2,000-acre facility limit, the ability of areas used as gravel mines to fulfill their previous ecological and hydrological functions could be accelerated by proper reclamation.	ROP 24 addresses the reclamation of gravel mines.
335.	Withheld	Withheld	—	68965	51	Suggestion for specific change to an alternative	22. Table 2-2, ROP 41, page 2-35. Regarding summer vehicle tundra access, consider including in this requirement/standard explicit cross references to other lease stipulations and ROPs that limit access. Be as explicit as possible about the limits on the discretion of the BLM Authorized Officer to grant summer vehicle tundra access (see general comment (4) above).	Lease stipulations and ROPs designed to protect a specific resources may also provide protections for additional resources.

S. Public Comments and BLM Responses (Alternatives)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
336.	Withheld	Withheld	—	68965	74	Suggestion for specific change to an alternative	44. Chapter 3; section 3.3.3 (Birds), page 3-102. Consider developing an ROP or timing limitation developed expressly for the purpose of reducing program impacts on staging snow geese. At minimum, this ROP could be incorporated into alternative D or some other appropriate least environmentally damaging practicable alternative developed in response to comments	Text has been added to ROP 34.
337.	Withheld	Withheld	—	68965	78	Suggestion for specific change to an alternative	49. Chapter 3; section 3.3.4, page 3-116. Terrestrial Mammals. Most program-related aircraft operators would maintain minimum flight altitudes to reduce disturbance of wildlife and subsistence hunters. Lease Stipulation 7 and ROP 34 are a useful start, but rather than rely on voluntary compliance or an aircraft use plan to be developed subsequently, please consider elaborating ROP 34 to specify timing limitations and minimum requirements for altitudes and flightlines that would be effective at minimizing disturbance to caribou and other bird and wildlife species. Include this ROP, at minimum, in Alternative D and an appropriate least environmentally damaging practicable alternative developed in response to comments	ROP 34a requires submittal of an aircraft use plan that would analyze impacts from these specific activities. Review of this plan by tribes or ANCSA corporations could allow for additional up-front mitigations. LEDPA is a requirement of the EPA Section 404b1 guidelines under the CWA, and is not applicable to this EIS.
338.	Withheld	Withheld	—	68965	81	Suggestion for specific change to an alternative	53. Chapter 3; section 3.3.5, page 3-129. Marine Mammals. Consider developing an ROP that requires use of best available sensing and modeling approaches to survey polar bear habitat before seismic exploration or other potentially disturbing activities. Include this ROP, at minimum, in Alternative D and an appropriate least environmentally damaging practicable alternative developed in response to comments	All operators will be subject to regulations and stipulations under the ESA and MMPA. LEDPA is a requirement of the EPA Section 404b1 guidelines under the CWA, and is not applicable to this EIS.

339.	Withheld	Withheld	—	68965	91	Suggestion for specific change to an alternative	64. Chapter 3; section 3.4.6, page 3-205. Recreation. Protective measures that prevent the placement of aboveground infrastructure or that specify the use of downcast lighting or other light trespass mitigation measures would minimize impacts on the quality of nighttime recreation. I agree that such measures could be effective at reducing impacts of artificial light, but no such mitigation measures are included in the action alternatives. Consider including ROPs regarding artificial lighting that are consistent with International Dark Sky guidelines. At minimum, all program lighting should: *Only be on when needed, *Only light the area that needs it, *Be no brighter than necessary, *Minimize blue light emissions, *Be fully shielded (pointing downward).	ROP 26 addresses lighting restrictions. Additional lighting restrictions would be identified during project-specific authorizations to ensure that requirements do not conflict with one another (e.g., International Dark Sky guidelines and Polar Bear Interaction Plan requirements).
340.	Peter	Stern	—	69296	13	Suggestion for specific change to an alternative	Page 2-11 Alternative D BLM officer only consults with NSB and Kaktovik people in possibly altering restrictions to construction activity during calving. Excluding Native Village of Venetie Tribal Gov't is wrong.	The BLM will consult with the appropriate entities on future oil and gas activities. See footnote 1, Table 2-3 in the Final EIS.
341.	Peter	Stern	—	69296	14	Suggestion for specific change to an alternative	Page 2-19 Water use does not identify sources of water to be used in exploration or development drilling. There is very little surface water in this area of the slope so using lakes as sources could be a VERY negative impact.	This level of specificity would be determined at the project-level authorization. Site-specific analyses, including those associated with infrastructure in support of oil and gas development, can more realistically be provided when the BLM receives an application to permit such infrastructure. The Leasing EIS makes no decisions on such infrastructure, except to prohibit it in specified areas of particularly high value surface resources under some alternatives.
342.	Peter	Stern	—	69296	15	Suggestion for specific change to an alternative	Page 2-27 There are no standards mentioned in what caribou studies required of the lessee would consist of if no gov't studies have been conducted within 10 years.	Studies would focus on caribou movement as described in ROP 23 (section f).

S. Public Comments and BLM Responses (Alternatives)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
343.	Peter	Stern	—	69296	16	Suggestion for specific change to an alternative	Page 2-29 ROP 29. There is not requirement that tribes be consulted in studying cultural and paleotological issues in an area by the lessor/operator/contractor. This is wrong.	The BLM will consult with the appropriate entities on future oil and gas activities. See footnote 1, Table 2-3 in the Final EIS.
344.	Peter	Stern	—	69296	18	Suggestion for specific change to an alternative	Page 2-26 ROP 36 Subsistence Consultation for Permitted Activities. Subsections a, b, c and d. This section is terrible. "Native Village of Kaktovik, NSB, and the North Slope and Eastern Interior Alaska Subsistence Regional Advisory Councils" are listed as consulting bodies. BLM us using a govt to govt relationship for this type of consultation. The Eastern Interior Alaska Subsistence Advisory Council is really an advisory board to the Federal Subsistence Board not a policy making board. There is 1 person from Ft Yukon on the council. Arctic Village and Venetie with the most interest in this issue are excluded. This is flat wrong. at the very least the Native Village of Venetie Tribal Gov't should be the representative agency as they would be a govt to govt agency in the same as the NSB and are indicated as much by ES-5 and section 1.7.2. Subsection e shows govt to govt consultation with The Alaska Eskimo Whaling Commission and the NSB as well as local whaling captains. This level of consultation supports the reason why the Native Village of Venetie tribal govt should be included in subsections a, b, c and d.	Subsections a, b, c, and d apply to "affected communities," which would be determined through NEPA analysis associated with future site-specific oil and gas activities. See footnote 1, Table 2-3 in the Final EIS.
345.	Peter	Stern	—	69296	19	Suggestion for specific change to an alternative	Page 2-34 ROP 39 Native Village of Venetie Tribal Govt should be included.	ROP 39 applies to a future, specific lease within the Coastal Plain. Footnote 1, Table 2-3 in the Final EIS requires coordination with affected parties as appropriate. This also does not replace the BLM's responsibility to conduct government-to-government consultation with affected tribes.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
346.	Peter	Stern	—	69296	20	Suggestion for specific change to an alternative	Section 3.2.2 Visibility. The document acknowledges reasons for monitoring visibility but the nearest official recording stations are no where near the area of the proposed leases. At the very least the BLM needs to set up monitoring stations in the 1002 area.	This Leasing EIS will not result in the authorization of any on-the-ground activities. Accordingly, the environmental baseline will be preserved throughout the lease sale process. Any on-the-ground activities will require additional NEPA analysis. At that time, the BLM will determine which baseline studies or monitoring may be necessary.
347.	Peter	Stern	—	69296	61	Suggestion for specific change to an alternative	Page 3-215 The 1 mile setback for the Jago river needs to be increased to 3 miles like the Okpilak.	Buffer widths were determined through coordination with cooperating agencies, government-to-government and ANCSA consultation, and recommendations from agency subject matter experts to protect the wide range of resources within those areas. The widths vary among the alternatives to facilitate analysis of the different management options.
348.	Peter	Stern	—	69296	90	Suggestion for specific change to an alternative	If concentration of predators begins to happen in the narrow section of the calving area due to roads, pipelines or human caused issues, Fish and Wildlife needs to monitor its' effect on calf mortality and have a plan for dealing with the issue. Quality of the forage PCH depend on needs to be monitored. If movement on the slope for post calving aggregation and/or insect driven is causing the animals to be driven to areas of poor forage this needs to be researched.	It is not within the BLM's authority to require other agencies to do studies and monitoring or house data.
349.	Peter	Stern	—	69296	91	Suggestion for specific change to an alternative	Funding needs to be found to ensure up to date and accurate subsistence harvest data is being collected. Monitoring of water use and extraction needs a published plan for which agency will have authority and responsibility and how it will be conducted.	Monitoring of water use and extraction is the responsibility of the State of Alaska, Department of Natural Resources.

S. Public Comments and BLM Responses (Alternatives)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
350.	Peter	Stern	—	69296	97	Suggestion for specific change to an alternative	Staging of oil spill containment equipment either at drill sites or in Kaktovik should be required as appropriate.	At the time of a site-specific proposal, the operator will be required to submit an oil discharge prevention and contingency plan (required by the State of Alaska), which will address oil spill containment and recovery.
351.	Curt	Leigh	—	69329	5	Suggestion for specific change to an alternative	Lease stipulations were included in the evaluation as measures to minimize impacts on non hydrocarbon resources. Unfortunately, even the most protective stipulations identified in the document are unreliable. All lease stipulations are subject to future waivers, exemptions, and modifications as authorized by the BLM Authorized Officer during project construction and operation (EIS p. 2-3 and Table 2-2). This flexibility makes the lease stipulations unreliable and ineffective measures to evaluate or reduce environmental impacts. The BLM Authorized Officer will be placed in a nearly impossible position, the Officer will need a wide range of expertise in order to understand the environmental, subsistence and cultural implications of contractor requests to exempt or modify measures that were originally developed to protect the full range of resources in the Arctic Refuge. In addition the Authorized Officer must conduct business in a remote setting while being subjected to pressure from lease holders, contractors and their political supporters. Without monitors that have the authority to stop work and immediately correct construction methods and without unprecedented protection from economic and political pressure the Authorized Officer's ability to protect resource values in the Arctic Refuge will be severely compromised.	Operators are required to submit a written request for an exception, waiver, or modification and information demonstrating that (1) the factors leading to the inclusion of the stipulation in the lease have changed sufficiently to make the protection provided by the lease stipulation no longer needed or (2) the proposed operation would not cause unacceptable impacts. The criteria for approval of exceptions, waivers, and modifications should be supported by NEPA analysis, and may require site-specific environmental review. Requests should contain, at a minimum, a plan that includes related on-site or off-site mitigation efforts to adequately protect affected resources; data collection and monitoring efforts; and timeframes for initiation and completion of construction, drilling, and completion operations. The operator's request may be included in an Application for Permit to Drill, Notice of Staking, Sundry Notice, or letter. The BLM may also proactively initiate the process. During the review process, BLM coordination with other local, state, or federal agencies (e.g., ADFG, NSB, and local governments) should be undertaken, as appropriate, and documented. The BLM will also consult with the federal surface management agency (e.g., USFWS). Approval or disapproval is made by the Authorized Officer, and the decision is documented. If the

351. (cont.)	(see above)	(see above)	(see above)	(see above)	(see above)	(see above)	(see above)	waiver, exception, or modification is approved, any necessary mitigation is also documented. The applicant is then provided with a written notification of the decision. See Instruction Memorandum 2008-032 and 43 CFR 3101.1-4 for additional details.
352.	Brett	Mayer	American Canoe Association	69778	1	Suggestion for specific change to an alternative	Alternative D2 should be amended to ensure protections for: access, wilderness character, visual resources, soundscapes, water resources and natural resources, in the stipulations and regulations.	Lease stipulations and ROPS designed to protect one resource may also provide protections for additional resources.
353.	Withheld	Withheld	—	70515	5	Suggestion for specific change to an alternative	DOES NOT have a proper spill response plan and the nearest Coast Guard station is in Kodiak, which is hundreds of nautical miles away and would take days to reach if there were to be large spill.	BLM requirements should not duplicate State of Alaska requirements, especially when ADEC requirements are more detailed and in some cases more stringent than federal requirements. At the time of a site-specific proposal, the operator will be required to submit a spill response plan.
354.	Withheld	Withheld	—	71099	3	Suggestion for specific change to an alternative	There has to be a risk assessment in event of a spill, especially after the Gulf disaster including bonds and money held to remedy such an event, restoration, impacts to native people, cultural and natural heritage.	Risk probability and analysis are beyond the scope of this EIS, but they may be completed at the development plan or site-specific level.

S. Public Comments and BLM Responses (Alternatives)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
355.	Jill	Nogi	Environmental Protection Agency	71634	16	Suggestion for specific change to an alternative	Required Operating Procedures: Required Operating Procedure 6, Item A, states that BLM may require a minimum of one year of baseline ambient air monitoring data for any pollutant of concern. We recommend the BLM consider requiring contemporaneous PSD-quality meteorological monitoring at the location of the air quality monitor. Required Operating Procedure 6, Item F, states that BLM may require mitigation measures and strategies in case an air quality analysis finds an exceedance of the NAAQS. The EPA recommends BLM expand this requirement to also include mitigation in the event an air quality analysis finds an exceedance of a PSD increment.	The BLM will consider air monitoring data and meteorological data collection requirements in coordination with ADEC at the time of a site-specific project proposal, which could include collecting PSD-quality data. Air modeling performed in support of project-specific NEPA analyses would include a comparison of modeled results to PSD increments. However, because regulatory authority for PSD consumption analyses lies with ADEC, it is outside of the BLM's regulatory authority to require mitigation for modeled PSD exceedances.
356.	Withheld	Withheld	—	72125	38	Suggestion for specific change to an alternative	* A general stipulation should be added to all alternatives that describes that, "rights-of- way or easements across the Coastal Plain for exploration, development, production, or transportation may be issued only where necessary to carry out oil and gas production activities within the identified surface use areas."	Section 20001(c)(2) of the Tax Act states the Secretary shall issue any ROWs or easements across the Coastal Plain for the exploration, development, production, or transportation necessary to carry out this section. Any surface disturbance associated with ROWs count toward the 2,000-acre surface facility limit.
357.	Withheld	Withheld	—	72125	46	Suggestion for specific change to an alternative	A stipulation should be added that states, "[t]o extent authorized by under law, the free- flowing characteristics of Eligible river segments cannot be modified to allow any or all of the following: stream impoundments, diversions, channelization, and river bank stabilization."	Under all alternatives, the BLM would maintain free-flowing characteristics of eligible river segments and ensure that authorized uses comply with all stated objectives. Management actions that prohibit surface-disturbing activities, including NSO, CSU, and TLs near the eligible and suitable WSRs (Table 3-32) would provide varying protections for ORVs. This would also ensure that the free-flowing condition of the river remains intact.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
358.	Withheld	Withheld	—	72125	61	Suggestion for specific change to an alternative	The Leasing EIS must assess the effects of oil and gas seismic activities, exploration, and the full potential development footprint of the proposed action and alternatives on the collective purposes of the Arctic Refuge. In addition, the Fish and Wildlife Service recommended that the, "BLM analyze the cumulative effects of a full oil and gas build-out scenario within the Arctic Refuge Coastal Plain coupled with the full build-out scenarios for NPR-A and the State of Alaska lands of the Central Arctic."	All action alternatives are designed to meet the purpose and need, and to account for all purposes of the Arctic National Wildlife Refuge. Additional text has been added. The hypothetical development scenario and the EIS analysis take a full build-out scenario of 2,000 acres of surface development into consideration. Projects considered as part of the cumulative impact analysis need to be "reasonably foreseeable." Full build-out scenarios for NPR-A and the State of Alaska lands do not meet this criterion.
359.	Joshua	Morris	Seattle Audubon Society	72238	1	Suggestion for specific change to an alternative	Required Operating Procedure 43 (pg. 2-36): By what process will equipment and vehicles be certified as free of nonnative invasive species? We are not aware of any such certification process nor of detection methods for all nonnative invasive species. Please clarify.	Text has been added to ROP 43.
360.	Joshua	Morris	Seattle Audubon Society	72238	2	Suggestion for specific change to an alternative	General Wildlife and Habitat Protections (pg. 2-36): Two Required Operating Procedures require minimization of loss of populations and habitat for plant species (ROP 44) and mammalian species (ROP 45) designated as sensitive by BLM in Alaska. Please clarify why there are no requirements to protect avian, fish, or invertebrate species designated as sensitive by BLM in Alaska.	BLM sensitive species policy would apply to all taxa. ROP 45 has been modified.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
361.	Richard	Edwards	—	74281	15	Suggestion for specific change to an alternative	On page 3-207, we discover that for Alternative B: "The long-term, permanent degradation of the program area's primitive recreation setting could result from not requiring final abandonment to meet minimal standards for WSR designation, not restoring general wilderness characteristics of the area, and allowing exceptions to abandonment conditions." Whereas, on page 3-208, we read that for Alternatives C & D: "In the long term, requiring final abandonment to meet minimal standards for WSR designation and intent to restore general wilderness characteristics of the area would allow the program area to return to a primitive recreation setting. The removal of facilities and restoration of disturbed areas would eliminate displacement and access impacts associated with those features." Given the already unproven track record of even the most aggressive reclamation efforts to date in this harsh environment and the BLM's attempt to promote the 2,000-acre occupation limit as a moving target, why would we even consider constructing an alternative incorporating a lesser reclamation standard? The Draft EIS must be revised to eliminate a low bar reclamation standard as part of any proposed action alternative through revision of ROP #35 (page 2-32).	Under all alternatives, ROP 35 requires restoration to the land's previous hydrological, vegetation, and habitat condition.

S. Public Comments and BLM Responses (Alternatives)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
362.	Richard	Edwards	—	74281	16	Suggestion for specific change to an alternative	Lease Stipulation #9 purports to provide special protective measures for the biologically sensitive coastal waters. However, there is no specific mention of seawater treatment plants. Given critical nature of STP placement and operation in coastal waters, this is a significant omission. Lease stipulation #9 must be revised to highlight the specific requirements related to STPs.	The level of specificity for this would be determined at the project-level authorizations. Site-specific analyses, including those associated with infrastructure in support of oil and gas development, can more realistically be provided when the BLM receives an application to permit such infrastructure. The Leasing EIS makes no decisions on such infrastructure, except to prohibit it in specified areas of particularly high value surface resources under some alternatives.
363.	Richard	Edwards	—	74281	18	Suggestion for specific change to an alternative	6) Needed Revision of Required Operating Procedure 1 (DEIS, Chapter 2): Although the objective statement refers to “applicable ... laws and regulations”, the requirement/standard statement provides the lessee with no specific direction---in contrast to almost all other ROPs. For example, on page B-17, we find the following description: “Solid, unburnable waste would be disposed of in large trash receptacles or other approved containers and hauled to approved off-site landfills. On-site burial of solid wastes is not anticipated.” Could this ROP objective be achieved by on-site burial? The last sentence in the above excerpt certainly does not seem to eliminate that as an option. On-site burial of solid, unburnable waste is certainly not a best management practice for the Coastal Plain ROP #1 must be revised to provide direct prescriptive guidance to potential lessees.	ROP 2 provides direct prescriptive guidance through the development of a comprehensive waste management plan.

S. Public Comments and BLM Responses (Alternatives)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
364.	Lisa	Baraff	Northern Alaska Environmental Center	74306	3	Suggestion for specific change to an alternative	The rationale presented in Section 2.3 (Alternatives Considered But Eliminated From Detailed Analysis) regarding the decision to not carry forward an alternative considering 800,000 acres is irrational. BLM argues that low and medium potential areas must be included, since the high potential area is only 427,900 acres. With 658,400 acres of medium potential and 477,200 of low potential, BLM would only need to include 372,100 acres of medium potential and no acres of low potential areas. And that assumes that 400,000 acres would sell in each lease sale. In addition, BLM argues that the acreage considered in Alternative D (1,037,200) is "similar in concept" to an 800,000 acre option. The roughly 30% difference in acreage could be anything but "similar."	Alternative D2 has been revised to offer 800,000 acres of land available for lease. Based off best available information, the action alternatives maximize the areas with the highest HCP; the action alternatives balance areas with the highest HCP with surface resource protection. Because there are only an estimated 427,000 acres of high HCP, in order to get to an 800,000-acre lease sale, areas in medium HCP and low HCP would also need to be included in the lease sale (while still balancing resource protections).
365.	Lisa	Baraff	Northern Alaska Environmental Center	74306	18	Suggestion for specific change to an alternative	BLM states in required operating procedure 35 that it will "[e]nsure ongoing and long-term reclamation of land to its previous condition and use" through unspecified reclamation requirements. BLM claims that, before final abandonment, "land used for oil and gas infrastructure - including well pads, production facilities, access roads, and airstrips - will be restored to ensure eventual restoration of ecosystem function and meet minimal standards to restore general wilderness characteristics." What are the criteria for reclamation and what agency will be responsible for determining what is adequately reclaimed and when that land can be released from the 2000 acre cap?	Under all alternatives, ROP 35 requires restoration to the land's previous hydrological, vegetation, and habitat condition. Section 1.9.1 describes those facilities that will be counted against the 2,000 acres. The BLM will use facility data in the form of ArcGIS-compatible shapefiles obtained under ROP 33 to track facility acreage to assure continued compliance with the Tax Act limit.

367.	Matthew	Rexford	Kaktovik Iñupiat Corporation	74331	2	Suggestion for specific change to an alternative	In addition to our recommendations on the modifications to Alternative B, KIC makes the following suggestions for BLM to refine their EIS to be more aligned with the local community most directly impacted by leasing in the Program Area: 1. Focus the impact analysis on the Kaktovikmiut; 2. Enhance the local input and traditional knowledge in the DEIS; 3. Incorporate local economic impacts and potential for local capacity building in the impact analysis; 4. Include co-management with Alaska Native Landowners and opportunities for Nativeowned land; 5. Include local access issues raised by the community of Kaktovik; 6. Clarify FWS management over unleased land in the Program Area; and 7. Refine the analysis of Subsistence and Subsistence Resources.	As appropriate, additional information has been added to the EIS on the Kaktovikmiut. Traditional knowledge has been shared with the BLM throughout development of the EIS, including during the scoping, public meetings on the Draft EIS, government-to-government and ANCSA consultations, and through the Section 106 process. This information has been used to help inform development of the EIS and ensure a more robust analysis. Additional local economic impacts have been included in Section 3.4.10. The BLM does not have authority to enter into cooperative agreements for comanagement of surface resources in the Coastal Plain because they are not BLM public lands under FLPMA 307(b). Additional text has been added to subsistence, transportation, and lands in Sections 3.4.3, 3.4.9, and 3.4.1, respectively. Additional clarifying text has been added to Section 1.4. Analysis of subsistence uses and resources (Section 3.4.3) has been revised as necessary based on responses to public comments.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
368.	Matthew	Rexford	Kaktovik Inupiat Corporation	74331	3	Suggestion for specific change to an alternative	Though BLM acknowledges Kaktovik is the impacted community, BLM strays from assessing the impacts to Kaktovik throughout the DEIS. KIC understands that BLM must assess the extent of impacts, but we do not think these should be discussed equally but weighed in proportion. The Gwich'in will not be impacted from oil and gas leasing similarly to the Kaktovikmiut. Yet, BLM spends almost the same (or more) time discussing the impacts to the Gwich'in, providing background on Gwich'in history, and summarizing Gwich'in cultural resources, socioeconomic impacts, subsistence, and more. We find this analysis distracting from the actual impacts. Ironically, BLM and others often neglect to include the Gwich'in own efforts toward resource development. In the 1980s, Venetie attempted to lease 1.8 million acres of their land near the wilderness area of the ANWR-an area larger than the entire Program Area being discussed for resource development. There are also ongoing efforts to develop the Yukon Flats Refuge, both Arctic Village and Venetie have received payments from leasing and seismic acquisition efforts. KIC is not against the Gwich'in effort to develop their land and to utilize their natural resource to the benefit of their people, for that is what we are attempting to provide for our shareholders. Despite BLM's longwinded background on the Gwich'in, BLM concludes in almost every section, including subsistence, that the Kaktovik are the only impacted community. KIC agrees with this assessment. BLM's should modify their analysis to center their analysis on the impacted community-Kaktovik-and a discussion of impacts expected from leasing in the Program Area.	The BLM has edited the EIS to provide additional information on Kaktovik as necessary to support the analysis.

369.	Matthew	Rexford	Kaktovik Inupiat Corporation	74331	4	Suggestion for specific change to an alternative	2. Enhance the level of local input and traditional knowledge in the DEIS KIC has attended several meetings with BLM staff to discuss leasing in the Program Area and is actively participating in ANCSA Corporation Consultation. BLM has worked to include Kaktovik in this process and has had several meaningful engagements in Kaktovik discussing this important topic; however, there is hardly mention of the local expertise reflected in the DEIS. BLM references several "phone conversations" with "experts" on important topics like subsistence and polar bears, but valuable information from our engagements are not included. BLM should work to better include the Traditional Knowledge and local expertise in the DEIS to produce a more balanced document.	The BLM has edited the EIS to provide additional information on Kaktovik as necessary to support the analysis.

370.	Matthew	Rexford	Kaktovik Inupiat Corporation	74331	8	Suggestion for specific change to an alternative	6. Clarify FWS management over unleased land in the Program Area BLM must distinguish its oversight role with that of FWS. Historically, the FWS has managed the 1002 as wilderness, which has caused numerous issues with the local people. KIC was created by ANCSA to provide for our shareholders, however FWS' management of the refuge and the restriction of development in the 1002 Area have limited our ability to utilize the natural resources in the Coastal Plain to provide for our shareholders. We have felt ignored and that our concerns have been disregarded as development has progressed around us in Canada and across the North Slope in equally pristine regions. As BLM assumes authority over oil and gas leasing, BLM and FWS should clarify what their management roles will be within the 1002 Area. At the onset of leasing, KIC is concerned that FWS may continue to manage setbacks at the coast or along the requested rivers and unleased land as wilderness. Not only will this have detrimental effects on the success of leasing, but it will also carry on unresolved subsistence access issues if these areas are managed as wilderness.	Additional clarifying text has been added to Section 1.4 regarding roles and responsibilities of the BLM and the USFWS. Additional text has been added to the subsistence, transportation, and lands Sections 3.4.3, 3.4.9, and 3.4.1, respectively.
371.	Eric	Walsh	Government of Canada	74346	7	Suggestion for specific change to an alternative	requests that the BLM complete an analysis to determine if meeting the intended purposes of the ANWR10 may best be accomplished by leasing the minimum acreage required by PL 115-97. We note that, for Refuge management purposes, oil and gas leasing is subservient to the conservation purposes according to Fish and Wildlife Service policy11.	Alternative D2 has been revised to include 800,000 acres of land available for lease. All action alternatives are designed to meet the purpose and need, and to account for all purposes of the Arctic National Wildlife Refuge. See Section 3.4.7.

372.	Eric	Walsh	Government of Canada	74346	22	Suggestion for specific change to an alternative	In many instances, mitigations and measures can be waived by the "BLM Authorized Officer". Though this term is defined in the glossary, it is unclear to what level in the organization this authority is normally delegated. More concerning however is that there are no criteria in the dEIS that indicate how such discretionary authority will be objectively applied. The United States Government Accountability Office report GAO-17-30731 concludes that "Because BLM does not consistently track exception request data or have a consistent process for considering requests and clearly documenting decisions, BLM may be unable to provide reasonable assurance that it is meeting its environmental responsibilities."	Operators are required to submit a written request for an exception, waiver, or modification and information demonstrating that (1) the factors leading to the inclusion of the stipulation in the lease have changed sufficiently to make the protection provided by the lease stipulation no longer needed or (2) the proposed operation would not cause unacceptable impacts. The criteria for approval of exceptions, waivers, and modifications should be supported by NEPA analysis, and may require site-specific environmental review. Requests should contain, at a minimum, a plan that includes related on-site or off-site mitigation efforts to adequately protect affected resources; data collection and monitoring efforts; and timeframes for initiation and completion of construction, drilling, and completion operations. The operator's request may be included in an Application for Permit to Drill, Notice of Staking, Sundry Notice, or letter. The BLM may also proactively initiate the process. During the review process, BLM coordination with other local, state, or federal agencies (e.g., ADFG, NSB, and local governments) should be undertaken, as appropriate, and documented. The BLM will also consult with the federal surface management agency (e.g., USFWS). Approval or disapproval is made by the Authorized Officer, and the decision is documented. If the waiver, exception, or modification is approved, any necessary mitigation is also documented. The applicant is then provided with a written notification of the decision. See Instruction Memorandum 2008-032 and 43 CFR 3101.1-4 for additional details.

S. Public Comments and BLM Responses (Alternatives)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
373.	Eric	Walsh	Government of Canada	74346	30	Suggestion for specific change to an alternative	While the dEIS discusses ROPs and stipulations, more detail is warranted, specifically in a formal adaptive management context by having an independent oversight board for development, coordinated before-and-after studies, publicly available data and results, and timely revision of ROPs, stipulations, and mitigations.	Exceptions, waivers, and modifications provide an effective means of applying “adaptive management” techniques to oil and gas leases and associated permitting activities to meet changing circumstances. The BLM or operators can initiate adaptive management modifications. See Instruction Memorandum 2008-032 and 43 CFR 3101.1-4 for additional details.
374.	Donald	Pendergrasst	—	75129	3	Suggestion for specific change to an alternative	Stronger temporal limits need to be included in Alternative D2 in order to protect Porcupine Caribou Herd calving and post-calving periods (“when caribou abound, shut ‘em down”).	Current lease stipulations and ROPs regarding protections for PCH calving and post-calving habitat were developed through coordination with cooperating agencies, government-to-government and ANCSA consultation, and recommendations from agency subject matter experts. The varying protections remain in order to analyze a reasonable range of alternatives.
375.	Withheld	Withheld	—	75139	2	Suggestion for specific change to an alternative	Secondly, the proposed alternatives are inadequate, in that they do not provide an absolute-minimum scenario. One striking example is the projected impact on visual resources under alternative D, which clearly represent a major impact. The EIS should include an absolute-minimum scenario. BLM has an obligation to provide a true picture of the severity of impacts that would be incurred if oil and gas are allowed to proceed in the Coastal Plain, and to provide a minimum impact scenario to enable maximal protections of this precious resource and against global climate impact from such an irresponsible plan as oil and gas leasing as called for in the atrocious PL 115-97.	Alternative D2 has been revised to include 800,000 acres of land available for lease.

376. (cont.)	(see above)	(see above)	(see above)	(see above)	(see above)	(see above)	two reasons. There are thousands of places that are ecologically sensitive that deserve protection that are not named - and are not addressed at all in the lease stipulations. There is no language for limiting non-permanent facilities of any kind so temporary roads, trails, airstrips, powerlines, pipelines, etc. are not restricted. This impact is not analyzed. 6. ROP 28 and 29 require the creation of an ecological land classification map and an archaeological / paleontological resources map to be able to assess the appropriateness of facility development. It seems like this is the basic standard for an analysis in an EIS for all resources. Completing an EIS and then determining what is out there so important areas can be avoided is a backward way of evaluating the proposed alternatives and determining effects.	(see above)
377.	Withheld	Withheld	—	75601	7	Suggestion for specific change to an alternative	Only two ROPs directly address cultural resources, and they by themselves are not sufficient to minimize or mitigate adverse effects. Specifically, ROP 29 requires the lessee/operator/contractor to conduct a cultural resources survey before ground-disturbing activity. However, potential impacts to cultural resources should be known prior to the lease being approved, and therefore a cultural resources study should be required prior to the lease being approved, and submitted as part of the lease application.	Lease stipulations and ROPs designed to protect non-cultural resources may also provide protections for cultural resources. ROP 29 requires a cultural resource survey before any ground-disturbing activity; the BLM cannot impose a ROP tied to a lease prior to a lease being issued.

378.	Cherise	Gaffney	Alaska Oil and Gas Association, and American Petroleum Institute	79893	5	Suggestion for specific change to an alternative	many of the proposed NSO restrictions and setbacks go far beyond mitigation measures effectively employed for decades across the North Slope to protect sensitive areas, water bodies, wetlands, polar bears, caribou, and other natural resources. BLM should make determinations on the appropriateness of surface occupancy restrictions as compared to other successfully deployed mitigation measures based on site-specific analyses of reservoir targets, the best available technology, and site-specific wildlife studies, as is done in the NPR-A.	All action alternatives are designed to meet the purpose and need, and to account for all purposes of the Arctic National Wildlife Refuge. See Section 3.4.7.
379.	Cherise	Gaffney	Alaska Oil and Gas Association, and American Petroleum Institute	79893	9	Suggestion for specific change to an alternative	Table 2-2 describes the minimization objectives associated with each lease stipulation but does not describe or analyze how NSO stipulations would achieve the stated objectives. In fact, in some places, the DEIS appears to suggest that a mitigation objective could be similarly achieved through either an NSO or a non-NSO stipulation, suggesting that the choice between these alternatives would be arbitrary. ⁶³ Without the benefit of BLM's analysis of whether and to what extent NSO restrictions are warranted to meet the stated mitigation objectives, the oil and gas industry cannot meaningfully comment on whether the specific NSO requirements are reasonably related to a legitimate governmental purpose or whether the stated mitigation objectives could be achieved with less burdensome mitigation measures.	The Lease stipulations and ROPs were designed to mitigate impacts on multiple resources. The fact that impacts on a specific resource are similar across all action alternatives does not, per se, indicate that the range of alternatives is not reasonable under NEPA.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
380.	Cherise	Gaffney	Alaska Oil and Gas Association, and American Petroleum Institute	79893	10	Suggestion for specific change to an alternative	As discussed in Section III.A.3 supra, mitigation or avoidance measures to protect surface resources should be developed by BLM in consideration of site-specific development proposals at the time the surface use plan and application for permit to drill for such proposals are considered. Accordingly, BLM must modify the alternatives, consistent with the Tax Act, to remove broad NSO stipulations, setbacks and other broad, surface-related restrictions not related to site-specific information.	The BLM is required to ensure all action alternatives are designed to meet the purpose and need, and to account for all purposes of the Arctic Refuge at the leasing stage. In the event that an objective of a lease stipulation or ROP may be met through another means, when submitting a site-specific proposal, operators may request a waiver, modification, or exemption. See Instruction Memorandum 2008-032 and 43 CFR 3101.1-4 for additional details.
381.	Cherise	Gaffney	Alaska Oil and Gas Association, and American Petroleum Institute	79893	22	Suggestion for specific change to an alternative	2-4 to 2-5 Lease Stip. 1 This stipulation should provide an explanation for why the proposed setback distances correlate to protection of terrain, habitat or floodplain features, and the stipulation should define boundaries based upon the presence of such features. Finally, the FEIS should recognize that a pipeline cannot span a river or stream under the setbacks provided in this stipulation. The FEIS should describe scenarios in which such crossings would be allowed, rather than relying on future undefined and uncertain exception processes for all pipeline crossings.	The setbacks are designed to protect multiple resource functions and values. Additional text has been added to Table 2-3 in the Final EIS to further describe the waivers, exceptions, and modifications for applicable lease stipulations and ROPs.
382.	Cherise	Gaffney	Alaska Oil and Gas Association, and American Petroleum Institute	79893	23	Suggestion for specific change to an alternative	Lease Stips. 1 & 2 The DEIS appears to describe a different stipulation framework for river deltas than for rivers and streams. The Associations suggest moving river delta stipulations to stipulation 2.	No change. Lease Stipulation 2 is specific to the Canning River Delta and lakes only.

S. Public Comments and BLM Responses (Alternatives)

383.	Cherise	Gaffney	Alaska Oil and Gas Association, and American Petroleum Institute	79893	24	Suggestion for specific change to an alternative	Lease Stip. 4; Alternative D(b) This component of the stipulation requires coordination of construction and infrastructure use with "all other prospective Arctic Refuge users or user groups," but does not clarify how this coordination would be achieved given the likely difficulty of identifying and coordinating with "all" potential user groups. This stipulation should be revised to clarify that coordination will be accomplished through public notice and consultation.	Text revised to add that this "may be accomplished through public notice and coordination with users in affected communities."
384.	Cherise	Gaffney	Alaska Oil and Gas Association, and American Petroleum Institute	79893	25	Suggestion for specific change to an alternative	Lease Stip. 10; Alternative D In order to "[p]rotect wilderness values," this stipulation would prohibit surface occupancy within 3 miles of the southern and eastern boundaries of the Coastal Plain near the Mollie Beattie Wilderness Area. This presumptive setback is inconsistent with the Tax Act and the newly revised purpose of ANWR under ANILCA "to provide for an oil and gas program on the Coastal Plain." Visual or other impacts in such areas should be considered on a case-by-case basis in review of specific proposals for development, not subject to preemptive prohibition.	The BLM is required to ensure all action alternatives are designed to meet the purpose and need, and to account for all purposes of the Arctic National Wildlife Refuge at the leasing stage. See Section 3.4.7.
385.	Cherise	Gaffney	Alaska Oil and Gas Association, and American Petroleum Institute	79893	27	Suggestion for specific change to an alternative	2-18 ROP 6(c) To remove ambiguity, this ROP should be revised to clarify the scope of indirect emissions sources or to allow indirect sources to be addressed qualitatively, consistent with the most current practice on the North Slope. For example, hauling materials to the North Slope on the Dalton Highway is generally considered an indirect source, but is never quantified. As written, this ROP could be interpreted to require calculation of these emissions and many others as part of an initial application. This is more information than is needed for BLM to determine the appropriate scope of the air quality analysis under NEPA.	The specific change was not implemented; however, the text of ROP 6 has been modified.

387.	Cherise	Gaffney	Alaska Oil and Gas Association, and American Petroleum Institute	79893	29	Suggestion for specific change to an alternative	2-19 ROP 7 This ROP would require a proponent of a permanent oil and gas development to design and implement a monitoring study of contaminants in locally used subsistence foods. We recommend removing this proposed requirement for at least three reasons. First, potential contaminants from oil and gas operations are already prevented from entering subsistence foods due to the applicability of numerous monitoring and release prevention requirements. This ROP may be interpreted to imply some level of tolerance for pollution to enter subsistence foods, which is misleading and would likely cause groundless concern over subsistence food. Monitoring should instead be focused as needed on potential sources of contamination and related environmental areas such as nearby water bodies. Second, placing responsibility on a lessee or operator to conduct subsistence food sampling can be intrusive to subsistence users and tends to create tension between the users and the operators. Third, a sampling program designed and implemented by an operator may be viewed with skepticism by the subsistence community. Accordingly, should any sampling of subsistence foods prove to be necessary, it is an effort better suited to the federal land manager, the trustee agency for the species at issue, or the local government.	As noted in footnote 1, Table 2-3 in the Final EIS, the BLM will consult with appropriate entities on site-specific projects, which could include approaches to monitoring.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
388.	Cherise	Gaffney	Alaska Oil and Gas Association, and American Petroleum Institute	79893	30	Suggestion for specific change to an alternative	2-19 ROP 8 This ROP would prevent the withdrawal of unfrozen water from springs, rivers, and streams during winter. If implemented, this ROP would have significant adverse impacts on oil and gas operations, particularly given that rivers and streams comprise most of the water resource available in the lease areas. Moreover, the ROP is unnecessary and inconsistent with proven existing regulation of water withdrawals on the North Slope. BLM should consider modifying this ROP to be similar to stipulations protecting anadromous fish, including the use of fish screens and limitations on the amount of liquid water under ice that could be removed.	This ROP is consistent with current practices across the North Slope and is included in the current NPR-A Integrated Activity Plan Record of Decision as a best management practice. If the objective can be met without implementation of this ROP, then the operator could apply for a waiver, exemption, or modification.
389.	Cherise	Gaffney	Alaska Oil and Gas Association, and American Petroleum Institute	79893	31	Suggestion for specific change to an alternative	ROP 9 Paragraph d of proposed ROP 9 is confusing and has been contentious in its application in the NPR-A. There, BLM often applies this provision in an overly restrictive manner that regularly results in the need to request a deviation in order to secure the amount of ice needed for ice road and pad construction. These requests are granted because ice aggregate is removed from areas of lakes frozen down to the lake bed and therefore does not reduce fish, aquatic invertebrate, or waterfowl habitat. For this reason, we recommend that BLM delete paragraph d from this proposed ROP and add a clause to paragraphs a and b that allows up to 20% total lake volume to be used when both ice and water are being withdrawn. This would be protective of hydrology and habitat, and consistent with state regulations.	The 15 percent, 20 percent, and 30 percent limits are what the State of Alaska (both Alaska Department of Fish and Game and DNR Water) will use to issue any required fish habitat permits or temporary water use authorizations. Deviations could be issued if the operator provides adequate justification for the need and provides the necessary bathymetric information and predicted or measured recharge for the lake in question.

390.	Cherise	Gaffney	Alaska Oil and Gas Association, and American Petroleum Institute	79893	32	Suggestion for specific change to an alternative	<p>ROP 10 The Associations have significant concerns about ROP 10, both in terms of how it is presented and its specific mitigation proposals. First, ROP 10 appears to primarily apply to marine or on-ice seismic operations. Much of the anticipated seismic work on the Coastal Plain is expected to be terrestrial, so the presentation of ROP 10 is unnecessarily confusing. The Associations request that the FEIS clearly indicate that ROP 10 applies to marine or on-ice operations only. Second, the FEIS should treat polar bears and ice seals separately in terms of the "requirement/standard" articulated in the ROP. These species have different life cycles, agencies of oversight, dates of biological significance, and types of mitigation. It is inappropriate to apply the same requirements and standards to both. Moreover, while ringed seals are mentioned, there is no mention of other ice seals or whales. It is 5 99959215.12 0078439-00052 critical that the FEIS clarify to which species this ROP is intended to apply, and that the requirements/standards and mitigation be specific to and appropriate for each species. For example, it is valid and appropriate to assume that a polar bear maternal den survey would be conducted between October 30 and April 30 in consultation with FWS for winter overland moves and seismic work. However, this date range is only valid for polar bears. For ice seals, new activities over a previously undisturbed area in ice seal habitat should occur between March 1 and April 15 in consultation with NMFS. Seal mitigation measures should be set forth separately, as they do not build lairs or pup until March.</p>	<p>The BLM revised ROP 10 to clarify the distinction of marine mammals, and mitigation measures associated with each species and during separate activities.</p>

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
391.	Cherise	Gaffney	Alaska Oil and Gas Association, and American Petroleum Institute	79893	33	Suggestion for specific change to an alternative	ROP 32 This ROP should be modified to remove the requirement for eider nest searches. The DEIS recognizes at page 3-86 that Steller's eiders are "considered to occur only as a rare visitor in the program area and [are] not expected to nest that far east on the ACP." On the same page, the DEIS notes that Spectacled eiders are "uncommon breeders in the program area, and nests have been documented only on the Canning River delta."	This ROP was developed in coordination with resource experts and determined to be a necessary precaution to protect the resource.
392.	Cherise	Gaffney	Alaska Oil and Gas Association, and American Petroleum Institute	79893	34	Suggestion for specific change to an alternative	ROP 11(e) This component of the ROP requires an undefined offset to avoid portions of previous ice road routes. This is not warranted because, as recognized in the GMT2 SEIS, "[a] study by Yokel et al. (2007) suggests that seasonal ice roads and pads constructed within the same footprint each year do not have additive effects over years." GMT2 SEIS at 336. Moreover, constructing an ice road in the same location as subsequent years is considered best practice and may be necessary to avoid difficult terrain, archaeological sites or sensitive environmental resources.	ROP 11 has been modified related to ice roads.

395.	Cherise	Gaffney	Alaska Oil and Gas Association, and American Petroleum Institute	79893	37	Suggestion for specific change to an alternative	2-36 ROP 45 Based on molecular genetic research published in 2010 and 2012, the Alaska tiny shrew has been merged by mammal taxonomists with the Eurasian least shrew and is now classified as the Holarctic least shrew (<i>Sorex minutissimus</i>), which occurs from Scandinavia, across Russia, and into Alaska and Yukon, and which is classified by the International Union for the Conservation of Nature as "least concern." Because of this changed taxonomic status and the fact that the species is not listed in the State of Alaska's current Wildlife Action Plan, this species does not meet the eligibility criteria for Sensitive species established by BLM Manual 6840.	ROP 45 has been modified accordingly.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
396.	Anne	Fuller	—	80944	4	Suggestion for specific change to an alternative	<p>This DEIS proposes only a few alternatives, while not respecting the law. While the new law (Tax Act) requires that only 2000 acres be impacted, the project described in the DEIS includes more acreage (from the abstract: "Alternatives B, C, and D propose a range of the extent of the Coastal Plain that would be available for lease sale—from 66 to 100 percent of the 1.56 million-acre Coastal Plain.") Disturbance to the land and water (and thus to the creatures, including humans who depend on it) from ice roads and ice pads matter. It is hard to see how one can justify that digging up gravel is not part of the facilities for oil and gas production (as you say on 1-6). Where is the analysis of proposed seismic exploration, surely a necessary part of the project? Clarification of the leased, non-leased, and reclaimed acreage is needed to evaluate the impacts of this leasing. There should be a scientifically accurate statement of what reclaimed acreage looks like and what ecological functions have been restored. Are there any examples of such ground north of the Brooks Range?</p>	<p>Section 1.9.1 has been revised to identify the production and support facilities that would count toward the 2,000-acre limit, which now includes gravel mines. Rationale as to why certain facilities may not be included is contained in Section S.1.2 of this Appendix. Appendix B explains the different types of seismic exploration that are analyzed in the EIS. Seismic exploration can be done across the full area of the Coastal Plain, even if an area is not available for lease. A site-specific NEPA analysis would be done for any proposed seismic explorations. Section 1.9.1 describes those facilities that will be counted against the 2,000 acres. The BLM will use facility data in the form of ArcGIS-compatible shapefiles obtained under ROP 33 to track facility acreage to assure continued compliance with the Tax Act limit. ROP 35 requires the development of a BLM-approved abandonment and reclamation plan. Under all alternatives, ROP 35 requires restoration to the land's previous hydrological, vegetation, and habitat condition.</p>

397.	Natalie	Dawson	—	81061	8	Suggestion for specific change to an alternative	As an Alaskan, I am particularly concerned about the impacts of this leasing program on the future of climate change in the Arctic. I am asking the BLM to require a cost-share agreement as part of any leasing program, in which leases on federal land are taxed at a higher than current rate, and some of the revenue (at least 50%) is returned to environmental research and ongoing monitoring, including spill response systems. The Arctic Slope Regional Corporation, and each of its subsidiaries including SAEploration, should have additional taxes placed on them when developing and leasing federal lands because they are for-profit corporations. Currently, it is tax-advantageous in the state of Alaska to promote oil and gas leasing. This structure should change, so that taxes benefit research and not development. This should take the form of a climate tax-any project that adds significantly to climate change (measured by carbon concentrations) should be taxed with an additional structure in place to pay forward the harm done to the environment for current and future generations.	The BLM does not have tax authority. In PL 115-97, Congress has dictated the distribution of revenues generated from an oil and gas program.
398.	Todd	Campbell	Conservation Biology course	81185	9	Suggestion for specific change to an alternative	We suggest modifying alternative D-1 to require bear safety training for all working on 1002 to avoid human-bear interaction (including waste management).	Under ROP 40g (all alternatives), all personnel involved in oil and gas and related activities would be trained on human/bear safety.

399.	Todd	Campbell	Conservation Biology course	81185	11	Suggestion for specific change to an alternative	Each terrestrial animal discussed could be affected by the habitat destruction and noise pollution. The special rules in the D-1 alternative protecting caribou and their calving sites should be extended to moose, wood bison and muskoxen. These species are struggling in calf survival as well. The D-2 alternative is also offering the least number of affected acres which is important because many of these species have uncertain range and affecting the least number of acres is ideal. This alternative will not be rejected compared to a no action request. However, modification is needed to care for more terrestrial animals aside from the caribou.	Lease stipulations and ROPs designed to protect one resource may also provide protections for additional resources.

S. Public Comments and BLM Responses (Alternatives)

400.	Todd	Campbell	Conservation Biology course	81185	12	Suggestion for specific change to an alternative	Noise pollution can also be a huge problem with vessels and other machinery that would be used in oil and gas drilling. We would need an understanding of how noise was going to be regulated and where the noise would be traveling too and how severely that would affect certain mammals. Alternative D does have the biggest protection of marine mammals apart from alternative A, which has been deemed unviable due to the Tax Cuts and Jobs Act of 2018. Alternative D seems to show 0.5- to 4-mile buffers around 17 rivers and streams which is good for some noise and water pollution reduction. This alternative also shows that it would have the lowest habitat destruction. What the EIS fails to show is the key differences for Alternative D-1 and Alternative D-2 in regards to marine mammals. There is no way to define which one would seem like the better option since they are so similar. I also suggest there be in place a required plan for the quickest ways to clean up oil-spills if ever were to occur and if drilling would continue once a spill had happened. Alternative D seems like the best and most reasonable alternative for the marine mammals' future and conservation.	The fact that impacts on marine mammals are similar across Alternatives D1 and D2 does not, per se, indicate that the range of alternatives is not reasonable under NEPA. At the time of a site-specific proposal, the operator will be required to submit an oil spill response plan.
401.	Steven	Amstrup	Polar Bears International	81368	101	Suggestion for specific change to an alternative	BLM must include a more comprehensive set of required, measurable, and enforceable mitigations, that is based on the results of air quality modeling analyses, to ensure there will be no significant impacts to air quality from the proposed leasing program.	This level of specificity would be determined at the project-level authorization. Site-specific analyses, including those associated with infrastructure in support of oil and gas development, can more realistically be provided when the BLM receives an application to permit such infrastructure. The Leasing EIS makes no decisions on such infrastructure, except to prohibit it in specified areas of particularly high value surface resources under some alternatives.

S. Public Comments and BLM Responses (Alternatives)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
402.	Steven	Amstrup	Polar Bears International	81368	107	Suggestion for specific change to an alternative	At the Prudhoe Bay oil field - which includes oil and gas production, gas processing and gas reinjection processes - BP has successfully implemented a cost-effective centrifugal compressor seal oil de-gassing emissions recovery system that uses wet seal centrifugal compressors with a seal-oil / gas separation system that recycles the separated gas and reduces over 45,000 tons per year of CO ₂ eq emissions from each compressor. ⁶⁴ BLM should consider this and / or the use of dry seals as a means to minimize CO ₂ eq emissions from centrifugal compressors, where applicable, at development sites on the Coastal Plain. Controlling emissions from compressors in these ways is consistent with EPA's New Source Performance Standards (NSPS) for the oil and natural gas sector. ⁶⁵	This level of specificity would be determined at the project-level authorization. Site-specific analyses, including those associated with infrastructure in support of oil and gas development, can more realistically be provided when the BLM receives an application to permit such infrastructure. The Leasing EIS makes no decisions on such infrastructure, except to prohibit it in specified areas of particularly high value surface resources under some alternatives.
403.	Steven	Amstrup	Polar Bears International	81368	108	Suggestion for specific change to an alternative	Equipment leak detection and repair programs across all sectors (i.e., processing, production, transmission and storage) can be cost-effective and significantly reduce methane and VOC emissions. Leak detection and repair (LDAR) programs are vital to addressing fugitive emissions from oil and gas sources. EPA's technical analysis for its 2016 NSPS for the oil and natural gas industry estimated the following potential emissions reductions from LDAR programs: 40 percent reduction in emissions for annual monitoring; 60 percent reduction in emissions for semiannual monitoring; and 80 percent reduction in emissions for quarterly monitoring programs. ⁶⁶ Any oil and gas development on the Coastal Plain should require leak detection and repair programs at sites with gas production, processing, and / or transport.	This level of specificity would be determined at the project-level authorization. Site-specific analyses, including those associated with infrastructure in support of oil and gas development, can more realistically be provided when the BLM receives an application to permit such infrastructure. The Leasing EIS makes no decisions on such infrastructure, except to prohibit it in specified areas of particularly high value surface resources under some alternatives.

404.	Megan	Williams	o.b.o. Trustees for Alaska	81368	110	Suggestion for specific change to an alternative	BLM should commit to requiring specific minimum oil and gas mitigations and consideration of additional enhanced mitigations based on the most recent demonstrated technologies. In order to ensure that the minimum required mitigations are reflective of the latest available technologies and practices, BLM should make a commitment to periodically reviewing and revising the list of minimum required controls and enhanced mitigation measures every three years based on a review of currently-available cost-effective controls. This process of updating the minimum controls should include input from an air quality technical work group established under the air quality MOU.	This level of specificity would be determined at the project-level authorization. Site-specific analyses, including those associated with infrastructure in support of oil and gas development, can more realistically be provided when the BLM receives an application to permit such infrastructure. The Leasing EIS makes no decisions on such infrastructure, except to prohibit it in specified areas of particularly high value surface resources under some alternatives.
405.	Carolyn	Alkire	Key-Log Economics o.b.o. The Wilderness Society	81368	113	Suggestion for specific change to an alternative	There is a large body of scientific work documenting the adverse impacts to public health and welfare from climate change caused by greenhouse emissions, such as methane. More recently, scientific studies have demonstrated that these same methane emissions contribute to the formation of ground-level ozone. ⁷⁵ Methane reductions, therefore, have a direct impact on both climate change and ozone pollution. In addition, many of the proven methane emission controls for the oil and gas sector also reduce volatile organic compounds (VOCs) and HAPs. The associated air quality benefits that result from reductions in VOC and HAP emissions are a huge co-benefit of methane reduction technologies. BLM should consider mitigation measures and reasonable alternatives to minimize fugitive methane from an oil and gas program on the Coastal Plain.	This level of specificity would be determined at the project-level authorization. Site-specific analyses, including those associated with infrastructure in support of oil and gas development, can more realistically be provided when the BLM receives an application to permit such infrastructure. The Leasing EIS makes no decisions on such infrastructure, except to prohibit it in specified areas of particularly high value surface resources under some alternatives.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
406.	Allison	Athens	—	81746	8	Suggestion for specific change to an alternative	The orientation program associated with permitted activities is wholly inadequate. There are no consequences attached to failing to follow these standards and no actual behavioral requirements expected of and enforced on operators. In order to show that an orientation program would be effective at meeting this procedure, BLM needs to supply associated data for all aspects of this program as experienced in other remote oil fields in Alaska with rural Native communities living close by.	As noted under ROP 40 (section i), the BLM has authority under 43 CFR 3163 to issue assessments and penalties for non-compliance with oil and gas operational requirements.
407.	Allison	Athens	—	81746	12	Suggestion for specific change to an alternative	What is the oversight of whether or not the seasonal workers conform to these standards to be instituted and enforced? BLM has failed to address these as actual, real, impacts on people and animal lives. BLM has failed to provide any data that an orientation program lessens the impacts associated with seasonal worker camps on remote village communities and on endangered and subsistence animals.	As noted under ROP 40 (section i), the BLM has authority under 43 CFR 3163 to issue assessments and penalties for non-compliance with oil and gas operational requirements.
408.	Allison	Athens	—	81746	13	Suggestion for specific change to an alternative	BLM has failed to provide actual mitigation of these effects because BLM has not provided any enforceable consequences for failing to adhere to these standards. Without punishable consequences, BLM presents a toothless platitude to the real concerns of community members. No doubt the making of this ROP is informed by the concerns of community members voiced at public hearings who have heard of the social ills brought by the influx of seasonal workers into isolated rural communities. Given that BLM has seen fit to have this ROP in all three alternatives, it is not outside the scope of this project to require more substantial analysis of these orientation programs.	As noted under ROP 40 (section i), the BLM has authority under 43 CFR 3163 to issue assessments and penalties for non-compliance with oil and gas operational requirements.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
409.	Ruth	Wood	—	83199	2	Suggestion for specific change to an alternative	<p>A bigger problem is that this Draft EIS should cover only one lease sale. Public Law 115-97 calls for one lease sale in 4 years and another in 7 years. If a lease sale is allowed to proceed, and I assert that it should not, then things learned from the first lease sale should be used to draft an EIS for the second. Developments under the first lease sale will most assuredly impact the Refuge, and an additional EIS will be needed to address the cumulative impacts. Under no circumstances should both lease sales proceed at the same time, and Congress clearly did not intend for them to be simultaneous: "(I) the initial lease sale under the oil and gas program under this section not later than 4 years after the date of enactment of this Act; and (II) a second lease sale under the oil and gas program under this section not later than 7 years after the date of enactment of this Act."The Draft EIS says, "This Draft EIS is intended to fulfill NEPA requirements for lease sales conducted at least through December 2027 and potentially thereafter. Before it conducts the second and each subsequent lease sale, the BLM will evaluate the adequacy of the Draft EIS in light of new information and circumstances to determine whether it requires supplementation or revision in order to comply with NEPA" (from volume 1, I-5.) First, the clause "and potentially thereafter" should be deleted from the Draft EIS. As stated, the Draft EIS would fulfill NEPA requirements forever, and that clearly does not make sense. Second, this clause says the second and each subsequent lease sale. Only two sales have been authorized, so this language needs to be fixed. I understand that BLM thinks it may employ a phased approach, but this whole section is unclear and needs to be rewritten</p>	<p>The Tax Act requires a minimum of two lease sales; the lease sales are not simultaneous. This EIS is programmatic and intended to address all potentially foreseeable lease sales in the Coastal Plain. After the initial sale, and prior to each subsequent sale, the EIS will be evaluated to determine if it continues to remain adequate under NEPA.</p>

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
410.	Matt	Krogh	Stand.earth	83321	3	Suggestion for specific change to an alternative	It remains unclear how the seismic process folds into the DEIS and lease sales. The lease sale bidding process is also unclear, as outlined in detail in the coalition comments referenced above. These processes need to be clarified with opportunity for public comment.	The EIS analyzes seismic activities as part of oil and gas development under all action alternatives, as this activity can occur post-lease. 43 CFR 3131.4-1 outlines the details of the lease sale bidding process.
411.	Cody	Deane	—	92108	1	Suggestion for specific change to an alternative	However, this relevant background information is rarely followed by quantitative predictions and results from other communities following oil development. Stated otherwise, there is little relative information exploring how 1002 development under the four alternatives. This is repeated throughout much of the document. For example, in the section beginning on page 240 (“Noise, Traffic, and Human Activity”) there are no predictions on how these factors might change in a meaningful way. For example, “Under Scenario B, it could be expected that winter truck traffic to well pads would average 14 trucks per day during the period in which permafrost roads are intact. The impact to the sound and view scape, to both caribou and Kaktovik residents, is predicted to extend 2 miles on either side of wellpad roads under normal winter conditions. Under Alternative C, Under Alternative D, the large reduction in the land available for lease sale would reduce the expected number of trucks per day during the period in which permafrost roads are intact to 2-6 trucks per day.” This lack of quantitative comparisons between the different scenarios leads me, and many others, to the conclusion that this EIS document is incomplete. The entire document contains little quantitative information for comparing the alternatives. It is especially frustrating that there is an apparent effort to appear quantitative by repeating the size of the lease sales,	The hypothetical development scenario represents a good faith effort to project reasonably foreseeable oil and gas exploration, development, production, and abandonment in accordance with the Tax Cuts and Jobs Act of 2017 and 40 CFR 1508.8(b). Estimating the level of future oil and gas activity in this area is difficult at best. The analysis in the Draft EIS incorporates quantitative analysis when available. Future site-specific NEPA analyses for proposed projects would be required. A more quantified analysis is more appropriate during site-specific analysis.

411. (cont.)	(see above)	(see above)	(see above)	(see above)	(see above)	(see above)	“Under Alternative B, 721,200 acres of calving habitat . . .” These repetitive statements provide almost no new information to the EIS and should not be considered quantitative contributions to the EIS once repeated. The current EIS should be considered an incomplete draft until the hundreds of shortcomings are addressed.	(see above)
412.	—	—	Alaska Department of Natural Resources	94102	5	Suggestion for specific change to an alternative	In proposing sweeping NSO and CSU measures, including proposed setbacks along rivers and streams that are larger than those developed for federally managed lands in NPR-A, BLM fails to meet the Tax Act's requirement that 2,000 surface acres shall be provided for production and support facilities.	The analysis in Chapter 3 shows that 2,000 surface acres can be provided under each action alternative for production and support facilities, thereby complying with the Tax Act requirement.
413.	—	—	Alaska Department of Natural Resources	94102	6	Suggestion for specific change to an alternative	Additionally for Alternative B, Lease Stipulation 1-Rivers and Streams is shown in Map 2-2 as being applicable to the entire Canning River Delta or “from the western boundary of the Coastal Plain to 2 miles east of the eastern edge of the active floodplain.” The State of Alaska claims title to about 20,000 acres in the northwest portion of the Coastal Plain, which appears to be encompassed by Lease Stipulation 1 as it relates to the Canning River. That acreage is subject to a lawsuit brought by the State that is pending before the Interior Board of Land Appeals (IBLA 2016-109 and IBLA 2017-55). We request that BLM eliminate Lease Stipulation 1 from the Canning River and consult further with the State in the context of our cooperating agency relationship on this important issue.	The lease stipulation remains. Text has been added to Section 1.4 to further explain landownership around the Canning River delta.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
414.	—	—	Alaska Department of Natural Resources	94102	28	Suggestion for specific change to an alternative	Chapter 2, Section 2.2, Pages 2-2 and 23 Failure to disclose other regulatory control measures Pages 2-2 and 2-3 of this Chapter discuss the lease stipulations and required operating procedures for this lease sale. This section needs a discussion of the state regulatory landscape before discussing the alternatives. Otherwise it would appear that BLM's BMPs and lease stipulations are the only regulatory controls. It would be clearer if this chapter included a section covering the "Permits, Licenses and Other Approvals" as well as "Regulatory Setting for Alternatives Analysis". See pages 1-15 through 2-1 of the Point Thomson Project Final EIS for an example of what should be included.	Appendix D provides requirements of federal, state, and local laws and regulations associated with future development in the Coastal Plain.
415.	—	—	Alaska Department of Natural Resources	94102	29	Suggestion for specific change to an alternative	5 Chapter 2, Section 2.2 Lease Stipulation 1 - Rivers and Streams In Lease Stipulation 1, a mixture of 'active floodplain' and 'ordinary high water' is used to delineate setback distances from various rivers. One term should be used for all setbacks.	These terms were used intentionally to account for differing sizes of waterbodies.
416.	—	—	Alaska Department of Natural Resources	94102	31	Suggestion for specific change to an alternative	6 Chapter 2, Section 2.2 Lease Stipulation 2 - Canning River Delta and Lakes "See ROP 9 for additional requirements/standards" that is included in Alternatives B and C should also be included in Alternative D as water withdrawal could be used for seasonal activities (e.g., seismic) or exploration activities. Alternative D as written is directed at permanent facilities that are essentially prohibited in this Alternative. It would be useful to identify the minimum size waterbody that is included in the Canning River Delta area under the National Hydrography Dataset discussed in footnote 2. Is it 1 acre, 10 acres, 50 acres? This is important to know as Alternative D includes a 0.5-mile setback from any one of these waterbodies.	ROP 9 does apply to Alternative D, in addition to the objectives and requirements identified for Lease Stipulation 2 for Alternative D. The National Hydrography Dataset, maintained by the US Geological Survey, is publicly available data and can be referenced for what waterbodies are considered part of the Canning River delta, or any other waterbody in this EIS.

418.	—	—	Alaska Department of Natural Resources	94102	33	Suggestion for specific change to an alternative	8 Chapter 2, Section 2.2 Lease Stipulation 4 - Nearshore Marine The Requirement/Standard (NSO)(a) for all three alternatives states “ Exploratory well drill pads, production well drill pads, of a CPF for oil or gas would not be permitted in coastal waters, lagoons or barrier islands within the boundaries of the Coastal Plain.” In Alternative D, Requirement/Standard (NSO)(b)(iii) discusses siting of facilities that are generally associated with drilling or processing. This directly conflicts with Requirement/Standard (NSO)(a) that prohibits these types of structures. The list of facilities permitted in Requirement/Standard (NSO)(b)(iii) should match that found in Requirement/Standard (NSO)(a). In Alternative D, (TL) describes oil and gas exploration operations, such as drilling, seismic exploration and testing, that would be allowed under timing restrictions. This directly conflicts with Requirement/Standard (NSO) that states exploratory well drill pads, production well drill pads, or a CPF for oil and gas would not be permitted in coastal waters, lagoons, or barrier islands within the boundaries of the Coastal Plain.	The text of Lease Stipulations 4 and 9 has been revised for clarity.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
419.	—	—	Alaska Department of Natural Resources	94102	35	Suggestion for specific change to an alternative	10 Chapter 2, Section 2.2, Page 2-9, Table 2-2 Definition of open water season unclear The third paragraph in the Alternative D columns notes that "(TL) Oil and gas exploration operations such as drilling, seismic exploration, and testing are not allowed on the major coastal water bodies and coastal islands between May 15 and November 1 or when sea ice extent (as defined by Fetterer et al. 2017)...is beyond 10 miles of the coast each season, whichever is later." It is not clear from the second part of this statement what is being described. The first part of the statement appears to describe open water season, but the second part describes sea ice extent which is the antithesis of open water. The inclusion of the definition by Fetterer et al. does not help, since no additional information regarding that reference was provided with the EIS document. This has implications for oil spill prevention and response. Please clarify.	The text of Lease Stipulation 4 has been revised for clarity.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
420.	—	—	Alaska Department of Natural Resources	94102	36	Suggestion for specific change to an alternative	11 Chapter 2, Section 2.2, Page 2-15, Table 2-2 Non-applicability of lease stipulation to adjacent State of Alaska lands The information contained in the column for Alternative D that is labeled "Lease Stipulation 10 -Wilderness Boundary" states that "Surface occupancy including exploration and production well drill pads, structures and facilities, and gravel and ice roads would not be allowed within three miles of the southern and eastern boundaries of the Coastal Plain where they are near designated wilderness." According to Map 1-1 contained in Appendix A, this would preclude any surface occupancy on state lands adjacent to the wilderness area boundary. According to the Alaska National Interest Lands Conservation Act at 16 U.S.C.3101(c) "Only those lands within the boundaries of any conservation system unit which are public lands shall be deemed to be included as a portion of such unit. No lands, which before, on or after the date of enactment of this Act, are conveyed to the State, to any Native Corporation, or to any private party shall be subject to the regulations applicable solely to public lands within such units." This language precludes such buffers being added to the boundary with State lands adjacent to the Mollie Beatty Wilderness. Make this clarification in the text.	Since the NSO area would not establish a withdrawal, conservation system unit, or similar area, it is not precluded by Section 1326 of ANILCA.

Add "An exception, modification, or waiver to the pipeline/road separation requirement may be granted if separation alternatives are not feasible or practicable.	The text of ROP 23c has been revised for clarity.
430.	—	—	Alaska Department of Natural Resources	94102	48	Suggestion for specific change to an alternative	23 Chapter 2, Section 2.2, Page 2-27, Table 2-2 Clarification of stipulation - Gravel Mines For Alternative D (a), consider including gravel mine sites within the active floodplains of the Canning, Sadlerochit, Hulahula and Aichilik rivers as mine sites in these floodplains or outside of the floodplain but connected to a river channel may provide additional overwintering fish habitat and final water volumes would easily be recharged on a yearly basis. Appropriate site selection criteria would need to be developed for these in-floodplain sites.	The varying protections remain in order to analyze a reasonable range of alternatives under NEPA.
431.	—	—	Alaska Department of Natural Resources	94102	49	Suggestion for specific change to an alternative	24 Chapter 2, Section 2.2, Page 2-29, Table 2-2 Clarification of stipulation - Nesting Raptors Requirement/Standard (b) regarding instream mining and raptor cliffs needs clarification regarding what bank heights define 'river bluffs' as well as the proximity to a cliff/bluff that would initiate the requirement to conduct a hydrological study regarding the potential instream mining effects to the river bluffs.	A site-specific analysis would identify areas where sand or gravel extraction would not be allowed. A hydrological study would be conducted by the operator should the operator desire to extract sand or gravel from an active river or stream channel with bluffs.

S. Public Comments and BLM Responses (Alternatives)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
432.	—	—	Alaska Department of Natural Resources	94102	50	Suggestion for specific change to an alternative	25 Chapter 2, Section 2.2, Page 2-32, Table 2-2 Clarification of regulatory roles The information discussed under Required Operating Procedure 35 “Ensure ongoing and long-term reclamation of land to its previous condition and use” discusses BLM approved reclamation plans for well pads, production facilities, access roads and airstrips. It is not clear if this reclamation work includes well closure and capping. If well closure and capping is involved, proper plugging and abandonment of well is governed by Article 2 of the Alaska Oil and Gas Conservation Commission (AOGCC) regulations at 20 AAC 25.105.	. The BLM believes that the objective is appropriate. Operators would be required to submit a reclamation plan that satisfies the objective of the ROP. Bonding would be determined and required with the specific oil and gas authorization (43 CFR 3134; the BLM would also apply these NPR-A regulations to the Coastal Plain).
433.	Edward	Rexford	Native Village of Kaktovik	95607	11	Suggestion for specific change to an alternative	NVK understands that the Coastal Plain EIS for Leasing’s purpose is to analyze the impacts of a leasing program at a high level and subsequent National Environmental Policy Act (NEPA) processes for on the ground activities will be much more robust and technical and will likely involve further studies on wildlife and natural resources. NVK recommends including language in the Final EIS for leasing that these studies should occur collaboratively between agencies to minimize impacts of multiple studies on subsistence activities. Scientific studies often require low-flying aircraft and other invasive activities that can have a negative impact on hunting, fishing, and trapping.	The BLM will consult with the appropriate entities on future oil and gas activities, including study development. See footnote 1, Table 2-3 in the Final EIS.
434.	Harry K.	Brower Jr.	North Slope Borough	95612	7	Suggestion for specific change to an alternative	BLM should only include the following river setbacks: (1) 0.5 mile on either side of the Okpilak River; (2) 0.5 mile on either side of the Hulahula River; (3) 0.5 mile on the Staines-Canning River along the east side of the Coastal Plain border; and (4) 1 mile around Fish Hole One.	Setback distances were determined through coordination with cooperating agencies, government-to-government and ANCSA consultation, and recommendations from agency subject matter experts to protect the wide range of resources within those areas. The widths vary among the alternatives to facilitate analysis of the different management options.

S. Public Comments and BLM Responses (Alternatives)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
435.	Harry K.	Brower Jr.	North Slope Borough	95612	9	Suggestion for specific change to an alternative	Alternative B with modifications to the timing limitation is preferred. BLM should revise the area subject to the timing limitation to reflect the location where calving predominantly occurs based on the most current wildlife surveys. BLM also should reserve the ability to reduce or remove the timing restriction if calving is not occurring in a particular area.	The Draft EIS does indicate that areas outside the primary calving area are used in some years. Additional stipulations are added to the primary calving area because this area is used more frequently than other portions of the program area. Exceptions, waivers, and modifications provide an effective means of applying "adaptive management" techniques to oil and gas leases and associated permitting activities to meet changing circumstances. The BLM or operators can initiate adaptive management modifications. See Instruction Memorandum 2008-032 and 43 CFR 3101.1-4 for additional details.
436.	Harry K.	Brower Jr.	North Slope Borough	95612	13	Suggestion for specific change to an alternative	In Lease Stipulation 9, for Alternative C, BLM would require that the lessee/operator/contractor consult with the Alaska Eskimo Whaling Commission, the Borough, and local whaling captains' associations to minimize impacts on subsistence whaling and other subsistence activities of the communities of the North Slope. This lease stipulation should be included in Alternative B and, in addition to open water activities, should be expanded to apply to any activities that could potentially impact subsistence whaling and other subsistence activities of the communities of the North Slope.	The varying protections remain in order to analyze a reasonable range of alternatives under NEPA. Under all alternatives, the BLM will consult with the appropriate entities on future oil and gas activities. See footnote 1, Table 2-3 in the Final EIS.
437.	Harry K.	Brower Jr.	North Slope Borough	95612	14	Suggestion for specific change to an alternative	Finally, when siting any oil and gas facilities, we suggest that BLM encourage the use of existing sites that have already been subject to development activities. For example, this could include Distant Early Warning Line sites. By co-locating facilities or by reusing such areas, the impacts of development under the Leasing Program could be reduced.	ROP 21 discusses minimizing impacts of the development footprint, including collocation of facilities.

S. Public Comments and BLM Responses (Alternatives)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
438.	Harry K.	Brower Jr.	North Slope Borough	95612	16	Suggestion for specific change to an alternative	ROP 7 The design and implementation of the monitoring study of contaminants in subsistence foods should be coordinated with the Borough's Department of Wildlife Management.	Under all alternatives, the BLM will consult with the appropriate entities on future oil and gas activities. See footnote 1, Table 2-3 in the Final EIS.
439.	Harry K.	Brower Jr.	North Slope Borough	95612	17	Suggestion for specific change to an alternative	ROP 8 The Borough notes that fish in some streams have been observed to have fish mold. The ROP should be revised to require that streams be evaluated to determine if fish mold is present prior to any water withdrawals to prevent potential contamination of other streams during oil and gas activities.	This level of specificity would be determined at the project-level authorization. Site-specific analyses, including those associated with infrastructure in support of oil and gas development, can more realistically be provided when the BLM receives an application to permit such infrastructure. The Leasing EIS makes no decisions on such infrastructure, except to prohibit it in specified areas of particularly high value surface resources under some alternatives.
440.	Harry K.	Brower Jr.	North Slope Borough	95612	18	Suggestion for specific change to an alternative	ROP 9 For the guidelines on winter water use, the Integrated Activity Plan (IAP) for the National Petroleum Reserve Area in Alaska (NPR-A) includes a withdrawal limit of 35 percent for lakes with no fish present. BLM should provide an explanation for the proposed imposition of a 20 percent limitation on such lakes in the DEIS.	The winter water withdrawal limit is specific to the Coastal Plain landscape. It was developed using best available science in conjunction with review by cooperating agencies and resource experts to minimize impacts on water resources.
441.	Harry K.	Brower Jr.	North Slope Borough	95612	19	Suggestion for specific change to an alternative	ROP 10 As part of Alternative B, BLM could include requirement (b) from Alternative D. This would be consistent with the NPR-A IAP and would provide adequate protection for the species. The other required measures included in Alternative D are overly restrictive and unnecessary.	The varying protections remain in order to analyze a reasonable range of alternatives under NEPA. All operators will be subject to regulations and stipulations under the Endangered Species Act and MMPA.

S. Public Comments and BLM Responses (Alternatives)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
442.	Harry K.	Brower Jr.	North Slope Borough	95612	21	Suggestion for specific change to an alternative	ROP 35 Alternative B is preferred. BLM should require lessees to post a bond to ensure adequate funding for spill response, cleanup, and eventual decommission, remediation, and removal (DR&R). DR&R must be addressed early, and negotiating appropriate DR&R measures with stakeholders should be an ongoing process throughout development and production as these activities will likely continue until late this century. DR&R measures should not be put in place at the planning phase only to be left unaddressed for decades.	Bonding would be determined and required with the specific oil and gas authorization (43 CFR 3134; the BLM would also apply these NPR-A regulations to the Coastal Plain). The reclamation plan will be developed in coordination with applicable federal, state, and local agencies (see footnote 1, Table 2-3 in the Final EIS).
443.	Harry K.	Brower Jr.	North Slope Borough	95612	22	Suggestion for specific change to an alternative	ROP 38 BLM should revise the ROP to also include a prohibition on fishing by lessees/operators/contractors	The BLM has revised the text of ROP 38.
444.	Harry K.	Brower Jr.	North Slope Borough	95612	23	Suggestion for specific change to an alternative	Thus, BLM must reduce and minimize the number of helicopter surveys, while still requiring the collection of adequate information about subsistence resources. There are likely novel methods that could be used, such as remote sensing, drones, etc., which would minimize disturbance but still allow for the collection of information. We encourage BLM to involve the Borough in discussions about those methods and others that could be employed for scientific studies.	Under all alternatives, the BLM will consult with the appropriate entities on future oil and gas activities. See footnote 1, Table 2-3 in the Final EIS.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
445.	Greta	Burkart	—	96243	19	Suggestion for specific change to an alternative	Assuming the maximum allowable surface disturbance in the tax act will be the surface disturbance is not logical if there are efforts to minimize impacts. It does not make sense that 200,000 acres of disturbed area (plus of 305 +- 5 acres of disturbed areas due to gravel mining) would occur in all action alternatives. While congress may have made this a maximum level of surface disturbance, it was not defined as minimum level of disturbance. If there is a responsible attempt to reduce impacts, it does not make sense 200,000 acres of surface disturbance would occur under all alternatives. For example, it does not make sense that 200,000 acres of disturbance would be necessary when the area available for leasing is not as sprawling as it is in other options. To minimize unnecessary impacts due to unnecessary surface disturbance, an analysis should be conducted to determine what acreage of surface disturbance is actually necessary under each action alternatives.	Section 20001(c)(3) of the Tax Act states “the Secretary shall authorize up to 2,000 surface acres.” Any interpretation by the BLM to modify the limit for a given alternative would be inconsistent with the Tax Act.

S. Public Comments and BLM Responses (Alternatives)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
446.	Greta	Burkart	—	96243	20	Suggestion for specific change to an alternative	Transportation infrastructure and material requirements will vary between alternatives if there really are efforts to minimize surface disturbance in each action alternative. It does not make sense to assume that the same level of surface disturbance (200,000 acres of surface disturbance plus 308-315 acres of gravel mining-related surface disturbance) will occur under each alternative. For example, one alternative involves no surface occupancy and no leasing in a substantial area and another alternative involves surface occupancy and leasing across a much broader sprawling area which would require more roads and material sources. The comparison of alternatives should attempt to include an accurate estimate of surface disturbance and infrastructure acreage as they will both have substantial long-term impacts to hydrology and water quality, vegetation, soils, etc. Appendix Band analyses of resources impacted by surface disturbance and infrastructure should use these estimates when assessing impacts.	Section 20001(c)(3) of the Tax Act states “the Secretary shall authorize up to 2,000 surface acres.” Any interpretation by the BLM to modify the limit for a given alternative would be inconsistent with the Tax Act. Gravel mines are now included in the 2,000-acre definition (see Section 1.9.1).
447.	Greta	Burkart	—	96243	24	Suggestion for specific change to an alternative	Realistic forecasting of gravel material needs and a cap on gravel removal and surface area disturbance is necessary to fully understand the potential impacts to vegetation, soils, water, fish, recreation, etc under different alternatives. The analysis presented in appendix B is unreasonably crude and does not provide adequate information.	Section 1.9.1 has been revised to identify the production and support facilities that would count toward the 2,000-acre limit, which now includes gravel mines. Rationale as to why certain facilities may not be included is contained in Section S.1.2 of this Appendix.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
448.	Greta	Burkart	—	96243	26	Suggestion for specific change to an alternative	To properly evaluate alternatives and consider the need for stipulations and ROPs, a much more rigorous analysis of gravel material needs, and potential source locations is required. The currently analysis stems from Appendix B, which involves an extremely crude analysis that one might think was done in five minutes on the back of an envelope. More accurate estimates are also critical for evaluating impacts of gravel mining to water resources, vegetation, soils, fish, recreation, etc under all alternatives. Given the widespread importance and implications, a much more meaningful analysis should be conducted. Also, make a map of potential gravel mining sites under all alternatives. This is particularly important to illustrate that the current No Surface Occupancy stipulations allow for gravel removal which is likely one of the most destructive and irreparable oil-development related activities.	Section 1.9.1 has been revised to identify the production and support facilities that would count toward the 2,000-acre limit, which now includes gravel mines. Rationale as to why certain facilities may not be included is contained in Section S.1.2 of this Appendix.
449.	Greta	Burkart	—	96243	29	Suggestion for specific change to an alternative	[comment:96243-29; 190.07]CommentsGMT SEIS provided readers with proposed plans for bridges and pipeline access road routes. The EIS for oil leasing in the Arctic Refuge does not have similar information that would allow readers to better assess potential impacts of development. Omissions such as this make it impossible to adequately evaluate impacts and effectiveness of mitigation strategies in a landscape that is very different from those in the NPRA.[comment end]	The GMT SEIS is a project-specific analysis. Site-specific analyses, including those associated with infrastructure in support of oil and gas development, can more realistically be provided when the BLM receives an application to permit such infrastructure. The Leasing EIS makes no decisions on such infrastructure, except to prohibit it in specified areas of particularly high value surface resources under some alternatives.

S. Public Comments and BLM Responses (Alternatives)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
450.	Greta	Burkart	—	96243	30	Suggestion for specific change to an alternative	Residual risk after application of mitigation strategies must be clarified-- > To properly assess residual risk, there is a need to verify that mitigation strategies are effective. Verification of the effectiveness of mitigation strategies is largely absent for the stipulations that the GMT2 SEIS claims will "largely" mitigate for all impacts to marine and freshwater fishes. There is no evidence from statistically valid studies that documents the effectiveness of these studies, so tiering-off to these NPRA documents really does not provide with an adequate impact analysis for the Arctic Refuge 1002 Area.	The GMT SEIS is a project-specific analysis. Site-specific analyses, including those associated with infrastructure in support of oil and gas development, can more realistically be provided when the BLM receives an application to permit such infrastructure. The Leasing EIS makes no decisions on such infrastructure, except to prohibit it in specified areas of particularly high value surface resources under some alternatives.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
451.	Greta	Burkart	—	96243	34	Suggestion for specific change to an alternative	A major problem with oil development on the North Slope has been the lack of data to assess what the cumulative impacts of oil and gas development are (see National Research Council Report, Cumulative Environmental Effects of Oil and Gas Activities on Alaska's North Slope (2003)). Standards for effectiveness monitoring need to be defined in stipulations or there needs to be a stipulation that includes development of an effectiveness monitoring plan (and centralized publicly accessible database) that would be prepared in consultation with the USFWS and implemented by lessee/operator/contractor. At a minimum the following requirement should be met for all effectiveness monitoring programs: statistically valid sampling designs with clearly defined levels of inference and change detection capabilities. Without a properly designed long-term effectiveness monitoring program and publicly accessible database, there is no way to detect impacts and employ adaptive management techniques. When pre-development monitoring will not occur, general methods for selecting control sites using a statistically valid approach is necessary. Requirements for a research and monitoring program need to be clearly defined in this EIS.	This level of specificity would be determined at the project-level authorization. Site-specific analyses, including those associated with infrastructure in support of oil and gas development, can more realistically be provided when the BLM receives an application to permit such infrastructure. The Leasing EIS makes no decisions on such infrastructure, except to prohibit it in specified areas of particularly high value surface resources under some alternatives. Exceptions, waivers, and modifications provide an effective means of applying "adaptive management" techniques to oil and gas leases and associated permitting activities to meet changing circumstances. The BLM or operators can initiate adaptive management modifications. See Instruction Memorandum 2008-032 and 43 CFR 3101.1-4 for additional details.
452.	Greta	Burkart	—	96243	35	Suggestion for specific change to an alternative	No surface occupancy needs to pertain to gravel mining, drilling, reinjection of hazardous wastes as well. Gravel mines impact physical, chemical, and biological properties of water resources in perpetuity. Drilling and reinjection of hazardous wastes endanger aquatic ecosystems, especially groundwater ecosystems and should not be permitted in NSO areas because of the special resources in these areas.	It is not possible to have an oil and gas program without access to gravel, and it is often less impactful to obtain gravel from streambeds. For example, areas overlain with tundra may be more difficult to reclaim. All future projects would be analyzed for site-specific impacts.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
453.	Greta	Burkart	—	96243	36	Suggestion for specific change to an alternative	The objectives for alternative B and C should be the same as that for alternative D (e.g. include recreation and hunting) and should include wilderness and scenic values important for recreation. Maintaining recreational value supports the National Wildlife Refuge Improvement Act.	The varying protections remain in order to analyze a reasonable range of alternatives under NEPA.
454.	Greta	Burkart	—	96243	37	Suggestion for specific change to an alternative	To meet the objective and protect Refuge purposes, gravel mining sites cannot be in the NSO. Gravel mining disturbs flow paths, water quality, and can alter the natural diversity of fisheries by altering complete balance and predator prey relationships. It would not be possible to meet his objective if gravel mining is allowed in the NSO areas.	It is not possible to have an oil and gas program without access to gravel, and it is often less impactful to obtain gravel from streambeds. For example, areas overlain with tundra may be more difficult to reclaim. All future projects would be analyzed for site-specific impacts. All action alternatives are designed to meet the purpose and need, and to account for all purposes of the Arctic National Wildlife Refuge. See Section 3.4.7.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
455.	Greta	Burkart	—	96243	38	Suggestion for specific change to an alternative	River setbacks are not adequate to allow for continuation of the primary purposes of the Refuge. The following are exceptional rivers with exceptional fisheries, recreation, subsistence, cultural, or other values: · The Hulahula should have a 4-mile setback under all alternatives to protect its values and purposes. It provides the most important winter subsistence fishery in the 1002 Area. It is also an important recreational river and recommended Wild River (Arctic Refuge CCP 2015). · The Canning River should have a 3-mile setback to protect the important fisheries, recreation and cultural values of this eligible Wild River. For more information see Arctic Refuge CCP 2015. · The Aichillik River, which flows along the Wilderness boundary, should have at least a 3-mile setback under all alternatives to protect its important Wilderness and recreational value. For more information see Arctic Refuge CCP 2015. · The Sadlerochit River and Itkilyariak Creek Spring - complex should have a 3-mile setback in all alternatives due to its cultural significance and unique terrestrial and aquatic communities. The Sadlerochit River and Itkilyariak Creek Spring - complex has a unique endemic population of dwarf Dolly Varden and is also an important subsistence use area. For more information see Arctic Refuge CCP 2015. · The Jago and Okpilak Rivers should have 2-mile setbacks in alternative B and C and 3-mile setbacks in Alternatives D to protect their outstanding resource values. For more information see Arctic Refuge CCP 2015. · Spring-fed rivers are the most unique and productive habitats in the Refuge. In alternatives B and C, they should have a minimum setback of 1-mile. In alternative D they should have a minimum setback distance of 2-miles.	Buffer widths were determined through coordination with cooperating agencies, government-to-government and ANCSA consultation, and recommendations from agency subject matter experts to protect the wide range of resources within those areas. The widths vary among the alternatives to facilitate analysis of the different management options.

456.	Greta	Burkart	—	96243	39	Suggestion for specific change to an alternative	Alternative B and C (Lease stipulation 2) should require setback distances for the Canning Area lakes because of their special values and to help meet the objective of Stipulation 2.	The requirements vary among the alternatives to facilitate analysis of the different management options.
457.	Greta	Burkart	—	96243	40	Suggestion for specific change to an alternative	Spring-fed river systems are the most important, productive and unique aquatic habitats in the Refuge. In addition, they provide benefits to terrestrial wildlife and subsistence users. Alternatives B, and C should have the same requirements as Alternative D.	The requirements vary among the alternatives to facilitate analysis of the different management options.
458.	Greta	Burkart	—	96243	42	Suggestion for specific change to an alternative	Section/Description Lease Stipulation 3, Alternative B/C/D Comments The perennial springs that feed Itkilyariak Creek are part of the Sadlerochit Spring system. All alternatives should include protection of the entire Itkilyariak-Sadlerochit spring system.	Current springs/aufeis protections were determined through coordination with cooperating agencies, government-to-government and ANCSA consultation, and recommendations from agency subject matter experts to protect the wide range of resources within those areas. Variation in protections among the alternatives remains in order to facilitate analysis of the different management options.
459.	Greta	Burkart	—	96243	43	Suggestion for specific change to an alternative	Section/Description Lease Stipulation 3, Alternative B/C/D Comments The standard requiring studies prior to drilling should "ensure drilling or injection of wastes will not alter the natural flow or impair the water quality of perennial springs"	The BLM made the following edit to Lease Stipulation 3 (section a): "...and waste injection wells will not contaminate any perennial springs."
460.	Greta	Burkart	—	96243	44	Suggestion for specific change to an alternative	Section/Description Lease Stipulation 3, Alternative B/C/D Comments No surface occupancy needs to prohibit gravel extraction. Gravel mining would alter ground and surface water flow and impact the natural fish diversity.	It is not possible to have an oil and gas program without access to gravel, and it is often less impactful to obtain gravel from streambeds. For example, areas overlain with tundra may be more difficult to reclaim; however, all future projects would be analyzed for site-specific impacts.

S. Public Comments and BLM Responses (Alternatives)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
461.	Greta	Burkart	—	96243	45	Suggestion for specific change to an alternative	Lease Stipulation 3, Alternative B/C/D Comments In areas where no leasing is allowed, the following should be prohibited as well: gravel mining, roads, infrastructure and other disturbances that support development.	Section 20001(c)(2) of the Tax Act states the Secretary shall issue any rights-of-way or easements across the Coastal Plain for the exploration, development, production, or transportation necessary to carry out this section. Therefore, if an operator were required to access resources through a no-lease area, prohibiting such access would not comply with the Tax Act.
462.	Greta	Burkart	—	96243	46	Suggestion for specific change to an alternative	Section/Description Addition to Lease Stipulations Comments To meet water quality purposes of the Arctic Refuge, a lease stipulation to protect lakes in the 1002 area should be included. This is especially important since lakes are relatively rare. Include the following stipulation for all alternatives: "Generally, permanent oil and gas facilities, including gravel pads, roads, airstrips, gravel mines, and pipelines, are prohibited on the lake or lakebed and within 0.25 mile of the ordinary high watermark of any lake that may have fish."	All action alternatives are designed to meet the purpose and need, and to account for all purposes of the Arctic National Wildlife Refuge. See Section 3.4.7.
463.	Greta	Burkart	—	96243	48	Suggestion for specific change to an alternative	Lease Stipulation 4, Alternative B/C/D Comments At a minimum, stipulations in alternative D should be applicable under alternative B and C as well.	The requirements vary among the alternatives to facilitate analysis of the different management options.
464.	Greta	Burkart	—	96243	49	Suggestion for specific change to an alternative	ROP 3 Comments The scarcity and purposes of the Arctic Refuge warrant greater setback distances for fueling stations and fueling activities. 2,000 feet should be a minimum distance in alternative DI. In alternative B and C the minimum setback distance should 1,000.	Current setbacks were determined through coordination with cooperating agencies, government-to-government and ANCSA consultation, and recommendations from agency subject matter experts to protect the wide range of resources within those areas. The widths vary among the alternatives to facilitate analysis of the different management options.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
465.	Greta	Burkart	—	96243	50	Suggestion for specific change to an alternative	ROP 3 Comments To minimize the potential for impacts of contaminant spills, there must be required operating procedures for containment under all alternatives. Include the following in ROP 3 for all alternatives: 1) containment of fuel over 200 gallons should be bear-proof, 2) spill containment systems for all fuel storage should be capable of containing 150% of the stored volume 3) "Except during overland moves, fuel, other petroleum products, and other liquid chemicals designated by the authorized officer that in total exceed 210 gallons shall be stored within an impermeable lined and diked area or within approved bear-proof alternate storage containers" and 4) All temporary and permanent fueling Stations shall be lined or have impermeable protection to prevent fuel migration to the environment from overfills and spills. Note - NPR-A EIS 2012 ensures containment is considered	BLM requirements should not duplicate State of Alaska requirements, especially when ADEC requirements are more detailed and in some cases more stringent than federal requirements. At the time of a site-specific proposal, the operator will be required to submit a spill response plan.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
466.	Greta	Burkart	—	96243	51	Suggestion for specific change to an alternative	Section/Description ROP 8, Standard Comments Change the ROP to the following: "Withdrawal of unfrozen water or ice aggregates from rivers, streams, and springs during winter is prohibited. If it has been shown that no impacts to hydrology (including hydrologic flow paths) at breakup, channel morphology, and/or impacts to fish and invertebrates and their habitat will occur, withdrawal of up to 20% of ice aggregate from a grounded area ___4-feet deep may be authorized on a site-specific basis if it is determined that such removal will not impact natural hydrologic regimes or habitats. This will be determined by the BLM authorizing officer in collaboration with the USFWS. Monitoring of hydrology and channel morphology prior to and after removal may be required. The design of the monitoring effort must be peer-reviewed to ensure the ability to detect changes in hydrology, substrate, and morphology."	The State of Alaska has the responsibility to authorize water withdrawals, ensuring sufficient water quality and quantity. See footnote 1, Table 2-3 in the Final EIS.
467.	Greta	Burkart	—	96243	52	Suggestion for specific change to an alternative	ROP 9 Comments Rationale for different withdraw volumes compared to NPR-A EIS: 1) impacts on species and habitat are unquantified (NRC 2003), especially impacts of removal of entire permitted volume; 2) lakes are relatively rare in the Arctic Refuge thus a much larger proportion of lakes will be impacted by water withdraw which would have more significant impacts to fish and wildlife in the area; 3) because lakes are rare, companies would be more likely to withdraw fully permitted volume; 4) the original and primary ANILCA purpose of the Refuge is to maintain adequate water quality and quantity to support fish and wildlife and their habitat. Furthermore, impacts of water withdrawal on soils, shorebird habitat (wet meadow zones, and invertebrates in the NPR-A have never been assessed. The few studies	ROP 9 provides protections at the leasing stage for water quantity and quality. Any future actions or activities are required to receive the appropriate authorizations for water withdrawals. A determination of specific water withdrawals and impacts on water quantity cannot be made until site-specific development activities are proposed.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
467. (cont.)	(see above)	(see above)	(see above)	(see above)	(see above)	(see above)	<p>of the impacts of water withdrawal on hydrology and chemistry did not have a statistical design that allowed for change detection or inference to other lakes, especially lakes in regions as far away as the Arctic Refuge. During these studies, only a small fraction of the permitted water/ice was withdrawn, allowing no assessment of the impacts when the permitted volume is withdrawn. Even when only a small fraction of the permitted volume of water was removed, one of the few lakes studied did not fully recharge at snow melt. Other studies indicate that dissolved oxygen in untapped lakes is typically close to dissolved oxygen thresholds that, if crossed, would have severe impacts on fish and wildlife habitat. These findings suggest that additional declines in oxygen due to water withdrawal could have a severe negative impact on fish and wildlife habitat. Based on these studies and the Refuge's primary purpose to maintain adequate water quality and quantity, more conservative guidelines need to be in place. Change requirements a-d TO THE FOLLOWING FOR ALL ALTERNATIVES: "a. Lakes with sensitive fish (i.e., any fish except ninespine stickleback or Alaska blackfish): unfrozen water available for withdrawal is limited to 10% of calculated volume deeper than 7 feet; only ice aggregate may be removed from lakes that are 5.7-feet deep. b. Lakes with only non-sensitive fish (i.e., ninespine stickleback or Alaska blackfish): unfrozen water available for withdrawal is limited to 20% of calculated volume deeper than 7 feet; only ice aggregate may be removed from lakes that are 57-feet deep. c. Lakes with no fish present, regardless of depth: water available for use is</p>	(see above)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
467. (cont.)	(see above)	(see above)	(see above)	(see above)	(see above)	(see above)	limited to 20% of total lake volume. d. In lakes where unfrozen water and ice aggregate are both removed, the total use shall not exceed the respective 10%, 20%, or 20% volume calculations.	(see above)
468.	Greta	Burkart	—	96243	53	Suggestion for specific change to an alternative	ROP 9 Comments There are no requirements for determining fish presence prior to activities that could impact fish. Add the following requirement: Sensitive and nonsensitive fish species will be assumed to be present until surveys with 95% detection probability have been conducted during the appropriate seasons.	The State of Alaska requirements would address impacts on fish present during a site-specific analysis.
469.	Greta	Burkart	—	96243	54	Suggestion for specific change to an alternative	ROP 9 Comments The following should be included for all alternatives. Additional modeling and monitoring of lake recharge shall be required to ensure natural hydrologic regime, water quality, and aquatic habitat for migratory birds and macroinvertebrates is maintained. Data from these efforts shall be stored in a geodatabase with appropriate metadata and be accessible to the USFWS and the general public	The requirements vary among the alternatives to facilitate analysis of the different management options.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
470.	Greta	Burkart	—	96243	55	Suggestion for specific change to an alternative	ROP 9 Comments Because water withdrawal from ice-covered lakes can have severe negative impacts on a wide range of species and habitats there is a need for a BMP that puts a cap on the percentage of lakes in each area that can be impacted by water withdrawals. Add the following requirement for all alternatives: a) Up to 20% of lakes in each class (1. deep isolated, 2. deep connected, 3. shallow isolated, and 4. shallow connected) in each major ecoregion and watershed (HUC8) can be tapped annually, b) Up to 30% of lakes in each class in major ecoregion and watershed (HUC8) can ever be tapped unless statistically valid studies with the appropriate level of inference indicate there will be no impacts to hydrology, fish and wildlife, and their habitat.	The State of Alaska has the responsibility to authorize water withdrawals, ensuring sufficient water quality and quantity.
471.	Greta	Burkart	—	96243	56	Suggestion for specific change to an alternative	ROP 9 Comments Under all alternatives, there is a need for stronger protections for isolated lakes. These isolated lakes are important for shorebirds and may harbor particularly dense and unique macroinvertebrate populations. Water quantity and quality in these habitats is important to protecting fish and wildlife diversity and habitats in the Refuge. Add the following to all alternatives: e) In isolated lakes with limited recharge capabilities, water available for use is limited to guidelines established in ROP 10 or 30% of the estimated snowmelt recharge volume, whichever is lesser.	The State of Alaska has the responsibility to authorize water withdrawals, ensuring sufficient water quality and quantity.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
472.	Greta	Burkart	—	96243	57	Suggestion for specific change to an alternative	ROP 11 Comments Requirement/standard (a) for alternative D should be changed to the following to help ensure protection: "Snow depth and density and vegetation data should be collected where ground operations will actually be occurring. There is a great deal of evidence that shows how variable these conditions are even within the same watershed. The exact dates should be determined by the BLM authorized officer in coordination with the USFWS." For all Requirements/Standards that need to be approved by the BLM authorized official, the decision on approval should be made in coordination with USFWS subject matter experts familiar with the area. Winter ground operations are known to have negative impacts on the tundra. These impacts have cascading effects on water quantity, water flow paths, and habitat quality for fish and wildlife. To protect Refuge resources, the standards for ROP 11, Alternative D should also be applied to B and C.	See footnote 1, Table 2-3 in the Final EIS. The requirements vary among the alternatives to facilitate analysis of the different management options.
473.	Greta	Burkart	—	96243	58	Suggestion for specific change to an alternative	ROP 12 Comments There should be a requirement to monitor effectiveness of breaching at crossings to ensure impacts to fish and hydrology do not occur. The rationale for this is that there is only limited information about the effectiveness of this ROP in the NPR-A and the effectiveness of this ROP has not been assessed in the 1002 Area, which has very different terrain and hydrology compared to NPRA.	If an objective cannot be met, then a waiver, exception, or modification would need to be considered.

S. Public Comments and BLM Responses (Alternatives)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
474.	Greta	Burkart	—	96243	59	Suggestion for specific change to an alternative	ROP 15 Comments Permitting should occur in consultation with the USFWS subject matter experts who are familiar with polar bear denning habitats and snow and hydrologic modeling. Distribution of denning habitat, snow and hydrologic monitoring should be considered in an analysis of the potential impacts of snow fencing.	See footnote 1, Table 2-3 in the Final EIS. This level of specificity would be determined at the project-level authorization.
475.	Greta	Burkart	—	96243	60	Suggestion for specific change to an alternative	ROP 16 Comments Non-fish bearing systems provide important habitat that supports invertebrates, migratory birds and other wildlife. Change requirement to the following for all alternatives to help ensure protection of fish, invertebrates, riparian vegetation and water resources: Exploratory drilling is prohibited upon or within 100-year flood plain of streams and rivers, on or within 2,000 feet of the ordinary high water mark of potential fish-bearing lakes, and 1,000 feet as measured from the ordinary high watermark of non- fish-bearing waterbodies unless further setbacks are stipulated under Lease Stipulations. Any consideration of exploratory drilling within these areas should be assessed in consultation with USFWS subject matter experts with knowledge of aquatic resources in the 1002 Area.	The varying protections remain in order to analyze a reasonable range of alternatives under NEPA. See footnote 1, Table 2-3.
476.	Greta	Burkart	—	96243	61	Suggestion for specific change to an alternative	ROP 19 Comments The scarcity and purposes of the Arctic Refuge warrant greater setback distances for protection of fish and wildlife. The importance of fishless lakes in supporting unique invertebrate communities and migratory bird populations warrant protections for fishless lakes. Permanent facilities should be at least 2,000 feet from the ordinary high-water mark of fish-bearing lakes and 1,000 from ordinary high water in other lakes.	All action alternatives are designed to meet the purpose and need, and to account for all purposes of the Arctic National Wildlife Refuge. See Section 3.4.7.
477.	Greta	Burkart	—	96243	62	Suggestion for specific change to an alternative	ROP 10 Comments To protect fisheries and other wildlife requirements in alternative D must be applied to all alternatives.	The requirements vary among the alternatives to facilitate analysis of the different management options.

S. Public Comments and BLM Responses (Alternatives)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
478.	Greta	Burkart	—	96243	63	Suggestion for specific change to an alternative	ROP 22 Comments Add the following to requirements: d) 5 years of data on stream flow, seasonal patterns in lake connectivity, and sheet flow shall be collected prior to planning bridges and culverts. These data will be stored in a centralized database and available to the general public. Standard "C" should ensure crossing structures are designed for ice-dam flooding as well.	Additional requirements, including those associated with infrastructure in support of oil and gas development, can more realistically be added when the BLM receives an application to permit such infrastructure.
479.	Greta	Burkart	—	96243	64	Suggestion for specific change to an alternative	ROP 24 Comments The impacts and severity of gravel mining on water resources in active floodplains will be severe and long-lasting. Creating deep water habitats that are connected to rivers could alter the outcome of competitive interactions between species and predator-prey relationships that are important for maintaining naturally occurring fish populations. Prior to these activities extensive studies should be undertaken. In all alternatives the following standards should apply: no mining sites in the 100-year floodplain of rivers with anadromous, freshwater, or endemic fisheries (e.g., Canning, Sadlerochit, Tamayariak, Itkilyariak, Aichillik, Hulahula).	It is not possible to have an oil and gas program without access to gravel, and it is often less impactful to obtain gravel from streambeds. For example, areas overlain with tundra may be more difficult to reclaim; however, all future projects would be analyzed for site-specific impacts.
480.	Greta	Burkart	—	96243	65	Suggestion for specific change to an alternative	ROP 24 Comments Requirement/Standard (e) should apply to alternatives to help ensure the protection of water resources.	The requirements vary among the alternatives to facilitate analysis of the different management options.
481.	Greta	Burkart	—	96243	66	Suggestion for specific change to an alternative	ROP 24 Comments There is a need for mining restoration plans (see 2003 NRC report, Cumulative Environmental Effects of Oil and Gas Activities on Alaska's North Slope (2003). Add the following requirement to each alternative: Each proposed mine site shall have a USFWS-approved restoration plan and effectiveness monitoring plan prior to site approval and construction. Restoration effectiveness monitoring shall continue for ten years following completion of restoration.	It is the BLM's responsibility for implementation of the oil and gas program. See footnote 1, Table 2-3 in the Final EIS.

S. Public Comments and BLM Responses (Alternatives)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
482.	Greta	Burkart	—	96243	67	Suggestion for specific change to an alternative	ROP 28 Comments The requirement should include cooperation with the USFWS to assess the information necessary for a plan.	The BLM will consult with all applicable federal, state, and local agencies. See footnote 1, Table 2-3 in the Final EIS.
483.	Greta	Burkart	—	96243	68	Suggestion for specific change to an alternative	ROP 35 Comments The lack of adequate restoration plans and adequate bonds to cover reclamation of areas impacted by oil and gas development on the North Slope is a major problem (2003 NRC report, Cumulative Environmental Effects of Oil and Gas Activities on Alaska's North Slope (2003)). Restoration standards need to be set in stipulations in this EIS. It should also be clearly stated what level of restoration will be required before land is no longer considered part of the infrastructure development cap. Restoration plans should be required and reviewed prior to issuing a lease and should be approved by the BLM and USFWS. All alternatives should include requirement for plans to include ecosystem restoration to restore pre-development stability, visual, hydrologic, vegetation, wilderness, and habitat conditions and Wild and Scenic River eligibility conditions.	Under all alternatives, ROP 35 requires operators to restore the land's previous hydrological, vegetation, and habitat condition through implementation of an approved reclamation plan.
484.	Greta	Burkart	—	96243	86	Suggestion for specific change to an alternative	Appendix B Comments The lack of adequate restoration plans and adequate bonds to cover reclamation of areas impacted by oil and gas development on the North Slope is a major problem (2003 NRC report, Cumulative Environmental Effects of Oil and Gas Activities on Alaska's North Slope (2003)). Restoration standards need to be set in stipulations in this EIS. It should also be clearly stated what level of restoration will be required before land is no longer considered part of the infrastructure development	Under all alternatives, ROP 35 requires operators to restore the land's previous hydrological, vegetation, and habitat condition through implementation of an approved reclamation plan.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
485.	Brook	Brisson	Trustees for Alaska	96981	46	Suggestion for specific change to an alternative	Relatedly, BLM should also modify its alternatives analysis to consider whether additional areas should be closed to exploration activities, particularly in areas where seismic damage is likely to be exacerbated because of the topography or other concerns, or where those areas will be closed to leasing. For example, in the draft EIS, BLM asserts for purposes of Alternative D that it would close 476,600 acres of caribou calving habitat to lease sales, but would still allow seismic activity over the entire program area.158 BLM needs to modify Alternative D so it does not allow seismic exploration in areas that are closed to leasing.	Appendix B explains the different types of seismic exploration that are analyzed in the EIS. Seismic exploration can be done across the full area of the Coastal Plain, even if an area is not available for lease. A site-specific NEPA analysis would be done for any proposed seismic explorations.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
486.	Karimah	Schoenhut	Sierra Club	97751	50	Suggestion for specific change to an alternative	since the stipulation allows it to be waived if "the BLM Authorized Officer approves alternative measures," and does not in any manner prescribe limits on that approval, a process for that approval, what "alternative measures" may be considered, or limitations on the circumstances under which such an approval may be sought, BLM cannot rationally rely on it to avoid analyzing the impacts of permanent facilities being developed in and across that portion of the Coastal Plain.	Operators are required to submit a written request for an exception, waiver, or modification and information demonstrating that (1) the factors leading to the inclusion of the stipulation in the lease have changed sufficiently to make the protection provided by the lease stipulation no longer needed or (2) the proposed operation would not cause unacceptable impacts. The criteria for approval of exceptions, waivers, and modifications should be supported by NEPA analysis, and may require site-specific environmental review. Requests should contain, at a minimum, a plan that includes related on-site or off-site mitigation efforts to adequately protect affected resources; data collection and monitoring efforts; and timeframes for initiation and completion of construction, drilling, and completion operations. The operator's request may be included in an Application for Permit to Drill, Notice of Staking, Sundry Notice, or letter. The BLM may also proactively initiate the process. During the review process, BLM coordination with other local, state, or federal agencies (e.g., ADFG, NSB, and local governments) should be undertaken, as appropriate, and documented. The BLM will also consult with the federal surface management agency (e.g., USFWS). Approval or disapproval is made by the Authorized Officer, and the decision is documented. If the waiver, exception, or modification is approved, any necessary mitigation is also documented. The applicant is then provided with a written notification of the decision. See Instruction Memorandum 2008-032 and 43 CFR 3101.1-4 for additional details.

487.	Karimah	Schoenhut	Sierra Club	97751	51	Suggestion for specific change to an alternative	[Lease Stipulation 5] this stipulation is only imposed under Alternative D. The other action alternatives for Lease Stipulation 5 stipulate a requirement for compliance with the ESA and MMP A in lieu of actually setting forth protective measures. But BLM cannot satisfy its obligations for analysis under NEP A merely be deferring to future requirements that mayor may not be imposed through the actions of other agencies. And consequences that do not cause jeopardy to the whole species or no more than a negligible impact to the whole stock do not necessarily amount to insignificant impacts for the purposes of a NEPA analysis of how polar bears using the Refuge will be affected by the proposed alternatives.	All alternatives must comply with the Endangered Species Act and MMPA as a requirement of federal law, which provides certainty in the analysis.
488.	Sophie	Minich	Cook Inlet Region, Inc	97926	2	Suggestion for specific change to an alternative	Alternative B, Lease Stipulation 1 states that "essential pipeline and road crossings" will be permitted on a case-by-case basis, which may present ambiguity to an operator. A potential lessor is provided no certainty that their lease would be perfected. The BLM is encouraged to provide additional processes and guidance that would provide assurance to lessors that their lease investments would be developable.	Additional text has been added to Table 2-3 providing additional details on the waiver, exception, and modification process.

S. Public Comments and BLM Responses (Alternatives)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
489.	—	—	United States Fish and Wildlife Service	97942	1	Suggestion for specific change to an alternative	As the land and surface estate manager, the Service would like the importance of consultation between the BLM Authorized officer and the Service in implementing the oil and gas program to be more explicit when access to the subsurface may affect the surface resources managed by the USFWS. We recommend that relationship be defined in Section 1.7 and throughout Section 2. We suggest the following language: "Where oil and gas program activities may affect surface resources managed by the USFWS, the BLM Authorize officer will consult with the USFWS to reach consensus on decisions. This can include approval of a variety of instruments for activity implementation, including but not limited to plan approval, permits, exceptions, modifications, and waivers." Additionally, Table 2-2 on page 2-4 should be revised where it states that exceptions could be made by the Authorized Officer to indicate that exceptions would be made by consensus of the BLM Authorizing Officer and the USFWS designated Officer when pertaining to surface resources managed by the USFWS. Consensus would not apply to decisions relating to oil and gas activities that do not affect surface resources managed by the USFWS.	Although the BLM intends to consult with the USFWS as noted in footnote 1 of Table 2-2 of the Final EIS, Section 20001(a)(2) of the Tax Act assigns the BLM the sole responsibility for making oil and gas program decisions for lands within the Coastal Plain.

S. Public Comments and BLM Responses (Alternatives)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
490.	—	—	United States Fish and Wildlife Service	97942	2	Suggestion for specific change to an alternative	Given the overlap of potential lease blocks and polar bear denning habitat, we recommend ensuring that surveys of polar bear denning habitat are required under all alternatives and development scenarios. We also emphasize that it would be important to ensure that all potential lessees are aware that they will have to consider the need to avoid disturbance of denning polar bears when they consider the temporal and spatial aspects of their operations.	<p>ITR wording for the Coastal Plain has been removed or streamlined to explain that it is referring to the current ITRs in place west of the Coastal Plain. Verbatim mitigation, monitoring, and reporting text from the Beaufort Sea ITRs has been placed in the lease stipulations to tie into the current level of oversight that is required of operators working in polar bear country.</p> <p>All operators will be subject to regulations and stipulations under the ESA and MMPA. Site-specific oil and gas projects will require additional NEPA analysis, MMPA authorization, and ESA consultation, at which time additional site-specific mitigation measures would be identified.</p>
491.	—	—	United States Fish and Wildlife Service	97942	6	Suggestion for specific change to an alternative	The DEIS could better address strategies to prevent introduction and spread of invasive species. To address invasive terrestrial plants, the Required Operating Procedures (ROPs) should recognize the use of, and include additional information about, certified weed-free gravel and supplies for road corridor construction and pipeline construction.	Additional text has been added to ROP 43.
492.	—	—	United States Fish and Wildlife Service	97942	7	Suggestion for specific change to an alternative	The DEIS should also describe how the proponent will respond to an introduction of nonnative species.	As noted under ROP 43, future site-specific authorizations would require an invasive species management plan.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
493.	—	—	United States Fish and Wildlife Service	97942	8	Suggestion for specific change to an alternative	We recommend adding a ROP under all alternatives the requirement for development of spill response plans. This is currently only found under Stipulation 4, Alternative D, Standard iv. Our recommended standard/requirement is as follows: Operators would be responsible for developing comprehensive spill prevention and response plans, including Oil Discharge Prevention and Contingency Plans and spill prevention, control, and countermeasure plans as well as to maintain adequate oil spill response capability to effectively respond during periods of ice, broken ice, or open water. Plans should be based on the statutes, regulations, and guidelines of the EPA, Alaska Department of Environmental Conservation (ADEC), and the Alaska Oil and Gas Conservation Commission (AOGCC), and well as ROPs, stipulations, and policy guidelines of the BLM and USFWS.	A new ROP has not been added; some additional text has been added to Lease Stipulation 4 (section [b][iv]). BLM requirements should not duplicate State of Alaska requirements, especially when ADEC requirements are more detailed and in some cases more stringent than federal requirements. At the time of a site-specific proposal, the operator will be required to submit a spill response plan.
494.	—	—	United States Fish and Wildlife Service	97942	14	Suggestion for specific change to an alternative	Throughout the DEIS there are requirements that applicants will need to monitor, assess, and evaluate the effects of development activities on the resources of the Arctic Refuge. In all of these instances, the data and analyses should be provided to the USFWS and BLM for their records. Data should be provided in electronic format and be accompanied by complete metadata and information about collection and analysis methodology.	The BLM will share data with the USFWS and other agencies/governments as appropriate.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
495.	—	—	United States Fish and Wildlife Service	97942	16	Suggestion for specific change to an alternative	[Stipulation 1] In a manner similar to the NPRA FEIS/IAP, we recommend that river setbacks be used to meet the objectives stated in Stipulation 1, which include the other Refuge purposes. Alternative D reflects the Service's recommended minimum of 0.5 mi setback for all identified rivers, while we also identified greater setbacks for larger rivers, which we believe are necessary and appropriate to protect the other purposes of the Refuge as well as Wild and Scenic River values. The recommendations are similar to setbacks used for important habitat and subsistence-use rivers and riparian areas in NPRA. Exact setback distances necessary to meet the objectives could be refined by further quantitative analyses of viewshed, soundscape and the Reasonably Foreseeable Development Scenario. Overlaying river setbacks on the viewshed study submitted by TrueNorth GIS suggests that Alternative D would minimize impacts on approximately 25% more land through NSO than the other alternatives, better protecting the species, habitats and activities identified in the Refuge purposes while allowing for oil and gas development through full access to hydrocarbons through subsurface leasing. We recommend that all rivers have minimum setbacks of 0.5 mi under Alternatives B and C to meet other Refuge purposes, except for spring-fed rivers, which should have minimum setbacks of 1 mile to protect these important, unique habitat features. We believe this change is necessary to ensure that Alternatives B and C are compatible with the purposes of the Arctic Refuge as stated in ANILCA.	The requirements vary among the alternatives to facilitate analysis of the different management options.

S. Public Comments and BLM Responses (Alternatives)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
496.	—	—	United States Fish and Wildlife Service	97942	17	Suggestion for specific change to an alternative	[Stipulation 1] Stipulation 1 under Alternative D protects a much broader area of important, and highly used denning habitat than the other alternatives, especially in the central portion of the Coastal Plain. We believe application of this Stipulation across alternatives B and C would be more consistent with all of the purposes of the Arctic Refuge, the MMPA and BLM's responsibility under Section 7(a)(1) of the ESA.	Buffer widths were determined through coordination with cooperating agencies, government-to-government and ANCSA consultation, and recommendations from agency subject matter experts to protect the wide range of resources within those areas. The widths vary among the alternatives to facilitate analysis of the different management options. All operators will be subject to regulations and stipulations under the ESA and MMPA.
497.	—	—	United States Fish and Wildlife Service	97942	19	Suggestion for specific change to an alternative	[Stipulation 1] Requirement/standard(s) should be added that prohibits infrastructure within maximum perceptible visible distances (e.g: how far an individual person would be able to see from any place inside a river buffer); or above heights that an individual person (spatially) is likely to be able see. Additional analysis should be completed to determine the area extent of the infrastructure prohibitions/height limitations.	This level of specificity would be determined at the project-level authorization. Site-specific analyses, including those associated with infrastructure in support of oil and gas development, can more realistically be provided when the BLM receives an application to permit such infrastructure. The Leasing EIS makes no decisions on such infrastructure, except to prohibit it in specified areas of particularly high value surface resources under some alternatives.
498.	—	—	United States Fish and Wildlife Service	97942	20	Suggestion for specific change to an alternative	[Stipulation 1] We recommend that appropriate Stipulations and ROPs to minimize impacts to Wild and Scenic River characteristics (e.g., maintaining water quality, free-flowing condition, identified Outstandingly Remarkable Values (ORVs), and wild classifications) be applied whenever activities may affect a river's Wild and Scenic River characteristics.	This level of specificity would be determined at the project-level authorization. Site-specific analyses, including those associated with infrastructure in support of oil and gas development, can more realistically be provided when the BLM receives an application to permit such infrastructure. The Leasing EIS makes no decisions on such infrastructure, except to prohibit it in specified areas of particularly high value surface resources under some alternatives.

S. Public Comments and BLM Responses (Alternatives)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
499.	—	—	United States Fish and Wildlife Service	97942	21	Suggestion for specific change to an alternative	[Stipulation 1] We recommend that Requirement/Standard(s) should be added across alternatives B-D that provides acoustic protections for natural quiet from within suitable river corridors.	This level of specificity would be determined at the project-level authorization. Site-specific analyses, including those associated with infrastructure in support of oil and gas development, can more realistically be provided when the BLM receives an application to permit such infrastructure. The Leasing EIS makes no decisions on such infrastructure, except to prohibit it in specified areas of particularly high value surface resources under some alternatives.
500.	—	—	United States Fish and Wildlife Service	97942	22	Suggestion for specific change to an alternative	[Stipulation 1] We recommend adding a Requirement/Standard(s) under Oil and Gas Field Abandonment, across alternatives B-D that specifies all eligibility findings and suitability factors as specified in the Arctic Refuge wild and scenic river review should be restored to a point where the area is again qualified for inclusion in the National Wild and Scenic River System.	Under all alternatives, ROP 35 requires restoration to the land's previous hydrological, vegetation, and habitat condition.
501.	—	—	United States Fish and Wildlife Service	97942	23	Suggestion for specific change to an alternative	[Stipulation 1] We recommend adding an additional Requirement/Standard(s) that reads: Before activities affecting suitable Wild and Scenic river corridors can occur, collection of baseline data that documents current suitable river characteristics will be completed as prescribed by the Authorizing Officer and in consensus with the USFWS as the surface management agency. This information will be used to monitor impacts, detect when National Wild and Scenic River System values are threatened, and identify needs for changes in practices. The lessee is to provide support for these efforts to help monitor and analyze effects on suitable river values and wild classification.	The USFWS conducted a Wild and Scenic Rivers review as part of its Revised CCP (2015) as the surface management agency. The Revised CCP describes baseline outstandingly remarkable values data used in making suitability determinations.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
502.	—	—	United States Fish and Wildlife Service	97942	24	Suggestion for specific change to an alternative	[Stipulation 1] The Requirement/Standard(s) should be designed to specifically maintain characteristics of the recreation and scenic ORVs for the Kongakut River, even though it is outside the project area. GIS modeling should be completed to determine whether/to what extent a setback within the eastern boundary of the project area would be needed to maintain viewshed characteristics of the scenic ORV for the Kongakut River.	Given the substantial distance between the river and the eastern boundary of the Coastal Plain, a protective buffer within the program area boundary is not warranted, unlike the rivers for which buffers would be established under Lease Stipulation 1.
503.	—	—	United States Fish and Wildlife Service	97942	25	Suggestion for specific change to an alternative	[Stipulation 1] Alternatives B-D prohibit permanent oil and gas facilities (gravel pads, roads, airstrips, pipelines) within certain river corridors; and on a case-by-case basis allow pipeline and road crossings deemed essential to cross through setbacks. This threatens the tentative wild classification of suitable rivers. We recommend changing requirement/standard wording for and the HulaHula river under all alternatives to include the following language: "(NSO) No permanent oil and gas facilities are allowed in the streambed and within the setback distances to protect Wild and Scenic River characteristics." Alternatives B-D seek to "minimize the disruption of free flow" but language should specify that maintaining free flow is required to meet Service interim management requirements for suitable rivers.	Section 2001(c)(2) of the Tax Act states the Secretary shall issue any rights-of-way or easements across the Coastal Plain for the exploration, development, production, or transportation necessary to carry out this section. Therefore, if an operator were required to access resources east of the Hulahula River, they may need a right-of-way across the river; prohibiting such access would not comply with the Tax Act.
504.	—	—	United States Fish and Wildlife Service	97942	26	Suggestion for specific change to an alternative	[Stipulation 1] Preservation of recreational hunting, fishing, hiking and boating values and opportunities is an original purpose of the Arctic Refuge, and the majority of visitors recreate within the project area. In order to meet the original purpose of this area, an objective for Alternatives B and C should be to minimize impacts on recreation.	Although recreation is not a current purpose of the Arctic Refuge under ANILCA, the lease stipulations and ROPs provide protections for multiple resources that maintain recreation values.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
505.	—	—	United States Fish and Wildlife Service	97942	27	Suggestion for specific change to an alternative	[Stipulation 1] The Canning, Marsh Fork-Canning (main tributary of the Canning), Hulahula, and Kongakut Rivers are highly valued and/or used by the public for recreation. The objective of this stipulation should include preservation of Recreational Outstandingly Remarkable Values as described for the Marsh Fork-Canning, Hulahula and Kongakut Rivers, and include requirement/standards consistent with USFWS interim management prescriptions for suitable rivers.	Although recreation is not a current purpose of the Arctic Refuge under ANILCA, the lease stipulations and ROPs provide protections for multiple resources that maintain recreation values. Section 20001(c)(2) of the Tax Act states the Secretary shall issue any rights-of-way or easements across the Coastal Plain for the exploration, development, production, or transportation necessary to carry out this section. For example, if an operator were required to access resources east of the Hulahula River, they may need a right-of-way across the river; prohibiting such access would not comply with the Tax Act.
506.	—	—	United States Fish and Wildlife Service	97942	28	Suggestion for specific change to an alternative	[Stipulation 1] We recommend deleting the last sentence in the objective "Protect the water quality, quantity....across the coastal plain", and include "springs and aufeis" in the first sentence following "riparian areas".	Text has been edited as recommended.
507.	—	—	United States Fish and Wildlife Service	97942	29	Suggestion for specific change to an alternative	[Stipulation 1] While Sadlerochit Springs appears to be within the Sadlerochit River, it is actually west of the Sadlerochit River and is a tributary to the Itkilyariak River. We recommend that Sadlerochit Springs and Creek, and Itkilyariak Creek-complex have a 3-mile setback in all alternatives in Leasing Stipulation 1 due to its cultural significance and unique terrestrial and aquatic communities. The Sadlerochit Spring Creek and Itkilyariak Creek complex have a unique endemic population of dwarf Dolly Varden and is an important subsistence use area. For more information see Arctic Refuge CCP (2015).	Current setbacks were determined through coordination with cooperating agencies, government-to-government and ANCSA consultation, and recommendations from agency subject matter experts to protect the wide range of resources within those areas. The widths vary among the alternatives to facilitate analysis of the different management options.

S. Public Comments and BLM Responses (Alternatives)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
508.	—	—	United States Fish and Wildlife Service	97942	31	Suggestion for specific change to an alternative	[Stipulation 1] To meet the objective for Stipulation 1 and meet the other identified Refuge purposes, gravel mining sites should not be allowed in areas designated No Surface Occupancy.	The language of each lease stipulation has been revised to indicate whether gravel mines are allowed. The BLM has revised Section 1.9.1 to include gravel mines as support facilities subject to the 2,000-acre limit.
509.	—	—	United States Fish and Wildlife Service	97942	32	Suggestion for specific change to an alternative	[Stipulation 1] We recommend the EIS provide additional clarity on how case-by-case approvals may occur and how they will be decided. Additionally, we recommend including a requirement that approvals will be reached by consensus between the BLM Administrative Officer and an authorized Service representative.	Additional text has been added to Table 2-3 in the Final EIS explaining the waiver, exemption, and modification process. Although the BLM intends to consult with the USFWS as noted in footnote 1 of Table 2-3, Section 20001(a)(2) of the Tax Act assigns the BLM the sole responsibility for making oil and gas program decisions for lands within the Coastal Plain.
510.	—	—	United States Fish and Wildlife Service	97942	33	Suggestion for specific change to an alternative	[Stipulation 2] Water resources in the Canning River Delta, including lakes, represent some of the highest quality wetland habitat within the Refuge. Unlike the coastal plain ecosystems to the west of the Refuge, the Refuge Coastal Plain has considerably fewer lakes. Therefore, lakes in the Canning River delta provide important habitat for fish and waterbirds that is not widespread in the project area. Protection of these habitats from disturbance is required to conserve fish and wildlife populations and habitats in their natural diversity and ensure water quality and quantity within the refuge is maintained. We previously recommended No Surface Occupancy be allowed in this area except for essential infrastructure approved by the BLM and with consensus from the Service. This requirement is currently supported in Alternative D, and should be applied to alternatives B and C to help maintain the other ANILCA purposes of the Refuge.	The varying protections remain in order to analyze a reasonable range of alternatives under NEPA.

S. Public Comments and BLM Responses (Alternatives)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
511.	—	—	United States Fish and Wildlife Service	97942	35	Suggestion for specific change to an alternative	[Stipulation 3] To help ensure the other purposes of the refuge are met, we recommend that the Requirement/Standard for Stipulation 3 be changed under all alternatives to: "Before exploratory or production drilling, the lessee/operator/owner would conduct studies to ensure drilling would not disrupt flow to or from, and waste injection wells will not contaminate any perennial springs. Study plans would be developed in consultation with the BLM, USFWS, and other agencies, as appropriate." Under all alternatives, the following phrase should be added after all delineated buffers referring to "above" springs: "or to a distance that sufficiently protects groundwater sources and flows of (the named spring), whichever is greater."	Text of Lease Stipulation 3 has been edited.
512.	—	—	United States Fish and Wildlife Service	97942	36	Suggestion for specific change to an alternative	[Stipulation 4] Due to the abundance, diversity and accessibility of subsistence resources in the nearshore area, this zone is a significant subsistence hunting area. Alternative D requirements to coordinate with local users represents best-practices developed for NPRA and the Chukchi Sea leasing programs and should be applied consistently when subsistence resources may be impacted.	The objective of ROP 36 provides opportunities for subsistence users to participate in planning and decision-making to prevent unreasonable conflicts between subsistence uses and other activities in all alternatives.

S. Public Comments and BLM Responses (Alternatives)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
513.	—	—	United States Fish and Wildlife Service	97942	37	Suggestion for specific change to an alternative	[Stipulation 4] As such, the coastline provides an important movement corridor and habitat for resting for bears during summer and autumn. Alternatives B and C do not provide temporal restrictions on activities which could lead to unnecessary conflict with polar bears. Alternative D restricts activities in this area to the time of year when polar bears are less likely to be moving along the coast, thus providing a good mechanism for reducing conflicts, and potential lethal removal of bears. We recommend that the requirements/standards from D be applied across all alternatives to ensure requirements of the MMPA and ESA are met.	The requirements vary among the alternatives to facilitate analysis of the different management options. All operators will be subject to regulations and stipulations under the ESA and MMPA.
514.	—	—	United States Fish and Wildlife Service	97942	38	Suggestion for specific change to an alternative	[Stipulation 4] We recommend altering the Objective in this stipulation to better describe the diversity of avian species. 'Waterfowl' is used, but should be 'waterbirds', and include 'sea birds and larids', since larids and seabirds are not covered by definition of 'waterbirds' on p. 3-86, or in Table J-9. Please change to "Objective: Protect fish and wildlife habitat, including that for waterbirds, larids, sea birds, and shorebirds, caribou insect relief"	See Table J-9 to distinguish between larids and seabirds.

S. Public Comments and BLM Responses (Alternatives)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
515.	—	—	United States Fish and Wildlife Service	97942	39	Suggestion for specific change to an alternative	[Stipulation 5] Alternatives B and C do not provide protections for the possible behavioral avoidance of important polar bear denning habitat even with a small development footprint. Alternative D allows polar bears unhindered access to large areas of their preferred denning areas in the Coastal Plain. This will become increasingly important as the density of land-based dens increases in future years due to sea ice loss. We recommend that the requirements/standards from Alternative D be applied to Alternatives B and C. This would be most consistent with the Refuge purposes as outlined in ANILCA, the ESA and the MMPA.	The requirements vary among the alternatives to facilitate analysis of the different management options. All operators will be subject to regulations and stipulations under the ESA and MMPA.
516.	—	—	United States Fish and Wildlife Service	97942	40	Suggestion for specific change to an alternative	[Stipulation 5] The language in Alternative D, Requirements/Standard subparts (a) and (b) allow the BLM Authorizing Officer to approve alternative protective measures. We recommend any such approvals be granted only in the case of consensus by the Service, given the need to ensure compliance with the ESA and MMPA.	Although the BLM intends to consult with the USFWS as noted in footnote 1 of Table 2-3 of the Final EIS, Section 20001(a)(2) of the Tax Act assigns the BLM the sole responsibility for making oil and gas program decisions for lands within the Coastal Plain. All operators will be subject to regulations and stipulations under the ESA and MMPA.
517.	—	—	United States Fish and Wildlife Service	97942	42	Suggestion for specific change to an alternative	[Stipulation 5] Changes in denning and/or disturbance should be monitored and evaluated over time. We recommend adding a requirement that a study of a minimum of 5 years be conducted to detect polar bear dens in all active lease blocks that overlap with polar bear designated critical habitat. If changes and/or disturbance are identified, then corrective measures may be applied	The BLM intends to consult and coordinate with the USFWS as noted in footnote 1 of Table 2-3. Any new information would be incorporated into a NEPA analysis, MMPA authorizations, and ESA consultations.
518.	—	—	United States Fish and Wildlife Service	97942	43	Suggestion for specific change to an alternative	[Stipulation 6] Recommend ROP be revised as: "Objective: Reduce disturbance of caribou and hindrance or alteration of caribou movements during periods when caribou are sensitive to disturbance."	Timing limitations are applied for sensitive periods under Lease Stipulations 7 and 8.

S. Public Comments and BLM Responses (Alternatives)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
519.	—	—	United States Fish and Wildlife Service	97942	44	Suggestion for specific change to an alternative	[Stipulation 6] Recommend that the monitoring plan required in Requirement/Standard “g.” in ROP 23 be expanded beyond vehicle use management to all potential activities that may disrupt caribou, and that allows for adaptive management to ensure ROP 23 is effective.	Exceptions, waivers, and modifications provide an effective means of applying “adaptive management” techniques to oil and gas leases and associated permitting activities to meet changing circumstances. The BLM or operators can initiate adaptive management modifications. See Instruction Memorandum 2008-032 and 43 CFR 3101.1-4 for additional details.
520.	—	—	United States Fish and Wildlife Service	97942	45	Suggestion for specific change to an alternative	[Stipulation 7] Recommend that the “Note” in this section be reworded as: “For the purposes of this document, the Porcupine Caribou Herd (PCH) primary calving habitat area was defined as the area with a higher-than-average density of cows about to give birth during more than 40 percent of the years surveyed. It is recognized that locations of important calving areas may shift over time; thus, this definition will require continued assessment and possible revision.”	Additional text has been added to Table 2-3 of the Final EIS that further describes the waivers, exceptions, and modifications for applicable lease stipulations and ROPs.
521.	—	—	United States Fish and Wildlife Service	97942	46	Suggestion for specific change to an alternative	[Stipulation 7] Recommend revision of the Objective for this stipulation to: “Reduce the possibility of disturbance of caribou or hindrance or alteration of their movements in the south-southeast portion of the Coastal Plain, which has been identified as important caribou calving habitat during many years.”	Timing limitations are applied for sensitive periods under Lease Stipulations 7 and 8.
522.	—	—	United States Fish and Wildlife Service	97942	47	Suggestion for specific change to an alternative	[Stipulation 7] Recommend that the monitoring plan required in Requirement/Standard “a.i.” be expanded beyond vehicle use management to all potential activities that may disrupt caribou, and that allows for adaptive management to ensure Lease Stipulation 7 is effective.	Exceptions, waivers, and modifications provide an effective means of applying “adaptive management” techniques to oil and gas leases and associated permitting activities to meet changing circumstances. The BLM or operators can initiate adaptive management modifications. See Instruction Memorandum 2008-032 and 43 CFR 3101.1-4 for additional details.

S. Public Comments and BLM Responses (Alternatives)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
523.	—	—	United States Fish and Wildlife Service	97942	48	Suggestion for specific change to an alternative	[Stipulation 8] Because of the level of activity, noise and larger footprint associated with Central Processing Facilities, we recommended that they be prohibited from the lands identified as calving and post-calving habitat in Maps 3-22 and 3-23 for the PCH and Central Arctic Herd (CAH), as described in Alternative D.	The identified PCH calving area is not available for lease under Alternative D. Therefore, construction of any oil and gas facility, including central processing facilities, would be prohibited in this area.
524.	—	—	United States Fish and Wildlife Service	97942	49	Suggestion for specific change to an alternative	[Stipulation 8] Recommend revision: "Note: For the purposes of this document, the PCH post-calving area was defined as the area with a higher-than-average density of cows during the post-calving period for more than 40 percent of the years studied. This includes and extends beyond the primary calving area. It is recognized that locations of important post-calving areas may shift over time; thus, this definition will require continued assessment and possible revision."	Additional text has been added to Table 2-3 of the Final EIS to further describe the waivers, exceptions, and modifications for applicable lease stipulations and ROPs.
525.	—	—	United States Fish and Wildlife Service	97942	50	Suggestion for specific change to an alternative	[Stipulation 8] Recommend the following revision of the Objective for this stipulation: "To protect key surface resources and subsistence resources/activities from disturbance resulting from permanent oil and gas development and associated activities in areas used by caribou during post-calving and insect-relief periods."	Text has been edited for clarity.
526.	—	—	United States Fish and Wildlife Service	97942	51	Suggestion for specific change to an alternative	[Stipulation 9] Recommend revising the Requirement Standard under Alternative B as follows: "...lessee/operator/contractor would develop and implement a Service-approved Polar Bear impact and conflict avoidance and monitoring plan."	The BLM agrees. Verbatim mitigation, monitoring, and reporting text from the Beaufort Sea ITRs has been placed in the lease stipulations to tie into the current level of oversight that is required of operators working in polar bear country. This includes operators developing and implementing a polar bear interaction plan, which outlines how to minimize disturbance to polar bears.

S. Public Comments and BLM Responses (Alternatives)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
527.	—	—	United States Fish and Wildlife Service	97942	56	Suggestion for specific change to an alternative	Under all alternatives, we recommend adding the requirement for development of spill response plans, which is currently only under Stipulation 4, Alternative D, Standard iv (with these edits): "Operators would be responsible for developing comprehensive spill prevention and response plans, including Oil Discharge Prevention and Contingency Plans and spill prevention, control, and countermeasure plans and maintain adequate oil spill response capability to effectively respond during periods of ice, broken ice, or open water, based on the statutes, regulations, and guidelines of the EPA, Alaska Department of Environmental Conservation (ADEC), and the Alaska Oil and Gas Conservation Commission (AOGCC), and well as Best Management Practices (BMPs), stipulations, and policy guidelines of the BLM and USFWS." Alternatively, we recommend creating a Stipulation or ROP to address this requirement, which is then required across all habitats. Any requirement for development of spill response plans should reference water quality standards for a suitable river's preliminary classification.	BLM requirements should not duplicate State of Alaska requirements, especially when ADEC requirements are more detailed and in some cases more stringent than federal requirements. At the time of a site-specific proposal, the operator will be required to submit a spill response plan.

S. Public Comments and BLM Responses (Alternatives)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
528.	—	—	United States Fish and Wildlife Service	97942	57	Suggestion for specific change to an alternative	A concern with oil development on the North Slope has been the lack of data to assess cumulative impacts of oil and gas development (see National Research Council Report, Cumulative Environmental Effects of Oil and Gas Activities on Alaska's North Slope (2003)). Therefore, we recommend a long-term monitoring program be developed that analyzes the effectiveness of the Lease Stipulations and ROPs. Statistically valid sampling designs with clearly defined levels of inference and change detection capabilities should be included in the design. Development of this program would help detect impacts and employ adaptive management techniques as necessary.	Exceptions, waivers, and modifications provide an effective means of applying "adaptive management" techniques to oil and gas leases and associated permitting activities to meet changing circumstances. The BLM or operators can initiate adaptive management modifications. See Instruction Memorandum 2008-032 and 43 CFR 3101.1-4 for additional details.
529.	—	—	United States Fish and Wildlife Service	97942	75	Suggestion for specific change to an alternative	Page 3-146: The DEIS states, "Under ROP 10, the pre-activity surveys required to locate dens, plus the 0.5-mile and 1-mile buffers for seismic and heavy equipment operation around occupied dens of grizzly and polar bears, respectively, would help to reduce the impacts of behavioral disturbance on denning bears (as well as birth lairs of ringed seals on landfast ice along the coast) throughout the entire program area." However, Alternatives B and C do not require such surveys, just a requirement to avoid known dens. We recommend changing the ROP under Alternatives B and C to require den surveys. Without the requirement for surveys to detect dens, the requirement to avoid known dens carries greatly diminished conservation value.	The BLM has revised ROP 10 to clarify the distinction of marine mammals, and mitigation associated with each species and during separate activities and through alternatives.

S. Public Comments and BLM Responses (Alternatives)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
530.	—	—	United States Fish and Wildlife Service	97942	88	Suggestion for specific change to an alternative	Page 3-115, Paragraph 5: It is not clear how the definition of PCH calving area was determined to be the “concentrated calving area during >40% of years”, as the most of the 1002 area is used for calving by either the PCH or CAH, and often both herds. Recommend providing additional discussion and citations as to how this was defined.	Page 3-106 of the Draft EIS included an explanation of how the PCH calving area was defined, including citations. Additional text has been added to Section 3.3.4 for clarity.
531.	—	—	United States Fish and Wildlife Service	97942	126	Suggestion for specific change to an alternative	Page 3-89, Paragraph 4, Line 7: Additional larid species encountered along the vessel route to Dutch Harbor (USFWS survey data, most in Kuletz and Labunski 2017) would include slaty-backed gull, red-legged kittiwake, Aleutian tern; (latter two are breeding birds of conservation of concern). These species should be included here. Also, it was difficult to determine the vessel route, and not clear what that route would be used for - or how much vessel traffic the project would generate (especially through the Bering Strait). This information is necessary to adequately assess the affected environment and potential impacts.	The hypothetical development scenario anticipates two vessels per year on average. The hypothetical development scenario is applicable to the program area, and speculation beyond where marine vessel traffic would go is beyond the scope of this analysis. Direct and indirect impacts associated with vessel traffic cannot be analyzed on a site-specific basis within this EIS, but they are analyzed for the program area generally based off the hypothetical development scenario. Additional discussion has been added to Section 3.3.3, Birds.
532.	—	—	United States Fish and Wildlife Service	97942	170	Suggestion for specific change to an alternative	Wilderness [Wilderness] Recommend under Oil and Gas Field Abandonment, all alternatives specify that before final abandonment, all impacted areas should be reclaimed to a point where the area is again eligible for designation as Wilderness.	Under all alternatives, ROP 35 requires restoration to the land’s previous hydrological, vegetation, and habitat condition.
533.	—	—	United States Fish and Wildlife Service	97942	237	Suggestion for specific change to an alternative	Recommend additional information about certified weed-free gravel and supplies for road corridor construction (e.g., hay bales, wattles, blankets) and pipeline construction should be recognized throughout the document where appropriate.	Additional text has been added to ROP 43 related to weed-free gravel.

S. Public Comments and BLM Responses (Alternatives)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
534.	—	—	United States Fish and Wildlife Service	97942	239	Suggestion for specific change to an alternative	Additionally, we recommend the EIS state how the proponent will prevent and respond to the introduction of the following types of invasive species that may be brought in on construction supplies and equipment: * invasive terrestrial invertebrates; * invasive terrestrial vertebrates (e.g., rodents); and * marine invasive species.	As noted under ROP 43, future site-specific authorizations would require an invasive species management plan.
535.	—	—	United States Fish and Wildlife Service	97942	240	Suggestion for specific change to an alternative	Page 2-36, Operating Procedure: Objective - Invasive Species Prevention: Please include the list of supplies in the requirements (not just equipment and vehicles). Please add boats, planes, and helicopters to the description of what is considered a vehicle as these are all considered vectors for introduction. We also recommend adding language related to monitoring at ports for invasive species at barges, air strips, and landing pads. Additional consideration and language specific to response to invasive species other than weeds should be considered in the EIS; the paragraph in the DEIS currently only discusses "weed control measures".	Additional text has been added to ROP 43.
536.	—	—	United States Fish and Wildlife Service	97942	267	Suggestion for specific change to an alternative	ROP 1: [ROP 1] To meet all purposes of the Refuge, the Requirement/Standard for this ROP should read: "Areas of operation would be left clean of all debris, residual soil contamination, surface water contamination, and groundwater contamination where groundwater is hydrologically connected to springs."	Under all alternatives, ROP 35 requires restoration to the land's previous hydrological, vegetation, and habitat condition.

S. Public Comments and BLM Responses (Alternatives)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
537.	—	—	United States Fish and Wildlife Service	97942	268	Suggestion for specific change to an alternative	<p>ROP 2: [ROP 2] Recommend adjusting the wording in the Requirement /Standard as follows: [ROP 2] The plan would be submitted to the BLM Authorized Officer for approval, in consultation with federal, State, and NSB regulatory and resource agencies for approval, as appropriate. [ROP 2] b. Lessees/operators/contractors would have an approved a written procedure. [ROP 2] c. To protect the water quality standard inherent to the wild river classification, add: "i. within setbacks for all suitable rivers, no pumpable, solid, liquid, and sludge waste shall be disposed of by injection (as is the standard elsewhere). Rather, ADEC approved storage for backhaul shall be the standard method for disposal of pumpable waste products." [ROP 2] Under disposal of rotting waste (b), recommend requiring exclusionary devices (e.g., grating, mesh, fence) be installed at all incineration sites to preclude access by wildlife.</p>	<p>The plan is submitted to the Authorized Officer for approval. BLM requirements should not duplicate State of Alaska requirements, especially when ADEC requirements are more detailed and in some cases more stringent than federal requirements. At the time of a site-specific proposal, the operator will be required to submit a spill response plan.</p>

S. Public Comments and BLM Responses (Alternatives)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
538.	—	—	United States Fish and Wildlife Service	97942	269	Suggestion for specific change to an alternative	ROP 3: [ROP 3] Recommended revision: The BLM Authorized Officer may allow storage and operations at areas closer than the stated distances if properly designed and contained to account for local hydrologic conditions. [ROP 3] Under all alternatives, recommend adding language to the Requirement/Standard that requires secondary containment and spill response equipment for all fuel equipment and caches. [ROP 3] For Alternatives B-D: To protect the water quality standard inherent to the wild river classification, recommend inserting a Requirement/Standard specific to suitable rivers: "Refueling equipment within setbacks for all suitable rivers is prohibited. Fuel storage stations would be located outside the setbacks except for small caches (up to 210 gallons) for motor boats, float planes, and ski planes, and for small equipment such as portable generators and water pumps, which would be located at least 100 feet from the active floodplain of suitable rivers."	The text has been revised. BLM requirements should not duplicate State of Alaska requirements, especially when ADEC requirements are more detailed and in some cases more stringent than federal requirements. At the time of a site-specific proposal, the operator will be required to submit a spill response plan. ROP 3 provides adequate protection for all waterbodies, including those suitable for wild and scenic river status.
539.	—	—	United States Fish and Wildlife Service	97942	270	Suggestion for specific change to an alternative	ROP 5: [ROP 5] The Requirements/Standard section under ROP 6 should be moved in its entirety to ROP 5 and added to the current ROP 5 Requirement/Standard.	The Requirements/Standards of ROP 6 have not been added to ROP 5.

S. Public Comments and BLM Responses (Alternatives)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
540.	—	—	United States Fish and Wildlife Service	97942	271	Suggestion for specific change to an alternative	ROP 6: Consistent with the mandate for habitat protection within the project area(s), environmental damage and unnecessary or undue degradation of the lands should be avoided and minimized to the greatest extent practicable, including that which may be caused by vehicular traffic. [ROP 6] Paragraphs "b." and "e.": In order to determine air impacts to the Arctic National Wildlife Refuge, we recommend adding "and Class II" after Class I areas. [ROP 6] Paragraph "g.": Ambient monitoring data can be used to determine impacts to Air Quality Related Values (AQRVs). This paragraph should include the following language: "or shows impacts above specific levels of concern for AQRVs".	Additional edits have been made to ROP 6. Class I areas receive special treatment in ROP 6 (sections b and e) because, unlike Class II areas, which constitute the rest of the U.S., they are subject to more stringent air quality standards. See ROP 6 (section f) for impacts on AQRVs.
541.	—	—	United States Fish and Wildlife Service	97942	272	Suggestion for specific change to an alternative	ROP 8: [ROP 8] This Requirement/Standard as currently worded does not meet the stated Objective or ANILCA purposes for the refuge. We recommend editing the objective to read: "In flowing waters (rivers, streams and springs) ensure water of sufficient quality and quantity to conserve fish, waterbirds, and wildlife populations and habitats in their natural diversity." [ROP 8] While the requirements should meet Alaska DNR guidelines for temporary water withdrawals, the unique presence of springs within the coastal plain warrants inclusion in the protections. Thus, we recommend the Requirement/Standard be edited to read: a. Withdrawal of unfrozen water from springs, rivers and streams during winter (onset of freeze-up to break-up) is prohibited. The removal of ice aggregate from grounded areas 4 feet deep or less may be authorized from rivers on a site-specific basis. b. Water withdrawal is prohibited year round from the following rivers, streams and springs: Canning, Hulahula, and Sadlerochit rivers	Text of the requirement/standard has been edited. With regards to comments b and c, the State of Alaska has the responsibility to authorize water withdrawals, ensuring sufficient water quality and quantity. It is the BLM's responsibility to ensure compliance with authorizations.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
541. (cont.)	(see above)	(see above)	(see above)	(see above)	(see above)	(see above)	including Itkilyariak Creek, a tributary of the Sadlerochit River that drains the Sadlerochit Spring, and perennial springs on the Tamayariak, Sadlerochit (the spring is located just west of the main stem in a tributary of the Sadlerochit River), Fishhole I Spring on the Hulahula River, and the perennial spring on the Okerokovik River, which is a tributary to the Jago River. c. Water withdrawal from other rivers and streams, outside of the winter, may be approved by the BLM Authorized Officer, in consensus with the USFWS, with adequate protection of hydrologic regimes, water quality and fish and wildlife habitats and populations." [ROP 8] We recommend the ROP identify who will monitor these requirements/standards and how the operator will determine the best approach to achieve required percentages and depths.	(see above)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
542.	—	—	United States Fish and Wildlife Service	97942	273	Suggestion for specific change to an alternative	<p>ROP 9: [ROP 9] Recommend providing additional explanation in the body of the document as to how water withdrawal amounts were determined within the Requirement/Standard and whether these withdrawal amounts ensure water volumes will remain sufficient to support fish communities found within the affected water bodies. [ROP 9] We recommend adding the following requirement to this ROP as it currently does not contain requirements for determining fish presence prior to activities that could impact fish: "Sensitive and non-sensitive fish species will be assumed to be present until surveys with 95% detection probability have been conducted during the appropriate seasons." [ROP 9] We recommend adding the phrase "connectivity to adjacent bird nesting sites" under the Requirement/Standard. Additionally, we recommend changing the rest of the Requirement/Standard to read: "Withdrawal of unfrozen water from lakes and the removal of ice aggregate from grounded areas 4 feet deep or less during winter and withdrawal of water from lakes during the summer may be authorized on a site-specific basis, depending on water volume and depth, the fish community, and connectivity to other lakes or streams and adjacent bird nesting sites." [ROP 9] Under Alternative D: This ROP is applicable to all birds. Please change "Additional modeling and monitoring of lake recharge may be required to ensure natural hydrologic regime, water quality, and aquatic habitat for migratory birds" to "Additional modeling and monitoring of lake recharge may be required to ensure natural hydrologic regime, water quality, and aquatic habitat for birds."</p>	<p>Water withdrawal amounts are determined through coordination with cooperating agencies, government-to-government and ANCSA consultation, and recommendations from agency subject matter experts. State of Alaska requirements would address impacts on fish present. Text has been added to clarify.</p>

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
543.	—	—	United States Fish and Wildlife Service	97942	274	Suggestion for specific change to an alternative	<p>ROP 10: [ROP 10] This ROP currently states that these restrictions do not apply to the use of equipment on ice roads after they are constructed. This is inconsistent with the language below and also with standards promulgated in ITRs for polar bears. If an ice road is constructed and a polar bear den is later detected within 1 mile of it, industry will likely have to reroute the road. While it is true that ITRs will likely have requirements about detecting dens, this ROP does not provide enough detail on how dens will be detected. Without a survey, there would be no known dens, and therefore no need to modify activity. Section b under Alternative D should be included in Alternatives B and C as well, given there is a requirement that all known dens be avoided and surveys are necessary to locate dens. [ROP 10] Recommend modifying the date range in Section b to end on April 18th, as this is the upper tail of den emergence for land-based denning for bears in the Southern Beaufort Sea as calculated from data published in Rode et al. (2018) and summarized in USGS Alaska Science Center, Polar Bear Research Program (2018). The text should clarify that if an aerial infrared survey is to be conducted, it should be conducted between December 15 and January 31 of any given year. [ROP 10] Requirement/standard (a) states that use of vehicles and other equipment is prohibited within 0.5 miles of grizzly bear dens identified by ADFG, however ADFG does not currently identify grizzly bear dens in the Refuge. Revise this to state that grizzly bear dens will be identified by the Service, and if the data are not available then the lessee will work with the Service to develop or conduct</p>	<p>Regarding polar bears, the current language is verbatim from 2016 USFWS incidental take regulations and mitigation measures in the CFR. It aligns with what the USFWS expects of operators currently working in the polar bear's range in the Beaufort Sea.</p> <p>With regard to grizzly bears, the State of Alaska, the primary manager for this species, manages them. The BLM will initiate work with the State of Alaska in cooperation with the USFWS as the land manager.</p>

543. (cont.)	(see above)	(see above)	(see above)	(see above)	(see above)	(see above)	studies to model habitat use (including denning, foraging and travel) by grizzlies in and around 1002	(see above)
544.	—	—	United States Fish and Wildlife Service	97942	275	Suggestion for specific change to an alternative	<p>ROP 11: The program area is steeper, more incised, and includes more river systems compared to flat areas in NPRA where extensive 3D-seismic surveys have been conducted. Topography strongly affects snow, hydrology and permafrost regimes of this generally hilly region and increases the potential for significant impacts to vegetation. Detailed microtopographic transects across existing 3D seismic trails show that there is compression of the tundra vegetation mat that is up to 20 cm in depth. These changes to microtopography within the track cause other changes to snow, hydrology, and thermal regimes, which make the tracks visible from the air and create conditions in some areas favorable to thermokarst and thermal erosion. Changes in the microtopography and compression of the vegetation mat also would have likely consequences to habitats of many species of plants, insects, small mammals, and birds (Walker et al. 2019). In order to minimize these effects, we suggest the following: *</p> <p>[ROP 11] For Alternatives B-D, change requirement/standard h. to "...overland travel will be monitored, and the operator will accommodate representative(s) during operations." *</p> <p>[ROP 11] In Alternatives B-D, recommend including the requirement for the operator to submit a snow monitoring plan that outlines measurement protocols (occurring before and during winter tundra travel) to be submitted to BLM and USFWS for review prior to work being conducted, to ensure habitat impacts are minimized. Protocols should include field measurements</p>	The operators are required to accommodate representatives during operations for monitoring. It is the discretion of the agency whether they will conduct monitoring. Details of a monitoring plan will be determined when site-specific proposals are submitted. Text has been edited ROP 11 as needed.

S. Public Comments and BLM Responses (Alternatives)

544. (cont.)	(see above)	(see above)	(see above)	(see above)	(see above)	(see above)	accounting for snow depth and density at sites on the Coastal Plain, and should represent the topographic diversity (e.g. terrain ruggedness, elevation, landforms, latitude and longitude) of the project area. Existing protocols used by the State of Alaska Department of Natural Resources (DNR) for the central Arctic, such as described in Deny et al. 2009 or newer may be useful. * [ROP 11] Under Requirement/Standard "a," all Alternatives, indicate that the exact dates are determined annually and recommend removing the approximate dates given the differences in snow depth and distribution for the Arctic Refuge Coastal Plain compared to the central Arctic and the trend towards decreasing snow cover season over time. * [ROP 11] Change Requirement/Standard "b," second sentence, under all Alternatives to read: "These vehicles would be selected and operated in a manner that eliminates direct impacts on the tundra caused by shearing, scraping," * [ROP 11] Alternative D (standard a) mentions measurements should be made "over the highest tussocks". No features are mentioned in alternatives A-C leaving the question open from where measurements can originate. Suggest standardizing across alternatives (e.g., above tussock tops) and in a manner consistent with DNR measurement protocols. * [ROP 11] Recommend adding that pre-packing with appropriate low-pressure ground vehicles to achieve required depth x density requirements may be required in tussock tundra and other sensitive vegetation types.	(see above)
545.	—	—	United States Fish and Wildlife Service	97942	276	Suggestion for specific change to an alternative	ROP 15: [ROP 15] The Requirement/Standard listed here may be conflicting with ROP 1 I, standard G. We recommend reviewing these two requirements for compatibility.	ROPs 11 and 15 are compatible.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
546.	—	—	United States Fish and Wildlife Service	97942	277	Suggestion for specific change to an alternative	<p>ROP 16: High levels of biodiversity are typically found within river corridors due the topographic gradient and associated vegetation diversity. [ROP 16] Thus, to meet the purposes of the Refuge to conserve fish and wildlife populations and habitats, as well as provide continued subsistence access to these resources and ensure water quality and quantity, we recommend that the objective be revised to “Protect water quality and quantity in rivers and streams and minimize alteration of riparian habitat.”</p> <p>Subsequently, the requirement/standard could be revised to state “Exploratory drilling is prohibited in rivers, streams and other water bodies.” No exceptions need to be allowed at this time, as it is our understanding that it is not typical industry practice to drill in rivers or other waterbodies.</p>	Lease Stipulation 1 addresses water quality and quantity protections.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
547.	—	—	United States Fish and Wildlife Service	97942	278	Suggestion for specific change to an alternative	ROP 19: [ROP 19] Recommend changing the Requirement/Standard "a". to read: "...unless further setbacks are stipulated under lease stipulations 1, 2, and 3." [ROP 19] Requirement/Standard "a." and "c.": Alternatives B-D allow for non-permanent oil and gas facilities (gravel pads, roads, airstrips, pipelines), and on a case-by-case basis allow pipeline and road crossings deemed essential to cross through setbacks. This threatens the tentative wild classification of suitable rivers. We recommend changing the Requirement/Standard wording to: "(NSO) No permanent oil and gas facilities are allowed in the streambed and within the setback distances outlined to protect Wild and Scenic River characteristics." [ROP 19] Recommend changing the Requirement/Standard "c." to read, "Siting temporary winter exploration and construction camps on river sand and gravel bars is allowed and encouraged, except on suitable river setbacks."	The tex in ROP 19t has been revised as needed. Section 20001(c)(2) of the Tax Act states the Secretary shall issue any rights-of-way or easements across the Coastal Plain for the exploration, development, production, or transportation necessary to carry out this section. Therefore, applicants may need a right-of-way across rivers; prohibiting such access would not comply with the Tax Act. Placement of infrastructure on sand and gravel bars reduces impacts on vegetation and therefore is encouraged, even within suitable river setbacks.

550.	—	—	United States Fish and Wildlife Service	97942	281	Suggestion for specific change to an alternative	ROP 23: These recommendations were developed for the Central Arctic Caribou Herd . Given the differences in herd and range characteristics, they may or may not be appropriate or effective at mitigating impacts to the Porcupine Caribou Herd. [ROP 23] We recommend that the monitoring plan noted in Requirement/Standard “g.” be expanded beyond vehicle use management to monitor the effectiveness of these requirements on the PCH. The plan should allow for adaptive management to ensure effectiveness. [ROP 23] We recommend approval on the adequacy of any caribou studies be granted only in the case of consensus by the Service and in consultation with the Porcupine Caribou Management Board. Additionally, we recommend that any development proposal should include studies of caribou movements before, during and after completion.	Exceptions, waivers, and modifications provide an effective means of applying “adaptive management” techniques to oil and gas leases and associated permitting activities to meet changing circumstances. The BLM or operators can initiate adaptive management modifications. See Instruction Memorandum 2008-032 and 43 CFR 3101.1-4 for additional details.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
551.	—	—	United States Fish and Wildlife Service	97942	282	Suggestion for specific change to an alternative	<p>ROP 24: [ROP 24] For Alternatives B and C, in Requirement/Standard, suggest deleting “c. Potential use of the site for enhancing fish and wildlife habitat.” It may be that fish will eventually find gravel pit water reservoirs and use them, but it would not be in keeping with Refuge purposes to promote this. Additionally, any impoundments affecting suitable rivers would threaten the interim management responsibilities of the Service to maintain free-flowing condition. [ROP 24] Requirement/Standard “a” in Alternative D should be modified to read “...floodplains of the three rivers...” and remove the Aichilik River from the list of major fish bearing rivers because it is outside of the 1002 Area. [ROP 24] Requirement/Standard “a”: Alternatives B-C: Recommend changing gravel mine site language to “Locate outside the active floodplain: except where further setbacks are stipulated under Lease Stipulation 1.” Alternative D: insert additional requirement: “Construction of gravel mine sites or water reservoirs may not be considered within the setbacks stipulated for suitable rivers under Lease Stipulation 1.” [ROP 24] In order to promote development of mining restoration plans (see 2003 NRC report, Cumulative Environmental Effects of Oil and Gas Activities on Alaska's North Slope (2003), we recommend adding the following requirement to each alternative: “Each proposed mine site shall have a Service-approved restoration plan and effectiveness monitoring plan prior to site approval and construction.”</p>	<p>The USFWS CCP (2015) will be revised to reflect all purposes of the Arctic Refuge. Text has been edited. The language of each lease stipulation has been revised to indicate whether gravel mines are allowed. The BLM has revised Section 1.9.1 to include gravel mines as support facilities subject to the 2000-acre limit. Although the BLM intends to consult with the USFWS as noted in footnote 1 of Table 2-3 of the Final EIS, Section 20001(a)(2) of the Tax Act assigns the BLM the sole responsibility for making oil and gas program decisions for lands within the Coastal Plain.</p>

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
553.	—	—	United States Fish and Wildlife Service	97942	284	Suggestion for specific change to an alternative	ROP 27: [ROP 27] The Service recommends the use of lattice towers and avoidance of guy wires which pose a significant collision risk for birds. [ROP 27] Page 2-29 ROP: Under Requirement/Standard: The Avian Power Line Interaction Committee (APLIC) produced a document in 2012 with guidance for reducing bird collisions with power lines. We recommend the Requirement/Standard include complying with the most up-to-date, suggested practices as published in the 2012 APLIC document, "Reducing Avian Collisions With Power Lines: The State Of The Art In 2012" and future updates to this guidance to minimize collisions and subsequent unauthorized take of eagles, other protected species, and birds in general. [ROP 27] Under Requirement/Standard: If exceptions are granted to the requirement/standard, wires would pose a risk to birds, but mitigation measures are available. Recommend changing the language in this section read: "If exceptions are granted allowing overhead wires, overhead wires would be clearly marked along their entire length to improve visibility to low-flying birds. Such markings would be developed through consultation with the USFWS", after items "i." through "ii	Text has been added to ROP 27 (section b). See ROP 31 for APLIC guidelines.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
554.	—	—	United States Fish and Wildlife Service	97942	285	Suggestion for specific change to an alternative	<p>ROP 28: [ROP 28] Current plans for developing an Ecological map does not specify including information on habitat needs of priority birds and mammals to help determine beforehand which land is most likely important for these animals. Information currently available on habitat suitability should be part of the ecological mapping process. Further, more than one year of surveys may be needed to understand wildlife values, particularly for species showing large variation in numbers from year to year (e.g., opportunistic shorebirds such as pectoral sandpipers, red and red-necked phalaropes, buff-breasted sandpipers). Thus, we recommend the requirement be revised to state: "The map would be prepared in time to plan an adequate number of seasons of ground-based wildlife surveys needed to characterize habitat suitability."</p> <p>[ROP 28] The proposed "ecological land classification map of the area" would likely not be able to address the stated objective. We recommend the development of a database, map, and models of likelihood of use need for targeted species within the program area. [ROP 28] The requirement should include cooperation with the Service to assess the information necessary for planning of ground-based wildlife surveys.</p>	Text has been edited in ROP 28. Additional requirements, including those associated with infrastructure in support of oil and gas development, can more realistically be added when the BLM receives an application to permit such infrastructure. The BLM intends to consult with the USFWS, as noted in footnote 1 of Table 2-3 of the Final EIS.

555.	—	—	United States Fish and Wildlife Service	97942	286	Suggestion for specific change to an alternative	ROP 29: [ROP 29] Recommend adding to Requirement/Standard: "Cultural Outstandingly Remarkable Values as described for the Hulahula River shall be maintained." [ROP 29] Recommend including the following language, "If the Permittee discovers any historic, prehistoric, or archaeological sites or artifacts during the course of field operations, all activity at that site shall cease and the State Historic Preservation Office in conjunction with BLM and USFWS shall be contacted immediately but not more than 24 hours after the incident occurs."	Lease Stipulation 1 provides specific protections for the Hulahula River. ROPs 29, 40, and 41 provide protections for cultural and paleontological resources throughout the program area. Additional coordination requirements for compliance with Section 106 will be specified in the programmatic agreement.
556.	—	—	United States Fish and Wildlife Service	97942	287	Suggestion for specific change to an alternative	ROP 30: [ROP 30] Under Requirement/Standard: Activities associated with removal of less than 100 cubic yards of bedrock outcrops, sand or gravel from cliffs also have potential to result in raptor mortality and nest/territory abandonment (all of which are prohibited under the Bald and Golden Eagle Protection Act). To avoid unauthorized take of these protected species, project proponents must consult with the Migratory Bird Management Permit Office prior to conducting these activities. The presence of nests may not preclude the work, but an Eagle or Eagle Nest Take Permit may be required before work commences to avoid unauthorized eagle take. Please add a statement that lessee/operator/contractor will consult with the USFWS Migratory Bird Management Permit Office prior to conducting activities that disturb potential eagle habitat. [ROP 30] Please use metric units in this ROP (e.g. 200 meters rather than 656 feet). This change will ensure consistency and reduce confusion.	All future project-specific authorized activities are required to comply with the Migratory Bird Treaty Act. This ROP does not use feet.

S. Public Comments and BLM Responses (Alternatives)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
557.	—	—	United States Fish and Wildlife Service	97942	288	Suggestion for specific change to an alternative	ROP 33: [ROP 33] In order to monitor and assess and impacts of construction on wildlife movements, we recommend adding that the lessee may need to support studies and monitoring efforts in addition to providing information on locations of new infrastructure.	Additional monitoring or studies determined to be necessary are determined at the project-specific basis. ROP 33 does not preclude the BLM from requiring additional monitoring based on future NEPA analysis and site-specific authorizations.
558.	—	—	United States Fish and Wildlife Service	97942	289	Suggestion for specific change to an alternative	ROP 34: [ROP 34] We recommend adding a Requirement/Standard to address aircraft associated disturbance to denning polar bears, as well as polar bears active on the land during summer and autumn. Minimum altitudes for aircraft should 1,500 feet above ground level (except for takeoffs and landings). This requirement should be applied to all alternatives to ensure requirements under MMPA and ESA are met. [ROP 34] Under Requirement/Standard, Effects of low-flying aircraft on wildlife: To avoid unauthorized take (including disturbance) of eagles, aircrafts operating within 0.5 mile of any eagle nest should be prohibited below 1,500' regardless of nest substrate. As currently written, the ROP only precludes aircraft activity around nests on cliff substrates. Protected nests may be located on almost any substrate type including the ground (e.g. owls) or in trees (e.g. bald eagle). Any eagle disturbance regardless of activity type (including takeoffs and landings), is prohibited by federal law without a USFWS Eagle or Eagle Nest Take Permit.	All operators will be subject to regulations and stipulations under the ESA and MMPA. All operators are required to comply with federal laws regardless of permit requirements.
559.	—	—	United States Fish and Wildlife Service	97942	290	Suggestion for specific change to an alternative	ROP 35: The lack of adequate restoration plans and adequate bonds to cover reclamation of areas impacted by oil and gas development on the North Slope is a concern as highlighted in the 2003 NRC report, Cumulative Environmental Effects of Oil and Gas Activities on Alaska's North Slope (2003). [ROP 35] Restoration standards should be set in	The BLM has included an explanation regarding restoration and reclamation for the 2,000 acres included in the narrative in Section S.2.1 of Appendix S. The condition meets the intent. See footnote 1, Table 2-3. Other ROPs address contamination (e.g., ROPs 3 and 7). See ROP 1: "areas of operation would be left clean of all debris."

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
559. (cont.)	(see above)	(see above)	(see above)	(see above)	(see above)	(see above)	<p>stipulations in this EIS. It should also be clearly stated what level of restoration will be required before land is no longer considered part of the infrastructure development cap. We also suggest that the EIS include a description of the process that will be used to approve restoration and ultimately remove these acres from the cap. Restoration plans should be required and reviewed prior to issuing a lease. Additional information on this issue can be found in Becker et al. 2016; Walker et al. 2019; NRC 2003; GAO 2002. [ROP 35] Under Alternatives B and C, we recommend the following change: "...would be adequately reclaimed to ensure eventual restoration of ecosystem function, productivity and value. The leaseholder would develop and implement a BLM and USFWS-approved abandonment and reclamation plan. [ROP 35] Under Alternative D, we recommend the following change: "...would be restored to ensure eventual restoration of ecosystem function, productivity and value, and meet adequate standards..." [ROP 35] Under all Alternatives, we recommend changing "...visual, hydrological, and productivity objectives..." to "visual, hydrological, contamination, and productivity objectives..." [ROP 35] Recommend adding the following requirement to this ROP and elsewhere as appropriate: "All survey flagging, stakes, wire, or other debris associated with this program should be removed from the Refuge. However, shot points may remain identified to assist the required summer cleanup crew until that project has been completed."</p>	(see above)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
560.	—	—	United States Fish and Wildlife Service	97942	291	Suggestion for specific change to an alternative	ROP 36: [ROP 36] Recommend changing Requirement/Standard, line "d" to, "...assess and appropriate range of potential effects on resources and subsistence, including contamination of those resources, as determine	ROP 7 adequately addresses this recommendation.
561.	—	—	United States Fish and Wildlife Service	97942	292	Suggestion for specific change to an alternative	ROP 40: [ROP 40] Lease Notice I provides language regarding ESA Section 7 Consultation. We suggest an additional Lease Notice be included for MMPA, similar to the following: * Lease Notice 2: The lease area may now or hereafter contain marine mammals. The BLM may require modifications to exploration and development proposals to further its conservation and management objective to avoid BLM-approved actions that would contribute impacts to marine mammals. The BLM would not approve of any action that may affect marine mammals until it completes its obligations under application requirements of the MMPA.	Additional lease notice added.
562.	—	—	United States Fish and Wildlife Service	97942	293	Suggestion for specific change to an alternative	ROP 41: [ROP 41] Along with approved studies that stipulate individual vehicles, suggest adopting general stipulations similar to guidance from state of Alaska DNR about summer off-road travel including: * Operations shall be restricted to dry uplands whenever possible. * Wetland crossing shall be minimized to the extent practical. * Multiple passes over the same area shall be kept to a minimum. * All operators should be made familiar with arctic vegetation types to ensure compliance.	BLM requirements should not duplicate State of Alaska requirements and North Slope Borough authorizations.

S. Public Comments and BLM Responses (Alternatives)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
563.	—	—	United States Fish and Wildlife Service	97942	294	Suggestion for specific change to an alternative	ROP 42: [ROP 42] Recommend clarifying in the existing Requirement/Standard that chasing wildlife with ground vehicles or aircraft is prohibited. [ROP 42] Recommend adding a Requirement/Standard to avoid and minimize the disturbance to loafing and nesting birds to the extent practicable, unless deemed to be an invasive or invading species that may negatively impact other animals that are deemed to be a priority. [ROP 42] Recommend adding a statement under Requirement/Standard: "Disturbance to both bald and golden eagles is prohibited under the Bald and Golden Eagle Protection Act (BGEPA). Appropriate spatial buffers around nests may be required to avoid take (including disturbance) by project activities. Buffer distances are both species and activity (e.g. land clearing, vehicle operation, building construction, pile driving, aircraft operation, etc.) specific. Buffer sizes range from 330 feet to 2 miles. To avoid violations of the BGEPA, the USFWS recommends project proponents apply for a USFWS Eagle and/or Eagle Nest Take Permit prior to conducting any activity with potential to take (including disturb) eagles or their nests (occupied or unoccupied)."	Text has been clarified and added in ROP 42 as needed. Operators are required to comply with federal laws regardless of permit requirements.
564.	—	—	United States Fish and Wildlife Service	97942	295	Suggestion for specific change to an alternative	ROP 43: [ROP 43] If gravel is to be brought in from off the Refuge it will be clean of invasive species or "weed free". [ROP 43] Annual monitoring for nonnative species will likely not allow for adequate eradication and control measures to be implemented. Because most invasive plants are wind-dispersed, if anything is detected, it should be eradicated immediately, not the following year. Therefore, all appropriate NEPA documents, Refuge Pesticide Use Permits, and Certifications must be in place prior to any oil/gas activities	1) Additional text has been added to ROP 43. 2) No changes made. As noted under ROP 43, future site-specific authorizations would require an invasive species management plan. 3) See response 2, above. 4) Text has been edited. 5) See response 2, above. 6) See response 2, above.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
564. (cont.)	(see above)	(see above)	(see above)	(see above)	(see above)	(see above)	<p>occurring on the Refuge, to allow an ADEC-certified chemical applicator to conduct eradication/control efforts in response to the observance and documenting of invasives during growing season. [ROP 43] Executive Order 13112 (1999) requires all federal agencies to prevent the introduction of invasive species; provide for their control; and minimize their impacts to the local economy, ecology, and human health. We recommend adding the following language under the Requirement/Standard: "In consultation with the USFWS, the operator/contractor shall develop and implement a long-term monitoring and treatment plan for invasive plant species, in conjunction with the authorized work. This plan shall be developed prior to the start of work, to allow for review and subsequent approval by the USFWS." [ROP 43] Recommend changing the Requirement/Standard to read: "...detailing the methods for cleaning equipment and vehicles, including off-site disposal of cleaning fluids or materials and detected organisms, and monitoring..." [ROP 43] Erosion waddles and similar have been identified as vectors for invasive species. Therefore, these should be certified weed-free prior to allowing their use on the Refuge. [ROP 43] There are so few invasives that have been documented north of the Brooks Range that it is imperative a project of this magnitude implement a higher standard of care when addressing the potential for the spread of invasives. Therefore, all equipment must be thoroughly washed at the point of departure to ensure invasives are not brought onto the Refuge. If being transported on trailers up the haul road, by barge or plane, all equipment</p>	(see above)

S. Public Comments and BLM Responses (Alternatives)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
564. (cont.)	(see above)	(see above)	(see above)	(see above)	(see above)	(see above)	should be cleaned at the point of departure and not cleaned in Deadhorse, Kaktovik, etc. Additionally, an approved Invasive Plant Management and Response Plan should be in place that addresses all approved chemicals for use on the Refuge, certifications of those who will be applying those chemicals and how often those chemicals can be used.	(see above)
565.	—	—	United States Fish and Wildlife Service	97942	296	Suggestion for specific change to an alternative	[Stipulation 3] We recommend adding NSO buffers and no lease setbacks as described in Alternative D to all alternatives. Alternatives B and C may not meet the other purposes of the Refuge without this requirement, including significant impacts to fish and wildlife populations and habitats in their natural diversity, the opportunity for continued subsistence uses, and water quality and quantity. Rivers in the Arctic Refuge with perennial springs support fish during the harsh winters, and rivers without springs have no fish. All Arctic Grayling and Dolly Varden are major subsistence resources in the Arctic Refuge, and their survival depends on approximately twenty springs found within the coastal plain and adjacent foothills, thus they are truly critical habitats. Only four rivers that cross the 1002 Area support major anadromous or endemic fish populations, requiring special recognition. Subsurface flow paths to perennial springs are unknown and could potentially be disturbed by drilling or fracking activity. This universal stipulation is needed to ensure that these important and unique habitats and water resources are protected per ANILCA purposes of the Refuge, while accounting for uncertainty regarding sources and flowpaths of groundwater in the Coastal Plain.	All action alternatives are designed to meet the purpose and need, and to account for all purposes of the Arctic National Wildlife Refuge. See Section 3.4.7. The requirements vary among the alternatives to facilitate analysis of the different management options.

S. Public Comments and BLM Responses (Alternatives)

566.	Jamie	Williams	The Wilderness Society	98058	4	Suggestion for specific change to an alternative	Because BLM failed to produce such a necessary depiction, TWS prepared the attached map, which depicts the sprawling nature of a realistic development scenario under Alternative B.7 This depiction of hypothetical full-scale development on the Coastal Plain mirrors how North Slope oil development has proceeded (beginning with Prudhoe Bay and its satellite fields, then moving mostly westward to the non-contiguous fields). While the locations of each well pad and other type of oilfield infrastructure shown on the map are not exact due to limited exploration data for the Coastal Plain, and the infrastructure icons are not to scale, the map provides a depiction of the reasonable extent of foreseeable development that could occur under BLM's interpretation of the 2,000-acre limitation and consistent with No Surface Occupancy stipulations in Alternative B.8Because this type of visual has immense value for agency and other decision-makers and the public to understand the possible scale of development and impacts, and is wholly feasible to produce at this stage, BLM should prepare comparable depictions for all alternatives in a revised DEIS	At the leasing stage, it is unknown as to where leases will be issued, where exploration will occur, and, if oil and gas resources are discovered in economic quantities, where development would occur. Accordingly, a spatial depiction could mislead the public into assuming the developments would occur in the depicted areas.

567.	Brook	Brisson	Trustees for Alaska	98269	95	Suggestion for specific change to an alternative	BLM also needs to modify ROP 35. ROP 35's objective is to "[e]nsure ongoing and long-term reclamation of land to its previous condition and use."500 To effectuate this, bonding requirements consistent with the discussion above must be added to ROP 35. BLM should estimate actual, likely reclamation costs of reasonably foreseeable development projects and consider alternatives that impose corresponding bonding amounts. Additionally, BLM should require that bonds be adjusted for inflation at regular intervals to ensure that they remain sufficient to cover any necessary reclamation activities after operations eventually conclude.	The BLM believes that the objective is appropriate. Operators would be required to submit a reclamation plan that satisfies the objective of the ROP. Bonding would be determined and required with the specific oil and gas authorization (43 CFR 3134; the BLM would also apply these NPR-A regulations to the Coastal Plain).
568.	Brook	Brisson	Trustees for Alaska	98270	2	Suggestion for specific change to an alternative	The DEIS states that "[u]nder ROP 10, the pre-activity surveys required to locate dens, plus the 0.5-mile and 1-mile buffers for seismic and heavy equipment operation around occupied dens of grizzly and polar bears, respectively, would help to reduce the impacts of behavioral disturbance on denning bears (as well as birth lairs of ringed seals on landfast ice along the coast) throughout the entire program area."1588 But as noted above, the DEIS mentioned a 2.5-3.7 mile zone where noise impacts to seals can be expected, and the referenced buffers apply only to bear dens, not seal lairs. The DEIS thus overstates the protection provided to seals under ROP 10. 0.5-mile and 1-mile buffers are simply insufficient.	Buffers are a proactive approach to minimize behavioral disturbance of multiple species.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
569.	Brook	Brisson	Trustees for Alaska	98270	3	Suggestion for specific change to an alternative	<p>Finally, operations after May 1 would employ a full-time trained protected species observer (PSO) on vibroseis vehicles to ensure all basking seals are avoided by vehicles by at least 500 feet and would ensure that all equipment with airborne noise levels above 100 dB re 20 ?Pa were operating at distances from observed seals that allowed for the attenuation of noise to levels below 100 dB. The rationale behind these metrics is again not provided in the DEIS, and they do not appear to reflect the best available information. Seals are departing lairs earlier in the season, so basking seals can be expected before May 1 and this standard should be modified accordingly.1589 As detailed above, many sources of noise cause behavioral responses in seals from distances greater than 500 feet, so keeping that distance will not be effective in avoiding those responses. And while it may be a worthy goal, the effort to keep attenuated noise levels below 100 dB for observed seals would seem difficult to achieve as a practical matter. BLM should explain how this can be achieved, and/or include this in the required sound source verification test, so that distances that specified equipment must be kept from basking seals can be understood prior to undertaking the activity. 1589 Kelly 2006 (p. 48, Table 15); see also Von Duyke et al., Ringed seal spatial use, dives, and haul-out behavior in the Beaufort, Chukchi and Bering Seas (2011-2016) (using satellite transmitters to demonstrate haul-out behavior well in advance of May 1).</p>	<p>The 100 db level is the NMFS-approved standard for airborne noise levels. Operators will use approved methods and technologies for sound source verification in order to comply with the ESA and MMPA.</p>

570.	Brook	Brisson	Trustees for Alaska	98270	48	Suggestion for specific change to an alternative	<p>Stipulation 7 seeks to protect the "PCH primary calving habitat area." However, BLM has not supported the delineation of that area in the DEIS with any level of robust scientific justification.1667 Additionally, areas outside of the most commonly used concentrated calving areas are still very important for caribou for post-calving needs as well as calving during particular years. BLM needs to protect both key calving and post-calving habitat, as well as protect migration corridors and movements. Protecting only the "primary calving area" as defined here will provide little protection in some years, potentially increasing calf mortality and threatening the caribou population. This is especially a concern if warming conditions under climate change leads to "a western shift in concentrated calving areas," as the DEIS indicates.1668</p>	<p>Page 3-106 of the Draft EIS has an explanation of how the PCH calving area was defined, including citations. Operators are required to submit a written request for an exception, waiver, or modification and information demonstrating that (1) the factors leading to the inclusion of the stipulation in the lease have changed sufficiently to make the protection provided by the lease stipulation no longer needed or (2) the proposed operation would not cause unacceptable impacts. The criteria for approval of exceptions, waivers, and modifications should be supported by NEPA analysis, and may require site-specific environmental review. Requests should contain, at a minimum, a plan that includes related on-site or off-site mitigation efforts to adequately protect affected resources; data collection and monitoring efforts; and timeframes for initiation and completion of construction, drilling, and completion operations. The operator's request may be included in an Application for Permit to Drill, Notice of Staking, Sundry Notice, or letter. The BLM may also proactively initiate the process. During the review process, BLM coordination with other local, state, or federal agencies (e.g., ADFG, NSB, and local governments) should be undertaken, as appropriate, and documented. The BLM will also consult with the federal surface management agency (e.g., USFWS). Approval or disapproval is made by the Authorized Officer, and the decision is documented. If the waiver, exception, or modification is approved, any necessary mitigation is also documented. The applicant is then provided with a written</p>

570. (cont.)	(see above)	(see above)	(see above)	(see above)	(see above)	(see above)	(see above)	notification of the decision. See Instruction Memorandum 2008-032 and 43 CFR 3101.1-4 for additional details.
571.	Brook	Brisson	Trustees for Alaska	98270	49	Suggestion for specific change to an alternative	Moreover, BLM's mitigation measures which are specifically targeted to address impacts to subsistence users fall far short of avoiding and minimizing impacts to affected communities. ROP 36, "Subsistence Consultation for Permitted Activities" completely ignores the need to provide opportunities for Gwich'in communities to participate in planning and decision-making to prevent unreasonable conflicts between subsistence uses and other activities. Similarly, ROP 39 requires that "Before starting exploration or development, lessees/operators/contractors are required to develop a subsistence access plan, in coordination with the Native Village of Kaktovik and the City of Kaktovik..." It is unacceptable for BLM to arbitrarily limit these coordination and consultation opportunities to Kaktovik and the North Slope Borough, in light of the abundant evidence that Gwich'in subsistence users will be significantly impacted from oil and gas leasing on the Coastal Plain.	The Eastern Interior Alaska Subsistence RAC includes Arctic Village and Venetie (see a, b, and d under ROP 36). Where a Gwich'in community is directly affected, ROP 36 (section a) requires coordination with that community. ROP 39 is specific to subsistence use and access within the Coastal Plain. Footnote 1, Table 2-3 in the Final EIS requires coordination with affected parties as appropriate. This also does not replace the BLM's responsibility to conduct government-to-government consultation with affected tribes.

S. Public Comments and BLM Responses (Alternatives)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
572.	Brook	Brisson	Trustees for Alaska	98270	50	Suggestion for specific change to an alternative	<p>We further note that ROP 36 contains no clear mechanism for actually reducing impacts to subsistence activities. There is no provision that allows a local community to prevent any oil and gas activity from moving forward if there would be significant impacts on subsistence use - rather, the community would merely be informed ahead of time. Without providing for any type of "veto" power to local communities, such measures are essentially meaningless. Moreover, subsection (c) requires that applicants prepare a plan to describe how they will avoid subsistence impacts, and submit that plan to the BLM Authorized Officer. For such a plan to have any value whatsoever, it must be shared with all potentially affected communities to determine whether the plan would effectively avoid unreasonable conflicts with subsistence. The BLM Authorized Officer should not be given carte blanche to make such determinations. Finally, we note that several of the "requirements" of this ROP merely parrot existing legal mandates and should not be considered mitigation measures for purposes of this section. This includes the requirement for BLM to do government-to-government consultation in subsection (b) and the requirement for barge operators to avoid unmitigable adverse impacts, as determined by NMFS, on the availability of marine mammals to subsistence hunters in subsection (c)(vi).1669</p>	<p>ROP 36 (section a) identifies mechanisms to maximize users' opportunities to participate in the planning process in order to minimize impacts on subsistence uses (e.g., conflict avoidance agreements and additional mitigation measures). ROP 36 is specific to on-lease users. The public will be able to provide input to the Authorized Officer through future site-specific NEPA processes associated with oil and gas projects. 43 CFR 3590.2 identifies the responsibility of the Authorized Officer. BLM Authorized Officers receive their authorities through the delegation process within the agency.</p>

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
573.	Brook	Brisson	Trustees for Alaska	98270	132	Suggestion for specific change to an alternative	Particularly egregious, in Lease Stipulation I, under all alternatives, allows for “[o]n a case-by case basis, essential pipeline and road crossings to the main channel would be permitted through setback areas. The setbacks may not be practical in river deltas. In these situations, permanent facilities would be designed to withstand a 200-year flood” for the Hulahula, Canning, Okpilak and Jago Rivers.1851 Allowing development of pipelines and roads across any of these rivers is inconsistent with protecting any ORV and are exactly the type of inappropriate development for a “Wild” river, which should be maintained “free of impoundments and generally inaccessible except by trail, with watersheds or shorelines essentially primitive and waters unpolluted.”1852	Section 20001(c)(2) of the Tax Act states the Secretary shall issue any rights-of-way or easements across the coastal plain for the exploration, development, production, or transportation necessary to carry out this section. For example, if an operator were required to access resources east of the Hulahula River, they made need a right-of-way across the river; prohibiting such access would not comply with the Tax Act.
574.	Brook	Brisson	Trustees for Alaska	98270	133	Suggestion for specific change to an alternative	Required Operating Procedure 35, is meant to “[e]nsure ongoing and long-term reclamation of land to its previous condition and use” and describes leaseholder requirements for abandonment of “[o]il and gas infrastructure, including gravel pads, roads, airstrips, wells and production facilities.”1853 Alternative D would require the leaseholder to “develop and implement a BLM-approved abandonment and reclamation plan . . . describ[ing] . . . wild and scenic river . . . eligibility and suitability” before final abandonment.1854 Merely describing for the eligibility and suitability for inclusion in the Wild and Scenic River system is not substantive enough to ensure protections as required by the act. BLM’s] EIS currently fails to require maintenance of Wild and Scenic rivers free flowing state and ORVs. For Alternatives B and C, leaseholders would only have to “develop and implement a BLM-approved abandonment and	Under all alternatives, the BLM would maintain free-flowing characteristics of eligible river segments and ensure that authorized uses comply with all stated objectives. Management actions that prohibit surface-disturbing activities, including NSO, CSU, and TLs near the eligible and suitable WSRs (see Table 3-32 in the Draft EIS), would provide varying protections for ORVs. This would also ensure that the free-flowing condition of the river remains intact.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
574. (cont.)	(see above)	(see above)	(see above)	(see above)	(see above)	(see above)	reclamation plan describ[ing] short-term stability, visual, hydrological, and productivity objectives and steps to be taken to ensure eventual ecosystem restoration to the land's previous hydrological, vegetation, and habitat condition."1855 In addition, under Alternatives B and C, the reclamation must only "ensure eventual restoration," where "eventual" is not defined, so it is unclear exactly how extended a time this could be. Finally, in addition to Alternatives B and C already vague and pliable parameters these alternatives allow "[t]he BLM Authorized Officer [to] grant exceptions to satisfy stated environmental or public purposes."1856 By completely failing to account for wild and scenic river values in alternatives B and C, Required Operating Procedure 35 does not protect for any ORVs or the free flowing state of rivers. For only requiring "shortterm stability," "eventual restoration," and the availability of discretionary exceptions, extended or inadequate reclamation will negatively impact rivers' classification and potential eligibility for the Wild and Scenic Rivers system.	(see above)

S. Public Comments and BLM Responses (Alternatives)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
575.	Brook	Brisson	Trustees for Alaska	98270	171	Suggestion for specific change to an alternative	Lease stipulations 4 (Alt. D) and 9 (Alts. C and D) require that, before engaging in open water activities, the lessee/operator/contractor must consult with the Alaska Eskimo Whaling Commission, the North Slope Borough, and local whaling captains' associations to minimize adverse impacts on subsistence activities.1951 Similarly, ROP 36 requires permittees who propose transporting materials to the Coastal Plain in support of oil and gas activities to engage in advance consultation with the entities listed above in order to minimize subsistence impacts.1952 We believe advance consultation as a means to prevent conflicts and adverse impacts is a beneficial approach.1953 We urge BLM to expand these requirements to all action alternatives and to clarify that bulk fuel and hazardous substances are among the materials for which marine transport requires advance consultation. We further urge BLM to require the lessee/operator/contractor to engage in prior consultation with the U.S. Coast Guard before engaging in shipping activities.	Text of Lease Stipulation 4 has been modified. Operators are required to follow all federal, state, and local requirements related to fuel and hazardous substance transport. Transport of hazardous materials is coordinated and regulated by ADEC and the NSB.
576.	Brook	Brisson	Trustees for Alaska	98270	173	Suggestion for specific change to an alternative	ROP 10 prohibits oil and gas activity within one mile of known or observed polar bear dens, subject to limited exceptions.1954 We note that this ROP is only effective to the extent polar bear dens are accurately detected, and detection techniques have many shortcomings that BLM failed to consider. We further note that this ROP appears limited in scope to onshore oil and gas operations. We urge BLM to expand its applicability to encompass shipping activities as well and to include language clarifying that it prohibits icebreaking and other shipping activities within a one-mile radius of any polar bear den, including those on land and on sea ice.	Operators will follow USFWS guidelines for detecting and operating around known polar bear dens. Operators will also be subject to regulations and stipulations under the ESA and MMPA. Additional requirements will be determined at the site-specific level.

577.	Brook	Brisson	Trustees for Alaska	98270	174	Suggestion for specific change to an alternative	[comment:98270-174; 190.0402]Seasonal Restriction. ROP 46 includes a seasonal restriction designed to minimize impacts on marine mammals from vessel traffic. Vessel traffic associated with Coastal Plain oil and gas operations is generally prohibited before July 1.1955 We support the idea of a seasonal restriction not only because it helps minimize conflicts with marine mammals, but also because it reduces the risks of oil and hazardous substance spills occurring due to poor weather, visibility, and ice conditions and because such spills would be extraordinarily difficult to clean up in such conditions.1956 Moreover, avoiding seasonal periods when ice is present reduces or eliminates the need to utilize noisy and disruptive icebreaking measures that are harmful to wildlife. We urge BLM to strengthen this measure by adding an October 1 fall termination date for vessel traffic.1957 The same rationale supporting the early-season restriction would counsel in favor of this change. Precluding late-season shipping would likewise help minimize wildlife conflicts and ensure that shipping is not taking place during poor weather, visibility, and ice conditions that increase the need for icebreaking, increase the likelihood of oil and hazardous substance spills, and increase the difficulty of cleaning up any such spill. We also urge BLM to strengthen ROP 46 by requiring consultation with the U.S. Coast Guard before any waiver of the July 1 or October 1 seasonal restrictions is granted, in addition to consultation with NMFS and/or USFWS. While the resource agencies have expertise concerning marine mammals, the Coast Guard is the expert agency with respect to navigation safety and the avoidance of	A hard termination date for vessel traffic is unreasonable and is not based on environmental conditions. Consultation with the NMFS and USFWS, as the primary regulatory agencies for marine mammals, will occur in accordance with ROP 46(c), as the objective is to minimize impacts on marine mammals.

577. (cont.)	(see above)	(see above)	(see above)	(see above)	(see above)	(see above)	collisions, groundings, and oil and hazardous substance spills, all of which can harm marine mammals and other wildlife.[comment end]	(see above)
578.	Brook	Brisson	Trustees for Alaska	98270	178	Suggestion for specific change to an alternative	The analysis in the DEIS concludes that shipping impacts on marine mammals will be minimal because barges will generally be traveling slowly, such as at speeds of 10 knots or less.1958 The 10-knot speed restriction in ROP 46, however, only applies in North Pacific right whale critical habitat.1959 Additionally, recommended 5-and 9-knot speed limits are among the "reasonable precautions" that could be taken "as appropriate" when whales are observed nearby.1960 These geographically limited and non-binding speed limits are inadequate. As BLM has observed, the "speed of ships is related directly to the severity of collisions between vessels and whales."1961 Moreover, ship speed is a key factor affecting the risk of collisions, groundings, and oil and hazardous substance spills.1962 We urge BLM to expand the applicability of the 10-knot speed limit in ROP 46 to all barges, tankers, and other operational and support vessels associated with Coastal Plain oil and gas operations transiting the 5 nm buffer zone offshore of the program area and its vicinity.1968 Doing so would be consistent with the U.S. Bureau of Ocean Energy Management's (BOEM's) recent decision concerning the Liberty offshore drilling and production facility, which provided that "[v]essels traveling between West Dock/Endicott and Foggy Island Bay will not exceed speeds of 10 knots in order to reduce the potential for whale strikes."1969 We note that, while a 10-knot speed limit substantially reduces the number of whale strikes and their severity, it	The 10-knot speed is a reasonable standard and would align with other restrictions across the North Slope. Additional restrictions will be analyzed on a project-specific basis.

S. Public Comments and BLM Responses (Alternatives)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
578. (cont.)	(see above)	(see above)	(see above)	(see above)	(see above)	(see above)	does not entirely eliminate the risk of collision. Slower speeds are appropriate under certain circumstances, including when ships approach within 300 yards of observed whales and when visibility is limited. ROP 46 reflects this by recommending 5-and 9knot speed limits, respectively, in such situations. We urge BLM to make these 5-and 9-knot speed limits mandatory rather than merely listing them among the "reasonable precautions" that an operator "would take" to avoid whale interactions.	(see above)
579.	Brook	Brisson	Trustees for Alaska	98270	180	Suggestion for specific change to an alternative	Additionally, ROP 46 calls upon vessel operators to undertake a variety of measures when approaching within 1 mile of observed whales, including reducing the vessel speed to less than 5 knots when the vessel is within 300 yards of a whale. We urge BLM to strengthen this provision by requiring vessel speed to be reduced to 10 knots as soon as the vessel approaches within 1 mile of observed whales, and then vessels would further reduce speed to 5 knots when coming within 300 yards of a whale pursuant to the existing provision. With respect to this provision and all other provisions in ROP 46, the language must be revised to clarify that the procedures impose mandatory obligations. For instance, "would" and "should" must be replaced with "must" or "shall."	The 10-knot speed is a reasonable standard and would align with other restrictions across the North Slope. Additional restrictions will be analyzed on a project-specific basis.

S. Public Comments and BLM Responses (Alternatives)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
580.	Brook	Brisson	Trustees for Alaska	98270	181	Suggestion for specific change to an alternative	At present, lease stipulations 4 and 9 are limited to nearshore and coastal activities, and ROP 10 is only applicable to onshore oil and gas operations. The geographic scope of ROPs 36 and 46 is less clear but, given the DEIS's general emphasis on program area impacts, they could be construed as limited to oil and gas operations within or in the immediate vicinity of the program area. Shipping-related adverse impacts, however, have the potential to occur anywhere along the marine barge route as well. Accordingly, we urge BLM to revise lease stipulations 4 and 9 and ROPs 10, 36, and 46 to make it clear that these provisions are applicable to all shipping activities associated with Coastal Plain oil and gas operations wherever they may occur.	The BLM does not have authority to regulate marine traffic outside the Coastal Plain. Where marine vessel traffic would go is beyond the scope of the analysis for this Leasing EIS. Direct and indirect impacts are analyzed for the program area generally based off the hypothetical development scenario.
581.	Brook	Brisson	Trustees for Alaska	98270	247	Suggestion for specific change to an alternative	BLM's reliance on the DEIS's mitigation measures is misplaced. For instance, Stipulation 6 seeks to protect habitat of both the Porcupine and Central Arctic Herds by minimizing disturbance and hindrance of movements. ²¹⁴⁹ However, for its requirements and standards, it simply points to ROP 23 for Alternatives B and C, with only the addition of suspension of major construction activities using heavy equipment for a short period under Alternative D. This means that this stipulation does not provide any independent protection for caribou movements across the Coastal Plain. (It is unclear what is meant by "major construction activity" and also noteworthy that even that protection is subject to waiver.)	The BLM has the ability to manage using adaptive management principals by modifying requirements of ROPs through the waiver, exception, or modification process as needed. According to IM 2008-032 Attachment 1, page 5, the BLM or operators can initiate adaptive management modifications. Sharing of management monitoring data (if appropriate) would be initiated by the relevant wildlife management authorities and is outside the scope of this EIS. Federal, state, and local wildlife management agencies would evaluate data provided under ROP 33 to assess wildlife movements. Major construction activity has been defined in the glossary.
582.	Brook	Brisson	Trustees for Alaska	98270	248	Suggestion for specific change to an alternative	Stipulation 7 seeks to protect the "PCH primary calving habitat area." However, BLM has not supported the delineation of that area in the DEIS with any level of robust scientific justification. ²¹⁵⁰ Additionally, areas	Page 3-106 of the Draft EIS has an explanation of how the PCH calving area was defined, including citations. Operators are required to submit a written request for an exception, waiver, or modification

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
582. (cont.)	(see above)	(see above)	(see above)	(see above)	(see above)	(see above)	outside of the most commonly used concentrated calving areas are still very important for caribou for post-calving needs as well as calving during particular years. BLM needs to protect both key calving and post-calving habitat, as well as protect migration corridors and movements. Protecting only the "primary calving area" as defined here will provide little protection in some years, potentially increasing calf mortality and threatening the caribou population.	and information demonstrating that (1) the factors leading to the inclusion of the stipulation in the lease have changed sufficiently to make the protection provided by the lease stipulation no longer needed or (2) the proposed operation would not cause unacceptable impacts. The criteria for approval of exceptions, waivers, and modifications should be supported by NEPA analysis, and may require site-specific environmental review. Requests should contain, at a minimum, a plan that includes related on-site or off-site mitigation efforts to adequately protect affected resources; data collection and monitoring efforts; and timeframes for initiation and completion of construction, drilling, and completion operations. The operator's request may be included in an Application for Permit to Drill, Notice of Staking, Sundry Notice, or letter. The BLM may also proactively initiate the process. During the review process, BLM coordination with other local, state, or federal agencies (e.g., ADFG, NSB, and local governments) should be undertaken, as appropriate, and documented. The BLM will also consult with the federal surface management agency (e.g., USFWS). Approval or disapproval is made by the Authorized Officer, and the decision is documented. If the waiver, exception, or modification is approved, any necessary mitigation is also documented. The applicant is then provided with a written notification of the decision. See Instruction Memorandum 2008-032 and 43 CFR 3101.1-4 for additional details.

S.3.4 ANILCA

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
1.	Douglas	Fruge	—	30574	11	ANILCA (Alaska National Interest Lands Conservation Act)	I note that the Arctic Refuge's legislative purpose "v" may be in direct conflict with purposes "i" and "iv" (see Page 1 above) if impacts from an oil and gas development program affect the conservation of ". . . fish and wildlife populations and habitats in their natural diversity" or ". . . continued subsistence uses by local residents."	All action alternatives are designed to meet the purpose and need, and to account for all purposes of the Arctic Refuge. The USFWS will be revising its CCP to address the five purposes of the Arctic Refuge and its management strategies.
2.	Tim	Mayer	—	56678	1	ANILCA (Alaska National Interest Lands Conservation Act)	[comment:56678-1; 191]The Alaska National Interest Lands Conservation Act states that the refuge purposes are to conserve fish and wildlife populations and habitats in their natural diversity and to ensure water quality and necessary water quantity within the refuge. These purposes should be at the forefront of the analysis in the DEIS. As stated in the DEIS, "the oil and gas leasing program must also consider the Arctic Refuge purposes set out in Section 303(B)(2) of ANILCA, as amended, and modified by Section 20001 of Public Law (PL) 115-97 (Dec. 22, 2017) (PL 115-97)." (ES-1)[comment end]	All action alternatives are designed to meet the purpose and need, and to account for all purposes of the Arctic Refuge.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
3.	Charlotte	Basham	—	58396	3	ANILCA (Alaska National Interest Lands Conservation Act)	Despite acknowledging that oil and gas can have impacts on caribou, BLM concludes that there will not be an impact on the subsistence resources for the Gwich'in and that the subsistence needs of the Gwich'in do not qualify for an 810 hearing under ANILCA (Alaska National Interest Lands Conservation Act) which is required for development that will substantially affect subsistence. Despite the fact that a significant percent of Gwich'in subsistence comes from the Porcupine Caribou Herd, which the BLM's own analysis finds leasing will affect, they then find that Gwich'in subsistence use will not be affected.	Based on the Draft EIS's analysis of impacts on caribou (Section 3.3.4), the preliminary ANILCA 810 subsistence evaluation concluded that under all action alternatives impacts on PCH abundance may be affected due to minor displacement of maternal caribou; however, due to the mitigating effects of the lease stipulations and ROPs, large-scale displacement and consequent large decreases in the abundance of PCH caribou available for subsistence use are unlikely. Accordingly, the ANILCA Section 810(a)(2) requirement for a subsistence hearing was not triggered for any community based on impacts on caribou.
4.	Withheld	Withheld	—	59376	14	ANILCA (Alaska National Interest Lands Conservation Act)	The Tax Act merely states that Section 1003 of ANILCA shall not apply (the prohibition against development was lifted). The other sections of ANILCA are still valid. ANILCA Section 1002 has a list of requirements before any informed decision is made. Congress did not exempt BLM from other legal compliance or direct BLM to violate any law in implementing the Tax Act direction. Did BLM fulfill ANILCA's other requirements (e.g., studies) prior to issuing the Draft EIS?	The Arctic National Wildlife Refuge, Alaska, Coastal Plain Resource Assessment: Report and Recommendation to the Congress of the United States and Final Legislative Environmental Impact Statement, U.S. Department of the Interior, April 1987, was a culmination of the 5 years of baseline studies as directed by Section 1002 of ANILCA.
5.	Withheld	Withheld	—	62945	1	ANILCA (Alaska National Interest Lands Conservation Act)	The BLM failed to consider how oil and gas development will interfere with the U.S. Fish and Wildlife Service's administration of the Coastal Plain. It fails to guarantee that the wilderness, conservation, and subsistence food resources for which the Arctic Refuge was first set aside in 1960 will continue to be protected.	All action alternatives are designed to meet the purpose and need, and to account for all purposes of the Arctic Refuge.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
6.	Peter	Stern	—	69296	7	ANILCA (Alaska National Interest Lands Conservation Act)	ES-5 excluding Arctic Village, Venetie and the Native Village of Venetie Tribal Govt from 810 requirements of ANILCA is wrong as they heavily depend on the Porcupine Caribou Herd (PCH) for their subsistence.	Based on the Draft EIS's analysis of impacts on caribou (Section 3.3.4), the preliminary ANILCA 810 subsistence evaluation concluded that under all action alternatives impacts on PCH caribou abundance may be affected due to minor displacement of maternal caribou; however, due to the mitigating effects of the lease stipulations and ROPs, large-scale displacement and consequent large decreases in the abundance of PCH caribou available for subsistence use are unlikely. Accordingly, the ANILCA Section 810(a)(2) requirement for a subsistence hearing was not triggered for any community based on impacts on caribou.
7.	Peter	Stern	—	69296	9	ANILCA (Alaska National Interest Lands Conservation Act)	I-6 section 1.10 Kaktovik is the only village to have an ANILCA section 810 hearing scheduled even though Arctic Village and Venetie subsistence depend on the PCH. This is wrong. 810 hearings should be held in these villages.	Based on the Draft EIS's analysis of impacts on caribou (Section 3.3.4), the preliminary ANILCA 810 subsistence evaluation concluded that under all action alternatives impacts on PCH caribou abundance may be affected due to minor displacement of maternal caribou; however, due to the mitigating effects of the lease stipulations and ROPs, large-scale displacement and consequent large decreases in the abundance of PCH caribou available for subsistence use are unlikely. Accordingly, the ANILCA Section 810(a)(2) requirement for a subsistence hearing was not triggered for any community based on impacts on caribou.

10.	Linda	Serret	—	69357	7	ANILCA (Alaska National Interest Lands Conservation Act)	The Tax Act merely states that Section 1003 of ANILCA shall not apply (the prohibition against development was lifted). The other sections of ANILCA are still valid. ANILCA Section 1002 has a list of requirements before any informed decision is made. Congress did not exempt BLM from other legal compliance or direct BLM to violate any law in implementing the Tax Act direction. Did BLM fulfill ANILCA's other requirements (e.g., studies) prior to issuing the Draft EIS?	The Arctic National Wildlife Refuge, Alaska, Coastal Plain Resource Assessment: Report and Recommendation to the Congress of the United States and Final Legislative Environmental Impact Statement, U.S. Department of the Interior, April 1987, was a culmination of the 5 years of baseline studies as directed by Section 1002 of ANILCA.
11.	Becky	Long	—	69710	21	ANILCA (Alaska National Interest Lands Conservation Act)	It is inaccurate to conclude that there is no impact on caribou subsistence resources of the Gwich'in and Inupiaq peoples in Alaska and Canada. There needs to be an 810 hearing under ANILCA because a significant portion of their subsistence comes from the Porcupine and Central herds.	Based on the Draft EIS's analysis of impacts on caribou (Section 3.3.4), the preliminary ANILCA 810 subsistence evaluation concluded that under all action alternatives impacts on PCH caribou abundance may be affected due to minor displacement of maternal caribou; however, due to the mitigating effects of the lease stipulations and ROPs, large-scale displacement and consequent large decreases in the abundance of PCH caribou available for subsistence use are unlikely. Accordingly, the ANILCA Section 810(a)(2) requirement for a subsistence hearing was not triggered for any community based on impacts on caribou.
12.	Rosa	Brown	Vuntut Gwitchin Government	74326	21	ANILCA (Alaska National Interest Lands Conservation Act)	In fact, while the Bureau of Land Management determined the analysis area for direct, indirect and cumulative impacts to subsistence use is, "all areas used by the 22 Alaska caribou study communities and seven Canadian user groups subsistence study communities" it did not consider the Vuntut Gwitchin First Nation under the ANILCA Sec. 810 (subsistence impacts). The preliminary evaluation only addressed US communities, and did not explain why Canadian communities were not assessed.	Section 810 of ANILCA only applies to subsistence uses by rural Alaska residents, per the definition of "subsistence uses" in Section 803 of ANILCA.

17.	Marna	Sanford	Tanana Chiefs Conference	79886	1	ANILCA (Alaska National Interest Lands Conservation Act)	The DEIS contains an analysis under Section 810 of the Alaska National Interest Lands Conservation Act (ANILCA) that ignores impacts to the Gwich'in subsistence way of life and finds that there will be no significant impacts. Such findings are not supportable based on the traditional knowledge of the Tribes and long history of reliance on the Porcupine Caribou Herd. Oil and gas exploration and development in the heart of the calving and post-calving grounds of the Porcupine Caribou Herd is a direct threat to indigenous culture and the ability to continue the subsistence way of life - and yet BLM has wholly ignored these concerns.	Based on the Draft EIS's analysis of impacts on caribou (Section 3.3.4), the preliminary ANILCA 810 subsistence evaluation concluded that under all action alternatives impacts on PCH caribou abundance may be affected due to minor displacement of maternal caribou; however, due to the mitigating effects of the lease stipulations and ROPs, large-scale displacement and consequent large decreases in the abundance of PCH caribou available for subsistence use are unlikely. Accordingly, the ANILCA Section 810(a)(2) requirement for a subsistence hearing was not triggered for any community based on impacts on caribou.
18.	Withheld	Withheld	—	80930	1	ANILCA (Alaska National Interest Lands Conservation Act)	Despite acknowledging that oil and gas can have impacts on caribou, the BLM concludes that there will not be an impact on the subsistence resources for the Gwich'in and that the subsistence needs of the Gwich'in do not qualify for an 810 hearing under ANILCA (Alaska National Interest Lands Conservation Act), which is required for development that will substantially affect subsistence. Despite the fact that a significant proportion of Gwich'in subsistence comes from the Porcupine Caribou Herd, which the BLM's own analysis finds will be affected by leasing, the agency concluded that Gwich'in subsistence use will not be affected. This finding negates the traditional knowledge and human rights of the Gwich'in.	Based on the Draft EIS's analysis of impacts on caribou (Section 3.3.4), the preliminary ANILCA 810 subsistence evaluation concluded that under all action alternatives impacts on PCH caribou abundance may be affected due to minor displacement of maternal caribou; however, due to the mitigating effects of the lease stipulations and ROPs, large-scale displacement and consequent large decreases in the abundance of PCH caribou available for subsistence use are unlikely. 19.	Roberta	Joseph	Tr'ondek Hwech'in First Nation	81742	14	ANILCA (Alaska National Interest Lands Conservation Act)	TH interprets the omission of a minimum alternative as a demonstration of the lack of commitment by the United States government toward fulfilling the other purposes set forth for ANWR (ANILCA Sec. 303(B)(2)), including conservation of fish and wildlife populations and habitats, and fulfilling international treaty obligations with regard to fish and wildlife and their habitats.	Alternative D2 has been modified to offer the minimum of only 800,000 acres of land available for lease. All action alternatives are designed to meet the purpose and need, and to account for all purposes of the Arctic Refuge.
20.	Withheld	Withheld	Native Village of Venetie Tribal Government	81748	8	ANILCA (Alaska National Interest Lands Conservation Act)	The BLM's preliminary evaluation under the Alaska National Interest Lands Conservation Act (ANILCA) Section 810 is another example of the flawed analysis found throughout the DEIS. The Tribes have repeatedly raised with the BLM the importance of caribou, particularly the Porcupine Caribou Herd, to the Tribes and their members. Caribou form the backbone of Gwich'in life and culture, providing for the physical, cultural, and spiritual health, well-being, economic security, and food security of the Tribes' members. Perplexingly, the BLM's ANILCA Section 810 evaluation finds that there will be no significant restriction on subsistence uses for the communities of Arctic Village and Venetie. These findings are inconsistent with the information that the Tribes have provided to the BLM and the agency's own statements in other sections of the DEIS. ²⁶ These findings are also premised on BLM's flawed interpretation of subsistence access.	Based on the Draft EIS's analysis of impacts on caribou (Section 3.3.4), the preliminary ANILCA 810 subsistence evaluation concluded that under all action alternatives impacts on PCH caribou abundance may be affected due to minor displacement of maternal caribou; however, due to the mitigating effects of the lease stipulations and ROPs, large-scale displacement and consequent large decreases in the abundance of PCH caribou available for subsistence use are unlikely. Accordingly, the ANILCA Section 810(a)(2) requirement for a subsistence hearing was not triggered for any community based on impacts on caribou.

21.	Withheld	Withheld	Native Village of Venetie Tribal Government	81748	9	ANILCA (Alaska National Interest Lands Conservation Act)	The BLM's ANILCA Section 810 analysis focuses on how development would restrict access to the places where subsistence activities occur, rather than analyzing how development would restrict access to the subsistence resources themselves. This approach is significantly flawed, as it arbitrarily excludes from the analysis communities such as Arctic Village and Venetie, whose subsistence use areas lie outside the Program Area, but who harvest migratory species that rely on the Program Area. Impacts from development within the Program Area to the Porcupine Caribou Herd and other migratory substance resources will necessarily restrict Arctic Village and Venetie subsistence users' access to those resources. Access to subsistence use areas is meaningless if there are no subsistence resources to harvest. The BLM's egregious findings in its ANILCA Section 810 evaluation are insupportable even under its flawed construction of access because-as the BLM acknowledges-it lacks adequate harvest data from Arctic Village. ²⁷	Based on the Draft EIS's analysis of impacts on caribou (Section 3.3.4), the preliminary ANILCA 810 subsistence evaluation concluded that under all action alternatives impacts on PCH caribou abundance may be affected due to minor displacement of maternal caribou; however, due to the mitigating effects of the lease stipulations and ROPs, large-scale displacement and consequent large decreases in the abundance of PCH caribou available for subsistence use are unlikely. Accordingly, the ANILCA Section 810(a)(2) requirement for a subsistence hearing was not triggered for any community based on impacts on caribou.

22.	Withheld	Withheld	—	82848	9	ANILCA (Alaska National Interest Lands Conservation Act)	Additionally, I am concerned that the current process does not include an ANILCA 810 hearing on subsistence use for the Gwich'in people who rely upon the porcupine caribou herd for subsistence use, even though the draft EIS acknowledges that the leasing activities could have a detrimental effect on the caribou population. These are two instances (among many) that suggest the rush to enact leasing activities on the coastal plain are leading permitting entities to fail to live up to its requirement to involve the public sufficiently in EIS processes.	Based on the Draft EIS's analysis of impacts on caribou (Section 3.3.4), the preliminary ANILCA 810 subsistence evaluation concluded that under all action alternatives impacts on PCH caribou abundance may be affected due to minor displacement of maternal caribou; however, due to the mitigating effects of the lease stipulations and ROPs, large-scale displacement and consequent large decreases in the abundance of PCH caribou available for subsistence use are unlikely. Accordingly, the ANILCA Section 810(a)(2) requirement for a subsistence hearing was not triggered for any community based on impacts on caribou.
23.	Ruth	Wood	—	83199	1	ANILCA (Alaska National Interest Lands Conservation Act)	[comment:83199-1; 191]The Draft EIS does include a No Drill Alternative, but then states that the Draft EIS will ignore it because it conflicts with the Tax Bill that requires leasing. That is a false conclusion, and led to BLM ignoring its duty to adequately analyze the No Drill Alternative. The Refuge was created by specific legislation to preserve and protect fish and wildlife and habitat, wilderness, and recreational values. From the Draft EIS summary, "The oil and gas leasing program must also consider the Arctic Refuge purposes set out in Section 303(B)(2) of ANILCA, as amended, and modified by Section 20001 of Public Law (PL) 115-97 (Dec. 22, 2017) (PL 115-97)." Public Law 115-97 does not subordinate the original purposes to the one added, and according to the U.S. Fish and Wildlife Service, "The ANILCA purposes are:(i) to conserve fish and wildlife populations and habitats in their natural diversity; (ii) to fulfill the international fish and wildlife treaty obligations of the United States; (iii) to	The No Action Alternative is fully analyzed in the EIS as Alternative A, as a baseline requirement of NEPA. Section 20001 of the Tax Act precludes selection of Alternative A in a Record of Decision. The regulations require the analysis of the No Action Alternative even if the agency is under a legislative command to act. This analysis provides a benchmark, enabling decision makers to compare the magnitude of environmental effects of the action alternatives. It is also an example of a reasonable alternative outside the jurisdiction of the agency, which must be analyzed (Section 1502.14(c); CEQ's Forty Most Asked Questions Concerning CEQ's NEPA [Question #3]). All action alternatives are designed to meet the purpose and need, and to account for all purposes of the Arctic Refuge. Alternative D2 has been modified to offer the minimum of only 800,000 acres of land available for lease. PL 115-97 requires at least two lease sales within 7 years,

23. (cont.)	(see above)	(see above)	(see above)	(see above)	(see above)	(see above)	provide the opportunity for continued subsistence uses by local residents; and (iv) to ensure water quality and necessary water quantity within the refuge."Therefore, the Draft EIS must look at all the purposes of the Refuge, not just the newly inserted purpose to lease for oil & gas development. That means BLM must consider whether the No Drill Alternative is the best alternative for any of the purposes, and state for which purposes the No Drill Alternative would be the best. There is no question that the No Drill Alternative is the best alternative for subsistence users, for the Porcupine caribou herd, for the polar bear. The Draft EIS ignores every thing except the Tax Bill, and that is not the proper way to do a Draft EIS. The Draft EIS must acknowledge that going forward with these leases will make it impossible to fulfill the obligations required for the other purposes of the Refuge. Then, they must make a decision, and that decision must be based on evidence, that is even legal to take an action that makes it impossible to continue to fulfill the purposes of the Arctic National Wildlife Refuge as established in previously existing law (Arctic Refuge purposes set out in Section 303(B)(2) of ANILCA). The amendments and modifications of Section 20001 of Public Law (PL) 115-97 (Dec. 22, 2017) (PL 115-97) do not subordinate the original purposes to the purpose of drilling. There is a contradiction in terms, and I believe itComment #1 on Draft Coastal Plain Oil and Gas Leasing Program EIS Page 2 of 3 From Ruth D. Wood, Talkeetna, Alaska 99676March 8, 2019will take an additional act of congress to change it before a ROD on this Draft EIS can be signed and before any leasing can go forward.2.	but does not limit the number of sales.

23. (cont.)	(see above)	(see above)	(see above)	(see above)	(see above)	(see above)	OtherAlternatives The other alternatives all offer more than the 400,000 acres in each of 2 lease sales required by the Tax Bill. BLM did not look at any minimal alternative. Given the amount of opposition to any lease sales, BLM must include two minimal alternatives of 400,000 acres each, but currently it does not.[comment:83199-2; 190.0402]A bigger problem is that this Draft EIS should cover only one lease sale. Public Law 115-97 calls for one lease sale in 4 years and another in 7 years. If a lease sale is allowed to proceed, and I assert that it should not, then things learned from the first lease sale should be used to draft an EIS for the second. Developments under the first lease sale will most assuredly impact the Refuge, and an additional EIS will be needed to address the cumulative impacts. Under no circumstances should both lease sales proceed at the same time, and Congress clearly did not intend for them to be simultaneous:"(I) the initial lease sale under the oil and gas program under this section not later than 4 years after the date of enactment of this Act;and(II) a second lease sale under the oil and gas program under this section not later than 7 years after the date of enactment of this Act."The Draft EIS says, "This Draft EIS is intended to fulfill NEPA requirements for lease sales conducted at least through December 2027 and potentially thereafter. Before it conducts the second and each subsequent lease sale, the BLM will evaluate the adequacy of the Draft EIS requires supplementation or revision in order to comply with NEPA" (from volume 1, I-5.) First, the clause "and potentially thereafter" should be deleted from the Draft EIS. As stated, the Draft EIS would fulfill NEPA	(see above)

24.	Hal	Shepherd	Norton Bay Inter-Tribal Watershed Council	83235	1	ANILCA (Alaska National Interest Lands Conservation Act)	Expansion of FRWRs occurs in Alaska as well where Federal district courts, for example, have concluded that under Title VIII of ANILCA, the United States holds title to an interest in Alaska's navigable waters as an element of the "federal navigational servitude." 6 Since the United States holds an interest in the navigable waters of Alaska, they meet ANILCA's definition of public lands and the Secretary of the Interior was charged with the management of subsistence fishing in the navigable waters of Alaska.7 A couple of federal court opinions support the trust duty in relation to FRWRs as they relate to tribal water interests. In Alaska v. Babbitt, commonly referred to as "Katie John," for example, the Ninth Circuit concluded that public lands in Alaska include certain navigable waters, defined by the reserved water rights doctrine which states that when the United States withdraws lands from the public domain and reserves them for a federal purpose, it implicitly reserves water then unappropriated to the "extent needed to accomplish the purpose of the reservation."8 The Lease Sales, therefore, in conflict with the Trust Duty based on the fact that oil and gas leasing could cause significant and irreversible harm to the area's water and subsistence resources. The potential during drilling operations to contaminate ground water, for example is in conflict with the Federal Clean Water Act (CWA) enacted by Congress "to restore and maintain the chemical, physical, and biological integrity of the Nation's waters." 9	The lease stipulations and ROPs are designed to prevent significant impacts on water and subsistence resources, thereby maintaining compliance with the CWA and Title VIII of ANILCA..

25.	Hal	Shepherd	Norton Bay Inter-Tribal Watershed Council	83235	5	ANILCA (Alaska National Interest Lands Conservation Act)	In keeping with our comments on tribal consultations as stated above, we believe that BLM has to consult with all tribes that could potentially be impacted by the project beyond those of Kaktovik. This will also be relevant for complying with provisions of Section 810 of ANILCA because significant restrictions on the subsistence uses of the program area by tribes and native persons, others than those in the community of Kaktovik, is very likely, and BLM should conduct tribal consultations/hearings, and incorporate the measures voiced by those consulted into the reasonable steps needed to be taken to lessen the adverse effects on subsistence. Further, while BLM states that "the Final Evaluation will integrate input voiced during the hearing by the residents of Kaktovik," (DEIS, Appendix E, E-20) this should have been incorporated in the DEIS itself, in order for stakeholders to give full comments on the outcomes of such	See Appendix C for a list of the tribal consultation that has occurred to date. The Subsistence Section 810 hearing was held in Kaktovik after the release of the Draft EIS, as required by Section 810(a)(2) of ANILCA. Input received from residents of Kaktovik and other communities during scoping was incorporated into the Draft EIS, whereas the Final EIS incorporated similar information received during the subsistence hearing in Kaktovik, public meetings on the Draft EIS, and written comments submitted on the Draft EIS.

26.	Sayers	Tuzroyluk	Voice of the Arctic Inupiat	83318	32	ANILCA (Alaska National Interest Lands Conservation Act)	Local landowners KIC and ASRC, whom together own 92,000 acres of the Coastal Plain, also have the right to develop their own lands to provide economic bene-fits to their shareholders as set forth in the Alaska Native Claims Settlement Act (ANCSA) and the Alaska National Interest Land Conservation Act (ANILCA). The BLM and the FWS have a responsibility to not hinder the pursuit of that goal through burdensome restrictions and a complex and complicated land management structure that would affect adjacent Native landowners. We do not feel that the CCP in its current form, which essentially mandates that the Coastal Plain be managed as if it were a wilderness, is compatible with a leasing pro-gram. VOICE urges the BLM to recommend updating the CCP prior to leasing to more closely align with the directive put forth in the Tax Act: to establish and ad-minister a competitive oil and gas leasing program for the leasing, develop-ment, production, and transportation of oil and gas in and from the Coastal Plain. We feel strongly that immediate action be taken on this to avoid further confusion, frustration, and lack of trust from the community of Kaktovik towards the federal government	After BLM adopts a specific leasing program alternative in its Record of Decision, the USFWS will be revising its CCP to address the five purposes of the Arctic Refuge, as amended by the Tax Act, and its management strategies. BLM's oil and gas program will affect the USFWS's management of the Refuge in the Coastal Plain, and thus it will aid the CCP revision process to first know which program alternative BLM adopts.

27.	Withheld	Withheld	Government of the Northwest Territories	92862	31	ANILCA (Alaska National Interest Lands Conservation Act)	The analysis by Russell and Gunn (2019) 2 indicates the proposed oil and gas leasing program has a high risk of impacts to herd abundance, which has the potential to impact NWT communities. The BLM is planning on holding a public subsistence hearing in the potentially affected community of Kaktovik because the "preliminary evaluation finds that the cumulative case, when taken in conjunction with Alternatives B, C, D1, and D2 may significantly restrict subsistence uses and needs for the community of Kaktovik." Porcupine caribou are a highly valued traditional, cultural and subsistence resource for NWT communities in the Gwich'in Settlement Area and Inuvialuit Settlement Region of the NWT. The main users of the herd in the NWT include Inuvialuit and Gwich'in people from Aklavik, Inuvik, Fort McPherson and Tsiigehtchic. Recommendation The GNWT recommends that, as part of fulfilling the obligations in the Agreement, public subsistence hearings should be held at a minimum in the Canadian communities of Fort McPherson and Aklavik and Tsiigehtchic. The BLM should ensure that the Hunters and Trappers Committees, Renewable Resource Councils and public are notified of such meetings.	Section 810 of ANILCA only applies to subsistence uses by rural Alaska residents, per the definition of "subsistence uses" in Section 803 of ANILCA.

28.	Karen	Bollinger	—	94054	2	ANILCA (Alaska National Interest Lands Conservation Act)	Despite acknowledging that oil and gas can have impacts on caribou, BLM concludes that there will not be an impact on the subsistence resources for the Gwich'in and that the subsistence needs of the Gwich'in do not qualify for an 810 hearing under ANILCA (Alaska National Interest Lands Conservation Act) which is required for development that will substantially affect subsistence. Despite the fact that a significant percent of Gwich'in subsistence comes from the Porcupine Caribou Herd, which the BLM's own analysis finds leasing will affect, they then find that Gwich'in subsistence use will not be affected. This ignores the traditional knowledge and human rights of the Gwich'in.	Based on the Draft EIS's analysis of impacts on caribou (Section 3.3.4), the preliminary ANILCA 810 subsistence evaluation concluded that under all action alternatives impacts on PCH caribou abundance may be affected due to minor displacement of maternal caribou; however, due to the mitigating effects of the lease stipulations and ROPs, large-scale displacement and consequent large decreases in the abundance of PCH caribou available for subsistence use are unlikely. Accordingly, the ANILCA Section 810(a)(2) requirement for a subsistence hearing was not triggered for any community based on impacts on caribou.
29.	Bernadette	Demientieff	Gwich'in Steering Committee	94080	7	ANILCA (Alaska National Interest Lands Conservation Act)	DEIS section 810 evaluation finds that Gwich'in communities will not experience significant restrictions on subsistence uses, even after the Gwich'in expressed significant concerns related to food security and cultural identity. BLM does not find significant restrictions for any Gwich'in communities, and fails to even consider Canadian villages. Due to these incorrectly limited findings, the agency did not hold ANILCA 810 hearings in any Gwich'in communities.	Based on the Draft EIS's analysis of impacts on caribou (Section 3.3.4), the preliminary ANILCA 810 subsistence evaluation concluded that under all action alternatives impacts on PCH caribou abundance may be affected due to minor displacement of maternal caribou; however, due to the mitigating effects of the lease stipulations and ROPs, large-scale displacement and consequent large decreases in the abundance of PCH caribou available for subsistence use are unlikely. Accordingly, the ANILCA Section 810(a)(2) requirement for a subsistence hearing was not triggered for any community based on impacts on caribou. Section 810 of ANILCA only applies to subsistence uses by rural Alaska residents, per the definition of "subsistence uses" in Section 803 of ANILCA.

30.	—	—	Alaska Department of Natural Resources	94102	17	ANILCA (Alaska National Interest Lands Conservation Act)	The original Arctic Range purposes ⁵ are referenced in the second paragraph as having "...three purposes of preservation: wilderness values, wildlife, and recreational values." The EIS must also reference the savings clause in ANILCA Section 305, which states that while executive or administrative enabling actions for existing units of the Refuge system are still in effect (the Arctic Range was established by Public Land Order 2214), in the event of a conflict, the provisions of ANILCA and the Alaska Native Claims Settlement Act prevail. ⁶ As such, there are limits to the applicability of the original Range purposes, especially in relation to the new refuge purpose to establish and oil and gas leasing in the Coastal Plain.	The language has been revised to indicate that the original purposes established by PLO 2214 were superseded by Section 303(2)(B) of ANILCA, as amended by the Tax Act.
31.	—	—	Alaska Department of Natural Resources	94102	18	ANILCA (Alaska National Interest Lands Conservation Act)	ANILCA Section 101(b) is accurately quoted; however, the discussion needs to clarify that the quote applies generally to the purposes of the Act as a whole and are not specifically attributed to the Arctic Refuge as currently implied. Other provisions in ANILCA Section 101 clarify Congressional intent in balancing the national conservation interest with the economic and social needs of Alaska and its citizens, which is also relevant to the EIS but not referenced in the discussion. So as not to mislead the public, the discussion of Section 101 of ANILCA in the Final EIS must be discussed more comprehensively by including summaries of all subsections, not just 101(b).	The text has been modified to indicate that Section 101(b) addresses the purposes of ANILCA as a whole. Given that the section is about wilderness character, Section 101(b) is the only relevant provision that speaks to purposes of ANILCA.
32.	—	—	Alaska Department of Natural Resources	94102	19	ANILCA (Alaska National Interest Lands Conservation Act)	The second paragraph references ANILCA section 304(g)(2)(B), implying that ANILCA granted the Service authority to conduct the 2015 wilderness review. This is inaccurate.	Section 304(g)(2)(B) is accurately quoted. It requires the identification of wilderness values prior to undertaking the development of a refuge CCP.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
33.	—	—	Alaska Department of Natural Resources	94102	20	ANILCA (Alaska National Interest Lands Conservation Act)	In 1980, ANILCA expanded and re-designated the Arctic Range as the Arctic National Wildlife Refuge. 6 “All proclamations, Executive orders, public land orders, and other administrative actions in effect on the day before the date of the enactment of this Act with respect to units of the National Wildlife Refuge System in the State shall remain in force and effect except to the extent that they are inconsistent with this Act or the Alaska Native Claims Settlement Act, and in any such case, provisions of such Acts shall prevail.” (ANILCA Section 305) provision in ANILCA that granted the Service any authority to conduct a wilderness review is Section 1317, the timeframe for which has long passed. 7 ANILCA Section 1326(b) bars the Service from conducting new wilderness reviews absent subsequent direction from Congress. 8 The sentence “Further, ANILCA 304(g)(2)(B) requires the Secretary of Interior to identify and describe ‘the special values of the refuge, as well as...wilderness value of the refuge’ when developing plans” must be removed.	Section 304(g)(2)(B) is accurately quoted. It requires the identification of wilderness values prior to undertaking the development of a refuge CCP.
34.	—	—	Alaska Department of Natural Resources	94102	22	ANILCA (Alaska National Interest Lands Conservation Act)	Further, as referenced in the above WSR comments, ANILCA included numerous exceptions for designated wilderness in Alaska, including the ability to authorize transportation and utility systems, motorized use, and other development in designated wilderness; therefore, these administrative restrictions exceed those intended by Congress for designated wilderness in Alaska. It is inappropriate to apply them as restrictions either within or beyond designated wilderness. All designated wilderness buffers and related restrictions must be removed in the Final EIS.	Since the NSO area would not establish a withdrawal, conservation system unit, or similar area, it is not precluded by Section 1326 of ANILCA.

35.	—	—	Alaska Department of Natural Resources	94102	84	ANILCA (Alaska National Interest Lands Conservation Act)	60 Appendix E, Table E-1 ANILCA 810 Analysis Re-examine all values in this table. The No surface occupancy/not offered for lease sale numbers presented for Alternative D1 and D2 do not match any number provided elsewhere in the document.	The table has been revised.
36.	Withheld	Withheld	—	94435	3	ANILCA (Alaska National Interest Lands Conservation Act)	A significant portion of Gwich'in subsistence comes from the Porcupine Caribou Herd, BLM concluded that there will be no impact on the Gwich'in subsistence food source, even while acknowledging oil and gas impacts on caribou. BLM asserted that the Gwich'in do not qualify for an 810 hearing (necessary under the Alaska National Interest Lands Conservation Act), which is required for development that will substantially affect subsistence.	Based on the Draft EIS's analysis of impacts on caribou (Section 3.3.4), the preliminary ANILCA 810 subsistence evaluation concluded that under all action alternatives impacts on PCH caribou abundance may be affected due to minor displacement of maternal caribou; however, due to the mitigating effects of the lease stipulations and ROPs, large-scale displacement and consequent large decreases in the abundance of PCH caribou available for subsistence use are unlikely. Accordingly, the ANILCA Section 810(a)(2) requirement for a subsistence hearing was not triggered for any community based on impacts on caribou.
37.	Linda	Brown	—	94624	1	ANILCA (Alaska National Interest Lands Conservation Act)	Despite the fact that a significant percent of Gwich'in subsistence comes from the Porcupine Caribou Herd, which the BLM's own analysis finds leasing will affect, this Draft EIS finds that Gwich'in subsistence use will not be affected. The BLM must hold an 810 hearing with potentially impacted subsistence users before the ROD is finalized.	Based on the Draft EIS's analysis of impacts on caribou (Section 3.3.4), the preliminary ANILCA 810 subsistence evaluation concluded that under all action alternatives impacts on PCH caribou abundance may be affected due to minor displacement of maternal caribou; however, due to the mitigating effects of the lease stipulations and ROPs, large-scale displacement and consequent large decreases in the abundance of PCH caribou available for subsistence use are unlikely. Accordingly, the ANILCA Section 810(a)(2) requirement for a subsistence hearing was not triggered for any community based on impacts on caribou.

38.	Withheld	Withheld	Council of Athabascan Tribal Governments	95611	5	ANILCA (Alaska National Interest Lands Conservation Act)	<p>“The intent of Title VIII of ANILCA is to protect subsistence use, and . . . the Section 810 process has the ultimate goal of identifying ways in which impacts to subsistence can be minimized through the Notice and Hearings process.” Indeed, the threshold to hold hearings is that there “may” be impacts. BLM has not erred on the side of protection in its 810 analysis. Instead, BLM has chosen to ignore the significant direct and cumulative impacts to the Gwich’in, including the ways in which impacts to some communities will ripple out to other communities in light of community sharing practices. All of BLM’s proposed action alternatives would result in: 1. displacement impacts on calving PCH caribou, 2. increased calf mortality, and 3. impacts to migration patterns, and therefore may substantially restrict and/or reduce the abundance and availability of PCH for substance uses. BLM is required to find a positive 810 determination for all communities where there may be significant restriction subsistence, direct or cumulative, for all development alternatives. Again, the Council calls upon BLM to conduct an intensive and comprehensive ANILCA 810 analysis including Arctic Village, Venetie, and Fort Yukon at a minimum that include adequate evaluation, notice, and hearings.</p>	<p>Based on the Draft EIS’s analysis of impacts on caribou (Section 3.3.4), the preliminary ANILCA 810 subsistence evaluation concluded that under all action alternatives impacts on PCH caribou abundance may be affected due to minor displacement of maternal caribou; however, due to the mitigating effects of the lease stipulations and ROPs, large-scale displacement and consequent large decreases in the abundance of PCH caribou available for subsistence use are unlikely. 40.	Brook	Brisson	Trustees for Alaska	96981	24	ANILCA (Alaska National Interest Lands Conservation Act)	<p>Additionally, the DEIS asserts that it lists all "requirements of federal, state, and local laws and regulations associated with future development in the Coastal Plain."78 That list mentions some sections of ANILCA but fails to mention Title XI, which provides the "single comprehensive statutory authority for the approval or disapproval" of transportation and utility systems (TUSs) on conservation system units (CSUs) in Alaska.79 TUSs include roads, pipelines, and energy transmission systems, and all related structures and facilities needed to construct, maintain and operate them.80 Sections 1104-1106 of ANILCA set forth the detailed procedural and substantive requirements governing any approval or disapproval of a proposed TUS in a CSU.81 A decision that purports to authorize a TUS in a CSU without complying with the requirements of Title XI can have no effect.82 This means that the leasing process cannot convey a right to develop virtually any of the typical components of an oil and gas development unless it complies with Title XI.83 [83 The DEIS repeatedly states that "certain rights" are conveyed to lessees at the lease sale stage. E.g., DEIS vol. 1 at 3-133. BLM should clarify what it believes these rights to be and explain that any proposed TUS is conditional on compliance with the Title XI process, which inherently includes agency discretion to approve or disapprove. BLM cannot circumvent or rewrite Title XI with a lease]</p>	Appendix D has been revised to list ANILCA Title XI. Title XI does not affect the rights provided by an oil and gas lease under applicable law.

41.	Brook	Brisson	Trustees for Alaska	96981	25	ANILCA (Alaska National Interest Lands Conservation Act)	The DEIS's characterization of the Secretary's authority to issue rights-of-way, and especially its complete omission of Title XI from the list of applicable federal laws, leave the distinct impression that BLM believes that the substantive and procedural requirements of Title XI have somehow been waived for oil and gas development in the coastal plain. They have not been waived. As stated during bill passage, and as is discussed further in these comments, no laws were being waived by the Tax Act. ⁸⁶ BLM must make clear the applicability of Title XI to the approval or disapproval of any TUS that a future lessee may seek to establish.	Appendix D has been revised to list ANILCA Title XI. Title XI does not affect the rights provided by an oil and gas lease under applicable law.
42.	Brook	Brisson	Trustees for Alaska	96981	122	ANILCA (Alaska National Interest Lands Conservation Act)	There are serious questions about the authority to conduct gravel mining on the Coastal Plain. ANILCA section 304(c) withdrew all national wildlife refuge lands in Alaska "from all forms of appropriation or disposal under the public land laws" except for the mineral leasing laws. ⁸³² The Coastal Plain is further withdrawn from all forms of entry or appropriation under the mining laws and from operation of the mineral leasing laws. ⁸³³ The Tax Act did not modify these withdrawals. BLM has failed to identify any authority allowing it to permit gravel mining on the Coastal Plain, despite the fact that the EIS appears to assume gravel mining will be allowed. BLM needs to explain what it believes is the basis for its authority to allow gravel mining in the EIS.	The Materials Act of 1947 authorizes the disposition of mineral materials from federal public lands. ANILCA Section 304(c) does not prohibit the sale of mineral materials. The Tax Act amended the withdrawal in Section 1002(i) of ANILCA to require an oil and gas leasing and development program.

43.	Ted	Heuer	—	97531	2	ANILCA (Alaska National Interest Lands Conservation Act)	At the end of the 185-page Tax Cuts and Jobs Act (Public Law 115-907) there is a provision that amends the Alaska National Interest Lands Conservation Act (ANILCA) and adds a fifth purpose to the Arctic National Wildlife Refuge, “to provide for an oil and gas program on the Coastal Plain.” Section 304 (a) of ANILCA which directly follows the new purpose of the Coastal Plain states, “Each refuge shall be administered by the Secretary, subject to valid existing rights, in accordance with the laws governing the administration of units of the National Wildlife Refuge System, and this Act.” Nothing in the Tax Cuts and Jobs Act amends this section of ANILCA.	The USFWS continues to be responsible for managing all federal lands on the Coastal Plain as part of the Arctic Refuge, including both leased and unleased areas; however, the BLM is responsible for managing all aspects of the oil and gas program, including the issuance and administration of oil and gas leases, and permitting of all oil and gas activities.
44.	Francis	Mauer	—	97757	2	ANILCA (Alaska National Interest Lands Conservation Act)	The purposes of Executive Order 2214 and ANILCA have not been explicitly nullified by the Tax Cut Act, however, the DEIS does not clearly explain how these purposes will be affected by the proposed oil lease sales. Furthermore, the DEIS errors in claiming that Congress designated the coastal plain for potential oil development.[3] In fact, an assessment of potential hydrocarbon resources and the fish, wildlife and habitats was required including impacts of possible development. In addition, Congress prohibited any production of oil and gas from the Refuge and no leasing or other development leading to production was allowed (Section 1003 of ANILCA). The BLM must correct this misleading statement.	The Tax Act amends ANILCA to provide for an oil and gas program in the Coastal Plain of the Arctic National Wildlife Refuge. The USFWS will be revising its CCP to address the five purposes of the Refuge, as amended by the Tax Act, and its management strategies. The text has been revised to indicate that Section 1002 identified the Coastal Plain for study for potential oil and gas leasing and development.

45.	—	—	United States Fish and Wildlife Service	97942	58	ANILCA (Alaska National Interest Lands Conservation Act)	[Section 810 Analysis] Conclusions of no positive findings for Alternatives B, C, and D within the DEIS (e.g., the DEIS concludes that Alternatives B, C, and D will not result in a significant restriction in subsistence uses) are not justified, particularly in light of a positive finding for the cumulative case. The potential impacts on caribou abundance, distribution, and movements are far more likely to affect availability of caribou to subsistence users throughout the PCH range than the relatively minor, local effects of limiting access by Kaktovik residents to some areas on the coastal plain. Statements such as "Potential impacts on subsistence resources and access from future oil and gas exploration, development, and production would be minimal or would be adequately mitigated by stipulations or ROPs..." (page E-10) may be overly optimistic given that these recommendations were mostly developed for oilfields farther west, and have not been tested for the PCH. Given the lack of testing for the PCH, there is uncertainty regarding the effectiveness or adequacy of the mitigation measures in this situation. This means that abundance and, or movements of the PCH could be substantially affected, with resultant effects on availability of caribou to subsistence hunters throughout the herd's range. Recommend this uncertainty be acknowledged by a positive determination for all the action alternatives.	Based on the Draft EIS's analysis of impacts on caribou (Section 3.3.4), the preliminary ANILCA 810 subsistence evaluation concluded that under all action alternatives impacts on PCH caribou abundance may be affected due to minor displacement of maternal caribou; however, due to the mitigating effects of the lease stipulations and OPs, large-scale displacement and consequent large decreases in the abundance of PCH caribou available for subsistence use are unlikely. Accordingly, the ANILCA Section 810(a)(2) requirement for a subsistence hearing was not triggered for any community based on impacts on caribou.

46.	—	—	United States Fish and Wildlife Service	97942	59	ANILCA (Alaska National Interest Lands Conservation Act)	[Section 810 Analysis] Section E.3-22, Page E-7: The DEIS states, “In general, caribou responses to aircraft adhering to effective stipulation measures tend to be short-lived (Fullman et al. 2017).” Fullman et al. (2017) has been frequently mischaracterized in the literature. These authors used a limited dataset on take-offs and landings and did not consider flight altitude and patterns near the herd, distance from lead caribou, private aircraft, disturbance near narrow mountain corridors, or any number of other potentially important factors. The authors do, however, indicate that their results are limited to movements within the Noatak River valley. Given that, this paper does not lend itself to the broad application suggested in the 810 analysis. Additionally, it should be highlighted that the short-term effects of aircraft activity on caribou movements and resultant hunter success may be critical to subsistence opportunity and food security. This concern is frequently voiced by subsistence hunters of the coastal plain.	Citations have been reviewed and updated for accuracy.

47.	—	—	United States Fish and Wildlife Service	97942	60	ANILCA (Alaska National Interest Lands Conservation Act)	[Section 810 Analysis] Section E.3-22, Page E-7: The DEIS states, "Low-level flights or maneuvering in the presence of unhabituated caribou can elicit increased speed and abrupt direction change. Alternatively, caribou can become habituated to aircraft, particularly when aircraft pilots maintain altitudes greater than 500 feet above ground level and do not haze or harass the caribou (Valkenburg and Davis 1983)." Habituation and avoidance behavior may take quite some time and this should be pointed out in the 810 analysis. A recent analysis by the Office of Subsistence Management included the following information: studies [of caribou] have also reported reduction in the use of areas within 5 km from infrastructure and human activity (including aircraft) by 50-95% for weeks, months, or years (Vistnes and Nelleman 2008, Flydal et al. 2002). We recommend the potential for reduced use of areas in proximity to infrastructure be fully disclosed.	Citations have been reviewed and updated for accuracy.

48.	—	—	United States Fish and Wildlife Service	97942	61	ANILCA (Alaska National Interest Lands Conservation Act)	[Section 810 Analysis] Section E.3-22, Page E-7: The DEIS states, “Caribou crossing success would vary by season, behavioral motivation, level of habituation, and activity levels” but also states on page E-6, “Caribou abundance or availability and the subsistence use thereof would not likely be affected as a result of direct habitat loss.” These statements seem incongruent as there are too many unknowns about the short and long-term changes to migration patterns that may result. Minor changes, even if temporary, may have major impacts to subsistence if caribou move further from communities and traditional hunting grounds. Caribou migration patterns are very complex and the Fullman et al. (2017) paper, though a useful starting point, should not be considered definitive evidence of minimal effect. As mentioned in previous comment, habituation can take months or years.	The statements are compatible.
49.	—	—	United States Fish and Wildlife Service	97942	62	ANILCA (Alaska National Interest Lands Conservation Act)	[Section 810 Analysis] With regards to ensuring a meaningful subsistence experience, page 3-12 I of the DEIS includes the following: “In addition to affecting resource availability, future noise, traffic, and human activity may also affect user access by deterring subsistence users from their usual harvesting areas. Avoidance of subsistence use areas due to development has been documented in Nuiqsut (SRB&A 2017) and would likely occur for some Kaktovik harvesters if development occurs in their harvesting area. Residents may experience discomfort hunting in the presence of outsiders; may avoid hunting near areas of high air or ground traffic because of a perceived or actual reduction in the availability of subsistence resources; may avoid hunting near activity due to safety concerns; or may consider noise	The 810 evaluation text has been revised to reflect additional language from the Draft EIS as appropriate.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
49. (cont.)	(see above)	(see above)	(see above)	(see above)	(see above)	(see above)	<p>pollution and increased human activity to degrade the subsistence experience." We recommend the above language also be included in the 810 analysis. The ANILCA protects and recognizes many values associated with subsistence, far beyond the nutritional value. The cultural values associated with the subsistence "experience" need to be explicitly stated. In one example, noise pollution may affect these experiences as was noted in Chapter 3. We recommend including factors discussed in Halas (2015) as important factors affecting the subsistence experience. One potentially relevant quote from this paper: "Whether the aircraft intentionally or unintentionally may be 'influencing' caribou movement, observing 'scared' caribou can be a powerful experience for hunters. Observations of caribou disturbance may impact the quality of a good hunting experience for a subsistence hunter. Respondents who perceived that caribou are impacted by the behavior of aircraft may evaluate their own harvest success to the interaction between aircraft and movement of caribou."</p>	(see above)

50.	Adam	Kolton	—	98142	1	ANILCA (Alaska National Interest Lands Conservation Act)	is that your EIS absolutely disregards the responsibilities under the Alaska National Interest Lands Conservation Act to consult in a formal subsistence way with these Gwich'in villages. And it's extraordinary because you do that after acknowledging there are going to be impacts to the Porcupine caribou herd.	Based on the Draft EIS's analysis of impacts on caribou (Section 3.3.4), the preliminary ANILCA 810 subsistence evaluation concluded that under all action alternatives impacts on PCH caribou abundance may be affected due to minor displacement of maternal caribou; however, due to the mitigating effects of the lease stipulations and ROPs, large-scale displacement and consequent large decreases in the abundance of PCH caribou available for subsistence use are unlikely. Accordingly, the ANILCA Section 810(a)(2) requirement for a subsistence hearing was not triggered for any community based on impacts on caribou.
51.	Brook	Brisson	Trustees for Alaska	98269	16	ANILCA (Alaska National Interest Lands Conservation Act)	The finding that there may not be impacts to subsistence use and resources for Gwich'in villages is contrary to science and BLM's own discussion elsewhere in the Draft EIS. The Gwich'in of Alaska and Canada are culturally and spiritually connected to the Porcupine Caribou Herd, which in turn relies on the Coastal Plain for calving, post-calving and summer habitat. Because of this connection, protecting the Coastal Plain is vital to their human rights and food security. Despite acknowledging that oil and gas can have impacts on caribou, BLM concludes that there will not be an impact on the subsistence resources for the Gwich'in. This ignores the traditional knowledge and human rights of the Gwich'in, a problem which is exacerbated by the fact that BLM will not hold ANILCA 810 hearings in any Gwich'in communities.	Based on the Draft EIS's analysis of impacts on caribou (Section 3.3.4), the preliminary ANILCA 810 subsistence evaluation concluded that under all action alternatives impacts on PCH caribou abundance may be affected due to minor displacement of maternal caribou; however, due to the mitigating effects of the lease stipulations and ROPs, large-scale displacement and consequent large decreases in the abundance of PCH caribou available for subsistence use are unlikely. Accordingly, the ANILCA Section 810(a)(2) requirement for a subsistence hearing was not triggered for any community based on impacts on caribou.

52.	Brook	Brisson	Trustees for Alaska	98270	51	ANILCA (Alaska National Interest Lands Conservation Act)	BLM's finding of no significant restrictions on subsistence for Gwich'in communities under ANILCA section 810 is in error. The ANILCA 810 analysis improperly finds that impacts to the Porcupine Caribou Herd do not impose significant restrictions on the Gwich'in's subsistence hunting activities. 1670 It is critically important that BLM release preliminary findings and recommendations in a revised 810 analysis so that the agency can receive input on them before the agency finalizes them. These findings and recommendations will allow BLM to appropriately consider of sociocultural impacts to subsistence hunting and reduced opportunities to participate in other subsistence activities. The deficiency from not completing an adequate 810 analysis is reflected in BLM's incomplete analysis of impacts to the Gwich'in people's sociocultural systems.	Based on the Draft EIS's analysis of impacts on caribou (Section 3.3.4), the preliminary ANILCA 810 subsistence evaluation concluded that under all action alternatives impacts on PCH caribou abundance may be affected due to minor displacement of maternal caribou; however, due to the mitigating effects of the lease stipulations and ROPs, large-scale displacement and consequent large decreases in the abundance of PCH caribou available for subsistence use are unlikely. Accordingly, the ANILCA Section 810(a)(2) requirement for a subsistence hearing was not triggered for any community based on impacts on caribou.

53.	Brook	Brisson	Trustees for Alaska	98270	227	ANILCA (Alaska National Interest Lands Conservation Act)	The Gwich'in people live in fourteen small villages across a vast area extending from northeast Alaska to the northern Yukon and Northwest Territories in Canada. Though the Iñupiat community of Kaktovik is the only community located on the Coastal Plain, other villages such as Arctic Village, Fort Yukon, Venetie, Chalkyitsik, Beaver, and Canadian villages such as Old Crow and Fort McPherson, are located within the range for the Porcupine Caribou Herd and will be impacted by any oil and gas activities on the Coastal Plain. ²¹⁰¹ The draft EIS recognizes that many other communities, such as Wiseman, Birch Creek, and Stevens Village, have reported geographic, historic/prehistoric, or cultural ties to the Arctic Refuge as a whole. ²¹⁰² BLM further acknowledges that subsistence harvesting and sharing patterns for "22 Alaskan communities and seven Canadian user groups are relevant if post-lease oil and gas activities changes caribou resource availability or abundance for those users." ²¹⁰³ Despite this, BLM arbitrarily limits its ANILCA 810 analysis of subsistence impacts to four communities: Kaktovik, Nuiqsut, Arctic Village, and Venetie. ²¹⁰⁴ BLM did not adequately assess whether oil and gas leasing on the Coastal Plain would significantly restrict subsistence uses in the remaining potentially affected communities, as required by ANILCA 810.	Based on the Draft EIS's analysis of impacts on caribou (Section 3.3.4), the preliminary ANILCA 810 subsistence evaluation concluded that under all action alternatives impacts on PCH caribou abundance may be affected due to minor displacement of maternal caribou; however, due to the mitigating effects of the lease stipulations and ROPs, large-scale displacement and consequent large decreases in the abundance of PCH caribou available for subsistence use are unlikely. Accordingly, the ANILCA Section 810(a)(2) requirement for a subsistence hearing was not triggered for any community based on impacts on caribou. Section 810 of ANILCA only applies to subsistence uses by rural Alaska residents, per the definition of "subsistence uses" in Section 803 of ANILCA. Section E.2 of the subsistence evaluation explains in detail why the evaluation focused on the four communities.

54.	Brook	Brisson	Trustees for Alaska	98270	230	ANILCA (Alaska National Interest Lands Conservation Act)	BLM also states in analyzing the cumulative case that potential impacts to caribou abundance would be "minor due to the speculative locations of future proposed infrastructure." 2107 Speculative does not equal minor; the uncertainty about the exact location of infrastructure does not mean that the impacts to subsistence would be minor, particularly if that infrastructure is ultimately located in sensitive areas or disrupts migration patterns or obstructs migration corridors. BLM cannot circumvent doing a robust analysis of the potential impacts merely because the impacts are potentially speculative at this stage. BLM needs to analyze the full range of potential impacts to determine if it might cause impacts to subsistence, and needs to follow a precautionary approach in making those determinations.	The 810 evaluation text has been revised to reflect additional language from the Draft EIS as appropriate.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
55.	Brook	Brisson	Trustees for Alaska	98270	231	ANILCA (Alaska National Interest Lands Conservation Act)	The 810 analysis concludes “[l]egal and physical access to subsistence resources may be altered, depending on the locations of CPFs and industry-established safety areas; however it is likely that large-scale access to subsistence resources would be maintained.” ²¹⁰⁸ BLM appears to dismiss what it acknowledges will be impacts to subsistence by writing them off as unclear at this point since it does not know the exact infrastructure location. That is contrary to Section 810 and its purpose. BLM cannot write off impacts by concluding it does not know the exact location well enough to analyze them; it needs to actually take the time to analyze all potential impacts to subsistence, including cumulative impacts. BLM’s conclusion that it is “likely” on a large scale that access will be maintained is also not sufficient. When the agency is evaluating the potential impacts to subsistence, if the action “may” restrict subsistence uses, BLM is required to take a precautionary approach and comply with the notice and hearing procedures in Section 810. ²¹⁰⁹ BLM’s conclusion that it is “likely” on a wholly undefined “large-scale” that there will not be impacts is unsupported and meaningless. BLM cannot ignore the significance of these impacts by viewing them on such a large scale that effectively hides those impacts; it needs to look at what those impacts could look like at both local and broader scales. BLM failed to follow that precautionary approach with these findings, contrary to Section 810 and BLM’s guidance.	At the leasing stage the location of potential oil and gas facilities is unknown. Additional 810 evaluations would be performed when applications for specific exploration and development proposals are submitted.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
56.	Brook	Brisson	Trustees for Alaska	98270	232	ANILCA (Alaska National Interest Lands Conservation Act)	BLM's overall analysis of specific subsistence resources is also insufficient. As discussed in more detail in the next section, oil and gas leasing on the Coastal Plain is likely to have significant impacts on the Porcupine Caribou Herd, which will in turn restrict the abundance and availability of the herd for subsistence use. In the draft EIS, BLM states that "[d]evelopment would not significantly affect the availability of caribou for subsistence use." ²¹ 10 This assumption erroneously assumes that caribou and other subsistence resources will still be present in the area despite the high likelihood of disturbance from noise and human activity. There are also potentially significant impacts to access to subsistence resources if subsistence users are physically blocked from accessing key subsistence resources, as has been the case in Nuiqsut. BLM fails to explain how the fully waivable lease stipulations, ROPs, and mitigation measures will ensure that caribou will not be deterred from this area and that hunters will still be able to access these resources.	Based on the Draft EIS's analysis of impacts on caribou (Section 3.3.4), the preliminary ANILCA 810 subsistence evaluation concluded that under all action alternatives impacts on PCH caribou abundance may be affected due to minor displacement of maternal caribou; however, due to the mitigating effects of the lease stipulations and ROPs, large-scale displacement and consequent large decreases in the abundance of PCH caribou available for subsistence use are unlikely. For the cumulative case, which takes into account potential impacts from past, present, and reasonably foreseeable oil and gas activities occurring in the Coastal Plain and in other areas on the North Slope, the ANILCA 810 evaluation concluded that Kaktovik may experience a substantial reduction in access to its traditional subsistence use areas; thus, Kaktovik may experience a significant restriction to its subsistence use. Stipulations/ROPs cannot be waived if objectives are not met.

57.	Brook	Brisson	Trustees for Alaska	98270	233	ANILCA (Alaska National Interest Lands Conservation Act)	BLM further assumes that hunters will be able to adapt to the changes occurring around them.2111 BLM cannot rely on the potential for adaptation to bypass a positive subsistence finding under Section 810. How BLM foresees hunters adapting should be described. It is also necessary to consider that all hunters may not be able to adapt because of factors like increased cost of travel to more distant subsistence use areas and the need for better machinery to do so, which is not necessarily available to everyone that may be impacted. BLM should analyze and describe the limitations of adaptation to changed subsistence practices, resources, and conditions on the landscape. 2111 See, e.g., DEIS vol. 1 at 3-177.	Hunter adaption has been observed in Nuiqsut, which is near substantial oil and gas development. Notwithstanding, for the cumulative case, which takes into account potential impacts from past, present, and reasonably foreseeable oil and gas activities occurring in the Coastal Plain and in other areas on the North Slope, the ANILCA 810 evaluation concluded that Kaktovik may experience a substantial reduction in access to its traditional subsistence use areas.
58.	Brook	Brisson	Trustees for Alaska	98270	235	ANILCA (Alaska National Interest Lands Conservation Act)	There are also numerous impacts to fish that are not adequately considered in the draft EIS. The draft EIS acknowledges that non-salmon fish, including Dolly Varden and Bering cisco, are important subsistence resources and that there could be impacts to both abundance and availability under Alternatives B and C.2112 This alone is sufficient to trigger a positive finding under ANILCA 810 as subsistence use “may be affected.”	In order to trigger a positive “may significantly restrict” finding under ANILCA 810, impacts on abundance and availability must be large or major, respectively (BLM 2011).

59.	Brook	Brisson	Trustees for Alaska	98270	239	ANILCA (Alaska National Interest Lands Conservation Act)	BLM's analysis of impacts to marine mammals also completely fails to address impacts to polar bears and subsistence take of polar bears. The 810 analysis' marine mammals section does not even mention polar bears.2122 BLM appears to have dismissed the analysis of any impacts to subsistence take of polar bears on the grounds that they do not comprise the majority of the wild foods subsistence users in the region consume.2123 BLM's failure to account for impacts to polar bears is a serious omission from the 810 analysis. Impacts from seismic exploration alone, which BLM has not adequately analyzed elsewhere in the EIS, are significant and could lead to injury and lethal take of polar bears, particularly given the significant limitations and flaws with technologies used to detect denning polar bears. Any additional take of polar bears could have potentially serious impacts to this already imperiled species and its population, which could in turn impact subsistence take of polar bears. BLM needs to fully analyze this in its 810 analysis and elsewhere in the EIS.	Subsistence impacts are primarily subsistence use of fish, marine mammals (bowhead and beluga whales, and bearded seals), and caribou. Other resources such as waterfowl, polar bears, and furbearers may be culturally important to residents of these communities, but they do not comprise the majority of the wild foods consumed by residents of Kaktovik, Nuiqsut, Arctic Village, or Venetie (Section 3.4.3, Subsistence Uses and Resources). Under the ESA and MMPA, oil and gas activities may not be authorized if impacts on polar bears would be significant.
60.	Brook	Brisson	Trustees for Alaska	98270	240	ANILCA (Alaska National Interest Lands Conservation Act)	BLM's failure to make a positive finding for Gwich'in communities should not absolve the agency of its obligation under tier-2 of ANILCA 810. Under tier-2, if a proposed action would significantly restrict subsistence uses, BLM can only adopt that action if it finds that the restriction on subsistence is necessary and consistent with sound public lands management principals; involves the minimal amount of public lands necessary to accomplish the purpose of the use, occupancy or disposition of public lands; and takes reasonable steps to minimize the adverse impacts to subsistence uses and resources	The 810 evaluation has been revised to better describe the Tier 2 determinations.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
60. (cont.)	(see above)	(see above)	(see above)	(see above)	(see above)	(see above)	<p>from any use. 2124 BLM's evaluation of the availability of other lands for the purposes sought to be achieved and analysis of other alternatives that would reduce or eliminate the use, occupancy, or disposition of public lands needed for subsistence are also wholly inadequate. BLM's analysis of the availability of other lands provides only a cursory summary of the Tax Act and concludes that the alternatives would fulfill the purpose of the statute.2125 BLM's evaluation of alternatives that would reduce or eliminate the use of lands needed for subsistence similarly states that the action alternatives would meet the purpose of the Tax Act and notes that some of the alternatives would result in less land being available for leasing.2126 This is not a meaningful evaluation of the ways in which BLM can reduce impacts to subsistence. The 810 analysis fails to recognize that BLM is in no way obligated to open the entire Coastal Plain to leasing. BLM has not only the ability to further limit the areas it offers for lease, but an obligation under Section 810 to only allow an action if it involves the minimal amount of public lands necessary to accomplish the purpose.2127 BLM's cursory evaluation and apparent assumption that there is no difference between the different alternatives and how they relate to subsistence impacts goes against the requirements of Section 810 and fails to provide a meaningful evaluation of how BLM can minimize the impacts to subsistence users.</p>	(see above)

61.	Brook	Brisson	Trustees for Alaska	98270	242	ANILCA (Alaska National Interest Lands Conservation Act)	BLM's failure to make a positive ANILCA 810 determination for Arctic Village, Venetie, and all other communities who rely on the Porcupine Caribou Herd is in error.2128 The Porcupine Caribou Herd (PCH) uses the Arctic Refuge throughout the year, with the Coastal Plain providing essential calving, post-calving, insect relief, and other summer habitat.2129 The Gwich'in of Alaska and Canada are culturally and spiritually connected to the Porcupine Caribou Herd, which in turn relies on the Coastal Plain for calving, post-calving and other summer habitat. Despite acknowledging that oil and gas can have impacts on the Porcupine Caribou Herd, BLM concludes that there will not be an impact on the subsistence resources for the Gwich'in. This ignores best available science, traditional knowledge, and the human rights of the Gwich'in - a problem which is exacerbated by the fact that BLM will not hold ANILCA 810 hearings in any Gwich'in communities. BLM should hold 810 hearings in all communities where there may be impacts to subsistence. [2128 16 U.S.C. § 3120(a). 2129 See supra Part V.1 (impacts to caribou); Caikoski. 2015.]	Based on the Draft EIS's analysis of impacts on caribou (Section 3.3.4), the preliminary ANILCA 810 subsistence evaluation concluded that under all action alternatives impacts on PCH caribou abundance may be affected due to minor displacement of maternal caribou; however, due to the mitigating effects of the lease stipulations and ROPs, large-scale displacement and consequent large decreases in the abundance of PCH caribou available for subsistence use are unlikely. Accordingly, the ANILCA Section 810(a)(2) requirement for a subsistence hearing was not triggered for any community based on impacts on caribou. Section 810 of ANILCA only applies to subsistence uses by rural Alaska residents, per the definition of "subsistence uses" in Section 803 of ANILCA.
62.	Brook	Brisson	Trustees for Alaska	98270	243	ANILCA (Alaska National Interest Lands Conservation Act)	For all development alternatives, BLM acknowledges some portion of the herd's high-use calving area will be subject to leasing and surface occupancy, and the likely result is displacement and a decline in calf survival.2130 Although the restrictions on surface occupancy and leasing are slightly more stringent for Alternative C and Alternatives D1 and D2, all of BLM's proposed action alternatives would result in some level of displacement impacts on calving caribou.2131 especially as impacts will extend across no surface occupancy	The BLM's analysis of impacts on caribou takes into account differences in the range of alternatives regarding when and where oil and gas activities may occur. . Section E.2 of the subsistence evaluation explains in detail why the evaluation focused on the four communities.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
62. (cont.)	(see above)	(see above)	(see above)	(see above)	(see above)	(see above)	and no leasing boundaries.2132 Alternative B is particularly concerning, as it contemplates two central processing facilities, one of which could be located in area BLM identifies as a high-use calving area for the Porcupine Caribou Herd.2133 BLM concludes that there would be similar impacts under each of the alternatives because there would be only 2,000 acres of disturbance in the program area. 2134 This ignores the fact that there are likely to be very different impacts depending on where and when BLM allows infrastructure and industrial activity. BLM needs to analyze these differences and how they will impact subsistence, and cannot rely solely on the direct footprint of development. As explained above, the impacts of oil and gas development are felt far beyond the direct footprint of oil and gas projects. BLM's assertions that these impact will be minimal is in error. Any impacts to the Porcupine Caribou Herd on the Coastal Plain will be felt throughout their range in Alaska, the Yukon, and Northwest Territories and will result in a significant restriction to subsistence resources. BLM acknowledges the importance of caribou to 22 communities,2135 yet states that "Kaktovik, Arctic Village, and Venetie are the only communities that may be appreciably affected by changes in the abundance or availability of PCH caribou."2136 This conclusion is unsupported. There is again no explanation for BLM's wholesale failure to consider subsistence impacts to other Gwich'in communities.	(see above)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
63.	Brook	Brisson	Trustees for Alaska	98270	244	ANILCA (Alaska National Interest Lands Conservation Act)	For the two Gwich'in communities considered under ANILCA 810, Arctic Village and Venetie, BLM incorrectly finds there will not be significant restrictions to the abundance of resources available for subsistence use. Factors that can contribute to a reduction in abundance include adverse impacts on habitat, direct impacts on the resource, increased harvest, and increased competition from non-subsistence harvesters. ²¹³⁹ As discussed in detail in Part V.I of these comments, there are likely to be significant adverse impacts to the Porcupine Caribou Herd from the oil and gas program. Activities associated with the oil and gas program will potentially cause a reduction in the Porcupine Caribou Herd's population, leading to a decline in the amount of harvestable resources. The draft EIS acknowledges that there will be adverse impacts on the Porcupine Caribou Herd and its habitat in multiple places, and yet still somehow finds there will not be significant impacts to subsistence. ²¹⁴⁰ It is unclear how BLM avoids finding a reduction in abundance of the Porcupine Caribou Herd, based on even the limited information in its own DEIS. This must be more clearly explained.	Based on the Draft EIS's analysis of impacts on caribou (Section 3.3.4), the preliminary ANILCA 810 subsistence evaluation concluded that under all action alternatives impacts on PCH caribou abundance may be affected due to minor displacement of maternal caribou; however, due to the mitigating effects of the lease stipulations and ROPs, large-scale displacement and consequent large decreases in the abundance of PCH caribou available for subsistence use are unlikely. Accordingly, the ANILCA Section 810(a)(2) requirement for a subsistence hearing was not triggered for any community based on impacts on caribou.

64.	Brook	Brisson	Trustees for Alaska	98270	249	ANILCA (Alaska National Interest Lands Conservation Act)	Because of the importance of the Porcupine Caribou Herd to all Gwich'in communities, in both Canada and the U.S., any impacts with the potential to decrease the population and harvestable resources will have a significant effect to all Gwich'in communities. BLM failed to account for the potential impacts to abundance, as well as how that will have an even broader impact to these communities in light of sharing practices. BLM's finding of no significant restriction to the abundance of subsistence resources for all Gwich'in communities that rely on the Porcupine Caribou Herd is arbitrary and contrary to science and the record before the agency.	Based on the Draft EIS's analysis of impacts on caribou (Section 3.3.4), the preliminary ANILCA 810 subsistence evaluation concluded that under all action alternatives impacts on PCH caribou abundance may be affected due to minor displacement of maternal caribou; however, due to the mitigating effects of the lease stipulations and ROPs, large-scale displacement and consequent large decreases in the abundance of PCH caribou available for subsistence use are unlikely.

65.	Brook	Brisson	Trustees for Alaska	98270	250	ANILCA (Alaska National Interest Lands Conservation Act)	The hypothetical development scenario description states, without scientific analysis, “[i]n caribou areas, potential roads would be built on north-south and east-west orientations to the extent possible to limit interference with caribou migration. Figure B-2, Conceptual Layout of a Caribou Area Stand-alone Oil Development Facility, shows how the hypothetical layout could be adjusted for caribou mitigation if deemed appropriate by permitting agencies.” ²¹⁵⁵ Figure B-2 depicts a slightly different layout of the roads radiating out from the Central Processing Facility to additional “satellite” drill sites, but no explanation is provided for assumptions about why it would be expected have a differing impact on caribou compared with Figure B-1. Furthermore, no analysis was provided for how a major road and transportation system and infield roads would affect caribou movements. BLM instead relies on the erroneous conclusion that caribou would simply “forage within the total footprint of a [central processing facility and its associated well pads]” to dismiss the idea that infrastructure would impact the availability of the Porcupine Caribou Herd. ²¹⁵⁶ There has been extensive research on negative impacts of roads associated with the Trans-Alaska Pipeline and the Prudhoe Bay oilfield complex to the Central Arctic Herd. ²¹⁵⁷ BLM needs to address these issues using strongly supported scientific information, and fully consider impacts to caribou movement, which would directly impact availability for subsistence use.	The EIS incorporates all relevant scientific literature regarding the impacts of roads and other oil and gas facilities on caribou.

66.	Brook	Brisson	Trustees for Alaska	98270	251	ANILCA (Alaska National Interest Lands Conservation Act)	Furthermore, all alternatives recognize vehicle collision mortality, altered movement patterns from linear infrastructure, and air traffic impacts to the Porcupine Caribou Herd.2158 Although BLM claims some of these impacts can be mitigated with timing and surface limitations, BLM acknowledges that mitigation measures merely minimize, and do not eliminate impacts to subsistence.2159 BLM does not attempt to explain what the shortcomings of these mitigations measures may be in terms of restrictions on subsistence availability. BLM also does not adequately account for the fact that the mitigation measures are potentially subject to waivers, exceptions, and modifications. The effectiveness of any mitigation measures is in part directly tied to whether or not it is enforceable or could be waived. BLM needs to account for the potential waiver of these provisions as part of its analysis, as that could negate any of the purported protections and benefits of such provisions.	Exceptions, waivers, and modifications provide an effective means of applying “adaptive management” techniques to oil and gas leases and associated permitting activities to meet changing circumstances. The BLM or operators can initiate adaptive management modifications. See Instruction Memorandum 2008-032 and 43 CFR 3101.1-4 for additional details. Additional text has been added to Section 2.2.5 clarifying the process.

67.	Brook	Brisson	Trustees for Alaska	98270	253	ANILCA (Alaska National Interest Lands Conservation Act)	In describing impacts of oil and gas development, BLM focuses on impacts resulting from oil and gas development activities on the Coastal Plain. There is absolutely no discussion of the 3 reasonably foreseeable future actions discussed in the bullets above. BLM completed failed to analyze or even discuss impacts from development activities in the Colville-Canning Area, Alpine, a road and pipeline between Kaktovik and the Dalton Highway/Trans-Alaska Pipeline. BLM limits its discussion on development in Alpine to existing oil and gas development activities. This does not adequately account for the potential cumulative impacts to subsistence users or reasonably foreseeable projects, such as ConocoPhillips' Willow project near Nuiqsut.	Reasonably foreseeable actions have been updated as appropriate. Willow and Alpine CD-5 are included in Appendix F.

S.3.5 Birds

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
1.	Withheld	Withheld	—	41048	7	birds	The draft EIS contains a totally inadequate analysis of migratory birds on the coastal plain (see 3.3.3). The document admits on p. 3-85 that “detailed distribution and abundance data are lacking for many species” of birds. Oil development on the coastal plain would be catastrophic for migratory birds given the importance of the refuge to over 100 bird species. For example, over half the world’s population of Emperor Geese migrate to the refuge. A major oil spill and loss of habitat could potentially wipe out what are now non-endangered bird species. The oil infrastructure, constant helicopter and truck movement during breeding season, chronic noise and oil spills would put migratory birds in peril. There should be no activity during breeding season.	Detailed data on many species do not exist; however, the BLM prepared the EIS with the best available data. There are no emperor geese in the area. No bird species range is restricted to the refuge. Oil spills and chronic noise are discussed under Impacts Common to All Alternatives.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
2.	Withheld	Withheld	—	42704	1	Birds	<p>“Detailed distribution and abundance data for the program area are lacking for many, and contemporary data are lacking for most bird species. In addition, much of the contemporary data were collected for only 1 or 2 years, cover only a small portion of the program area, or were collected at low survey intensity.” These are globally unique wetlands that are the only breeding place in the world for several BLM sensitive species. The wetlands, according to this very report, are already threatened by climate change, with drastic changes in vegetation that will destroy suitable nesting sites and forage opportunities. Examples of this pattern of destruction abound, for species around the globe, and there is no science to suggest that climate change impacts at this site would be different. Yet the quoted sentences directly acknowledge that BLM has no idea of the current status of these breeding populations and therefore can only guess what the impact of the proposed oil and gas leases would be. This is therefore not a complete EIS, and it won't stand up in court. The Bureau must postpone any leasing until it completes a valid EIS.</p>	<p>Detailed data on many species do not exist; however, the BLM prepared the EIS with the best available data. The existing data are summarized, and impacts on wildlife and habitat are assessed from each alternative. No bird species' range is restricted to the Refuge, including BLM sensitive species. While the wetlands in the Refuge are valuable habitat, they are not generally considered globally unique.</p>

3.	James	Warren	—	45446	1	Birds	BLM lacks important data and should undertake to fill in the gaps in data BEFORE any exploration, seismic testing, or development takes place in the Arctic Refuge. Although there are historical survey data for the ARCP, as described in USFWS and BLM (2018), detailed distribution and abundance data for the program area are lacking for many, and contemporary data are lacking for most bird species. In addition, much of the contemporary data were collected for only 1 or 2 years, cover only a small portion of the program area, or were collected at low survey intensity. The program area contains far fewer water bodies, compared with sites farther west, such as Prudhoe Bay and the NPR-A. Because of this, many waterbirds and shorebirds are patchily distributed, which increases the difficulty in determining accurate abundance levels based on a small number of surveys. A few bird species have been relatively well studied on the ARCP, such as golden eagles and fall-staging snow geese (summarized in USFWS 2015a), but detailed distribution and abundance data are lacking for many species. Information about the various bird species and species groups found in the program area is summarized below.	Detailed data on many species do not exist; however, the BLM prepared the EIS with the best available data. The existing data are summarized, and impacts on wildlife and habitat are assessed from each alternative. No changes were made in response to this comment.
4.	James	Warren	—	45446	2	Birds	44 species out of 156 is 28%. Is this not significant? Even the lowest percentage one could mention in this paragraph, say 8%, would be significant. Is it possible that BLM can present this material and then ignore it? It is prima facie evidence that there is potential harm to special status species in the Arctic Refuge, a population of some 28% of the total number of species present. This is significant. It needs to be studied in much more depth and for much longer.	No changes were made in response to this comment. The status of 44 species listed by ADFG as at-risk does not indicate significance alone; however, the impacts on these species are what is assessed for significance. No bird species is anticipated to suffer population-level impacts as a direct result of the proposed action.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
5.	James	Warren	—	45446	3	Birds	Waterbirds and Shorebirds: BLM states that there are 23 species of waterbirds confirmed breeders or migrants, and that 3 of these are BLM sensitive, 2 are USFWS birds of conservation concern, and 4 are ADFG at-risk species. Is this not a significant number of species? My count of waterbirds listed as at-risk by ADFG in Appendix J-9 has 5 species, not 4. Even with overlap in this list, we have 6 species out of 23 to consider, and that is 25% of waterbirds. If you use the other data given in Appendix J-9, with lists by Audubon, the percentage of at-risk species is much higher. In addition, these species are an important subsistence resource for residents in Kaktovik.	The status of 44 species listed by ADFG as at-risk does not indicate significance alone; however, the impacts on these species are what is assessed for significance. No bird species is anticipated to suffer population-level impacts as a direct result of the proposed action. Subsistence is discussed in Section 3.4.3.
6.	James	Warren	—	45446	4	Birds	The status of waterbirds and shorebirds is such that much more research must be done to determine the vulnerability and status of at-risk populations using the Arctic Refuge Coastal Plain each year. The whole North Slope is a teeming ground for migratory birds, and we have enough preliminary data to suggest that there are many populations that will be SIGNIFICANTLY harmed by oil and gas development in the Coastal Plain.	Detailed data on many species do not exist; however, the BLM prepared the EIS with the best available data. The existing data are summarized, and impacts on wildlife and habitat are assessed from each alternative. No bird species is anticipated to suffer population-level impacts as a direct result of the proposed action. No changes were made in response to this comment.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
7.	James	Warren	—	45446	5	Birds	Here we see that for an anchor field as drawn by BLM (how accurately we don't really know, fudged by that comment on configuration of roads), the actual loss of habitat is 15-16 times greater than the gravel footprint. And so the total loss would be 31,000 acres, by this calculation. This is only an estimate, depending on configuration of the road system built. Since we are not actually counting the gravel pits, the roads and their various impacts here, the real acreage will be greater than 31,000. Under Alternative D effects, BLM says the following: Alternative D effects Under Alternative D, potential long-term loss and alteration of habitat from direct and indirect effects of gravel deposition would occur over approximately 1.6 percent of the area available for leasing (1,037,200 acres). Disturbance and displacement could occur over about 3 percent of the area available for leasing. We should total this as a net loss of 4.6% of the area available for leasing. By my calculations, that means a loss (displacement is the same as loss if you are a bird!) of 47,711 acres. How does this relate to the estimate of 31,000 acres given in the previously analyzed paragraph concerning habitat impacts?	The text accurately states that the hypothetical anchor field is at best a rough approximation of potential direct and indirect impacts. There is, however, no other proposed development layout available on which to base an assessment. Gravel pits have been interpreted as included in the 2,000-acre maximum footprint and the text updated accordingly. Actual displacement and disturbance will occur over a much smaller area for nearly all species, as the text correctly states. The areas of habitat modification and the areas of disturbance and displacement overlap and are not, therefore, additive.
8.	Gregg	Spindler	—	45493	6	Birds	Given the short nesting season and extremely long migrations to lower latitudes, creation of an industrial zone and the associated human activities will certainly disrupt the successful production of young and also impact the ability of adequate feeding prior to migration. The impacts of human disturbances on snow geese has been well documented.5 Indeed, it has been suggested that aircraft not be allowed overflight during nesting season.	No changes were made in response to this comment. Few, if any, snow geese nest in the Refuge, so aircraft restrictions to protect snow geese would need to occur during fall staging, when most birds use the Refuge.

9.	Malkolm	Boothroyd	—	54092	3	Birds	The DEIS's section on birds is inadequate. For instance, the DEIS claims that potential marine oil spills would not be toxic to birds, but fails to provide a citation. The DEIS also claims that the risk of major oil spills is low, but cites data on historical oil spills around Kaktovik, rather than an area that has experienced the types of oil development foreseen for the Coastal Plain (see Table I-4). The DEIS makes unreliable assumptions on the zone of influence for oil infrastructure on birds, and ignores data that songbird nests may experience declined survival rates as far as 5 km from certain types of North Slope oil infrastructure.	The EIS statement on toxicity to birds was not regarding marine oil spill but spills of salt water. The BLM revised the text to clarify this. Discussion of the spill history in the NPR-A appears in Section 3.2.6 (page 3-38), and a history of North Slope spills appears in Section 3.2.11 (page 3-62 to 3-64). Reference to songbird nests in the existing oil field was from Liebezeit et al. 2009 (cited in the EIS), and that small but detectable decrease in nest survival was attributed to predation, not contaminants, as correctly stated in the EIS. The estimates for the zone of influence of indirect habitat alteration and of disturbance and displacement are conservative for most species (i.e., effects would occur over smaller areas).
10.	Pamela	Mayne	—	54228	3	Birds	on the section addressing the impact of oil development on birds, the BLM has not cited a single reference or scientific paper on which to base your conclusions.	The statement is inaccurate; many references are cited to describe the effects of development on birds. The section describing spill impacts has been revised.
11.	Withheld	Withheld	—	55209	8	Birds	This draft EIS also minimizes impacts to birds - millions of which, from every single state and continent including off the coast of Antarctica, come to the Refuge to breed, forage, and molt. The EIS must include more information about exactly how this development will affect birds throughout the continent.	The EIS makes no attempt to minimize any impacts. Detailed data on many species do not exist; however, the BLM prepared the EIS with the best available data. Impacts are accurately described. No bird species is anticipated to suffer population-level impacts as a direct result of the proposed action. A section covering transboundary effects has been added for all resources.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
12.	Withheld	Withheld	Denver Audubon	57090	8	Birds	The most important functions of wetlands in the program area, according to the EIS, are wildlife habitat value and endangered species support. They provide nesting, brood-rearing and migration staging habitat for a variety of avian species (EIS, 3-69). We did not find a discussion of impacts of the loss of wetlands in the section on birds in the EIS.	Additional information on functional values of wetlands has been added to Section 3.3.1, Vegetation and Wetlands, and additional mention of wetlands has been incorporated into the Bird section. Note that the entire ARCP is considered wetlands and that a single wetland type (freshwater emergent wetland) is dominant, covering 83 percent of the program area. As described in Section 3.3.1, permafrost wetlands provide limited hydrologic and biogeochemical function, and their most important function is, therefore, typically wildlife habitat. This applies across the ARCP. Specific wetland equivalents for affected avian habitats are not provided in the Birds section because specific facility locations are unknown; however, all terrestrial, freshwater, and marine avian habitats mentioned are, indeed, wetlands and waters of the U.S., as accurately described in Section 3.3.1. All are important wildlife habitats.

13.	Renae	Smith	Counsel for Environmental Protection	74336	44	Birds	The DEIS also fails to meaningfully analyze the impacts on migratory birds of oil spills, which could have grave consequences for migratory bird populations. Although the DEIS acknowledges that oil spills "pose risks of injury or death to birds," the DEIS largely dismisses this threat without meaningfully analyzing the impacts of spills or providing any evidence to support its conclusions.227	Text regarding spills has been revised and expanded, and references have been incorporated for impacts that are well known, the most common and significant of which is death. Spill rates are discussed in Section 3.2.6, Petroleum Resources (page 3-38) and Section 3.2.11, Solid and Hazardous Waste. Large spills in the marine environment would be unlikely, and the EIS correctly indicates that such spills are possible in shipping lanes and near docking or STP sites. See page 3-39: "Operators would be required to prepare and implement spill prevention and control plans in compliance with applicable federal regulations." Spill prevention measures are presented in Appendix D, Section D.2.3 EPA, pages D-4 and D-5.
14.	Withheld	Withheld	Denver Audubon	57090	10	Birds	The Arctic Refuge Coastal Plain is recognized as an Important Bird Area by the National Audubon Society, American Bird Conservancy and Birdlife International (EIS, 3-84), which fact emphasizes its importance to national and international bird populations. The EIS discussion of impacts on populations is short and inadequate.	Impacts are accurately described. No bird species is anticipated to suffer population-level impacts as a direct result of the proposed action.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
15.	Withheld	Withheld	—	68965	69	Birds	39. Chapter 3; section 3.3.3, pages 3-85 to 3-103. Birds. Pg. 3-86. The ARCP represents a substantial portion of the Beaufort Sea coastline in Alaska. Accordingly, it also supports a large number of birds during the important nesting, rearing, and migration staging periods. For these reasons, the ARCP and adjacent marine waters are recognized as important bird areas by the American Bird Conservancy, Audubon, and Birdlife International. Because the ARCP completely encompasses it, the program area is considered part of the important bird areas. Prior studies (summarized in USFWS 2015a) have demonstrated that at least several hundred thousand breeding and nonbreeding birds use the ARCP and program area during the short arctic summer. This is an excellent summary of the importance of the Coastal Plain for birds. Regarding the analysis of direct and indirect effects to this important resource, please see general comment (2) above, as well as my previous specific comment (37) regarding Fish and Aquatic Resources. Please use the hypothetical development scenario to refine your analysis of differences in effects to birds among alternatives through each of the phases of program implementation.	Additional details on the phases of development are not available at this time, and the hypothetical development scenario is at best a rough approximation of acres of direct and indirect impacts that could result from a project. Comments otherwise accurately represent the statement in the EIS. Discussion of the schematic footprint and disturbance buffers was revised for clarity.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
16.	Withheld	Withheld	—	68965	70	Birds	40. Chapter 3; section 3.3.3 (Birds), page 3-93. Throughout this section would be a good place to refer to the hypothetical development scenario in Appendix B and explain how that scenario was used to analyze differences among alternatives regarding the four mechanisms of impact listed on page 3-92. The hypothetical development scenario contains many of the assumptions and quantitative estimates of the scope and pace of development that are needed to allow more quantitative estimates of potential effects and estimate differences in impacts among alternatives. I am bewildered by the emphasis here on effects associated with pads. More extensive effects may be associated with linear features like roads and pipelines. If you intend to focus on effects associated with pads, why doesn't your analysis of indirect effects include consideration of effects associated with noise and artificial light, which will likely have a much larger zone of influence than the 328-foot extent cited for fugitive dust, gravel spray, thermokarsting, and impoundments? Please clarify the structure and logic of your analysis of program effects on birds.	Some revisions of text have been made for clarity, including reference to Appendix B, Figure B-1. The comment mischaracterizes the supposed emphasis on pads. Most of the hypothetical scenario footprint is road. Artificial lights are unlikely to affect birds during 24-hour daylight of the entire season in which most birds are present; however, the importance of shielded lighting to reduce the collision risk is mentioned. Noise is included among effects potentially resulting in disturbance and displacement of birds. Noise is a minor influence by comparison with visual stimuli, particularly human presence or sparse and intermittent road traffic, which generally cause more severe reactions, as outlined in the EIS and references cited.
17.	Withheld	Withheld	—	68965	71	Birds	41. Chapter 3; section 3.3.3 (Birds), pages 3-94 to 3-95. Habitat impacts due to sand and gravel mining are estimated here at 320 acres. This estimated acreage, however, only accounts for the pits (pg. 3-49 to 3-50), and does not include access roads and staging/stockpiling areas. Please refine this estimate to include all impacts to bird habitats associated with sand and gravel mining.	Section 1.9.1 has been revised to identify the production and support facilities that would count towards the 2,000-acre limit, which now includes gravel mines. Rationale as to why certain facilities may not be included is contained in Section S.1.2.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
18.	Withheld	Withheld	—	68965	72	Birds	42. Chapter 3; section 3.3.3 (Birds), page 3-98. The detailed description of snow goose response to overflights is a welcome detail regarding an abundant species in the program area. Is similar information available about the response of snow geese to other aspects of the proposed action? Given the importance of the Coastal Plain to snow geese, consider elaborating on other potential program effects on this species. In this section on Disturbance and Displacement, please include an analysis of effects associated with noise and artificial light, especially during the production phase of program implementation. Similarly, the abandonment and reclamation phase of program implementation can involve extensive use of heavy equipment and can be a prolonged and very disruptive activity. See general comment 2 above regarding the limited attention in the draft EIS to consideration of the duration of effects. Please try to include more information, wherever possible, about the frequency and duration of program impacts to birds.	Text has been revised to attempt to better address frequency and duration of impacts and effects of noise on snow geese. The effects of light have not been studied.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
19.	Withheld	Withheld	—	68965	73	Birds	43. Chapter 3; section 3.3.3 (Birds), page 3-101. Assuming a maximum of 2,000 acres of facility footprints (excludes material sites), potential long-term loss and alteration of habitat from direct effects of gravel deposition and indirect effects of dust, thermokarsting, and impoundments under Alternative B would occur over 1 percent of the entire program area. Potential disturbance and displacement of breeding birds in tundra habitats could occur over about 2 percent of the area available for leasing. Please revise this paragraph to include consideration of the spatial area affected by all program activities, not just surface occupancy. What proportion of the program area will likely be affected if you include overflights, artificial light, noise, pipelines, ice roads, sand and gravel pits and access routes to them, seawater treatment plants, and barge infrastructure? If you made full use of estimates and assumptions in the hypothetical development scenario, a more comprehensive evaluation of effects would be possible, and this estimate could provide a more useful metric for comparing action alternatives.	Section 1.9.1 has been revised to identify the production and support facilities that would count toward the 2,000-acre limit, which now includes gravel mines., Rationale as to why certain facilities may not be included is contained in Section S.1.2 of this Appendix.. Estimates of the area in which birds may be subject to disturbance and displacement include any effects of lights and noise. GIS analysis is not possible for ice roads or aircraft overflights, as routes are undetermined. Details regarding air traffic are provided in other sections.
20.	Withheld	Withheld	—	69211	12	Birds	It must be fully analyzed that species that utilize the project area as resident or migratory or foraging, stopover or other habitat will be directly impacted and will therefore become less able and present to utilize other habitats in other times of their life cycles, with possible eventual extinction.	Extinction is unlikely from any alternative. No bird species is anticipated to suffer population-level impacts as a direct result of the proposed action.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
21.	Peter	Stern	—	69296	31	Birds	Pages 3-94-95 discuss gravel mining effects which will be long term. Fugitive dust is discussed and having effect hundred of feet from the roads but nothing is stated about how this will be controlled or minimized. The ambiguity in language about restoration/remediation for gravel pits is not very encouraging that BLM will offer much monitoring or oversight.	Under all alternatives, ROP 35 requires restoration to the land's previous hydrological, vegetation, and habitat condition. Additional site-specific requirements may be required during NEPA analysis of site-specific proposals.
22.	Peter	Stern	—	69296	32	Birds	Page 3-95 "The actual area potentially affected would depend entirely on the configuration of roads, but these numbers indicate that indirect impacts of gravel roads and pads would affect an additional area about 7 to 8 times larger than the gravel footprint." "Potential loss and alteration of habitat from direct effects of gravel deposition and indirect effects of dust, thermokarsting, and impoundments would be long term and would occur over about 17,000 acres (2,000 acres total gravel footprint plus approximately 15,000 acres within 328 feet), or about 1 percent of the program area (1,563,500 acres). " This seems to say the area impacted will be quite large but mostly not subject to acreage development limitations. It effects not only the shorebirds being discussed but also any animals within those areas if vegetation becomes degraded.	Section 1.9.1 has been revised to identify the production and support facilities that would count towards the 2,000-acre limit, which now includes gravel mines. Rationale as to why certain facilities may not be included is contained in Section S.1.2. The 2,000-acre maximum allowable footprint refers to actual gravel laydown and does not include indirect impacts.
23.	Peter	Stern	—	69296	33	Birds	Page 3-99 " Small spills would be short term and of several acres or fewer on land. This is because they are usually contained on gravel pads and roads."... "Large spills would be more extensive, with cleanup activities lasting days to weeks, and could pose contamination risk to large numbers of molting, feeding, or migrating birds. " Oil spills under pipelines aren't mentioned nor are effects on vegetation.	Large or small spills could definitely be associated with pipelines, and pipeline spills are not excluded from the discussion. Pipeline spills are discussed on page 3-59 (Section 3.2.10, Water Resources) and page 3-61 (Section 3.2.11, Solid and Hazardous Waste). The effects on vegetation are discussed in Section 3.3.1, Vegetation and Wetlands (see page 3-72). Additional information on spills has been incorporated into bird and vegetation sections.

24.	Curt	Leigh	—	69329	2	Birds	<p>Predicted reductions in both density and diversity of wildlife species are discounted in the document by making comparisons to global population trends and the unbelievable and erroneous expectation that displaced wildlife will simply move into adjacent habitats. If those adjacent habitats are suitable for displaced wildlife it is likely they are already occupied, creating further displacement and intensifying inter and intra species competition (EIS p. 3-95).</p>	<p>No changes were made in response to this comment. On page 3-95, two statements are made regarding displacement of birds due to permanent and temporary habitat loss. The first regarding permanent loss of tundra nesting habitat states, "For some species of tundra nesting birds, habitat loss due to gravel placement redistributes individual nesting pairs to adjacent similar habitats (Troy and Carpenter 1990; Johnson et al. 2003)." Citations are provided to support this statement. The second statement regarding temporary habitat alteration that may result from screening near a single landing site during multi-annual barge activities is "Although high numbers of birds use the lagoons, they are highly mobile and likely would be able to move to adjacent similar areas if necessary." See also page 3-97 and Flint et al. 2004. Flint et al. (2004) reported that molting long-tailed ducks using lagoons in the Beaufort Sea had low but variable fidelity to sites inside barrier islands, averaging 39 percent. Sites were occupied consistently, but turnover of individuals was high as flightless ducks moved among sites. Site fidelity was not clearly affected by seismic surveys, and little evidence was found for disturbance-related displacement of individuals (Flint et al. 2004); aerial surveys did not find a difference in density of long-tailed ducks between industrial and control sites (Fischer et al. 2002).</p>

25.	Curt	Leigh	—	69329	3	Birds	Even the mitigation measures proposed to address those adverse impacts are mostly ineffective or only marginally effective. For example, areas with the “No Surface Occupancy” designation can still be disturbed and developed. That designation has exceptions for barge landings, docks, pipelines, roads, and stream crossings (EIS p. 3-100). Even high value near shore marine lagoon and barrier island habitats that are important for migratory birds and polar bears are subject to barge landing facilities, docks, spill response staging, storage areas and pipelines (EIS p. 2-7). In addition, an undetermined number of seawater treatment plants will be built along the coast (EIS p. B-16).	NSO, as defined, does indeed include significant exceptions; however, only one STP is proposed and only one barge landing site is proposed.
26.	Curt	Leigh	—	69329	3	Birds	In addition spill response activities including soil movement associated with containment would occur without timing or setback limitations (EIS p. 3-85).	Spill response could disturb birds and affect other resources. Disturbance is discussed on page 3-96, and spills are discussed on page 3-99, with mention of cleanup activities. See also that annual deployment and maintenance of spill response equipment may disturb nesting birds (page 3-98).
27.	Curt	Leigh	—	69329	9	Birds	Over three hundred thousand snow geese use the Coastal Plain for feeding and staging prior to their fall migration. They are highly susceptible to disturbance from aircraft up to eight miles away. Impacts from aircraft would occur during all development phases and would be extensive in geographic scope (EIS p. 3-98). No mitigation measures to eliminate or compensate for these acknowledged adverse impacts are discussed.	ROPs and lease stipulations provide indirect mitigation for other species.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
28.	Curt	Leigh	—	69329	11	Birds	The risk of oil spills during the project life exceeds 100 percent. Experience on North Slope oil fields confirms three spills larger than 100,000 gallons (EIS p.3-62). Cumulative impact analysis predicts 34 spills of approximately 16,313 gallons (EIS p. 3-65). Recent history and impact analysis confirms the significant potential for uncontrolled release of oil onto the lands and waters of the Arctic Refuge, if this oil and gas development project proceeds. Several hundred thousand breeding and non-breeding birds use the program area during the short arctic summer (EIS p. 3-85). This concentration of migratory birds from all across North America represents a very high impact risk from spilled oil. The EIS acknowledged the potential for significant adverse impacts on birds but suggests no effective prevention measure (EIS p. 3-99). In spite of the message in the Dawn dishwashing commercial on TV, survival rates for birds and marine mammals impacted by spilled oil is very low, even under perfect working conditions. The difficulty of collecting impacted individuals in arctic conditions coupled with the lack of direct access to support facilities and volunteers for washing and rehabilitation will further reduce the already low survival rates.	Text regarding spills has been revised and expanded. Spill risk cannot exceed 100 percent, but the EIS correctly indicates that spills are likely to occur and that under some scenarios large numbers of birds could be affected. Spill rates are discussed in Section 3.2.6, Petroleum Resources (page 3-38) and Section 3.2.11, Solid and Hazardous Waste. Large spills in the marine environment would be unlikely, and the EIS correctly indicates that such spills are possible in shipping lanes and near docking or STP sites. See page 3-39: "Operators would be required to prepare and implement spill prevention and control plans in compliance with applicable federal regulations." Spill prevention measures are presented in Appendix D, Section D.2.3 EPA, pages D-4 and D-5.
29.	Withheld	Withheld	—	70934	32	Birds	Page 3 - 95 in regards to a statement about the mobility of shorebirds and their ability to use adjacent areas. This ignores abundant data about preferential use of specific river deltas by migrating shorebirds. River deltas may be widely distributed but high-quality river deltas with abundant food for migrating shorebirds is concentrated in a few key areas. Ignoring this reality is a significant miscalculation.	Page 3-95 has no statement about displaced shorebirds, but EIS pages 3-96 and 3-97 do describe potential displacement of shorebirds and other birds from both terrestrial and marine habitats. Abundant data document the movements of shorebirds among multiple river delta staging areas, and the EIS accurately describes the importance of these relatively limited delta habitats.

33.	Renae	Smith	Counsel for Environmental Protection	74336	41	Birds	lakes important for nesting and molting, climate change, vegetation damage, transportation, construction, air traffic, and many other threats that will reduce or alter previously untouched migratory bird habitat, impact prey, and contribute to bird injury and mortality. ²²⁰ Oil spills in particular could lead to high mortality, the loss of habitat, and long-term impacts on the health of migratory bird populations. Despite these potentially devastating impacts, the DEIS contains mostly generic, broad, and unsupported statements about the impacts of action alternatives on migratory birds. ²²¹ For example, in discussing habitat loss and alteration impacts, the DEIS makes the unsupported statement that in response to habitat alterations caused by screening for barge access that “would create a sediment plume that could disport feeding by non-breeding, post-breeding, and staging birds” the high number of birds using the area “are highly mobile and likely would be able to move to adjacent similar areas if necessary.” ²²² The DEIS does not provide support for any of these statements or otherwise explain the availability and quality of other adjacent similar areas, how the disruption may impact birds at different life-cycle stages, or whether birds are expected to return to the disrupted habitat after disruption ceases.	The BLM has revised the text for clarity. The EIS statement is regarding temporary habitat alteration and disturbance/displacement that may result from screening near a single landing site preceding multi-annual barge activities. As described in the EIS, screening and associated impacts would be short term in duration and limited in extent. See information regarding disturbance of molting ducks in Flint et al. 2004. See also page 3-97 where the EIS states: “Flint et al. (2004) reported that molting long-tailed ducks using lagoons in the Beaufort Sea had low but variable fidelity to sites inside barrier islands, averaging 39 percent. Sites were occupied consistently, but turnover of individuals was high as flightless ducks moved among sites. Site fidelity was not clearly affected by seismic surveys and little evidence was found for disturbance-related displacement of individuals (Flint et al. 2004); aerial surveys did not find a difference in density of long-tailed ducks between industrial and control sites (Fischer et al. 2002).”

34.	Renae	Smith	Counsel for Environmental Protection	74336	42	Birds	the DEIS notes that “[p]otential impacts of disturbance and displacement by summertime construction and operations would be long term and may affect nesting success for some birds near facilities; however, they are unlikely to affect regional or global population sizes or nesting densities of breeding birds.” ²²³ But, the DEIS provides no support for this conclusion. ²²⁴ Common sense suggests the opposite: that long-term disruption of nesting success for bird species likely would contribute to declines in nesting densities and/or population sizes. As with other topics in the DEIS, BLM addresses this issue not with data, science, or even common sense, but instead assumes that no problem exists.	No bird species has a nesting range restricted to the program area, and the program area is a relatively small proportion of the breeding range for all species. Effects on a scale that would affect global populations are unlikely. No such declines have been attributed to much denser industrial development in the Prudhoe Bay and adjacent fields. See J. C. Truett and S. R. Johnson, eds. 2000. <i>The Natural History of an Arctic Oil Field: Development and the Biota</i> . Academic Press, San Diego, California.
35.	Renae	Smith	Counsel for Environmental Protection	74336	43	Birds	additional analysis of the extent of these population consequences or how they may impact regional or global population sizes. Similarly, although the DEIS recognizes that long-tailed ducks “make up about 80 percent of the birds in the nearshore waters of the Beaufort Sea” and are “the predominant bird in the lagoon system,” the DEIS does not meaningfully analyze how this concentration of the long-tailed duck population might intensify impacts from disturbance and displacement or how these impacts in combination with habitat loss, mortality, injury, and a changing climate may impact population health. ²²⁶	Text has been revised for clarity. Population-level impacts on long-tailed ducks are not anticipated to result from the activities described for the program area in the EIS. Discussion of climate change and cumulative effects has been revised.

36.	Renae	Smith	Counsel for Environmental Protection	74336	43	Birds	Where the DEIS does provide bird-specific information, it merely notes the impact without drawing any meaningful conclusions about the significance of the impact to bird populations and long-term health. For example, the DEIS notes that lower water levels from drawdowns "could eliminate important nesting sites on islands and peninsulas and may reduce fish prey, with particular impacts on breeding Pacific and red-throated loons" that would include "potential population consequences for Pacific, red-throated, and yellow-billed loons." ²²⁵ But, despite recognizing that the impact from drawdowns could be significant, the DEIS provides no	Drawdown lakes have not been identified, so no further or quantitative analysis is possible.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
37.	Renae	Smith	Counsel for Environmental Protection	74336	45	Birds	the analysis of Alternative D repeatedly notes the potential benefits to birds from non-surface occupancy restrictions or timing limitations, but there is no analysis of the extent of the potential benefits or how these benefits would interact with other impacts. ²³² In addition, the DEIS misleadingly calculates the level of long-term loss and alteration of habitat and extent of disturbance and displacement as a percentage total of the overall area being leased. As a result, even though Alternative D is the most protective alternative considered in the DEIS, the DEIS misleadingly states that its percentage of long-term loss and alteration of habitat will be approximately 1.6 percent, compared with 1 percent for Alternatives B and C, even though Alternatives B and C will result in larger acreage impacts. Similarly, the DEIS calculates that disturbance and displacement under Alternative D could total 3 percent of the area available for leasing as compared to 2 percent under Alternatives B and C. ²³³ These misleading calculations erroneously suggest that Alternatives B and C may be more protective than Alternative D, when the reverse is true.	The quantitative analysis of disturbance buffers has been revised to clarify that the 2,000-acre project footprint would have similar areas affected by habitat alteration and disturbance in all alternatives.
38.	Renae	Smith	Counsel for Environmental Protection	74336	49	Birds	reasonably foreseeable oil and gas development impacts would be common to the impacts described for development pursuant to the program area lease sales” and that these impacts would likely increase in occurrence and intensity and affect birds in both terrestrial and marine environments. ²³⁸ NEPA demands more than this cursory analysis.	The Draft EIS provides an adequate analysis.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
39.	Renae	Smith	Counsel for Environmental Protection	74336	49	Birds	The DEIS's analysis of cumulative impacts on migratory birds is also deficient. Although the DEIS identifies seismic exploration surveys as a reasonably foreseeable action, ²³⁵ it does not meaningfully address the impacts of this testing on migratory birds in its cumulative impacts analysis. ²³⁶ The cumulative impacts analysis also fails to discuss other past, present, and reasonably foreseeable future oil and gas development projects in the area and how those other projects would contribute to impacts on migratory birds. ²³⁷ Instead, the DEIS merely states that	Additional information regarding the potential impacts of seismic exploration has been incorporated here and in sections on soil, permafrost, water resources, and vegetation.
40.	Renae	Smith	Counsel for Environmental Protection	74336	50	Birds	Decision to ensure the least possible impacts on migratory birds. BLM should also require ongoing monitoring to analyze the ongoing impacts of the Leasing Program on migratory birds.	ROPs (25–27 and 30–32) and Stipulations 4 and 9 are in place to minimize negative effects on birds. There are additional measures that could be applied, including monitoring, to further minimize impacts. Some will be applied at the project-specific level

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
41.	Rena	Smith	Counsel for Environmental Protection	74336	50	Birds	<p>The DEIS also fails to incorporate any meaningful mitigation measures to protect migratory birds from the acknowledged threats of the proposed Leasing Program. A DEIS should include a discussion of “[m]eans to mitigate adverse environmental impacts.”²⁴⁰ “Mitigation must be discussed in sufficient detail to ensure that environmental consequences have been fairly evaluated.”²⁴¹ Here, however, the DEIS recognizes potential methods for minimizing impacts but fails to identify any of these as mitigation measures. For example, although the DEIS notes that impacts from gravel and dust fallout “would be minimized by using the shortest road routes and smallest pads and by placing gravel in uplands and well-drained habitats,” the DEIS does not identify these measures for mitigation.²⁴² Similarly, although the DEIS recognizes that future disturbance and displacement could affect nesting within 0.8 miles of active roads and 3.1 miles of oilfield facilities, the DEIS does not require any mitigation to reduce this disturbance and displacement.²⁴³ Further, the DEIS notes that reduced speed limits and driver awareness of seasonal birds could reduce bird-vehicle collisions, but again the DEIS does not require this as a mitigation measure. In addition, the DEIS notes the importance of “[s]pill containment at strategic points on waterways,” but does not include any specific mitigation measures to ensure that the spill prevention and response contingency plans under the proposed Leasing Program incorporate measures to ensure protections for migratory birds. At the very least, BLM should incorporate these and other meaningful mitigation measures into the Leasing Program Record of</p>	<p>ROPs (25–27 and 30–32) and Stipulations 4 and 9 are in place to minimize negative effects on birds. There are additional measures that could be applied to further minimize impacts. Some will be applied at the project-specific level.</p>

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
42.	Eric	Walsh	Government of Canada	74346	48	Birds	The EIS does not quantify how cumulative effects are likely to impact populations. While additional harvest pressure on overabundant species (Lesser Snow Goose) populations could potentially have some benefits (e.g. reducing overabundant populations). The cumulative effect of additional development on other species that may be at risk or undergoing population declines (shorebirds) or that congregate in large numbers (Common Eider, King Eider) off shore are not described.	Additional discussion of cumulative effects has been added. Offshore impacts are anticipated to be minor, comprising mainly temporary disturbance and displacement near the STP and landing facilities. Population-level effects are not anticipated to result from these activities.
43.	Eric	Walsh	Government of Canada	74346	49	Birds	The EIS does not delineate or rank risks of potential routes for barge traffic along shipping routes in the Beaufort Sea. Barge traffic increases the risk of accidental spills of both marine fuel (diesel) and extracted oil/gas products from the lease production sites for key species that rely almost exclusively on marine habitat during migration/molting and wintering (e.g. Common Eider, King Eider, Stellar's Eider, Spectacled Eider, Brant).	The hypothetical development scenario is applicable to the program area, and speculation beyond where marine vessel traffic would go is beyond the scope of this analysis. Direct and indirect impacts cannot be analyzed on a site-specific basis within this EIS, but they are analyzed for the program area generally based off the hypothetical development scenario.
44.	Withheld	Withheld	—	75145	6	Birds	The BLM analysis of effects on birds is inadequate and contains large loopholes that would allow oil and gas activities to move forward regardless of harm to birds. A thorough analysis of direct and cumulative impacts on world bird populations that spend their summer on the Coastal Plain is necessary to determine the environmental impacts of oil and gas leasing in the Arctic National Wildlife Refuge.	Additional discussion of cumulative effects has been added. No bird species has a nesting range restricted to the program area, and there is no world population that spends the summer in the program area. Oil development activities are not anticipated to result in population-level impacts on any bird species.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
45.	Chandra	Turner	Inuvialuit Game Council	75904	14	Birds	We have read the section of the DEIS dealing with birds (3-84 - 3-103). At various points this section acknowledges that some of the populations are shared populations and also that some populations are important subsistence resources for North Slope residents (e.g. Common Eider and King Eider at 3-87). However, this section of the DEIS does not reference the Migratory Birds Convention or Protocol or the related North American Waterfowl Management Plan. Nor does the DEIS offer a systematic account of shared populations or even identify which populations fall within the terms of the Convention and Protocol. Nor does it offer a systematic account of shared populations that are important for subsistence purposes. Nor does it reference the interests of Canadian Indigenous communities in these resources.	The Migratory Bird Treaty Act is described on page D-4. Additional mention has been added to the avian section with reference to the North American Waterfowl Management Plan. Subsistence is discussed in Section 3.4.3. Virtually all birds found in the planning area are migratory, share populations with other countries and often other continents, and are protected similarly by the Migratory Bird Treaty Act.
46.	Withheld	Withheld	—	77891	4	Birds	The Arctic Refuge Coastal Plain is also an essential nesting, foraging, and migratory stopover for millions of birds each year. The BLM analysis of effects on birds contains large loopholes that would allow oil and gas activities to move forward regardless of harm to birds. A thorough analysis of direct and cumulative impacts on world bird populations that spend their summer on the Coastal Plain is necessary to determine the environmental impacts of oil and gas leasing in the Arctic National Wildlife Refuge.	Additional discussion of cumulative effects has been added. No bird species has a nesting range restricted to the program area. There is no world population that spends the summer in the program area. Oil development activities are not anticipated to result in population-level impacts on any bird species.

47.	Natalie	Dawson	—	81061	2	Birds	<p>he big takeaway there is that a ton of bird surveys & monitoring are needed before even being able to adequately analyze impacts from an oil & gas leasing program. The memo explains that the data gaps are glaring for where, when, and which birds are using the Refuge Coastal Plain for various aspects of their life histories. That big multi-faceted, multi-species gap is then carried forward to say that such information is needed “Before an assessment of potential impacts of development can be conducted...” The memo then articulates a few specific knowledge gaps on impacts from oil & gas on birds, but with that broader caveat that these are only the “most apparent needs” given that they don’t even have the baseline data needed to address the very question of oil & gas impacts</p>	No revisions were made in response to this comment. Detailed data on many species do not exist; however, the BLM prepared the EIS with the best available data.
48.	Todd	Campbell	Conservation Biology course	81185	7	Birds	<p>Although this alternative has been determined to be the best option, we feel uninformed as to the specific impacts this project would have on the birds in this wildlife refuge and cannot yet endorse opening ANWR for lease to oil and gas exploration. This refuge has been noted by the Audubon society as “holding the most globally-significant Important Bird Areas of any U.S. state”. That this EIS lacks sufficient information about this notable refuge for birds shows a lack of concern for the wildlife present in this area. Erwin, R.M. 1989. Responses to Human Intruders by Birds Nesting in Colonies: Experimental Results and Management Guidelines. Colonial Waterbirds, 12(1): 104-108.</p>	No revisions were made in response to this comment. Erwin 1989 is an investigation of disturbance in nesting colonies of terns and skimmers, and there are few similar situations of colonial nesting birds in the planning area. This reference was not incorporated.

49.	Withheld	Withheld	Alaska Wilderness League	81382	3	Birds	The Migratory Bird Treaty Act (MBTA), which Congress enacted to implement a 1916 convention with Canada to protect migratory birds, is one of many examples. The MBTA protects over 200 species of migratory birds found on the Coastal Plain. Any oil and gas activities that take or kill migratory birds on the Coastal Plain without authorization would violate the MBTA. The United States is also obligated to three other bilateral conventions with Mexico, Japan, and Russia to protect migratory birds. BLM has, to date, failed to ensure compliance with these, and other, international treaties and agreements. The BLM must revise the draft EIS and address how it will ensure compliance for an oil and gas program on the Coastal Plain with these international treaties and agreements.	The BLM requires operators to comply with all applicable federal, state, and local laws. Compliance with the MBTA only requires that no birds are deliberately killed and no nests deliberately destroyed, but there are no penalties for incidental take. None of the proposed actions include the deliberate destruction of birds or nests.
50.	Deanna	Noel	Defenders Of Wildlife	82837	2	Birds	Presently, population sizes and the distribution of nesting shorebirds are unknown. At the very least, more surveys should be carried out before determining that the area is appropriate for development and will not cause irreparable harm to avian species in the balance.	No revisions were made in response to this comment. Detailed data on many species do not exist; however, the BLM prepared the EIS with the best available data. The existing data are summarized, and impacts on wildlife and habitat are assessed from each alternative. Additional studies will likely occur, and more detailed minimization measures should be incorporated into future analyses.

52.	Deanna	Noel	Defenders Of Wildlife	82837	3	Birds	Because they nest on the ground in the open, all shorebirds are particularly vulnerable to the predators that are drawn to manmade disturbance. In order to drill for oil, roads, buildings, and industrial facilities would need to be built. This construction would fragment and degrade the habitat so much that nests would be abandoned or perhaps never even built.	No revisions were made in response to this comment. All nesting birds in the planning area nest on the ground and are similarly vulnerable. Effects on habitats and behavior of birds are accurately described, and potential impacts on nesting birds are recognized. However, population-level effects on nesting birds have not been noted in previous development areas on the North Slope and are not anticipated. See J. C. Truett and S. R. Johnson, eds. 2000. The Natural History of an Arctic Oil Field: Development and the Biota. Academic Press, San Diego, California.
53.	Maryanne	Adams	Onondaga Audubon	82837	3	Birds	Species that would be especially impacted by oil drilling on the Coastal Plain are the shorebirds that use this area for breeding. Surveys conducted in 2002 and 2004 indicate that 14 species of breeding shorebirds (more than 230,000 individuals) were present on the Coastal Plain (The Condor 109(1):1-14. 2007).	The citation for Brown et al. 2007 from Condor 109 has been cited correctly here and in the EIS.
54.	Deanna	Noel	Defenders Of Wildlife	82837	3	Birds	Species that would be especially impacted by oil drilling on the Coastal Plain are the shorebirds that use this area for breeding. Surveys conducted in 2002 and 2004 indicate that 14 species of breeding shorebirds (more than 230,000 individuals) were present on the Coastal Plain (The Condor 109(1):1-14. 2007).	The citation for Brown et al. 2007 from Condor 109 has been cited correctly here and in the EIS.
55.	Withheld	Withheld	—	82848	4	Birds	Additionally the EIS notes repeatedly that the proposed leasing regions are critical habitat for migratory birds, but that very few details are known about population numbers and habitat usage of birds in the proposed leasing area. Treatment of landbirds in the draft EIS is especially sparse. Without more information, consideration of potential impacts of leasing activities on birds is insufficient.	Detailed data on many species do not exist; however, the BLM prepared the EIS with the best available data. Additional studies will likely occur, and more detailed minimization measures should be incorporated into future analyses.

60.	Elizabeth	Ballard	—	90951	1	Birds	More than 150 species of birds have been documented on the Coastal Plain, many of which find vital habitat for foraging, nesting, migratory staging, and overwintering. ¹ The Coastal Plain of the Arctic Refuge lies within a designated Important Bird Area that is globally important for American Golden-plover, Buff-breasted Sandpiper, and Pectoral Sandpiper; continentally important for Snow Goose, Red Phalarope, Whimbrel, and Dunlin; and important at a state level for Golden Eagle, Red-necked Phalarope, Red-throated Loon, Ruddy Turnstone, Semipalmated Plover, Semipalmated Sandpiper, and Stilt Sandpiper. ² Yet the DEIS downplays the importance of the Coastal Plain to birds, misses important information, and conducts a poor analysis of the impacts that oil and gas development will have on birds. Moreover, the DEIS section on birds is extremely poorly organized, and presents information specific to certain birds directly alongside information on birds in general, forcing the public to try to piece together a narrative of the baseline and impacts.	The EIS attempts to present an accurate assessment of the risks to birds and does not downplay the importance of the project area to birds.
61.	Elizabeth	Ballard	—	90951	2	Birds	The DEIS does not provide adequate descriptions and baselines for the birds found within the project area. Throughout the DEIS the agency appears to downplay the importance of birds with the status “uncommon.”	The EIS attempts to present an accurate assessment of the risks to birds and does not downplay the importance of the project area to birds.
62.	Elizabeth	Ballard	—	90951	3	Birds	For example, the DEIS notes that “[w]aterbirds arrive in late May and June and begin nesting from late May through June,” ³ but does not provide any analysis of changes in phenology. Broadly across the bird section, the DEIS lacks sufficient description and information on potential changes in phenology and the potential for resulting impacts	Climate change and phenology are discussed in the subsection entitled climate change and not broadly across the bird section (similar to other resources). Please see the specific discussion there, in which phenological changes are discussed. Additional discussion of climate change has been incorporated in that section and under cumulative effects.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
63.	Elizabeth	Ballard	—	90951	4	Birds	The DEIS also fails to accurately describe the extent of impact to bird habitat. The 2000 acre “limit” that allows reclamation to exceed the cap will cause more than 2000 acres of impacts to birds. The DEIS explains that the agency would allow the 2000 acre “cap” to be exceeded if disturbed acres are “reclaimed.” ⁴ But shorebirds and passerines do not use reclaimed acres in the same way they use non-disturbed areas. ⁵ Furthermore, the DEIS itself notes that “[h]abitat alteration caused by fugitive dust, thermokarsting, and water impoundments intensifies with time,” ⁶ without explaining how remediation will undo these indirect impacts. Therefore, the DEIS must explain that the impacts to birds would go above and beyond the 2000 acres, and must address how this impact exceeding 2000 acres conforms with the law.	Indirect impacts and disturbance will exceed the 2,000 acres of allowed direct habitat loss. Text has been added regarding altered bird use of reclaimed disturbed habitats. See Section 3.2.10, Water Resources: “Reclamation has not been proven for gravel removal in the arctic environment once operations have ceased.” Additional information on reclamation has been incorporated into the vegetation section.
64.	Elizabeth	Ballard	—	90951	5	Birds	The DEIS fails to adequately describe and consider migratory birds. Migratory birds in the Arctic can face problems finding migratory and wintering habitat outside of the project area. The impacts from beyond the project area can in some cases be more severe than impacts in the Arctic, ⁷ and must be considered in the context of impacts within breeding ranges. For example, a number of shorebird species that breed in the 1002 Area are long distance migrants that are experiencing impacts along their migratory pathway and merit special consideration and analysis. ⁸ Pacific Brant are also experiencing changes to their wintering habitats, which may be changing nesting and survival in Brant on their Arctic breeding grounds. ⁹ The DEIS must consider these transboundary effects in conjunction with impacts from oil and gas activity.	The EIS has been revised to more fully analyze transboundary impacts, where applicable.

65.	Elizabeth	Ballard	—	90951	7	Birds	The DEIS analysis of oil spill impacts on birds is inadequate, incomplete, and lacks any reference to studies or articles. First, the DEIS ignores relevant spill data. Petroleum ReserveAlaska. The agency must amend its oil spill table to include oil spill data from these areas. When the DEIS presents these more relevant data, it will become more apparent that the DEIS's supposition that spills of 10,000 gallons are extremely rare,10 is wrong. There have been more than 16 spills of over 10,000 gallons of various toxic materials in the last 19 years, including a	See Section 3.2.11 and data on spills presented in that section. Revisions have been made to the bird section to clarify the discussion of spill impacts.
66.	Elizabeth	Ballard	—	90951	8	Birds	The DEIS lacks any analysis of acoustic impacts on birds. Noise from all stages of industrial activity can impact birds including causing stress, fright or flight, avoidance, changes in behavioral habits like nesting and foraging, changes in nesting success, modified vocalizations, or interference with the ability to hear conspecifics or predators.11 The DEIS should catalog the existing noise in the planning area, explain the changes in noise that will occur with the development of an oil and gas program, describe impacts that will occur for birds, and provide a method for addressing and monitoring this issue.	The acoustic environment is described in Section 3.2.3. Noise is a factor included in discussion of disturbance and displacement, and specific mention has been added. See ROP 32, which prohibits activities including high noise near known eider nests.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
67.	Elizabeth	Ballard	—	90951	9	Birds	The DEIS does not contain an adequate cumulative impacts analysis for birds. The sections below describe inadequate cumulative impacts analysis for specific birds and guilds, but more generally the “Cumulative Impacts” section within the “Birds” section of the DEIS12 is wholly inadequate. This small section essentially consists of an incomplete list of the individual indirect or direct impacts. The list includes increased predation, terrestrial transportation activities, boat and air traffic disturbance, subsistence harvest of birds, recreation, air-based sightseeing, adventure cruise ships, community development projects. But the list of impacts misses impacts like seismic activity’s effects to hydrology and oil spills; the list also completely misses impacts from beyond the project area including melting sea ice; marine boat traffic impacts to marinebirds along the marine traffic route; and impacts to migratory birds in other parts of their life history, at stop-over and wintering habitat. The list is also entirely too vague, and does not expand upon the impacts of barge and boat traffic to mention the effects from screeding.	The cumulative effects section has been revised to provide more information. Effects of climate change are discussed separately under that heading. Increased risk of spills, including the marine transport route, was incorporated, as suggested. Transboundary impacts have been incorporated as a separate section. Screeding is covered as an indirect effect of the leasing action; it would not be a cumulative effect unless additional screeding were conducted for other hypothetical development scenario actions. Although not mentioned specifically, screeding would be included among potential actions associated with community development projects, such as improvement of ports, which are listed in the hypothetical development scenario.
68.	Elizabeth	Ballard	—	90951	10	Birds	In addition to missing many of the individual impacts that can accumulate or become exacerbated, the cumulative impacts section simply does not analyze these impacts as accumulating or exacerbating. The section both misses habitat loss from infrastructure as an impact and furthermore entirely lacks any accounting of the accumulating infrastructure on the North Slope, including activity in land owned by private corporations or by the State of Alaska, and activity in the National Petroleum Reserve-Alaska in the western Arctic.	The cumulative effects section has been revised to provide more information, including habitat loss and alteration and potential development on non-BLM-managed lands. The hypothetical development scenario includes development projects in the NPR-A.

69.	Elizabeth	Ballard	—	90951	11	Birds	<p>Finally, this cumulative impacts section only mentions climate change in a single sentence: “The effects of climate change described under Affected Environment above, could influence the rate or degree of the potential cumulative impacts.”¹³ This completely misses the many and intertwining cumulative impacts that will stem from climate change, including exacerbated habitat loss, changes in phenology, invasive species, and changes to hydrology, erosion rates, and other physiological aspects of Arctic ecosystems. Earlier parts of the birds section make the same error. For example, following a confusing description of how gravel infrastructure could directly and indirectly reduce habitat for spectacled eiders (and the DEIS appears to expand these impacts to all birds), the DEIS mentions the same sentence found in the later section, that “The effects of climate change described under Affected Environment above, could influence the rate or degree of the potential cumulative impacts.”¹⁴ But again, this conclusory sentence does not expand on how climate change could modify the assumptions on how gravel infrastructure may impact bird habitat. In sections below, the inadequacies of the cumulative impacts analysis for specific bird species and guilds are described in more detail.</p>	<p>The organization of the EIS places climate change in a separate discussion from cumulative effects. Please see that section for treatment of climate change. All factors mentioned in the comment are discussed in that section (habitat loss, phenology, changing ranges/invasive bird species, hydrology, and erosion). The comment is correct that the buffer developed for eiders was used as a conservative estimate for all birds, recognizing that each species differs. The cumulative effects section has been revised to provide more information.</p>

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
70.	Elizabeth	Ballard	—	90951	12	Birds	The analysis of the impacts to cliff-nesting raptors is inadequate. The DEIS describes development activity that would remove gravel from rivers ¹⁵ and explains the action alternatives would remove gravel and sand from “alluvial deposits of larger rivers” and “streams and topographic high points.” ¹⁶ Within Appendix A, the reasonably foreseeable development scenario includes a section on gravel mines but does not provide more specificity, noting that gravel pits will likely occur near the facilities they are supplying. ¹⁷ But the section on birds does not use this information to explain where gravel mining may overlap with cliff-nesting raptor habitat, thus limiting the analysis on the extent of this impact. The DEIS therefore does not specify where removal of gravel from rivers will occur under the reasonably foreseeable development scenario and under the different alternatives, and therefore does not adequately assess the impact to cliff-nesting raptors	Locations of gravel mines are not known but will be determined during the permitting process for any proposed development project. Potential impacts on raptors will be assessed at that time.

71.	Elizabeth	Ballard	—	90951	17	Birds	<p>The DEIS fails to analyze where and how winter activity could impact American Dippers or other winter birds in the program area. The DEIS notes that winter birds remain in the program area year-round, including “dippers near open running water.”²³ Appendix J indicates that wintering birds are not rare (American Dippers are uncommon, meaning regular but not always observed; Willow Ptarmigan are uncommon; and Rock Ptarmigan are common).²⁴ Later, the DEIS mentions that “[t]raffic and machinery related to winter construction could cause disturbance, behavior alterations, and displacement to resident wintering birds.”²⁵ But the DEIS does not go on to mention American Dippers or other wintering birds in the short section on “Landbirds.”²⁶ There are no lease stipulations or ROPs related to the issue of winter activity impacts on American Dippers or other overwintering birds.²⁷ Without a basis for its conclusions, the DEIS simply states that development activity would “affect few species and low numbers of year-round residents,”²⁸ and that “only small numbers of only a few bird species are resident during winter, and none are breeding. Winter construction therefore would potentially affect small numbers of non-breeding birds during the construction phase of a development project.”²⁹ This constitutes insufficient analysis of impacts to wintering birds from industrial winter activity.</p>	<p>Specific mention of dippers has been added to the section on year-round resident landbirds; however, notwithstanding the presence of dippers, the EIS is accurate in stating that small numbers of birds would be affected by winter activities (see p. 3-96).</p>

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
72.	Elizabeth	Ballard	—	90951	18	Birds	<p>The DEIS does not adequately analyze or mitigate the impacts to shorebird habitat from winter work and the subsequent shifts in hydrology. The DEIS briefly notes that winter activities, such as seismic machinery and ice roads, can harm vegetation and change spring runoff, and that more damage occurs in well-drained areas of the tundra, which are areas favored by some shorebirds like Whimbrel and American Golden-plover.³⁰ But the DEIS never takes the next step to make the connection to shorebirds or their natural history. Nor does the DEIS connect the dots to explain that most of the high oil potential area in the 1002 is comprised of that habitat type. While the Canning River and Sadlerochit River have patchy wetlands, the rest of the high oil potential area is comprised of well-drained tundra, which provides habitat for shorebirds like American Golden-plover. Moreover, Lease Stipulations 1, 4, and 9,³¹ which involve purported protections to shorebirds and their habitat do not apply to winter work,³² when seismic activity and ice roads impact vegetation and hydrology.</p>	<p>Additional text regarding the potential impacts of seismic exploration has been incorporated here and in sections on soil, permafrost, water resources, and vegetation. The EIS does acknowledge the dominance of well-drained tundra and that habitat loss and alteration will occur and will affect shorebirds and other species in drier habitats. See Habitat Loss and Alteration, p. 3-95.</p>

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
73.	Elizabeth	Ballard	—	90951	20	Birds	Furthermore, the cumulative impacts analysis for shorebirds does not connect climate and infrastructure. The DEIS mentions climate-related changes that could affect shorebirds, saying that “[i]ncreases in shrubs and trees have been documented (Sturm et al. 2001b; Tape et al. 2006) and are expected to continue with increasing summer temperatures. . . . tundra nesting birds (. . . shorebirds. . .) may decline.” ³⁴ But the DEIS does not link this change to the potential hydrological changes from winter oil and gas activities. Nor does the DEIS connect the climate-induced change, or the winter-activity hydrological changes to the water drawdown, which “may affect shorelines, degrading habitat for a variety of waterbirds and shorebirds.” ³⁵ The DEIS must not only address individual impacts to shorebirds and other species, but must analyze these impacts collectively as cumulative effects, that could add or exacerbate the individual impacts.	The cumulative effects section has been revised to attempt to better address interactions between shrubification and drying on bird habitats.
74.	Elizabeth	Ballard	—	90951	21	Birds	The DEIS does not adequately examine the impacts from air traffic to snow geese and other nonnesting birds. Non-nesting birds are sensitive to aircraft overflights, from a distance of 1.2 to 2.5 miles from the aircraft pathway. ³⁶ But due to the narrowness of the coastal plain, the buffer of 2.5 miles could cover a large percentage of the total area. The DEIS should depict this impact spatially. Without an acknowledgement and depiction of how far-reaching air traffic impacts will be on the narrow coastal plain, the DEIS has not fully grappled with the extent to which aircraft could impact non-nesting birds.	Spatial analysis of air traffic is not possible because facility locations are unknown and flight paths are, therefore, unknown.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
75.	Elizabeth	Ballard	—	90951	25	Birds	Second, the DEIS further downplays the impacts of screeding on birds and their food web. The DEIS notes that screeding will cause a "sediment plume that could disrupt feeding by nonbreeding, post-breeding, and staging birds." ⁴¹ But the DEIS dismisses this as "short-term" and does not acknowledge that a sediment plume could present long-term impact of disrupting the food web.	Text on screeding has been revised to indicate that barging and screeding would occur annually. The EIS correctly describes that screeding would occur during short periods and only near a landing location and is, therefore, short duration and localized. The activities described do not suggest a long-term disruption of food webs.
76.	Elizabeth	Ballard	—	90951	28	Birds	One potential area is from deep-water lakes, but this poses a risk to the fish species found in these lakes, which in turn could have "potential population consequences for loons, primarily for Pacific and red-throated loons". ⁴² But the DEIS draws this conclusion without any further explanation of the status of loon populations in the project area, without describing which deepwater lakes may be at risk, and without noting which species of fish may be impacted and whether these fish species are in fact the forage species needed by loons. This analysis is wholly inadequate.	Specific drawdown lakes have not been identified, and the fish community composition in most lakes is unknown. The EIS was revised to clarify that RTLO do not feed in their nesting lakes.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
77.	Elizabeth	Ballard	—	90951	30	Birds	The DEIS briefly notes that climate change could increase shrub- and tree-nesting passerines,45 but does not provide any reference.46 The DEIS also notes in passing that vegetation damage from winter work is most severe in areas that support higher densities of passerines,47 and that passerines experience decreased nest survival within 3.1 miles of oilfield facilities,48 but neglects to connect these individual impacts to the cumulative impacts of a changing habitat and climate change. Instead the DEIS only concludes that because Alternative C has larger setbacks, it will be more protective of passerines,49 lacking any further analysis of how the development scenario and the different alternatives will impact passerines in different ways and at different levels.	Additional discussions of seismic exploration, climate change, and cumulative effects have been incorporated. Decreased nest survival within 3.1 miles of oil field facilities was detectable as accurately reported by the EIS (and correctly attributed to Liebezeit et al. 2009). That magnitude of effect is not anticipated to result in population-level changes; it was attributed to changes in predator abundance.
78.	Elizabeth	Ballard	—	90951	31	Birds	The DEIS contains almost no analysis on impacts to seabirds. The DEIS notes that "low levels of disturbance and displacement of seabirds could occur along the marine vessel route between the ARCP and Dutch Harbor, Alaska."50 But the analysis on impacts to seabirds in the coastal areas is focused on Long-tailed Ducks, rather than on seabirds in the coastal areas,51 and the DEIS does not contain any additional analysis of the impacts to seabirds from increased vessel traffic.52	Additional discussion of birds on the marine route has been incorporated. The EIS states that of seven seabird species that occur offshore of the ARCP, five are accidental/rare visitors (shearwaters, fulmars, and most alcids). Only black guillemot (rare breeder on barrier islands) and thick-billed murre (rare migrant) occur regularly. The EIS correctly focuses on molting ducks versus seabirds because these waterfowl occur in large numbers, while seabirds are rare. Note, however, that only minor impacts are anticipated to result; this includes all the visitors and the two species of seabird that occur regularly.

80.	Veronica	Estelle	—	94060	1	Birds	As a PhD ecologist with field experience in the Prudhoe Bay Oil Field, the Kuparuk Oil Field and the National Petroleum Reserve researching avian populations and their use of habitat, I request that population level and demographic studies be conducted on all waterfowl, shorebird, and passerine avian species on any leased and adjacent non-leased lands (for comparison throughout the study period), as well as studies on habitat use and availability by these species. I also request that population and demographic studies be conducted on predator species, particularly population studies that evaluate numbers, distribution and concentration of predators who may take avian species in leased and unleased areas, pre- and post-development. It is well documented that development leads to an increase in fox, ravens, crows, and other predators of avian species in oil fields. All studies should be conducted prior to lease, prior to development, during development and after development. Studies should be contracted by reputable consulting firms or academics with Arctic experience and who have no financial ties to the oil industry. The results of these studies, as well as the original data, should be publicly available at all times during and after the studies so that all researchers can access the data and evaluate the results.	Site-specific future development will be subject to additional studies.

81.	Malkolm	Boothroyd	CPAWS Yukon Chapter	94061	12	Birds	the BLM claims "potential effects on waterbirds would be minimized by using the shortest road routes and smallest pads and by placing gravel in uplands and well-drained habitats composed of moist and shrub tundra. ³⁵ " The BLM does not explain what protocols would be used to restrict the length of roads or the size of pads. The BLM states that the construction of oil and gas infrastructure is "unlikely to affect regional or global population sizes or nesting densities of breeding birds. ³⁶ " The BLM fails to support this claim with quantitative analysis of the impacts of oil and gas activities on birds. Without providing a quantitative assessment it is difficult for the public to scrutinize the BLM's findings. The BLM states that while 320 acres of the Coastal Plain could be transformed into gravel mines, impacts on birds could be ameliorated by transforming used gravel pits into wetlands. ³⁷ This fails to address the impacts of habitat loss on terrestrial birds.	The text has been revised for clarity. A more quantitative analysis is not possible without specifically proposed projects. The comment inaccurately paraphrases the EIS discussion of remediation of gravel pits. No effect on regional population sizes or density of birds has been documented in the older and more densely developed oil fields. See J. C. Truett and S. R. Johnson, eds. 2000. The Natural History of an Arctic Oil Field: Development and the Biota. Academic Press, San Diego, California.
82.	Malkolm	Boothroyd	CPAWS Yukon Chapter	94061	15	Birds	The BLM should also assess how oil and gas activities could impact populations of birds that migrate through Canada, especially the Buff-breasted Sandpiper, Red-necked Phalarope and Short-eared Owl, species listed under Canada's Species at Risk Act .	These species are not excluded from analysis. Canada's Species at Risk Act list has been incorporated into the species list and conservation listings table. No bird species is anticipated to suffer population-level impacts as a direct result of the proposed action. A section covering transboundary effects has been added.

S. Public Comments and BLM Responses (Birds)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
83.	Malkolm	Boothroyd	CPAWS Yukon Chapter	94061	15	Birds	The DEIS states "although high numbers of birds use the lagoons, they are highly mobile and likely would be able to move to adjacent similar areas if necessary.38" The BLM does not consider how displacement from lagoons could impact stress levels among birds or cause them to waste energy. The BLM does not analyze how disturbance of lagoon ecosystems could disrupt foraging patterns, or lead to increased competition for resources in habitats where birds are displaced to.	The EIS accurately describes how screeding activities might result in temporary displacement of birds from lagoon habitats. Such displacement would be short term and localized and is not anticipated to result in negative impacts on any species. Available evidence suggests that alternative habitats are available and that competition for resources is unlikely to change (see Flint et al. 2004). Increased stress and energy expenditure are described for all species on pages 3-96 to 3-98 and for birds affected by screeding specifically on page 3-98.
84.	Malkolm	Boothroyd	CPAWS Yukon Chapter	94061	30	Birds	The BLM fails to consider the impacts of screeding on chicks, which are vulnerable to environmental disturbance and are flightless throughout much of the summer.	Young of the year are included among birds molting in the lagoons, a period during which adults, too, are flightless. At this time of the year, such birds have attained nearly adult size and are largely indistinguishable from adults during surveys. All impacts of screeding apply to all birds present, including young of the year. Text has been revised for clarity.

85.	Sarah	Keller	—	94078	3	Birds	As a biologist, I am aware of the importance of the Migratory Bird Treaty Act (MBTA) of 1918. The federal government has the responsibility for environmental protection and conservation of migratory birds. It well documented that millions of birds of many species use the ANWR and the coastal plain to nest, forage and safely molt. Due to the MBTA, let me repeat, the federal government including the BLM has the responsibility for the environmental protection and conservation of migratory birds. The DEIS minimizes impacts to the point of absurdity. For example, if the 2000 acre rule (the limit on surface area development) in the DEIS was in keeping with the MBTA, it would include gravel mines, pipelines, and pads and other disturbances to the coastal plain. The areas used for development cannot at the same time be used by birds for the uses stipulated in the MBTA. These areas (gravel mines, pipelines, pads, etc.) must be counted within the 2000 acre rule. Nor can these affected areas can be reclaimed to their original use in any reasonable time period.	The MBTA is described on page D-4. Additional mention has been added to the avian section. Virtually all birds found in the planning area are migratory, share populations with other countries and often other continents, and are protected similarly by the MBTA. The MBTA has never been interpreted to protect habitat but attempts to prevent injury, mortality, and egg and nest loss. The EIS clearly outlines and recognizes potential negative impacts of development and does not attempt to minimize effects. Legal interpretation of the 2,000-acre limit to surface impacts is applied. It is correct that reclaimed areas are not used similarly to undisturbed areas and that even that degree of reclamation requires decades.

86.	Bernadette	Demientieff	Gwich'in Steering Committee	94080	16	Birds	the DEIS barely mentions how dust could harm habitat and thus negatively affect the productivity of nesting birds, and also fails to adequately analyze impacts to birds from other oil and gas infrastructure. The DEIS also downplays how oil spills and spills of other contaminants could harm birds and their habitat, impacts from winter activities like construction, habitat loss from hydrological changes, and impacts from aircraft traffic. BLM's cumulative impacts analysis is likewise defective, because it ignores impacts from seismic activity, melting sea ice, marine traffic, and impacts to migratory birds along their routes.	Analysis of impacts on habitats is discussed extensively under Habitat Loss and Alteration, and impacts on birds are summarized. The analysis of spill impacts has been revised and expanded. Additional details on seismic exploration have been incorporated. A global search for "dust" reveals numerous sections of the EIS that discuss the effects of dust on vegetation, snowmelt, water quality, and more. In the bird section, dust is mentioned at least 10 times, and the impacts are thoroughly outlined, with references to the vegetation section. Discussions of seismic exploration, oil spills, and cumulative impacts have been revised and expanded.
87.	—	—	Alaska Department of Natural Resources	94102	85	Birds	61 Appendix J, Table J-9, Page J18 Birds Probable typo: Fao should be changed to Falco as the genus for the American Kestrel, Merlin, Gyrfalcon, and Peregrine Falcon.	Typos have been corrected.

88.	Tim	Whitehouse	PEER	95601	15	Birds	Information gaps for bird phenology o Although surveys have demonstrated the importance of the Refuge lagoons for waterbirds, there is poor understanding of the phenology of their use of this habitat. In addition, climate-mediated changes to the Beaufort Sea nearshore areas may be affecting benthic prey communities and ice conditions, and therefore the timing of when birds use the lagoons could be affected. o Post-breeding phenology of adult shorebirds using the 1002 Area is poorly understood, and so far, the only data available from recently deployed tracking devices are for buff-breasted sandpipers from breeding locations to the west of the Refuge. o The amount of time birds remain at key stopover sites is virtually unknown for most birds using the 1002 Area. These data are important for calculating disturbance or displacement risk and determining seasonal abundance estimates.	The analysis is done with the best available information.
89.	Tim	Whitehouse	PEER	95601	16	Birds	Information gaps for potential impacts to birds from oil and gas development and disturbance o Before an assessment of potential impacts of development can be conducted, better information on abundance, distribution, habitat use, and phenology of breeding and non-breeding birds in the 1002 Area is required. Therefore, the topics below only address the most apparent immediate needs. o The extent to which wetlands will be lost due to water use for oil and gas development needs to be better understood to evaluate impacts on birds. Exploration and development activities generally require substantial volumes of freshwater, but the 1002 Area contains less than 1/10th the density of lakes compared to areas to the west where oil and gas activities are ongoing. In	The analysis is done with the best available information. Few lakes have been surveyed in the ARCP, as stated now in the text. Changes in avian predator abundance are described under Attraction to Human Activities and Facilities. No additional information is available on contaminant exposure in the area. All details are correctly stated in the comment.

89. (cont.)	(see above)	(see above)	(see above)	(see above)	(see above)	(see above)	<p>addition, 1002 Area lakes tend to be shallower and freeze to the bottom during winter. Therefore, wetlands and waterbodies, especially where clustered, have high value for birds inhabiting the 1002 Area. Because of this, activities that affect the availability, seasonality, or flow of water could have different effects on birds, their habitats, and their foods in the 1002 Area compared to areas further west, but how and to what extent is unknown. o Changes in the avian predator community makeup, predator abundance, and impacts to avian productivity are some of the most commonly described consequences of industrial activity for birds breeding on the Alaska Coastal Plain. Shelter associated with winter exploration activities may attract predators such as arctic fox and raven. Little is known about the contemporary predator community makeup or abundance in the 1002 Area. o Limited contemporary exposure data for birds are available for contaminants related to oil and gas development in the 1002 Area.</p>	(see above)
90.	Tim	Whitehouse	PEER	95601	17	Birds	<p>What studies/surveys need to be conducted to fill information gaps? o Conduct aerial- or ground-based inventories of breeding birds. Species groups should include waterfowl, loons, gulls, shorebirds, and landbirds and should also include both area-wide and sitespecific surveys. These data will provide contemporary information on distribution and abundance and help identify important areas for birds. Prioritization of surveys should be based on conservation needs. Because this information may be important to leasing, and because year-to-year variability will require baseline data to be collected over several years, surveys should begin as soon as</p>	<p>Site-specific surveys may be required prior to the permitting of future projects.</p>

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
90. (cont.)	(see above)	(see above)	(see above)	(see above)	(see above)	(see above)	possible. o Conduct aerial- or ground-based inventories of Brooks Range, foothills, and Coastal Plain rivers for breeding cliff-nesting raptors. Because raptors may begin using the Coastal Plain while winter exploration activities occur, these surveys/studies should begin in the near future. o Conduct surveys to estimate abundance and distribution of predators of birds and eggs. Additional studies should also be conducted to determine current makeup of nest predators for common or sensitive bird species, and gather baseline information on movement patterns of foxes in the 1002 Area. Because high annual variability will require baseline data to be collected over many years, surveys and studies should begin as soon as practical. o Conduct studies on the foraging ecology of nest predators and how individuals choose food items and adjust diet patterns based on alternative prey. Objectives should target ways to inform potential management actions if local predator abundance is found to increase in response to oil and gas related activities. o Determine post-breeding abundance, distribution, habitat use, and phenology of waterfowl and loons in lagoons, and of shorebirds in deltas and coastal areas. Prioritization should be based on species' conservation need and sensitivity to disturbance and development. o Investigate how water availability and the patchiness of waterbodies in the 1002 Area affects how disturbance and development may impact birds. o Update baseline contaminant exposure information for birds breeding in the 1002 Area and using deltas and lagoons for fall staging, with particular emphasis on hydrocarbon exposure and how contaminant burdens may affect reproduction, survival, and	(see above)

90. (cont.)	(see above)	(see above)	(see above)	(see above)	(see above)	(see above)	<p>subsistence value and human health.</p> <ul style="list-style-type: none"> o The above studies should incorporate how predators and birds adjacent to the 1002 Area may change their behavior in response to activities directly associated with 1002 Area oil and gas development. o Much of the data from surveys and studies conducted in the 1002 Area are not widely available. The Refuge is working with FWS Science Applications to build a publically accessible database for the long-term dataset for the Canning River Delta tundra nesting bird project. <p>Comparable efforts should follow for other projects to ensure appropriate storage and management of important data and allow for public data access to both contemporary and historical data.</p>	(see above)
91.	Harry K.	Brower Jr.	North Slope Borough	95612	42	Birds	The DEIS should reflect that eiders migrating past the Coastal Plain may be vulnerable to the potential impacts of spilled oil that reaches the marine environment.	Additional text has been added to incorporate information on eiders in the marine environment.
92.	Harry K.	Brower Jr.	North Slope Borough	95612	43	Birds	Finally, we recommend that BLM improve the analysis regarding cumulative impacts to bird species. 18 The DEIS does not identify the past, present, and reasonably foreseeable actions that were included for consideration. BLM should further expand its statement that there would be an “increase [in] the occurrence and intensity of these common impacts,” and provide a more robust analysis of the impacts to bird species associated with the Leasing Program on the Coastal Plain in conjunction with these other cumulative actions.	The cumulative effects section has been expanded. Past, present, and reasonably foreseeable future actions are presented in Appendix F (see Table F-1). A reference to Appendix F has been added to the text in the bird section.

93.	Withheld	Withheld	—	96175	3	Birds	<p>How is the Migratory Bird Treaty Act of 1918 going to be recognized and enforced? Some of the new conventions to the treaty stipulate protections not only for the birds themselves but also for the habitats necessary for their survival. This is a critical omission in this DEIS. In Vol. 2, p. D-4, the DEIS lists what the Act makes illegal regarding migratory birds, but it does not mention killing birds or depriving them of their habitat. Subsistence users can hunt migratory birds through a legal process. But subsistence users do not jeopardize the habitat of the animals and birds they hunt. Displacing bird breeding, nesting, and staging grounds can effectively threaten or kill hosts of migratory birds. Of the 156 species recorded on the Coastal Plain (Vol 1, 3-85), only 57 species occur in substantial numbers, leaving 99 species as uncommon or rare. The DEIS states, "Potential loss and alteration of habitat from direct effects of gravel deposition and indirect effects of dust, thermokarsting, and impoundments would be long term and would occur over about 17,000 acres (2,000 acres total gravel footprint plus approximately 15,000 acres within 328 feet), or about 1 percent of the program area (1,563,500 acres)" (Vol. 1, 3-95). But the actual habitat areas impacted depend on the configuration of roads: ". . . with a standardized footprint of 750 acres, an additional 11,820 acres of tundra within 656 feet was calculated, an additional area about 15 to 16 times larger than the gravel footprint. With a 2,000-acre gravel footprint at peak development, disturbance and displacement of breeding birds in tundra habitats could occur over about 31,000 acres, or about 2 percent of the program area" (Vol. 1, 3-97).</p>	<p>The MBTA is described on page D-4. An additional description has been added to the avian section. Virtually all birds found in the planning area are migratory, share populations with other countries and often other continents, and are protected similarly by the MBTA. The MBTA has never been interpreted to protect habitat but attempts to prevent injury, mortality, and egg and nest loss. However, the MBTA M-Opinion has interpreted the act to allow incidental take. There are other proactive components of the MBTA that still guide BLM actions. The BLM has many other laws, regulations, and policies that protect (or encourage protection of) migratory birds. Impacts of displacement are described and are unlikely to include mortality. Uncommon or rare status in the program area does not indicate threatened status or particular conservation concern. Quotes made from the EIS regarding habitat loss and alteration, and disturbance and displacement appear accurate.</p>

94.	Withheld	Withheld	—	96867	6	Birds	3-95 “the impact on birds would be long term and somewhat ameliorated by reclamation plans (i.e., terrestrial breeding habitats could be replaced by aquatic habitats).” Birds that require terrestrial breeding habitats cannot relocate to aquatic habitats	The EIS states, “Avian habitats would be lost to material sites, but rehabilitated sites would likely be used by some species of nonbreeding, breeding, and brood-rearing waterbirds. The potential habitat loss or alteration from gravel excavation would affect up to 320 acres of surface disturbance; the impact on birds would be long term and somewhat ameliorated by reclamation plans (i.e., terrestrial breeding habitats could be replaced by aquatic habitats).” There is no suggestion that habitats would be restored or that birds would change their habitat preferences.
95.	—	—	United States Fish and Wildlife Service	97942	90	Birds	Section 3.3.3 Birds, Affected Environment, Shorebirds: Only the following 10 species are fairly common, common, or abundant in the program areas: American golden-plover, ruddy turnstone, semipalmated sandpiper, red-necked phalarope, red phalarope, Western sandpiper, dunlin, stilt sandpiper, pectoral sandpiper, and long-billed dowitcher. The following four additional species are less common: semipalmated plover, Baird's sandpiper, whimbrel and buff-breasted sandpiper (based on PRISM surveys reported in Brown et al. 2007). Data from transmitters indicate that some birds also migrate westward across the ARCP before migrating southwest across Alaska and down either the Pacific Flyway or the East Asian-Australasian Flyway. Recommend correcting the information related to species abundance and including information related to the eastward migration that occurs. Brown et al. (2007) is the best source of data for shorebirds relative to the project area.	Relative abundance information in the EIS is from Pearce et al. 2018, which incorporates and cites the data from Brown et al. 2007 for shorebirds. Brown et al. 2007 is also cited by the EIS for various other details. Text has been revised regarding shorebird migrations, and a reference has been added to the radiotelemetry project by Taylor et al. 2011.

96.	—	—	United States Fish and Wildlife Service	97942	91	Birds	<p>Section 3.3.3 Birds, Affected Environment, Climate Change: Although summer duration may increase due to climate change effects, it is unlikely that insectivores will increase as invertebrate emergence is mediated by snow melt initially, followed by cumulative degree days of temperature. The volume of invertebrates may be limited, with the emergence simply occurring earlier. Contrary to what is stated in the DEIS, avian habitat is changing rapidly, both on the coast and inland tundra areas. Comparison of photographic images taken at Prudhoe Bay in the 1980s and the present show the landscape drying up, with a change from low-centered polygons to high-centered polygons (see Liljedahl et al. 2016). This in turn is leading to drainage of uplands and creation of larger water bodies that may indeed be good for species of waterfowl and loons. River deltas may also be affected from reduction in glacier melt-off. This change and the storm surges could affect migratory birds through changes in invertebrate distribution and composition (Churchwell et al. 2018). The DEIS does not correctly assess the potential impacts to birds and their habitat resulting from the changing climate. Please ensure the EIS accurately assesses the potential impacts to birds and their habitat resulting from a changing climate based on the best available science</p>	<p>The EIS does not suggest that insectivores would increase in abundance; rather, it says, "It is unclear if birds relying on insects to feed their young (songbirds and shorebirds) could adapt to hatch at the optimum time as insect hatch continues to advance (Grabowski et al. 2013)." The BLM has revised the text to clarify that rapid changes in coastal habitats are possible. Potential effects on nearshore benthic invertebrates have been added. Additional text has been incorporated to the discussion of climate change.</p>

97.	—	—	United States Fish and Wildlife Service	97942	92	Birds	Section 3.3.3 Birds, Affected Environment, Direct and Indirect Impacts: The DEIS understates the potential impact from water removal during ice road construction on wildlife. The 1002 Area has relatively few water resources compared to the NPR-A and the use of large volumes of water could negatively affect nesting habitat in the succeeding summer. Breeding grounds are the only place for the birds to increase their numbers, and thus are an essential part of the annual cycle for maintaining bird numbers. Please ensure the document more accurately reflects the potential impacts to breeding birds from the project as a result of water removal.	Impacts associated with water withdrawal are discussed on page 3-94 and accurately indicate that important nesting habitat could be affected and that recharge rates are a concern. Revisions have been made to this section.
98.	—	—	United States Fish and Wildlife Service	97942	93	Birds	Page 3-92: The indirect effects of post-leasing oil and gas activities on birds should be included in the DEIS, including the indirect effects of increasing contaminant concentrations below levels that would cause mortality. This discussion should include mobilization of contaminants, particularly heavy metals, from climate change (e.g., flood events contributing to increased erosion and release of contaminants from glaciers); earth-disrupting activities contributing to dust, sedimentation, or erosion; and activities that may result in melting permafrost with subsequent mobilization of mercury. These activities have the potential to increase contaminant concentrations in birds of the Arctic Refuge, especially those that eat invertebrates (shorebirds, nesting waterfowl) and fish (loons), and in raptors to levels below those that may cause mortality, but which may still result in population-level effects such as decreased productivity.	The BLM has added discussions of contaminant mobilization from dust and associated with thermokarst from climate change.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
99.	—	—	United States Fish and Wildlife Service	97942	94	Birds	Page 3-99: We disagree that “salt-water spills would not be toxic to birds,” especially if spills occurred in waterfowl breeding ponds. Newly hatched ducks have poorly developed salt glands and exposure to elevated salinity can cause impacts including mortality (e.g., DeVink et al. 2005). Additionally, saline spills can kill invertebrate prey.	The section on spills has been revised for clarity.
100.	—	—	United States Fish and Wildlife Service	97942	95	Birds	Page 3-84, Paragraph 7: Arctic Refuge CCP 4.3.6 states, “In the northern foothills of the Brooks Range, Arctic coastal plain and adjacent marine waters, 158 species have been recorded”. It appears the species list from Appendix F in the CCP was used here to assign a number of 158 species, but the inclusive areas for these sections is slightly differently between the CCP text and Appendix F. Please change, “According to the USFWS (USFWS 2015a), 156 bird species have been recorded in the Arctic Refuge on the northern foothills of the Brooks Range, in the ACP (an area inclusive of the program area), and in adjacent marine waters” to “According to the USFWS (USFWS 2015a; Appendix F), 156 bird species have been recorded in the Arctic Refuge Coastal Plain [i.e., the area between the coast and the Brooks Range inclusive of coastal areas (lagoons, barrier islands, and Beaufort Sea) and inland areas (uplands near the foothills of the Brooks Range)]”.	It is correct that the 201 species listed as recorded in the Arctic Refuge in Appendix F of the USFWS CCP (USFWS 2015) were used to compile the list of 156 (not 158) bird species on the Coastal Plain of the Arctic Refuge. There is no list specifically for the program area. The description provided by the EIS accurately represents the criteria used to identify species from the original list that are likely to occur in the program area.

104.	—	—	United States Fish and Wildlife Service	97942	99	Birds	<p>Page 3-85, Paragraph 3: The Affected Environment coverage of the “marine vessel route to Dutch Harbor” should be expanded. This route may impact areas used by the ESA listed short-tailed albatross and species of concern such as yellow-billed loon, red-legged kittiwake, Aleutian tern, and Kittlitz’s murrelet. Special consideration should be given to Important Bird Areas and “hotspots” that occur along the route. For examples, the area near the mouth of Barrow Canyon (and around Point Barrow) is a “hotspot” of marine bird and marine mammal activity throughout summer and fall “hotspots” occur offshore from Wainwright (head of Barrow Canyon) and over Hanna Shoal area (see Kuletz et al. 2015). Any marine vessel route would pass by large seabird colonies at Cape Lisburne (northernmost seabird colony of AMNWR) and Cape Thompson. Vessels would have to go through Barrow Strait, an Important Bird Area (Smith et al. 2017) and recognized “hotspot” for marine birds (Humphries and Huettmann 2014; Kuletz et al. 2015). The Bering Strait region supports mixed-species colonies of millions of birds (Stephensen and Irons 2003), with some of the largest seabird colonies in the world on Diomedes, King Island, St. Lawrence Island, and farther south - St. Matthew Island. An estimated 12 million seabirds aggregate in the Bering Strait region in summer through early fall (USFWS 2014). There are many “Important Bird Areas” identified along the route to Dutch Harbor and nearby Aleutian passes (Smith et al. 2014; 2017). Please add “waterbirds” and “larids” to the groups discussed in this section.</p>	Additional information on birds occurring near the marine vessel route and important bird areas near that route has been incorporated.

108.	—	—	United States Fish and Wildlife Service	97942	103	Birds	Page 3-86, Paragraph 1: The statement "The spectacled eider is an uncommon breeder in the program area, and nests have been documented only on the Canning River delta" only pertains to recent records of known spectacled eider nests found during operations of a primarily shorebird research site on the Canning River Delta and is therefore misleading. An exhaustive search for all records of spectacled eider nests occurring in the program area has not been conducted. This statement should also not be interpreted to mean that all locations within the program area have been searched to determine presence or absence. Rather, it only means that a few spectacled eider nests were found as part of other operations (primarily shorebird research) at a single small site on Canning River delta. There have been NO systematic ground surveys specifically targeting eider nests (outside the barrier islands) anywhere in the program area in the recent past. Please change to, "The spectacled eider is an uncommon breeder in the program area. Nests have been documented on the Canning River delta, but contemporary systematic ground surveys targeting tundra-breeding eiders have not been conducted."	The source has been changed to USFWS unpublished data. Nest location data (and the original citation) were provided by the USFWS, and no additional records are known. The text was revised for clarity. The EIS already correctly states, "The distribution of nesting is unknown in the program area because extensive surveys have not been undertaken."
109.	—	—	United States Fish and Wildlife Service	97942	104	Birds	Page 3-86, Paragraph 2: Spectacled eider nest density is expected to be low in the program area where suitable habitat is available. Please change, "Low numbers of spectacled eiders are expected to occur in the program area during the pre-nesting period, where suitable habitat is available", to "Low numbers of spectacled eiders are expected to occur in the program area during the pre-nesting and nesting period, where suitable habitat is available."	The text has been revised.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
110.	—	—	United States Fish and Wildlife Service	97942	105	Birds	Page 3-86, Paragraph 3: Within the DEIS 'Waterbirds' appears to include mergansers and seaducks. Please include these groups in the list of Waterbirds (first line of paragraph).	The EIS says, "As treated in this EIS, waterbirds on the ARCP are waterfowl, loons, grebes, and cranes." The statement is accurate as written, as "waterfowl" includes all species of ducks, including mergansers and seaducks. However, a definition of waterfowl has been added— "waterfowl (ducks, geese, and swans)."
111.	—	—	United States Fish and Wildlife Service	97942	106	Birds	Page 3-86, Paragraph 4: In the second sentence, referencing the ACP survey, the text indicates that "prior to 2018 only about a quarter of the area was included..." Insert "program" prior to "area". Without that specificity, the text suggests that only a quarter of the ACP was surveyed, when in fact one quarter of the program area that was surveyed as part of the ACP breeding pair survey.	The text has been revised.
112.	—	—	United States Fish and Wildlife Service	97942	107	Birds	Page 3-86, Paragraph 4: In the last sentence, please change "unreliable" to "imprecise". There is a large difference in meanings, and "imprecise" is the correct term here.	The text has been revised.
113.	—	—	United States Fish and Wildlife Service	97942	108	Birds	Page 3-86, Paragraph 4: Ban et al. (2012) provides estimates of waterbird population sizes for the ARCP. Please consider including these population estimates here.	The text has been revised as appropriate to cite Bart et al. 2012.
114.	—	—	United States Fish and Wildlife Service	97942	109	Birds	Page 3-87, Paragraph 1: The waterbird classification includes waterfowl like Northern pintail that often nest in dryer habitats. Bart et al. (2012) estimated more than 18,000 Northern pintail breed on the ARCP. Please change, "In addition to water body shorelines and islands, most waterbirds use a variety of wet and moist tundra habitats for nesting, often next to water" to "Most waterbird species nest in association with ponds or in wet and moist tundra habitats, but some species primarily nest in drier habitats".	The text has been revised for clarity.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
115.	—	—	United States Fish and Wildlife Service	97942	110	Birds	Page 3-87, Paragraph 1: A significant portion of the estimated hatch dates for several geese species in the program area in some years occur in June. Please change, "After hatching in July and August, most waterbirds occupy lakes and ponds to rear their young, although geese and cranes graze in tundra wetlands" to, "After hatching in June through August, most waterbirds occupy lakes and ponds to rear their young, although geese and cranes graze in tundra wetlands."	The text has been revised for clarity.
116.	—	—	United States Fish and Wildlife Service	97942	111	Birds	Page 3-87, Paragraph 1: The following statement is not accurate for most waterbird species occurring in the program area, "In the late summer, post-breeding and molting (temporarily flightless) waterbirds use coastal lagoons behind the barrier islands. Waterbirds continue to forage in the lagoons in the fall as they stage for the southward migration." Please remove that statement and insert "In the late summer, post-breeding and molting (temporarily flightless) sea ducks (primarily long-tailed ducks) use coastal lagoons. Sea ducks and other waterbirds continue to forage in the lagoons in the fall as they stage for the southward migration."	The text has been revised for clarity.
117.	—	—	United States Fish and Wildlife Service	97942	112	Birds	Page 3-87, Paragraph 1: The statement, "Most waterfowl (swans, geese, ducks) migrate through the central continent to wintering areas across the continental US" is poorly defined and not correct as written. Please change to, "Most geese, swans, and dabbling ducks migrate through Pacific and Central Flyways after leaving the ARCP."	The text has been modified for clarity.

S. Public Comments and BLM Responses (Birds)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
118.	—	—	United States Fish and Wildlife Service	97942	113	Birds	Page 3-87, Paragraph 2: Map 3-15, Post-Breeding and Fall Staging Common Eider, in Appendix A, is incorrectly titled. Map 3-15 depicts locations of likely breeding and post-breeding common eiders from two separate surveys conducted to estimate breeding and post-breeding (staging/molting) sea bird distribution and abundance. Please correct as appropriate.	Map titles have been changed.
119.	—	—	United States Fish and Wildlife Service	97942	114	Birds	Page 3-87, Paragraph 2: Language as written is incorrect and no source is provided for 1976 data. Please change "Common eiders have been increasing in abundance on their barrier island breeding grounds in the Arctic Refuge since 1976, when only 14 nests were found", to "Common eiders appear to be increasing in abundance on their barrier island breeding grounds in the Arctic Refuge since 1976, when only 14 active nests were found (Divoky 1978)".	The text has been revised for clarity. The Divoky reference was not added because the USFWS indicated that coverage of that survey was uncertain.
120.	—	—	United States Fish and Wildlife Service	97942	115	Birds	Page 3-87, Paragraph 2: The statement "Common eiders winter in coastal areas from the Aleutian Islands south to southern Alaska," is not correct. Common eiders breeding on Beaufort Sea barrier islands primarily winter near St. Lawrence Island and Chukota peninsula in the Bering Sea (though some also are known to winter in the Olyutorskij Gulf, northern Bristol Bay, and off the coast of the Yukon-Kuskokwim Delta). Please change to, "Common eiders breeding on Beaufort Sea barrier islands primarily winter near St. Lawrence Island and the Chukota peninsula in the Bering Sea, although some also have been documented wintering in the Olyutorskij Gulf, northern Bristol Bay, and off the coast of the Yukon-Kuskokwim Delta (Petersen and Hint, 2002).	The text has been modified, and citation (Petersen and Flint 2002) was added.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
121.	—	—	United States Fish and Wildlife Service	97942	116	Birds	Page 3-87, Paragraph 2: The statement, "The USFWS conducts annual aerial surveys to estimate the number, distribution, and population trend of breeding common eiders in coastal habitats on the North Slope, including Arctic Refuge lands (summarized in USFWS 2015a)" is not accurate. The USFWS has not conducted aerial surveys of coastal habitats on the North Slope since 2009. Please correct language to recognize aerial surveys are not currently being conducted for common eider on the ACP, and have not in a decade	The statement has been corrected. Dau and Bollinger 2012 report on the last USFWS survey conducted in 2011.
122.	—	—	United States Fish and Wildlife Service	97942	117	Birds	Page 3-87, Paragraph 2: The data referenced in, "In a 2015 ground-based survey conducted across most Arctic Refuge barrier islands, over 800 common eider nests were found (Latty, unpublished data)" belongs to USFWS, not Mr. Latty and the language is imprecise. Please clarify differences in spatial coverage between these two surveys. Please change to, "In a 2015 ground-based survey conducted across most Arctic Refuge barrier islands, over 800 active and inactive common eider nests were found (USFWS, unpublished data). There were differences in spatial coverage between the 1976 and 2015 surveys, primarily because the islands are constantly being reshaped."	The BLM modified the text for clarity and now cites USFWS 2015a regarding increases in abundance of common eiders in the Refuge. Reasons for the increase are unknown, and speculation regarding island physiography is not incorporated here. See, however, climate change sections where the physiography of barrier islands is discussed.

123.	—	—	United States Fish and Wildlife Service	97942	118	Birds	Page 3-87, Paragraph 4: The statement, "In aerial surveys of nearshore waters and barrier islands conducted during the early post-breeding period (early July 1999-2009)" does not describe the survey referenced. The latest report on that survey, "Aerial Population Surveys of Common Eiders and Other Waterbirds During the Breeding Season - Northwestern Alaska 2006-2009" by Bollinger et al. 2012 states, "The objectives of this Northwestern Alaska Common Eider Survey were to: 1) Estimate a population index during the breeding season...." (2012). The report also states, "All surveys were flown during the interval from 15 June to 01 July (Table 2). Survey timing was intended to coincide with egg laying and early incubation while pair bonds are still intact and prior to the dispersal of males to molting sites" which does not match the statement in the DEIS. Please change this sentence to, "In aerial surveys of nearshore waters and coastal areas near barrier islands conducted during June and early July 1999-2009."	The text has been revised for clarity. Dau and Bollinger 2012 report that the 2011 survey was conducted July 2-7. The egg-laying and incubation period occurs post-breeding, and most of the common eiders recorded are post-breeding males. The numbers of breeding pairs are estimated with a formula, yielding "indicated" pairs, which is too much detail for the EIS. The survey timing, however, was specific to this phase of the breeding period of common eiders, which nest later than most other species recorded on these surveys. For other species, these are virtually entirely post-breeding birds and not in their nesting habitats, although some tundra-nesting birds may also forage in the lagoons (red-throated loons, for example).
124.	—	—	United States Fish and Wildlife Service	97942	119	Birds	Page 3-88, Paragraph 2: Please provide a citation to support the statement, "It is likely that many of the birds using lagoons along the Arctic Refuge coast during post-breeding nested to the east, particularly in northern Canada" or remove.	This statement was removed.
125.	—	—	United States Fish and Wildlife Service	97942	120	Birds	Page 3-88, Paragraph 3, Sentence 1: The 325,000 estimate is 40 years old and therefore should be referenced in the past tense. The most recent (15 year old) estimates are approximately 185,000 (Kendall 2006).	The text was revised for clarity.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
126.	—	—	United States Fish and Wildlife Service	97942	121	Birds	Page 3-88, Paragraph 3: Please provide the Arctic Refuge CCP as a citation for the statement, “Up to 325,000 snow geese of the Western Arctic Population use the ARCP as a staging area for fall migration (USFWS and BLM 2018)”. Please change to, “Up to 325,000 snow geese of the Western Arctic Population use the ARCP as a staging area for fall migration (USFWS 2015a).	The text has been revised.
127.	—	—	United States Fish and Wildlife Service	97942	122	Birds	Page 3-88, Paragraph 4: The Shorebirds of Conservation Concern in the United States of America ~2016 (U.S. Shorebird Conservation Plan Partnership, 2016) is the most up-to-date conservation status document for North American shorebirds; therefore, this list should be identified in the Affected Environment text, not just in the Appendix.	Citation added to text.
128.	—	—	United States Fish and Wildlife Service	97942	123	Birds	Page 3-88, Paragraph 6: The statement, “Shorebirds use a wide range of aquatic, wet, and moist tundra habitats for nesting, often near bodies of water” is not correct as written. While most shorebirds prefer moist tundra, some use drier habitat and riverine areas. For example, whimbrels were only found in upland habitats on previous ARCP shorebird surveys. Please change to, “ARCP shorebirds use a wide range of tundra habitats for nesting. Most species occur in wetland, moist, and riverine habitats, but some species prefer drier upland sites (Brown et al. 2007).” Alternatively, remove this sentence and incorporate the information in the next sentence that includes the Brown et al. citation.	The text has been revised as suggested.
129.	—	—	United States Fish and Wildlife Service	97942	124	Birds	Page 3-89, Paragraph 1-3: This section excludes discussion of bald eagles. Although not as abundant as golden eagles, bald eagles also occur on both the coastal plain and in the foothills of the Brooks Range. Please update text to reflect this information.	Bald eagles are correctly listed in Table J-9 as casual visitors to the Coastal Plain, and they are not known to breed north of the Brooks Range. Text has been added to recognize their occurrence and protection under the BGEPA.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
130.	—	—	United States Fish and Wildlife Service	97942	125	Birds	Page 3-89, Paragraph 2: Up to several thousand shorebirds at a time may occur on individual river deltas in July and August (Churchwell 2015). Please change, "Most of the deltas are used by large numbers of foraging shorebirds" to "Most of the deltas are used by large numbers of foraging shorebirds. Up to 4,000 shorebirds were counted on daily surveys at Jago and Okpilak River Deltas in 2011 (Churchwell 2015)"	The text has been revised, and the Churchwell reference was added.
131.	—	—	United States Fish and Wildlife Service	97942	126	Birds	Page 3-89, Paragraph 4, Line 7: Additional larid species encountered along the vessel route to Dutch Harbor (USFWS survey data, most in Kuletz and Labunski 2017) would include slaty-backed gull, red-legged kittiwake, Aleutian tern; (latter two are breeding birds of conservation of concern). These species should be included here. Also, it was difficult to determine the vessel route, and not clear what that route would be used for - or how much vessel traffic the project would generate (especially through the Bering Strait). This information is necessary to adequately assess the affected environment and potential impacts.	The text has been revised as requested to list these three additional species. Appendix Table J-10 includes slaty-backed gull, red-legged kittiwake, and Aleutian tern; their conservation status is provided. Figure 3-6 illustrates the route, and additional details are provided in Appendix B. Annual barge traffic is described in Appendix B as comprising two barge transports per year.
132.	—	—	United States Fish and Wildlife Service	97942	127	Birds	Page 3-89, Paragraph 5: Last line of paragraph. When offshore or over marine waters, jaegers also eat fish (and scavenge or steal those from other seabirds and larids). Please correct this in text.	The text correctly states jaeger foods during breeding season, which is the subject of this sentence. There is no need to identify jaeger foods at sea (not done for other species at sea).

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
133.	—	—	United States Fish and Wildlife Service	97942	128	Birds	Page 3-91, Paragraph 2: Line 1-2. From our USFWS at-sea surveys in the waters off of ARCP, in addition to ones listed in Table J-9, glaucous gull, black-legged kittiwake, Ross's gull, Sabine's gull, and Kittlitz's murrelet have also been recorded (see Kuletz and Labunski 2017, Appendix I for maps, or Kuletz et al. 2015 for some species; also USFWS/Kuletz, unpublished data). Please update text to reflect this information.	Larid species listed were added to the Larid section. See Table J-9 to distinguish between larids and seabirds. Kittlitz's murrelet was added to the list of seabirds recorded offshore, as requested. Reference to Kuletz et al. 2015 was added. Kuletz and Labunski 2017 were not cited here because the data provided are inadequate to verify the locations of these sightings (except for black-legged kittiwakes).
134.	—	—	United States Fish and Wildlife Service	97942	129	Birds	Page 3-91, Paragraph 3: The DEIS contains few details regarding the "the marine vessel route to Dutch Harbor." Vessels traveling through the Chukchi Sea and down length of the Bering Sea to Dutch Harbor could encounter more than 63 species of marine birds. As written, little information is given for the Affected Environment for the vessel route to Dutch Harbor, which reduces the ability to estimate potential impacts or threats. Please clarify the details of the "the marine vessel route to Dutch Harbor", fully describe the Affected Environment in the appropriate sections in 3.3.3, and then discuss the potential impacts in the Direct and Indirect Impacts section beginning on page 3-92.	Additional details on the marine route have been added to Chapter 2, and the impacts assessment has been revised accordingly.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
135.	—	—	United States Fish and Wildlife Service	97942	130	Birds	Page 3-91, Paragraph 3: The ESA-listed short-tailed albatross occurs regularly (if not abundantly) in the southern portion of the route, and occurs in the northern portion in late summer and fall (especially the northwest outer shelf break, near the International Date Line), and near St. Lawrence Island. The short-tailed albatross and two other albatross species (black-footed and Laysan) have all increased in abundance and shifted distribution northward in the Bering Sea in recent decades (Kuletz et al. 2014), and so would be present en route to Dutch Harbor. The Aleutian passes, especially Unimak Pass near Dutch Harbor, have the highest risk to seabirds from vessel accidents (Renner and Kuletz 2015, Humphries and Huettmann 2014) and very high densities of albatrosses occur there. The first recorded sighting of a short-tailed albatross in the Chukchi Sea was made in 2011 (Day et al. 2013); thus, it could be encountered in that portion of the vessel route as well. Please update text to reflect this.	Additional information describing the marine route has been added to Chapter 2, and the impacts assessment has been revised as appropriate. Black-footed and Laysan albatrosses are listed in Table J-10 as occurring on the marine route.
136.	—	—	United States Fish and Wildlife Service	97942	131	Birds	Page 3-91, Paragraph 5: It should be noted here that seabird die offs have occurred in the Bering Strait region in 2017 and 2018 (USFWS 2017, 2018) and were associated with very warm water conditions; die offs in this region were previously very rare (or perhaps never recorded, with exception of the 2013 die off near St. Lawrence Islands). Birds died from starvation, although effects of toxins cannot be ruled out. The combined effects of increased vessel traffic, disturbance, noise, and changes in prey and sea ice have potential for increased cumulative effects. Please update text to reflect this information.	Mention of warm water and seabird die-offs has been added to the Climate Change section.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
137.	—	—	United States Fish and Wildlife Service	97942	132	Birds	Page 3-91, Paragraph 5: Predation is the primary factor affecting productivity for many ARCP breeding birds, but recent work suggests predation is increasing in the Arctic and maybe linked to climate-induced shifts in predator-prey relationships. Please add, "Recent work suggests predation is increasing in the Arctic and is linked to climate-induced shifts in predator-prey relationships (Kubelka et al. 2018)".	The text has been revised.
138.	—	—	United States Fish and Wildlife Service	97942	133	Birds	Page 3-91, Paragraph 5: A climate change vulnerability assessment on Alaska's North Slope identified the barrier island nesting Pacific common eider as the marine bird at highest risk of climate change impacts, including impacts from predicted sea level rise, increasing storm surges, and erosion and/or restructuring of barrier islands (Liebezeit et al. 2013). With the low elevation profiles of barrier islands and preference of low-lying nest sites by common eider, rising sea level and increasing storm surges may have significant effects on nest success of eiders. The intensity and frequency of storm surges in the Beaufort Sea is increasing, and sea levels have been predicted to rise by 0.26-0.98 meters by 2100 (Church et al. 2013). Model predictions suggest that wave heights and storm surges will continue to increase as ice retreats (Church et al. 2013, Lintem et al. 2013, Vermaire et al. 2013). In the future, eiders nesting on barrier islands may be impacted by both the increasing frequency and magnitude of storm surges, and an earlier timing of these events. Please include the following in this section: "Some species nesting on barrier islands, such as common eiders, could be negatively affected by predicted sea level rise and increasing storm surge. Both could flood nests and decrease productivity (see Liebezeit et al. 2013)."	The text revision was made, and additional text has been incorporated to the discussion of climate change.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
139.	—	—	United States Fish and Wildlife Service	97942	134	Birds	Page 3-91, Paragraph 6: Another potential impact of less sea ice is bigger, rougher sea conditions, which may impact foraging of marine birds, especially less experienced/smaller juveniles. Please update text to reflect this information.	The text has been revised to acknowledge increased wave action and the potential effects on foraging birds.
140.	—	—	United States Fish and Wildlife Service	97942	135	Birds	Page 3-91, Paragraph 6: Please provide a citation for the statement, “a delay in freeze-up in fall should be advantageous to the slow-growing young of such species as loons and swans, which are not always flight capable by time of freeze-up” or remove.	Citations have been added for loons and swans.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
141.	—	—	United States Fish and Wildlife Service	97942	136	Birds	<p>Page 3-91, Paragraph 7: The statement, “Some species of insect-feeders (shorebirds and songbirds) can initiate nests earlier with early snowmelt, whereas others (jaegers, common eiders, and raptors) do not; however, it is unclear if birds relying on insects to feed their young (songbirds and shorebirds) could adapt to hatch at the optimum time as insect hatch continues to advance (Grabowski et al. 2013)” is incomplete for the body of climate-mediated links for some of these species. For example, as discussed in the cited reference (Grabowski et al, 2013), “The lack of response in the common eider to timing of snowmelt is consistent with other studies that have linked both nest initiation and productivity to the area of marine ice cover adjacent to the nesting grounds.” Love et al. (2010) found common eiders nested earlier in warmer years associated with earlier ice-breakup and Chaulk and Mahoney (2012) found spring ice cover was a positive predictor of nest initiation date, but was also linked to smaller clutch sizes. Because climate change is predicted to lead to earlier ice-out along the coast, common eiders breeding on ARCP barrier islands may nest earlier as warming advances, but the advantage or disadvantage of this is yet unclear. For Arctic breeding geese, lower snow cover was also related to earlier egg laying (Dickey et al. 2008). Suggest changing to, “Some species, such as passerines, shorebirds, and waterfowl, initiate nests earlier with early ice-breakup and snowmelt, but the overall impact to demography is still unclear (Dickey et al. 2008, Love et al. 2010, Chaulk and Mahoney 2012, Grabowski et al. 2013).”</p>	<p>The opening sentence of this paragraph establishes the subject as insectivory. Common eiders, jaegers, and raptors, in contrast, are not insectivorous and not affected by the timing of insect emergence, as correctly stated in the EIS. They are not discussed further in this paragraph. The text has been modified for clarity, and a discussion of common eiders and ice cover was added to that discussion (later paragraph). The comment inaccurately characterizes the results of Chaulk and Mahoney (2012), which, in actuality, further verify the negative effects of prolonged ice cover on productivity.</p>

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
142.	—	—	United States Fish and Wildlife Service	97942	137	Birds	Page 3-91, Paragraph 8: The statement, "Avian habitat is likely to change slowly with climate change, except for coastal areas subject to erosion and deposition (see below)" appears to be incorrect as written. Most tundra nesting birds in the ARCP prefer wetlands or moist tundra (see Bart et al. 2012). However, Arctic lakes are disappearing (Smith et al. 2005), wetlands depletion is occurring following permafrost disturbance by thermo-erosion (Perreault et al. 2017), and ponds that have been permanent water bodies for millennia, are now completely drying during the polar summer (Smol and Douglas 2007). Therefore, Arctic habitats are already impacted and this loss is predicted to expand in the future [see "Rapid climate-driven loss of breeding habitat for Arctic migratory birds" (Wauchope et al. 2016) for further discussion]. We recommend deleting this sentence or clarifying that habitat changes (e.g., higher water temperatures, less sea ice, lower zooplankton biomass, and smaller species of zooplankton) are already occurring in the marine environment.	The discussion of climate change has been expanded, including clarification that habitat changes already have been documented. Added reference to Smith et al. 2005.
143.	—	—	United States Fish and Wildlife Service	97942	138	Birds	Page 3-92, Paragraph 3: Please add a paragraph specific to marine habitat after this coastal habitat paragraph.	A paragraph about changes occurring offshore and along the marine transportation corridor has been added.
144.	—	—	United States Fish and Wildlife Service	97942	139	Birds	Page 3-92, Paragraph 4: The citation (Hint et al. 2003) does not appear to support the statement, "Erosion of coastal shorelines could increase inundation of tundra by salt water; the resulting salt-killed tundra may be colonized by salt-tolerant species and develop into salt marsh, a rare but important post-breeding habitat for geese." Please correct or remove.	The citation is Flint et al. 2003, and it is included to support the statement that arctic salt marsh habitat is important for geese. The EIS is correct as written; no correction is required.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
145.	—	—	United States Fish and Wildlife Service	97942	140	Birds	Page 3-92, Paragraph 5, Line 7: If post-lease activities include transportation of oil, please address potential impacts to the marine environment. If oil transport includes any marine areas, it is not fully addressed in the draft EIS. Please update this section if oil will be transported in marine areas.	There is no plan to transport product via a marine vessel route. All fluid leaseables will be transported via pipeline as described in Chapter 2.
146.	—	—	United States Fish and Wildlife Service	97942	141	Birds	Page 3-92, Paragraph 6: The statement, "Winter activities would affect few species and low numbers of year-round residents" is incomplete. Breeding golden eagles return to Alaska, including the Arctic Refuge, from late February to mid-April, with non-breeders arriving later (summarized in Kochert et al., 2002). Within the Arctic Refuge, most nests are initiated in mid-April (range: late March to early May) (Young et al., 1995). Some snowy owls winter on Arctic breeding grounds, but most arrive during April and May, with most egg laying occurring in mid-May (summarized in Holt et al., 2015). Based on this information, please change to, "Winter activities would affect few species and relatively low numbers of winter, spring, and year-round residents."	The requested revision would be incorrect. Winter activities will affect birds during winter, and this would not include spring. Spring activities would affect birds during spring; however, non-winter seasons are difficult to define accurately in the Arctic. Note the definitions of status from the RCCP (do not include Winter Resident or Spring Resident). The EIS is correct that few species are present during winter months and all in low numbers. An exception for small numbers of golden eagles is noted. The text has been revised to mention golden eagles and snowy owls among species whose presence could overlap with some late winter activities.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
147.	—	—	United States Fish and Wildlife Service	97942	142	Birds	Page 3-92, Paragraph 6: Potential impacts of oil development on birds are listed as four primary categories, including “injury and mortality, and attraction of predators and scavengers (including both mammals and birds) to human activity or facilities, with subsequent changes in predator abundance”, but all are not discussed in the paragraphs that follow. Please consider the following to paragraph 1, page 3-93:”Changes in predator abundance and diversity could occur in all phases. For example, studies demonstrated low winter movement rates and high densities of habituated Arctic foxes in the Prudhoe Bay oil fields compared to more remote sites during winter (Pamperin, 2008; Lehner, 2012). Once uncommon, red foxes now occupy more den sites in Prudhoe Bay than arctic foxes and this shift has been linked to red foxes preference to den near facilities (Stickney et al. 2014). Injury and mortality from collisions with vehicles, structures, and wires and from contaminant exposure (including oil spills) could also occur at all phases, but would likely peak during drilling and operations.”	Each of the categories of impact is discussed separately under its own heading in the paragraphs that follow the description of development activities that cause them. Changes to predator abundance are thoroughly described on page 3-100 under the heading “Attraction to Human Activities and Facilities.” However, details regarding the abundance of foxes appear in the section on terrestrial mammals, and discussion here is limited to potential effects on birds. Injury and mortality also are described under a separate heading on page 3-98 and are accurately described as affecting birds during all phases of development. All these citations are used in the Terrestrial Mammals section to describe the same details.
148.	—	—	United States Fish and Wildlife Service	97942	143	Birds	Page 3-92, Paragraph 7: The statement, “Exploration occurs during winter and would have little direct effect on birds” may be incomplete if cleanup activities would occur during the snow-free season in relation to exploration. Please address how cleanup operations may impact migratory birds during the snow-free season. These impacts should be analyzed and the effects should be analyzed	No exploration activities, including cleanup, are described as occurring during the snow-free season.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
149.	—	—	United States Fish and Wildlife Service	97942	144	Birds	Page 3-94, Paragraph 6: The statement, "Drawdowns may cause fish mortality, and lack of fish would make such lakes unsuitable for breeding loons" is incomplete. Most birds using aquatic habitats in the program area feed on aquatic invertebrates. The sentence before states, "Withdrawing water from under ice could ... possibly result in some ... impacts on aquatic invertebrate communities"; therefore, the effects to species that feed on invertebrates should be discussed. Please change to, "Lack of fish would make such lakes unsuitable foraging habitat for some loons. Lower invertebrate abundance, or a shift in invertebrate diversity, may affect the quality of ponds as a food source for birds in general, particularly waterbirds and shorebirds."	The text has been revised for clarity.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
150.	—	—	United States Fish and Wildlife Service	97942	145	Birds	<p>Page 3-94, Paragraph 6: The statement, "The long-term loss of nesting lakes would have potential population consequences for loons, primarily for Pacific and red-throated loons; yellow-billed loons in the Arctic Refuge nest primarily in the northern foothills of the Brooks Range and outside of the program area" is unclear, and may be incorrect depending on how interpreted. Yellow-billed loons are considered a rare breeder on larger lakes in the Brooks Range. Unlike other loons, red-throated loons leave breeding territories to forage during incubation and while rearing chicks. On the Arctic Coastal Plain, these birds generally forage in the marine environment (See Barr et al. 2000, Uher-Koch 2017). In addition, the limiting factors of loons breeding in the program area is unclear, therefore the statement that the loss of a few nesting lakes could have broad population consequences seems somewhat unfounded. It is also unclear if the intention of this sentence is in regards to the loss of fish from lakes or from loss of nesting habitat through drying of lakes. Please consider providing citations to support, or change to, "The loss of nesting lakes by drying could have potential local population impacts for Pacific and red-throated loons." If the sentence is only meant to convey the effects to loons of loss of fish from breeding ponds, please also remove the reference to red-throated loons because they generally feed in the marine environment during the breeding period.</p>	The text has been revised for clarity.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
151.	—	—	United States Fish and Wildlife Service	97942	146	Birds	Page 3-95, Paragraph 1: The statement, “the impact [of gravel mining] on birds would be long term and somewhat ameliorated by reclamation plans (i.e., terrestrial breeding habitats could be replaced by aquatic habitats)” is incomplete as the species groups that are likely to use gravel pits filled with water will be different from those originally displaced. Suggest changing to, “the impact on birds would be long-term. Reclamation may reduce habitat loss if pits are fully transferred back to tundra, but reclaimed tundra is of lower value to breeding shorebirds and passerines compared to unaltered habitat (Bentzen et al. 2018). If pits fill with water, habitat loss may be permanent for the species originally inhabiting the site, but could provide new habitats for waterbirds (i.e., terrestrial breeding habitats could be replaced by aquatic habitats).”	Reclamation of gravel mines will not restore tundra habitats, and the EIS does not imply such. Other parts of the suggested rewrite are fully equivalent to the original statement that terrestrial habitats would be replaced by aquatic habitats.

152.	—	—	United States Fish and Wildlife Service	97942	147	Birds	Page 3-95, Paragraph 2: The following statement may be incorrect as written: "Future construction of gravel pads and roads would result in potential long-term direct loss of habitat and indirect alteration of habitat. Direct losses from gravel coverage (up to 2,000 acres allowable) would last as long as development projects are active, or until gravel is partially removed from retired roads and pads to restore some habitat features; this is estimated to be 85 years after the first lease sale before all facilities described in the hypothetical development scenarios are abandoned and reclaimed." Gravel pads would always lead to direct loss and potential indirect alteration of adjacent habitat. The above states habitat losses would only occur as long as the project is "active", but this term is undefined and direct loss from gravel coverage would last until gravel is removed. Reclaimed sites in Prudhoe Bay do not provide shorebird and passerine habitat comparable to that found prior to development (Bentzen et al. 2018). Please consider changing to, "Gravel pads and roads would result in the long-term direct loss of habitat and potential indirect alteration of habitat. Direct losses from gravel coverage would last until gravel is removed. In the hypothetical development scenarios, the gravel is predicted to be removed from all facilities 85 years after the first lease sale. Shorebird and passerine habitat quality is expected to be lower for at least 10 years for reclaimed sites (Bentzen et al. 2018)."	The text has been revised, including citation of Bentzen et al. 2018.

153.	—	—	United States Fish and Wildlife Service	97942	148	Birds	Page 3-95, Paragraph 5: The statement "Potential effects on waterbirds would be minimized by using the shortest road routes and smallest pads" is incomplete as written. Densities of waterbirds and shorebirds is generally greatest in wetlands on the ARCP (Bart et al. 2012). Because here we are comparing the effects of 2000 acre development scenario as described by the Tax Act, making pads smaller wouldn't minimize the effect (i.e. 2000 acres would always be affected). The statement would only be accurate if applied specifically to minimizing footprints in wetlands. Please change to, "Potential effects to waterbirds and shorebirds would be minimized by minimizing footprints in wetlands where densities are generally highest (Bart et al. 2012)."	The text has been revised, and the citation Bart et al. 2012 has been added.
154.	—	—	United States Fish and Wildlife Service	97942	149	Birds	Page 3-95, Paragraph 5: The statement, "Such habitats support higher densities of landbirds and impacts on these species could be greater as a result" is incomplete. Some species of waterfowl and shorebirds occur in higher densities in uplands and well-drained habitats composed of moist and shrub tundra on the ARCP (Bart et al. 2012). Lapland longspurs, the most abundant passerine breeding in the ARCP, occur at somewhat higher densities during the breeding season in wetlands on the ARCP (Bart et al. 2012). Please change to, "Such habitats are important to landbirds and some species of other guilds. Impacts to these species may be greater as a result.	Text has been revised for clarity.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
155.	—	—	United States Fish and Wildlife Service	97942	150	Birds	Page 3-95, Paragraph 7: Sea duck densities in coastal areas during the non-breeding season are related to habitat features including wind and wave exposure and substrate type (Esler et al. 2000). Common eider seek foraging habitats where food was most abundant, therefore not all habitat is of equal value (Larsen and Guillemette 2000). Sea ducks also deplete preferred foods when concentrated (i.e., as occurs during molt), causing birds to seek out new foraging sites (Guillemette et al. 1996). Given this information, please provide citations to support the statement, "Although high numbers of birds use the lagoons, they are highly mobile and likely would be able to move to adjacent similar areas if necessary" or remove.	The text has been revised as requested. References Larsen and Guillemette 2000 and Guillemette et al. 1996 were not incorporated because these reports are regarding wintering eiders (not molting long-tailed ducks) and not in Alaska. Prey distribution and habitat quality are unknown, but there is no evidence that habitat is limiting for sea ducks in the ARCP lagoons. Note that displacement is discussed in the EIS, and citations are provided there regarding movement and distribution of molting long-tailed ducks.
156.	—	—	United States Fish and Wildlife Service	97942	151	Birds	Page 3-95, Paragraph 7: ARCP mudflats are used by a large number of post-breeding shorebirds with up to 4,000 semipalmated sandpipers documented at some deltas in late July to mid-August (Brown et al. 2012, Churchwell 2018). If barging or other nearshore activities may affect habitat availability or quality into the late summer, large numbers of shorebirds may be affected. Please address this if it is applicable for the proposed activities.	Barge landing areas would be areas of deeper water close to the shore and would not overlap with mudflats. Barge landing would most likely be in Camden Bay.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
157.	—	—	United States Fish and Wildlife Service	97942	152	Birds	Page 3-95, Paragraph 8: The survey (Fischer et al. 2002) was conducted along a small portion of the Alaska Arctic coast outside the program area and more applicable surveys (i.e., Lysne et al. 2004) are available that covered most of the Alaska Beaufort and Chukchi Seas, as well as the program area. Please remove, "Long-tailed ducks made up 80 percent of the birds on surveys during late summer and fall in nearshore waters of the Beaufort Sea (Fischer et al. 2002). Other species included many of those potentially breeding in the program area, plus common eiders and scoters" and replace with, "Lagoon and near-shore surveys of post-breeding and molting waterbirds were conducted across the Alaska Arctic coast during fall 2002-2003 (Lysne et al. 2004). Up to 20, 28, 29, 33, and 41% of the yellow-billed loons, red-throated loons, long-tailed ducks, scaup, and Pacific loons, respectively, counted during the entire Alaska North Slope survey occurred along the Arctic Refuge coast. Over 28,000 long-tailed ducks were counted in the lagoons and nearshore waters along the Refuge coast in some years".	The text has been revised for clarity. The BLM agrees to replace Fischer et al. 2002 with Lysne et al. 2014. For most species mentioned in the comment, the survey timing probably was not optimal and the total number of birds observed in the ARCP was small; the proportions of the total were not meaningful.
158.	—	—	United States Fish and Wildlife Service	97942	153	Birds	Page 3-96, Paragraph 3: This paragraph is incomplete. It discusses a variety of winter work that may impact resident birds, but does not consider that some cleanup from wintertime travel and construction is generally necessary during the snow-free season. If any summer or fall cleanup will occur because of seismic, construction, or winter travel, this section should include a discussion of potential effects here.	No exploration activities, including cleanup, are described as occurring during the snow-free season.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
159.	—	—	United States Fish and Wildlife Service	97942	154	Birds	Page 3-97, Paragraph 3: Impacts to bird densities from chronic disturbances are poorly studied in Arctic Alaska. Studies outside the Arctic found bird densities increased for some species and decreased for others in relation to oil and gas infrastructure (Walker et al. 2007, Bayne et al. 2008, Dale et al. 2009, Gilbert and Chalfoun 2011, Kalyn Bogard and Davis 2014, Ludlow et al. 2015). Please provide citations to support the statement, "Potential impacts of disturbance and displacement ... are unlikely to affect ... nesting densities of breeding birds", or remove the reference about impacts to bird densities. Please consider changing the sentence to, "Potential impacts of disturbance and displacement by summertime construction and operations on the tundra would be long-term and may affect nesting success for some birds near facilities; however, they are unlikely to significantly affect regional or global population sizes."	Revision made as requested.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
160.	—	—	United States Fish and Wildlife Service	97942	155	Birds	Page 3-97, Paragraph 5: The survey (Fischer et al. 2002) was conducted along a small portion of the Alaska Arctic coast outside the program area and more applicable surveys (i.e., Lysne et al. 2004) are available that covered most of the Beaufort and Chukchi Seas in Alaska, as well as the program area. Please change the latter two sentences in this paragraph to, "Common eider are the predominant species nesting on barrier islands and using associated nearshore areas during breeding (Kendall 2005). In aerial surveys of the lagoons and nearshore areas, surf scoters were the predominant species encountered in June and early July and long-tailed ducks in late July and August (Bollinger and Platte 2012, Lysne et al. 2004, Pearce et al. 2018). Long-tailed ducks use the lagoons during their flightless feather molt (Lysne et al. 2004)."	This discussion is regarding the impacts of disturbance and displacement; the paragraph in question is regarding potential disturbing activities in nearshore and lagoon waters, which would occur during barging in late summer. Nesting birds on barrier islands will not be affected. The text has been revised for clarity, and citations were inserted for Dau et al. and Lysne et al. surveys.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
161.	—	—	United States Fish and Wildlife Service	97942	156	Birds	<p>Page 3-98, Paragraph 3: This paragraph primarily discusses how development of the ARCP may lead to increased air traffic in Deadhorse for transport of personnel. Although increased traffic through Deadhorse seems likely, moving personnel by fixed wing aircraft may also impact other sites. Airports at Barter Island and Kavik may also experience more flights since these airports would place staff closer to the Refuge (although still not within the ARCP). In order to move these staff during the snow-free season to duty stations within the program area, some additional means of transportation would be needed. Airports and roads may need to be built within the ARCP, and/or thousands of helicopter flights might be needed, all of which may impact birds. Please consider changing this paragraph to, "All types of air traffic could disturb and displace both breeding and non-breeding birds. Air traffic would include fixed-wing aircraft into Deadhorse, Kavik, and Barter Island airports; helicopters to move people and supplies from airports to sites within the program area, and potentially fixed-wing aircraft traveling in the program area if new airports are built on the ARCP. Potential impacts on birds would be both short- and long-term."</p>	<p>The text has been revised for clarity. Discussion of air traffic noise is presented in Section 3.2.3, Acoustic Environment.</p>

162.	—	—	United States Fish and Wildlife Service	97942	157	Birds	Page 3-98, Paragraph 6: The statement "Vehicle and aircraft traffic and tall structures, including communication towers and drill rigs, pose collision hazards that could kill or injure birds" is incomplete. Transmission and guy wires are an equal or greater collision risk (Manville 2005). There are limited data to support the hypothesis that structure height is a significant predictor of collision risk in the treeless tundra ecosystem of the Arctic. Please change to, "Vehicle and aircraft traffic; structures, including communication towers and drill rigs; and wires pose collision hazards that could kill or injure breeding, staging, or migrating birds."	The particular hazard of guy wires is discussed in the following paragraph; there is no need to repeat it here. Manville 2005 is also cited already in that location.
163.	—	—	United States Fish and Wildlife Service	97942	158	Birds	Page 3-99, Paragraph 2: The statement, "Collisions with tall structures increase with tower height, bright lighting, and the presence of guy wires (Manville 2005; Gehring et al. 2011)" is incomplete. Perhaps the most important results in the citations provided is that risk of tower collisions is greatest when near wetlands or in migration corridors, but this is not included in the current text. Please change to, "Collisions with structures increase with height, bright lighting, guy wires, and when structures occur near wetlands or in migratory corridors (Manville 2005; Gehring et al. 2011)."	The text has been revised for clarity. The entire 1002 Area is technically wetlands and, by the citations provided and correctly interpreted by the commenter, at higher risk than many other areas around the world for collisions with infrastructure. No migratory corridors, in the sense of Manville and Gehring's reports, are present in the program area. However, a very important movement corridor occurs along the coastal lagoon system where little infrastructure is allowed. The STP is the major exception. See the rewrite discussion of movement corridors and high-value habitats, such as wetlands.

164.	—	—	United States Fish and Wildlife Service	97942	159	Birds	Page 3-99, Paragraph 3: The statement, "Collisions would be expected to occur annually in small numbers, but mortalities could be serious if flocks of birds of conservation concern are involved" does not appear to be well supported. Collisions with towers are estimated to kill millions of birds annually (see Manville 2005). Please provide citations to support that collisions are expected to occur in small numbers, or change to, "Collisions are expected to occur annually and the number of birds likely injured or killed is unknown."	"Small numbers" has been changed to "unknown numbers."
165.	—	—	United States Fish and Wildlife Service	97942	160	Birds	Page 3-99, Paragraph 3: The following statement is unclear: "The potential impacts of collisions are short term, infrequent, and seasonal but would occur throughout the life of any development project and would be restricted to roads and facilities." The effects of collisions are often permanent and result in death. Frequency of collisions would depend on a host of factors including season, number of birds moving through an area, and weather. In some situations, dozens or more collisions occur in any given day. Collisions may also occur with aircraft anywhere in the program area. Please consider changing to, "Collisions would vary by season and occur throughout the life of any development project".	The text has been revised for clarity.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
166.	—	—	United States Fish and Wildlife Service	97942	161	Birds	Page 3-99, Paragraph 6: The following statement is incorrect: "Potential salt-water spills would not be toxic to birds but would likely kill vegetation in the spill zone and thus alter habitat." Many species of birds are not tolerant of ingestion of saltwater and others are not tolerant to its ingestion for extended periods or during certain parts of their life history. For example, despite their ecology, plovers and sandpipers lost weight when provided 0.3 M NaCl for drinking water, half the concentration of normal seawater (Purdue and Haines 1977). Even species that spend most of the lives at sea, like common eider, risk mortality if provided only saltwater during the brooding period (Devink et al. 2005). Please change to, "Potential salt-water spills would likely kill vegetation and invertebrates, and could be toxic to birds."	The text has been revised for clarity. References cited in the comment are not relevant and not incorporated.
167.	—	—	United States Fish and Wildlife Service	97942	162	Birds	Page 3-101, Paragraph 3: The statement, "Alternative B would occur over 1 percent of the entire program area. Potential disturbance and displacement of breeding birds in tundra habitats could occur over about 2 percent of the area available for leasing" may not completely describe the potential areas impacted if large portions of the 2000-acre footprint are linear features. Please consider changing to, "Alternative B would occur over 1 percent of the entire program area. Potential disturbance and displacement of breeding birds would depend on the orientation of the footprint and amount of linear features."	Linear features (i.e., roads) are the primary feature of the hypothetical development footprint; see Appendix F. Caveats for the hypothetical footprint are provided on page 3-95. The actual area depends entirely on the configuration of the roads. The text has been revised for clarity.

168.	—	—	United States Fish and Wildlife Service	97942	163	Birds	Page 3-101, Paragraph 5: The following statement is inaccurate, "Fall staging snow geese are an important exception, as the area closed to leasing overlaps extensively with areas historically used by the largest numbers of fall staging snow geese in the program area." There are no areas closed to leasing in Alternative C. A substantial portion of area heavily used by snow geese in the 2000s occurs in areas with standard terms and conditions (Kendall 2006). Please change to, "Fall staging snow geese are an exception, as the area of NSO overlaps with many areas used by the large numbers of fall staging snow geese that use the program area (Kendall 2006)."	The text has been revised for clarity.
169.	—	—	United States Fish and Wildlife Service	97942	164	Birds	Page 3-101, Paragraph 7: The statement, "With Alternative C, potential long-term loss and alteration of habitat from direct and indirect effects of gravel deposition would be similar to Alternative B" is incomplete. An important feature of Alternative C, compared to B, is that more wetlands and moist tundra would be afforded protections through NSO along the coast and from increased buffers around those rivers most important to breeding waterbirds and shorebirds (e.g., see Brown et al. 2007). Please consider changing to, "With Alternative C, potential long-term loss and alteration of the most heavily used bird habitats (wetland and moist tundra) from direct and indirect effects of gravel deposition would be somewhat less than Alternative B (the entire area is available for leasing) and would occur over approximately 1 percent of the program area; disturbance and displacement could occur over about 2 percent or more of the program area."	The text has been rewritten to better address effects of NSO with Alternative C.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
170.	—	—	United States Fish and Wildlife Service	97942	165	Birds	Page 3-102, Paragraph 1: Oil spills in riverine, deltaic, and lagoon habitats has the greatest likelihood of high impact to waterbirds. For this reason, Alternative D that includes the highest setbacks from waterways for refueling operations and that maximizes no surface occupancy for these habitats, will provide some protections for migratory birds. Please update the text to reflect this information.	The text has been revised.
171.	—	—	United States Fish and Wildlife Service	97942	166	Birds	Page 3-102, Paragraph 2: The following statement is incomplete: "Alternative D includes some larger setbacks than Alternatives B or C for riparian areas and is, therefore, somewhat more protective of avian habitats in riparian areas." The larger river setbacks in Alternative D would also provide some protections for habitats adjacent to riparian areas, such as wetlands. Please consider changing to, "Alternative D includes some larger setbacks than Alternatives B or C for riparian areas and is, therefore, more protective of avian habitats in riparian areas and other important adjacent habitats such as wetlands."	The text has been revised to include potential wetlands and uplands that may occur in riparian buffers.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
172.	—	—	United States Fish and Wildlife Service	97942	167	Birds	Page 3-102, Paragraph 3: The following statement is incomplete: “however, the various NSO areas with Alternative D would be protective to many important avian habitats, including riparian and stream habitats, Canning River delta water bodies and wetlands, lagoon and barrier island habitats, and coastal habitats.” During the breeding season, shorebird, waterfowl, loon, and larid densities are highest in wetlands (Brown et al. 2007, Bart et al. 2012). Even lapland longspurs, the most abundant passerine in the ARCP, occur at somewhat higher densities in wetlands compared to drier sites (Bart et al. 2012). Within the ARCP, wetlands are generally most abundant along rivers and river buffers are largest for Alternative D. Therefore, Alternative D provides more NSO coverage of wetlands adjacent to rivers than Alternative B or C. Please change to, “however, the various NSO areas with Alternative D would be protective to the most important avian habitats, including riparian and stream habitats, Canning River delta water bodies and wetlands, lagoon and barrier island habitats, river deltas, wetlands associated with rivers and coastal habitats.”	The text has been revised to include non-riparian habitats within the riparian buffers.
173.	—	—	United States Fish and Wildlife Service	97942	168	Birds	Page 3-102, Paragraph 3: The following statement is incomplete: “All these no lease areas, NSO areas, and CSU areas would potentially reduce impacts on birds. As with Alternative C, nearly all of the area closed to leasing are in the area of low HCP and in inland and drier habitats.” No areas are closed to leasing in Alternative C. Please change to, “All these no lease areas, NSO areas, and CSU areas would likely reduce impacts on birds. Nearly all of the area closed to leasing is in the area of low HCP and in inland and drier habitats.”	The text has been revised.

174.	—	—	United States Fish and Wildlife Service	97942	169	Birds	<p>Page 3-102, Paragraph 6: The statement, "Under Alternative D, potential long-term loss and alteration of habitat from direct and indirect effects of gravel deposition would occur over approximately 1.6 percent of the area available for leasing (1,037,200 acres). Disturbance and displacement could occur over about 3 percent of the area available for leasing" is confusing and makes it difficult to compare potential impacts for the various Alternatives. Recommend deleting this paragraph or maintaining a consistent denominator (i.e., the program area) for all alternatives. Specifically, we recommend that the comparison be the percent of the project area, not the leased area that would be affected by each alternative. Another way to present this is the total number of acres potentially altered under each alternative. Either of these would provide a more accurate comparison across alternatives than the current approach.</p>	<p>If the entire 1002 Area is used as the denominator, there is no difference between alternatives. With greater NSO areas, these calculations accurately reflect that more facilities will be placed in a smaller area under Alternative D, with a potentially higher density of development. The text has been revised for clarity.</p>
175.	—	—	United States Fish and Wildlife Service	97942	260	Birds	<p>Page 2-30: Map references aerial observations as coming from "North Slope Eider aerial survey and Arctic Coastal Plain breeding waterbird aerial survey"; however, the point location to the northeast (Beaufort Lagoon) and in the northwest (Brownlow Point) are not within the sampled area of the aerial breeding surveys. Instead, the Brownlow Point observation came from the Common Eider breeding pair survey in 2000 (referenced in Maps 3-15 through 3-20). The eastern point in Map 3-14 (Beaufort Lagoon) is misplaced and should be near Demarcation Point, which is outside of the project area. Please correct the map as appropriate. The map should also indicate that the area in white was not sampled in the aerial breeding pair surveys.</p>	<p>According to GIS analysts, the map locations were not changed; data came from Michael Swaim, USFWS. A note was added to the legend information on data sources for the two locations mentioned. A note regarding unsurveyed areas was added to the legend information.</p>

S. Public Comments and BLM Responses (Birds)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
176.	—	—	United States Fish and Wildlife Service	97942	261	Birds	Page 2-30: The upper panel of each of these maps should be labeled breeding survey, not post-breeding survey. The survey was timed for early incubation of common eiders. Birds observed during this survey may also include non-breeding or failed breeding birds.	Egg-laying and incubation occur after breeding. Few of the common eiders recorded were on nests, and most were post-breeding males. None of the other ducks or loons recorded nest in any numbers on the barrier islands. All likely were post-breeding males and smaller numbers of failed or non-breeding females, with the possible exception of red-throated loons that forage in the lagoons and nest on tundra ponds. As there is no perfect label that covers all maps for all species, the BLM has replaced the map titles with the dates of the surveys.
177.	Christy	Stebbins	—	97980	6	Birds	How is the Migratory Bird Treaty Act of 1918 going to be recognized and enforced? Some of the new conventions to the treaty stipulate protections not only for the birds themselves but also for the habitats necessary for their survival. This is a critical omission in this DEIS.	The MBTA is described on page D-4. Additional mention has been added to the avian section. Virtually all birds found in the planning area are migratory, share populations with other countries and often other continents, and are protected similarly by the MBTA. The MBTA has never been interpreted to protect habitat but attempts to prevent injury, mortality, and egg and nest loss.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
179.	Susan	Culliney	—	98092	1	Birds	the EIS provides no maps of birds other than snow geese. The spatial data do exist to provide the public with the depiction of how birds use the coastal plain and how the development scenarios would impact them. This visual and spatial comparison is vital for the public and for the agency to understand and analyze the impacts.	Maps 3-14 through 3-19 all depict bird data for species other than snow geese.
180.	Susan	Culliney	—	98092	2	Birds	the EIS lacks basic scientific reference for many topics. For instance, in the four paragraphs on the impacts of oil spills on birds, this short section entirely lacks footnotes or any reference to scientific literature. There is an unfortunate abundance of scientific study of the impact of oil spills on birds, and the agency must look at and reference that information in its explanation of the impact. And this deficiency is seen throughout the EIS.	References regarding oil impacts on birds have been incorporated; other details are presented in Sections 3.2.11, Solid and Hazardous Waste and 3.2.6, Petroleum Resources.
181.	Brook	Brisson	Trustees for Alaska	98269	128	Birds	The [climate change] discussion in the Birds section (page 3-91) is brief, general, speculative and lacking in specificity for the many species involved.	Additional text has been incorporated to the discussion of climate change.
182.	Brook	Brisson	Trustees for Alaska	98270	165	Birds	The DEIS devotes a few sentences to the shipping-related disturbance and displacement of birds and their habitat, but these statements are very cursory and general. 1934 Additional analysis of shipping and icebreaking noise impacts on birds near the program area and along the marine shipping route should be included in a revised draft EIS.	Additional details on shipping have been incorporated into Chapter 2 and on impacts in Chapter 3. None of the development alternatives include associated icebreaking activities.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
183.	Brook	Brisson	Trustees for Alaska	98271	45	Birds	The DEIS fails to address the important data gaps related to the scientific understanding of Arctic Refuge Coastal Plain avifauna and the potential impacts of oil and gas development on birds. The data on bird species densities in the Coastal Plain area are broadly incomplete and existing, completed surveys are restricted in statistical power as a result of limited spatial scope and temporal scale.901 New, additional surveys should be designed specifically for the project being considered and should be a mandatory component of any robust environmental impact assessment. For breeding waterbirds specifically, there is a need to better understand those species' distributions and abundances within the Coastal Plain in relation to varying habitat types.902 Relatedly, while populations of Snow Goose and Black Brant appear to be increasing on the North Slope,903 studies on any new resulting patterns in the distribution of these species during nesting and migratory staging have yet to be completed.	Appendix Q has been added to address incomplete or unavailable information per 40 CFR 1502.22.
184.	Brook	Brisson	Trustees for Alaska	98271	47	Birds	Finally, the issue of phenology, or migratory mismatch, is an area of needed study, particularly in the project area. While some migratory birds are displaying some plasticity to changing seasonal patterns,906 it is not known how the shifts in resource availability or migratory timing will reverberate through a species' life history; nor is it known whether the flexibility seen in other parts of Alaska are applicable to the Coastal Plain of the Arctic Refuge. The agency must address these areas of missing information prior to moving ahead with a leasing program.	The comment is correct that the effects of climate change cannot be accurately predicted. No revisions were made in response to this comment.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
185.	Brook	Brisson	Trustees for Alaska	98271	51	Birds	The DEIS does not provide adequate descriptions and baseline information for the birds found within the Coastal Plain. Throughout the DEIS, the document appears to downplay the importance of birds with the status "uncommon." The FWS defines "uncommon" as "[o]ccurs regularly, but not always observed either because of lower abundance or secretive behaviors." Although a bird may be "uncommon" according to FWS, the species is still regular in the project area. For birds and other species that have regular but dispersed populations, there can be major biological significance for a smaller number of individuals, even if the numbers do not constitute high densities. The DEIS should not, therefore, dismiss "uncommon" bird species. Yet the DEIS seems to downplay uncommon birds, saying that "Many of the 156 species recorded are uncommon or rare."907 Elsewhere, the DEIS makes special note of birds that are "fairly common, common, or abundant," but does not include birds that are "uncommon"908 despite the fact that this means that they occur regularly. By overlooking the uncommon birds, the overall effect of these different interpretations is to downplay the importance of the project area for birds.	Status and abundance labels are derived from USFWS 2015, Appendix F. These labels are as accurate as possible, and no attempt has been made to downplay the importance of uncommon species. The lists provided here are more inclusive than those provided in the USFWS RCCP (USFWS 2015b).
186.	Brook	Brisson	Trustees for Alaska	98271	52	Birds	The DEIS also does not always provide accurate names and citations for the bird species it purports to analyze. The DEIS is sloppy in the presentation of bird names, with incorrect names and typos (e.g. "red-neck phalarope;"909 "Calidris pugnaC;"910 "Gyrfaon," "Peregrine Faon," and indeed every "Fao" species in the Falco genus 911). These glaring errors underscore the rushed approach the agency took in developing this DEIS. The DEIS also	Typographical errors in scientific names of species have been corrected. The documents cited all are publicly available and accessible. Available data from 1982 to 2004 may (probably do) underestimate the numbers of snow geese that currently use the Refuge. The USFWS and BLM 2018 reference was a report created specifically in response to the Tax Act that opened the 1002 Area to leasing in 2017. It summarizes

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
186. (cont.)	(see above)	(see above)	(see above)	(see above)	(see above)	(see above)	<p>does not provide sufficient citation for the public to follow its logic or review its analysis. For instance, when describing populations and locations of Snow Geese, the DEIS references "USFWS and BLM 2018,"⁹¹² which appears to be an internal report entitled Rapid-Response Resource Assessments and Select References for the 1002 Area of the Arctic National Wildlife Refuge in Anticipation of an Oil and Gas Exploration, Leasing and Development Program, per the Tax Act of 2017, Title II Sec. 20001.913 The DEIS appears to be referring to a source that is a compilation of other select references. The DEIS should not cite to internal compilations, but instead should cite to original data and reports that the public may access and ensure that the primary reports are in fact publically accessible through the agency. Using inaccessible references deters the public from understanding how the agency came to its conclusions. Another example is that the DEIS cites to the "USFWS and BLM 2018" source to say "[u]p to 325,000 snow geese of the Western Arctic Population use the ARCP as a staging area for fall migration."⁹¹⁴ But later the DEIS says that "[a]s many as 325,760 snow geese have been documented using the ARCP, including the program area and east to the Canadian border, for several weeks..."⁹¹⁵ These two numbers are similar, but not the same, and it is possible that BLM is underestimating snow geese population. Without identifying the source of the information, the public is not able to check on the agency's analysis to discover which piece of data is correct.</p>	<p>much of the data used in this EIS. The RCCP is another summary document used heavily for this EIS and is the source of Map 3-20. Text has been modified for clarity.</p>

187.	Brook	Brisson	Trustees for Alaska	98271	53	Birds	In addition to providing inadequate and incomplete descriptions of birds, the DEIS does not adequately account for changes to bird habitat due to changes in phenology and coastal erosion. For example, the DEIS notes that “[w]aterbirds arrive in late May and June and begin nesting from late May through June,” ⁹¹⁶ but does not provide any analysis of changes in phenology and its impacts. Broadly across the bird section, the DEIS lacks sufficient description and information on potential changes in phenology and the potential for resulting impacts. ⁹¹⁷ The DEIS also notes that coastal habitats may change due to erosion and thawing, but cites to older data ⁹¹⁸ that is better replaced with updated data from USGS. ⁹¹⁹	The discussion of climate change has been expanded, including changes in phenology and coastal erosion.
188.	Brook	Brisson	Trustees for Alaska	98271	54	Birds	The DEIS also fails to accurately describe the extent of impacts to bird habitat. The 2,000-acre “limit” that allows reclamation to exceed the cap will cause more than 2,000-acres of impacts to birds. The DEIS explains that the agency would allow the 2,000-acre “cap” to be exceeded if disturbed acres are “reclaimed.” ⁹²⁰ We question whether areas can be effectively reclaimed following oil and gas development. Regardless, shorebirds and passerines do not use reclaimed acres in the same way they use non-disturbed areas. ⁹²¹ Furthermore, the DEIS itself notes that “[h]abitat alteration caused by fugitive dust, thermokarsting, and water impoundments intensifies with time,” ⁹²² without explaining how remediation will undo these indirect impacts. Therefore, the DEIS must explain that the impacts to birds would go above and beyond the 2,000 acres, and must address how this impact exceeding 2,000 acres conforms with the law.	It is correct that direct impacts of habitat loss on birds will exceed 2,000 acres and that indirect impacts will greatly exceed 2,000 acres. It is also correct that reclamation is unlikely to restore original wildlife values and that most habitat alteration will be permanent. The text has been revised for clarity.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
189.	Brook	Brisson	Trustees for Alaska	98271	74	Birds	The DEIS does not adequately describe the passerine bird guild in the project area. The DEIS notes that "passerines are the most abundant guilds of nesting birds on the ACP," ⁹⁵³ and that "landbirds on the ARCP include a diversity of species that are strongly dominated in abundance by passerines and ptarmigan." ⁹⁵⁴ But the DEIS does not go further to describe what habitat types the different species of passerines are using, does not describe which passerines are species of concern, and does not provide a life history for those species of concern.	Species of concern are identified in Table J-9; this paragraph summarizes conservation status. Habitat associations for Lapland longspurs, by far the most abundant passerine, are described on page 3-91. Available habitat mapping is not appropriate for more detailed analyses of bird distributions, and habitat associations across the 1002 Area are poorly understood, particularly for uncommon species. The text has been revised to say, "Currently, only low resolution vegetation and habitat mapping data for the area are available and habitat associations of birds in the area are poorly understood."

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
190.	Brook	Brisson	Trustees for Alaska	98271	80	Birds	<p>The DEIS analysis of oil spill impacts on birds is inadequate, incomplete, and lacks reference to studies or articles. First, the bird impacts section in the DEIS ignores relevant spill data. Within the four paragraphs on spills of oil and other contaminants in the bird section, the DEIS references Section 3.2.11 on Solid and Hazardous Waste.⁹⁶² This section references Appendix I, which contains only spill data for “Areas near Kaktovik, Alaska.”⁹⁶³ The area near Kaktovik and within the Arctic Refuge is an inappropriate source for data on oil spills when analyzing the impacts of an oil and gas program on birds. The relevant data are from the entire North Slope, particularly the industrial area to the west, including Prudhoe Bay, state and corporate land, and the National Petroleum Reserve-Alaska. The agency must amend its oil spill table to include oil spill data from these areas. When the DEIS presents these more relevant data, it will become more apparent that the DEIS’s supposition that spills of 10,000 gallons are extremely rare,⁹⁶⁴ is wrong. There have been more than 16 spills of over 10,000 gallons of various toxic materials in the last 19 years, including a spill of over 200,000 gallons of crude by BP in 2006.⁹⁶⁵ Presentation of this data is also necessary to test the DEIS’s conclusion that small spills on land will be “short term and of several acres” because these types of spills “are usually contained on gravel pads and roads.”⁹⁶⁶ Without these or other data, the DEIS does not have an adequate basis to make these conclusions.</p>	<p>The discussion of the spill history in the NPR-A appears in Section 3.2.6 (page3-38), and a history of North Slope spills appears in Section 3.2.11 (pages 3-62 to 3-64). Additional references to oil spill impacts on birds have been incorporated.</p>

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
191.	Brook	Brisson	Trustees for Alaska	98271	82	Birds	Second, the DEIS does not conduct a cumulative impacts analysis of oil spills on birds across the North Slope. Using up-to-date spill data from the North Slope, the agency could estimate the cumulative spills, how industrial activity under the different alternatives could add to spill impacts, and whether any bird species may be particularly impacted. The proposed development only increases the odds that the North Slope and its biological landscape will experience a major spill, with inadequate response capabilities. However, the DEIS fails to conduct this analysis.	The bird section has been expanded to include references regarding impacts of oil spills on birds. Details regarding spill histories are presented in Section 3.2.11. Species affected would depend entirely on the location of any spill, but the EIS correctly states that large spills could affect large numbers of birds.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
192.	Brook	Brisson	Trustees for Alaska	98271	84	Birds	Fourth, the DEIS does not explain or analyze where oil spills may occur, and therefore which bird species are likely to be most impacted. An oil spill in nearshore waters could be devastating to waterfowl, particularly molting and flightless Long-tailed Ducks, coastal staging shorebirds, and gulls. The DEIS does not analyze the likelihood of oil spills against the reasonably foreseeable development scenario, nor against the different alternatives, nor with any modeled scenarios. Instead, the DEIS analyzes spills generally, without spatial information. The DEIS says that larger spills "could reach streams or lakes" ⁹⁷¹ but provides no trajectory, directionality, or estimation of where and how far this impact could occur. The DEIS posits that "containment at strategic points on waterways would likely keep oil from flowing downstream into lagoons" ⁹⁷² but does not explain where this would occur. The DEIS mentions the potential for spills in docking areas or along shipping lanes, but does not provide more specificity that would allow for further analysis on bird and habitat impacts. The DEIS also notes that the cleanup of large spills "could pose contamination risk to large numbers of molting, feeding, or migrating birds," ⁹⁷³ but does not explain where the spill or the cleanup could occur.	Text regarding potential impacts from spills has been modified. It cannot be predicted where and when spills will occur. Greater specificity is not possible. Spill risks do not differ among alternatives. The description of spills is presented in Section 3.2.11.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
193.	Brook	Brisson	Trustees for Alaska	98271	86	Birds	The DEIS does not contain an adequate cumulative impacts analysis for birds. The sections below describe inadequate cumulative impacts analysis for specific birds and guilds, but more generally the "Cumulative Impacts" section within the "Birds" section of the DEIS976 is wholly inadequate. This small section essentially consists of an incomplete list of the individual indirect or direct impacts. The list includes increased predation, terrestrial transportation activities, boat and air traffic disturbance, subsistence harvest of birds, recreation, air-based sightseeing, adventure cruise ships, and community development projects. But the list of impacts misses impacts like seismic activity's effects to hydrology and oil spills; the list also completely misses impacts from beyond the project area including melting sea ice; marine boat traffic impacts to marine birds along the marine traffic route; and impacts to migratory birds in other parts of their life history, at stop-over and wintering habitat. The list is also too vague, and does not expand upon the impacts of barge and boat traffic to mention the effects from screeding.	The cumulative effects section has been revised to provide more information. The effects of climate change are discussed separately under that heading. An increased risk of spills, including the marine transport route, was incorporated, as suggested. Transboundary impacts have been incorporated as a separate section. Screeding is covered as an indirect effect of the leasing action and would not be a cumulative effect unless additional screeding were conducted for other hypothetical development scenario actions. Although not mentioned specifically, screeding would be included among potential actions associated with community development projects, such as improvement of ports, which are listed in the hypothetical development scenario.
194.	Brook	Brisson	Trustees for Alaska	98271	87	Birds	In addition to missing many of the individual impacts that can accumulate or become exacerbated, the cumulative impacts section simply does not analyze these impacts as accumulating or exacerbating. The section both misses habitat loss from infrastructure as an impact and furthermore entirely lacks any accounting of the accumulating infrastructure on the North Slope, including activity in land owned by private corporations or by the State of Alaska, and activity in the National Petroleum Reserve-Alaska in the western Arctic.	The cumulative effects discussion has been expanded.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
195.	Brook	Brisson	Trustees for Alaska	98271	89	Birds	The analysis of the impacts to cliff-nesting raptors is inadequate. The DEIS describes development activity that would remove gravel from rivers ⁹⁸⁰ and explains the action alternatives would remove gravel and sand from "alluvial deposits of larger rivers" and "streams and topographic high points." ⁹⁸¹ Within Appendix A, the reasonably foreseeable development scenario includes a section on gravel mines but does not provide more specificity, noting that gravel pits will likely occur near the facilities they are supplying. ⁹⁸² But the section on birds does not use this information to explain where gravel mining may overlap with cliff-nesting raptor habitat, thus limiting the analysis on the extent of this impact. The DEIS therefore does not specify where removal of gravel from rivers will occur under the reasonably foreseeable development scenario and under the different alternatives, and therefore does not adequately assess the impact to cliff-nesting raptors.	Locations of gravel mines are not known but will be determined during the permitting process for any proposed development project. The potential impacts on raptors will be assessed at that time.
196.	Brook	Brisson	Trustees for Alaska	98271	94	Birds	None of these mitigation measures are included in the DEIS's analysis of impacts to cliff-nesting raptors. Nor does the DEIS analyze the varying levels of impacts to cliff-nesting raptors under the different alternatives.	Because facility locations are unknown, more detail on potential impacts on specific cliff-nesting areas cannot be provided. Text has been added, where appropriate, describing differences among the alternatives, specifically riparian setbacks, which may protect cliff-nesting habitats.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
197.	Brook	Brisson	Trustees for Alaska	98271	95	Birds	<p>The DEIS fails to analyze where and how winter activity could impact American Dippers or other winter birds in the program area. The DEIS notes that winter birds remain in the program area year-round, including “dippers near open running water.”⁹⁹⁰ Appendix J indicates that wintering birds are not rare (American Dippers are uncommon, meaning regular but not always observed; Willow Ptarmigan are uncommon; and Rock Ptarmigan are common).⁹⁹¹ Later, the DEIS mentions that “[t]raffic and machinery related to winter construction could cause disturbance, behavior alterations, and displacement to resident wintering birds.”⁹⁹² But the DEIS does not go on to mention American Dippers or other wintering birds in the short section on “Landbirds.”⁹⁹³ There are no lease stipulations or ROPs related to the issue of winter activity impacts on American Dippers or other overwintering birds.⁹⁹⁴ Without a basis for its conclusions, the DEIS simply states that development activity would “affect few species and low numbers of year-round residents.”⁹⁹⁵ and that “only small numbers of only a few bird species are resident during winter, and none are breeding. Winter construction therefore would potentially affect small numbers of non-breeding birds during the construction phase of a development project.”⁹⁹⁶ This constitutes insufficient actual analysis of impacts to wintering birds from industrial winter activity.</p>	<p>A specific mention of dippers has been added to the section on year-round resident landbirds. Notwithstanding the presence of dippers, the EIS is accurate in stating that small numbers of birds would be affected by winter activities.</p>

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
198.	Brook	Brisson	Trustees for Alaska	98271	97	Birds	The DEIS does not adequately analyze or mitigate the impacts to shorebird habitat from winter work and the subsequent shifts in hydrology. The DEIS briefly notes that winter activities, such as seismic machinery and ice roads, can harm vegetation and change spring runoff, and that more damage occurs in well-drained areas of the tundra, which are areas favored by some shorebirds like Whimbrel and American Golden-plover. ¹⁰⁰⁰ But the DEIS never takes the next step to make the connection to shorebirds or their natural history. Nor does the DEIS connect the dots to explain that most of the high oil potential area in Coastal Plain is comprised of that habitat type. While the Canning River and Sadlerochit River have patchy wetlands, the rest of the high oil potential area is comprised of well-drained tundra, which provides habitat for shorebirds like American Golden-plover	Seismic activity may noticeably affect vegetation and microtopography. Additional text has been incorporated into the vegetation and bird sections regarding the effects of seismic exploration.
199.	Brook	Brisson	Trustees for Alaska	98271	104	Birds	Second, the DEIS further downplays the impacts of screeding on birds and their food web. The DEIS notes that screeding will cause a "sediment plume that could disrupt feeding by non-breeding, post-breeding, and staging birds." ¹⁰²² But the DEIS dismisses this as "short-term" and does not acknowledge that a sediment plume could present long-term impact of disrupting the food web. Moreover, the analysis completely lacks any mention of climate change and whether habitat impacts from screeding will be exacerbated by climate-change-induced erosion.	Revisions have been made to the description of screeding impacts; however, screeding will be short term and localized, as correctly described in the EIS. It will be unlikely to interact with climate change-induced coastal erosion except locally. See Section 3.2.4, Physiography (page 3-26).

S.3.6 Climate and Meteorology

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
1.	Donald	Walker	—	68	30	Climate and Meteorology	<p>Consistent, continuous, accurate records are needed for the 1002 Area. The only additional snow information available comes from the public data produced by the weather stations operated by the USGS,30 where wind speed and local snow depth have been collected by autonomous instruments. Unfortunately, no overlap exists between the older weather records and new data being collected by the USGS at its three climate monitoring stations in the Arctic National Wildlife Refuge, hence identifying any recent trends in snow depth is not possible, though the data still indicate a similar level of variability. This difficulty highlights the need for long-term field-based monitoring of basic climatic parameters including snow depth. While sonic depth-sounder measurements (which record depth rather than snow-water equivalent) offer an inexpensive way to monitor the snow, unshielded gauges like these are notoriously inaccurate and can report a station as a drift one year and a scour zone the next. Some recent papers have suggested that with the reduction in Arctic Ocean sea ice, there should be an increase in October-December precipitation^{31,32,33} but other predictions are that the increased precipitation will fall mainly as rain.³⁴ What we do know about snow in the 1002 Area is that it is generally thin (<50 cm) with large areas of wind-scour with even less snow in mid-winter and large drifts 2-5 m deep along the banks of the incised streams and rivers. The spatial distribution of the snow cover reflects the power of the wind in this region. A</p>	<p>This Leasing EIS will not result in the authorization of any on-the-ground activities. Accordingly, the environmental baseline will be preserved throughout the lease sale process. Any on-the-ground activities will require additional NEPA analysis. At that time, the BLM will determine which baseline studies may be necessary. That being said, the state does require specific parameters for winter tundra travel. These requirements will apply to travel in the 1002 Area for any winter exploration activities. On-site snow measurements are planned to ensure that the snow level meets minimum requirements for depth and density.</p>

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
1. (cont.)	(see above)	(see above)	(see above)	(see above)	(see above)	(see above)	<p>photogrammetrically produced snow-depth map from April 2018, made by subtracting a digital elevation model (DEM) of the summer ground surface from a winter snow surface³⁵, demonstrates the range of snow depths (Fig. 9) and the lack of sufficient snow cover for the proposed seismic work. The map was created in April 2018 using methods described here at a nearby location showing similar results and validated using ground measurements of snow depth collected within that study area. When examining the map, it is important to note that the all-time deepest snow recorded for the area occurred in 2018, yet vast areas of this study area were snow free in 2018 and even larger areas had less snow than the current Alaska Division of Natural Resources (ADNR) permit guidelines of 23 cm (9 in) for any off-road vehicle travel over snow in state-owned North Slope foothills. From the map, it is apparent that drifts in excess of 100 cm depth (blue) are found immediately adjacent to scoured areas where the snow depth is less than 25 cm deep (red and orange). In fact, it is best to think of these thin and thick areas of snow as conjugates, produced by wind removing snow from large areas of tundra and depositing it in much smaller areas of riparian zones.</p>	(see above)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
2.	Donald	Walker	—	68	32	Climate and Meteorology	<p>While an in-depth analysis of winter wind speeds in the 1002 Area has not been done, there is a common understanding that blizzard winds are stronger in this eastern part of the North Slope than farther west in the NPR-A. Currently, we lack comprehensive records of where scour and drift are most or least intense, and we have little information on how often excessive scour takes place in winter and how widespread it is when it does occur, nor how a variety of snow-related factors may be affected by rapid climate change. (See Section 2.7 for discussion of vegetation-snow relationships and the depth of snow needed to protect the tundra.) We do know that areas such as those shown in Figs. 9 and 10 are not unique within the 1002 Area and that even in high-snow years there is simply no way a 200 m x 200 m grid of trails can be established to avoid zones with too little snow to protect the tundra. Figure 10 was photographed in April of 2017, a year with less snow and more wind than 2018. The view is northeast from the Hulahula River across the 1002 Area. It is evident that 9 inches (23 cm) of snow does not exist in most of the field of view, nor is there a route through this area with snow sufficient to meet the minimum requirement for any over-snow vehicle operation in state-owned Arctic Foothills.³⁸ Even in the heavy snow year of 2018, the 9-inch minimum was not met over large parts of the mapped area (orange areas in Fig. 9). Spatial snow distribution studies are needed to clarify the extent and frequency of snow scour in the 1002 Area.</p>	<p>This Leasing EIS will not result in the authorization of any on-the-ground activities. Accordingly, the environmental baseline will be preserved throughout the lease sale process. Any on-the-ground activities will require additional NEPA analysis. At that time, the BLM will determine which baseline studies may be necessary. That being said, the state does require specific parameters for winter tundra travel. These requirements will apply to travel in the 1002 Area for any winter exploration activities. On-site snow measurements are planned to ensure that the snow level meets minimum requirements for depth and density.</p>

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
3.	Donald	Walker	—	68	45	Climate and Meteorology	<p>In recent years, ice-wedge thermokarst has become much more widespread in undisturbed tundra landscapes across the circumpolar Arctic that correspond to recent increases in permafrost temperatures.⁶¹ Ice-wedge degradation with flooded thaw pits became common after about 1990 in the central and eastern parts of the North Slope, and is also seen in the landscapes of the 1002 Area (Fig. 13). Ice-wedge degradation started earlier in portions of the Arctic Coastal Plain west of the Colville River.⁶² The likely reasons for the differences in the timing of the onset of widespread ice-wedge degradation include differences in ground-ice content, regional climate gradients from west (maritime) to east (continental), and regional differences in the timing and magnitude of extreme warm summers after the Little Ice Age. At present, it is not known how future seismic activities will affect these regional thermokarst patterns, but it can be assumed that the landscapes will be much more heterogeneous than they were during the 1980s and that ice wedges will be more sensitive to degradation.</p>	<p>If the increase in permafrost melting has happened to a greater degree farther west, then the Coastal Plain leasing area should be less risky to develop than other projects already being developed and in production to the west. If such changes to the west were already making the developments there unfeasible, companies would not continue to expand production in those areas.</p>

4.	Donald	Walker	—	68	120	Climate and Meteorology	Figure 12. Ice wedge at the Beaufort Sea coast, northern Alaska. Wedge ice is one of the most common forms of massive ground ice in permafrost, which is responsible for the prominent ice-wedge polygons visible in aerial photographs of the region. Good examples of ice-wedge polygons are visible in Figures 3, 4, 7, and 13. This ice wedge is approximately 4 m deep and over 5 m wide at the top. A warming climate is causing loss of ice at the top surface of ice wedges on most upland surfaces of the 1002 Area, resulting in thermokarst pits such as those shown in Figure 13. Disturbance to the microtopography and vegetation mat can exacerbate thermokarst and lead to thermal erosion, greater loss of ice, and major landscape changes. ⁵⁰	If the increase in permafrost melting has happened to a greater degree farther west, then the Coastal Plain leasing area should be less risky to develop than other projects already being developed and in production to the west. If such changes to the west were already making the developments there unfeasible, companies would not continue to expand production in those areas.
5.	Catherine	Carter	—	4989	1	Climate and Meteorology	you might at least consider the ANWR's role in sequestering carbon. Carbon emissions--as I think you know, no matter what you pretend to believe in public--are warming our planet drastically	The Draft EIS analyzes the potential GHG emissions resulting from development, thereby accounting for the de-sequestration of a portion of the carbon stored in Coastal Plain sediments.
6.	Sharon	Radulov	—	12021	1	Climate and Meteorology	The staggering amount of increased carbon pollution should not be ignored. The Center for American Progress has estimated that 62 million metric tons of CO2 equivalent would be released into the atmosphere from the oil that the DEIS has predicted to spill.	A 2013 study for BOEM (OCS Study BOEM 2013-205; see Figure 4-6) showed that the total volume of oil spilled on the North Slope represented on the order of 0.0002 percent of total production, so the Center for American Progress value, if correctly cited by the commenter, would be 4 to 5 orders of magnitude higher than actual data indicate. As such, the estimate from the cited study has not been incorporated into the analysis.

7.	Lester	Lubetkin	—	18452	1	Climate and Meteorology	While the DEIS recognizes that the public raised the concern about the indirect and cumulative impacts associated with the burning of the fossil fuels proposed for leasing (and subsequent potential development), the analysis does not adequately provide sufficient information to the decision maker nor the public to fully understand the possible impacts. By showing the percentage change at the National and Global scale, it minimizes the impact, while the science is showing that any increase is detrimental and going in the wrong direction (see the recent IPCC studies and other Climate Change scientific assessments). The EIS should be clearer in displaying these indirect impacts.	The state of the science is not capable of predicting whether there will be detrimental impacts from specific GHG emissions. "In climate research and modeling, we should recognize that we are dealing with a coupled non-linear chaotic system, and therefore that long-term prediction of future climate states is not possible" (IPCC Third Assessment Report [2001], Section 14.2.2.2, p. 774).
8.	James	Warren	—	18479	1	Climate and Meteorology	I raise the question of scope and scale regarding climate change. This relates to how a EIS is to be framed. In the case of the present Draft EIS, I think the framing is much too limited, to the detriment of the analysis and the conclusions drawn in the document. This is a matter of argumentation, but it is of specific import regarding climate change, a global problem we cannot address merely with local scales and scoping.	The scale and scope of climate and GHG analyses have been raised in many prior EIS efforts, with the resulting guidance from federal officials that it is not possible to attribute the global climate consequences to a single project.
9.	James	Warren	—	18479	4	Climate and Meteorology	In many parts of the Draft EIS, the writers address the question of direct and indirect impacts on the Arctic Refuge, and nearly every time they use a set of formulaic statements to limit the assessment of those impacts. For example, in Section 3, the writers address the question of climate. There are problems with the analysis in other ways, particularly in the scope of the analysis, but here is the main logical problem, as the analysis concludes concerning "Local and Global Direct and Indirect Impacts": "Issuance of oil and gas leases under the directives of Section 20001(c)(1) of PL 115-97	Pages 3-6 through 3-9 of the Draft EIS show the direct GHG emissions from post-lease oil and gas activities and indirect GHG emissions from combustion of net fuels production exported to market. It is not possible to attribute global climate consequences to a single project. As such, reporting potential GHG emissions from a plan or project and comparing these emissions with emissions at larger scales provides context for decision makers and the public.

9. (cont.)	(see above)	(see above)	(see above)	(see above)	(see above)	(see above)	would have no direct impacts on the environment because by itself a lease does not authorize any on the ground oil and gas activities; however, a lease does grant the lessee certain rights to drill for and extract oil and gas subject to further environmental review and reasonable regulation, including applicable laws, terms, conditions, and stipulations of the lease. The impacts of such future exploration and development activities that may occur because of the issuance of leases are considered potential indirect impacts of leasing. Such post-lease activities could include seismic and drilling exploration, development, and transportation of oil and gas in and from the Coastal Plain. Therefore, the analysis is of potential direct, indirect, and cumulative impacts on the climate from on-the-ground post-lease activities." The problem lies in the first clause. Direct impacts are only measured in terms of a lease, but the post-lease activities are not "potential indirect impacts of leasing." They will be direct consequences of the decision to lease certain acres. The use of "potential indirect impacts" is a red herring, an attempt to air-brush the actual consequences of these decisions. Disingenuous writing and thinking do not help us arrive at proper decisions. The other problems with the analysis of impacts come in terms of scope and scale. In Section 3, for example, the indirect impacts on climate are analyzed in such a way as to minimize the effects of the leasing. After all, the Draft EIS implies, these percentages of oil and gas being developed in this area are so small! How can this have a huge effect on the climate? But we know that climate effects are cumulative, and we know very well that the IPCC report and the recent National Assessment and the	(see above)

9. (cont.)	(see above)	(see above)	(see above)	(see above)	(see above)	(see above)	Arctic Region Report all show that we are facing an enormous challenge to halt all oil and gas production as soon as possible.	(see above)
10.	Ehrick	Costello	—	21391	1	Climate and Meteorology	My second issue is that the synergistic effects of climate change and development aren't addressed here, although they are well documented in the scientific literature. I'd like to see at least some recognition that the potential effects described here will have interplay with effects from climate change and reduce the adaptability of endemic species as their habitat changes.	Page 3-4 of the Draft EIS describes changes in climate over the prior three decades, including regional warming on the North Slope. The extent that regional warming is affecting or may continue to affect the adaptability of endemic species is addressed in the wildlife-related sections of the Draft EIS (in the Climate Change subsections of the wildlife-related Affected Environment sections).

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
11.	F	Chapin	—	29337	3	Climate and Meteorology	<p>The EIS does not consider the ways in which these responses to climate change will make the permafrost, hydrology, and ecology of the region more sensitive to human disturbance. Thus, the impacts of oil and gas development will likely be much more pronounced than they may have been in earlier times when the climate was cooler. This will increase the cumulative extensive effects of oil development to a greater degree than is conveyed in the EIS as written. There is extensive research that has been done on effects of climate change on Alaska's north slope permafrost, hydrology, and ecology. The EIS has not adequately drawn on this research to assess the possibility of threshold changes that development might cause in the ANWR coastal plain. The EIS also fails to consider the impact of oil development in ANWR on the climate system, both by the extraction and burning of fossil fuels and by the increase in carbon dioxide and methane emissions that result from the extensive impacts of disturbance. There is considerable research on the causes of these changes in ecosystem carbon fluxes that could be incorporated into the EIS.</p>	<p>The North Slope has already undergone over 40 years of significant warming, which has measurably affected permafrost and ecology as indicated in the Draft EIS. However, the substantial oil and gas development ongoing on the North Slope during that time has not resulted in major impacts on landscapes over this period. Where appropriate, the potential effects of climate change on permafrost, hydrology, soils, and ecology are addressed in other sections of the Draft EIS and Final EIS (in the Climate Change subsections of the relevant Affected Environment sections).</p>
12.	Craig	Mishler	—	31305	2	Climate and Meteorology	<p>The draft EIS does not address the changing climate, or its definitive and devastating impacts on Arctic communities. The Arctic is warming at more than double the rate of the rest of the country, with dozens of Alaska villages in need of relocation. The draft EIS fails to assess how expanding fossil fuel development in the coastal plain would increase the social, cultural, economic and public health hardships born by Arctic communities due to climate change.</p>	<p>The Draft EIS and referenced documents do explain the changes in climate that have occurred on the North Slope in recent decades. The effects of expanding fossil fuel development on socioeconomic factors affecting Arctic communities are addressed in the socioeconomic section of the Draft EIS.</p>

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
13.	Withheld	Withheld	—	55209	7	Climate and Meteorology	The draft EIS also underestimates carbon emissions that would result from drilling the Arctic Refuge because it does not account for burning all of the oil projected to be extracted. It does not assess how expanding oil and gas development in the Refuge will further exacerbate climate adaptation and mitigation challenges in the Arctic	The Draft EIS analysis accounts for the estimated incremental amount of oil and gas burned on a global scale, and the resulting estimates of GHG emissions. Because the increase is small in a global context, the proposed action, by itself, would not measurably affect climate change adaptation or mitigation challenges in the Arctic or globally.
14.	Withheld	Withheld	—	55252	2	Climate and Meteorology	Climate Change is Inadequately Addressed. The most glaring and inexcusable omission in the DEIS is a meaningful analysis about the impacts of climate change on the proposed leasing program. Notably, and symbolically, "climate change" is not even defined at the end of Volume I, in The Glossary. Given the extremely well documented impacts of climate change on the arctic, including diminishing Arctic sea ice, increasing temperatures, substantial coastal erosion, extensive permafrost warming and melting, vegetation changes, modifications to surface water, impacts on fish and wildlife and more, it is essential -- in order to comply with NEPA and CEQ's regulations -- to include this information in the Final EIS.	Section 3.2.1 of the Draft EIS discusses the impacts of climate change on potential development, specifically that warming temperatures in the North Slope region will make development more difficult by limiting the seasonal duration of heavy truck movement to periods when the surface is frozen. The ongoing effects of climate change on specific natural and human resources in the Arctic are described in the respective Climate Change subsections of the Affected Environment. The Final EIS cumulative effects sections have been updated, where appropriate, to include more information on the effects of leasing in combination with other reasonably foreseeable future actions, including climate change.

S. Public Comments and BLM Responses (Climate and Meteorology)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
15.	Robert	Burgess	—	55298	5	Climate and Meteorology	Climate Change is not addressed to any meaningful degree in the DEIS. Boreal and arctic regions are disproportionately affected by climate change	The Draft EIS presents estimated GHG emissions in a global context, so the reader can gauge the portion of the cumulative global GHG emissions that would be due to the proposed action. The ongoing effects of climate change on specific natural and human resources in the Arctic are described in the Climate Change subsection of the Affected Environment for those resources. The Final EIS cumulative effects sections have been updated, where appropriate, to include more information on the effects of leasing in combination with other reasonably foreseeable future actions, including climate change.
16.	Owen	Wozniak	—	55392	1	Climate and Meteorology	it appears that nowhere in the Draft EIS did the authors review or even note the recent Fourth National Climate Assessment, which clearly outlines in great detail the urgent need to reduce GHG emissions and undertake activities to mitigate climate change.	For a description of climate trends in the Arctic and on the North Slope, the reader is referred to Section 3.2.3.1 of the Greater Mooses Tooth 2 (GMT2) Development Project Final Supplemental Environmental Impact Statement (GMT2 Final SEIS), issued in August 2018 (BLM 2018a). These trends have been confirmed in the Fourth National Climate Assessment's Alaska Chapter (Markon et al. 2018), including that Alaska has been warming twice as fast as the global average since the middle of the twentieth century.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
17.	Dave	Gordon	—	55523	2	Climate and Meteorology	The document needs to address how development in this remote area will further exacerbate climate change.	Section 3.2.1 of the Draft EIS discloses potential direct and indirect GHG emissions associated with oil and gas-related activities on the Coastal Plain. The scope of climate analyses has been raised in many prior EIS efforts, with the resulting guidance from federal officials that it is not possible to attribute global climate consequences to a single project. The state of the science is not capable of predicting whether there will be detrimental impacts from specific GHG emissions on specific areas.
18.	Withheld	Withheld	—	56330	1	Climate and Meteorology	I find it to be a glaring omission that climate effects of burning all the oil and gas up there are not mentioned at all in the potential effects list in the executive summary. This is unacceptable and needs to be revised so that a better informed decision can be made about arctic drilling.	The executive summary of an EIS discloses the resources identified as having potentially significant impacts. With respect to climate change, the proposed action is not expected to have significant impacts.
19.	Richard	Sumner	—	56477	5	Climate and Meteorology	The DEIS does not quantify or otherwise proportionally scale the current and future effects of climate change on the environmental resources of the Coastal Plain, and how the effects will influence the magnitude of environmental harm and amount of mitigation opportunity that can be attributed to each of the leasing program alternatives. Generally worded and repeated cursory text in the DEIS about the general consequences of climate change is insufficient (e.g., 'The effects of climate change described under Affected Environment above, could influence the rate or degree of the potential direct and indirect impacts').	A general description of potential climate change effects on the project area is all that is possible based on current scientific understanding. Climate predictions and their effects on the Coastal Plain natural resources and potential human infrastructure, due to the proposed action, cannot be quantitatively assessed. However, the Final EIS cumulative effects sections have been updated, where appropriate, to include more information on the effects of leasing in combination with other reasonably foreseeable future actions, including climate change.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
20.	Nancy	Waterman	—	56488	4	Climate and Meteorology	Climate change impacts must be analyzed in the EIS. This includes the contribution of the proposed actions to climate change from emissions on site and potential emissions from oil and gas once shipped out of state, processed, and burned as fuel. The analysis also has to account for how the Coastal Plain is being impacted by climate change as well.	A general description of potential climate change effects on the project area is all that is possible based on current scientific understanding. Climate predictions and their effects on the Coastal Plain natural resources and potential human infrastructure, due to the proposed action, cannot be quantitatively assessed. However, the Final EIS cumulative effects sections have been updated, where appropriate, to include more information on the effects of leasing in combination with other reasonably foreseeable future actions, including climate change.
21.	Randy	Oliver	—	56583	5	Climate and Meteorology	Any potential effects of post-lease oil and gas activities on meteorological conditions would be on a very small scale (microscale) and would cover very small portions of the program area, for example, such as a decrease in localized wind speeds and the creation of snowdrifts immediately downwind of structures; therefore, impacts on meteorological conditions are not addressed further in this section. Do you have supportive data for the above assumption?	Examples of microscale conditions include the presence of snowdrifts in areas where a building or terrain obstructs wind flow, resulting in snowdrifts in regions that experience snow accumulation along with strong winds.
22.	Peter	Landres	—	56598	5	Climate and Meteorology	5) long term impacts of regional climate disruption on soils, plants, animals, and Gwich'in culture from the CO2 and methane emissions from the construction and extraction of this oil and gas;	The Draft EIS presents estimated GHG emissions in a global context, so the reader can gauge the portion of the cumulative global GHG emissions that would be due to the proposed action. The ongoing effects of climate change on specific natural and human resources in the Arctic are described in the Climate Change subsection of the Affected Environment for those resources. The Final EIS cumulative effects sections have been updated, where appropriate, to include more information on the effects of leasing in combination with other reasonably foreseeable future actions, including climate change.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
27.	Jed	Fuhrman	—	57367	1	Climate and Meteorology	The impacts are clearly understated in the document, and ignore the massive U.S. and global impacts and costs of continued high levels of fossil fuel burning that this drilling would support.	The Draft EIS presents estimated GHG emissions in a global context, so the reader can gauge the portion of the cumulative global GHG emissions that would be due to the proposed action. The ongoing effects of climate change on specific natural and human resources in the Arctic are described in the Climate Change subsection of the Affected Environment for those resources. The Final EIS cumulative effects sections have been updated, where appropriate, to include more information on the effects of leasing in combination with other reasonably foreseeable future actions, including climate change.
28.	Charlotte	Basham	—	58396	7	Climate and Meteorology	The DEIS needs to make a clear assessment on how oil and gas development in the Refuge will further exacerbate climate change. For example, how many metric tons of emissions will there be ? Your figure underestimated the effects because it did not account for all the infrastructure and downstream use of the oil.	Section 3.2.1 of the Draft EIS provided an accounting of both direct GHG emissions from the phases of development and the indirect impacts from downstream combustion of recovered oil and gas. Pages 3-7 and 3-8 of the Draft EIS describe emissions from the incremental downstream use of the oil and gas production.
29.	Withheld	Withheld	—	59352	1	Climate and Meteorology	I am not satisfied that the DEIS correctly describes the increases in atmospheric carbon dioxide levels that would result from proceeding with oil leasing and development activities in the Arctic Refuge.	Given the potential production-related GHG emissions represent a tiny fraction of global CO2 emissions, the increase in atmospheric CO2 levels due to the proposed action would be small.

30.	Withheld	Withheld	NatureConnect NW	59676	1	Climate and Meteorology	The 2018 IPCC Report speaks to the lack of deep investigation in this plan: from page 2: "The report finds that limiting global warming to 1.5°C would require "rapid and far-reaching" transitions in land, energy, industry, buildings, transport, and cities. Global net human-caused emissions of carbon dioxide (CO2) would need to fall by about 45 percent from 2010 levels by 2030, reaching 'net zero' around 2050. This means that any remaining emissions would need to be balanced by removing CO2 from the air. "Limiting warming to 1.5°C is possible within the laws of chemistry and physics but doing so would require unprecedented changes," said Jim Skea, Co-Chair of IPCC Working Group III."n This reality, in the USA and globally, is not addressed in the Coastal Plain Oil and Gas Leasing Program. What mitigation is being considered for the CO2 rise? What impact will continued melt have on the project? And on the aftermath of what remains when the resources of this drilling and pumping location is complete? What future do the inhabitants, human, animak and vegetative, have after extraction?	The IPCC has recently relied on global climate models that have grossly overestimated the amount of warming (based on actual observations) from a given amount of GHG emissions (Christy 2015). Despite recent IPCC claims, the state of the science is not capable of predicting whether there will be detrimental impacts from specified amounts of GHG emissions. The IPCC has previously stated, "In climate research and modeling, we should recognize that we are dealing with a coupled non-linear chaotic system, and therefore that long-term prediction of future climate states is not possible" (IPCC Third Assessment Report [2001], Section 14.2.2.2, page 774).

32.	Elizabeth	Dobbins	—	67482	2	Climate and Meteorology	Section on sea ice is misleading. It is not recovering. Extent in a certain month may not be the absolute lowest, but the trend is downward and getting thinner.	Arctic sea ice has changed greatly due to natural variations over time. It was reported in numerous media articles in the early 1900s to be decreasing and at low points compared with prior observations. This was well before major amounts of industrial GHG emissions. The Arctic ice then built up again during the 1940s to the 1970s, when many climate scientists claimed we were entering a new ice age. This ice buildup was despite a major increase in GHG emissions during this period. The subsequent decline in Arctic ice since the late 1970s has been blamed by some on GHG emissions, but that cause is not proven, given there were major declines in earlier eras when there was little or no industrial scale GHG emitted. The slight recovery in recent years highlights the fact that there is significant natural variability, and that the Arctic sea ice may be stabilizing as opposed to continuing to decline.
33.	Laura	Herman	—	67494	2	Climate and Meteorology	The EIS must include the full impact of lease sales including impact in parts per million and global warming.	Text has been added to the Climate and Meteorology section of the Final EIS (Section 3.2.1) to describe the estimated impact of the development on atmospheric CO2 levels.

S. Public Comments and BLM Responses (Climate and Meteorology)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
34.	Jenny	Rowland-Shea	Center for American Progress	67555	4	Climate and Meteorology	Misleadingly, the analysis only calculates the fractional GHG emissions from the consumption and combustion of oil that would result from the net increase in oil demand that the analysis predicts would result from Arctic Refuge production. As a result, the Trump administration's analysis suggests that the indirect GHG emissions from combustion and downstream use of the oil would amount to 0.7 million to 5 million metric tons annually. But if one calculates the total GHG emissions that would result from combustion of all the oil and gas that the DEIS predicts will be extracted from the Arctic Refuge, this number is magnitudes higher. CAP estimates that closer to 62 million metric tons of CO2 equivalent would be released into the atmosphere from the oil that the DEIS predicts will be produced from the Arctic Refuge-equal to the annual emissions of approximately 16 coal-fired power plants or 13 million cars.	The comment seems to be questioning the Draft EIS analysis methodology, which considers only the incremental global amount of petroleum production that could result from the proposed leasing, rather than looking at the total production as if it were isolated from global markets. The Draft EIS appropriately provides a comparison of the GHG emissions of the proposed action versus the No Action Alternative (i.e., the incremental GHG emissions), as prescribed by NEPA. In addition, BOEM's MarketSim analysis shown in Appendix R, Table R-3, of the Final EIS, shows total consumption-related GHG emissions of the Coastal Plain development, prior to discounting to account for market supply and demand effects.
35.	Margaret	Lorenz	—	67570	1	Climate and Meteorology	The DEIS must take into account the carbon pollution that this fossil-fuel project would exacerbate.	The Draft EIS presents estimated GHG emissions in a global context, so the reader can gauge the portion of the cumulative global GHG emissions that would be due to the proposed action. The ongoing effects of climate change on specific natural and human resources in the Arctic are described in the Climate Change subsection of the Affected Environment for those resources. The Final EIS cumulative effects sections have been updated, where appropriate, to include more information on the effects of leasing in combination with other reasonably foreseeable future actions, including climate change.

40.	Withheld	Withheld	—	69634	3	Climate and Meteorology	The DEIS further under-represents the amount of carbon pollution created, thus failing to truthfully address leasing implications to the looming climate crisis	The Draft EIS presents estimated GHG emissions in a global context, so the reader can gauge the portion of the cumulative global GHG emissions that would be due to the proposed action. The ongoing effects of climate change on specific natural and human resources in the Arctic are described in the Climate Change subsection of the Affected Environment for those resources. The Final EIS cumulative effects sections have been updated, where appropriate, to include more information on the effects of leasing in combination with other reasonably foreseeable future actions, including climate change.
41.	Becky	Long	—	69710	7	Climate and Meteorology	Comment- P. 3-6, Chapter 3.2.1 Climate and Meteorology, Impacts associated with potential development on climate change. Direct and Indirect Greenhouse Gas (GHG) Emissions are underestimated. The draft underestimates emissions by only calculating only "the relatively small increase in US demand from increased US supply." The draft only states there is a potential for additional GHG emissions from combustion of products themselves in global market place. But this is the exact data number that should be calculated i.e. burning all of the oil and gas that is projected to be extracted. This is important because p. 3-5 states the macro-scale effects on climate change would be through the increased GHG emissions. Carbon equivalent emission as a data category needs to be explained.	The Draft EIS presents estimated GHG emissions in a global context, so the reader can gauge the portion of the cumulative global GHG emissions that would be due to the proposed action. The ongoing effects of climate change on specific natural and human resources in the Arctic are described in the Climate Change subsection of the Affected Environment for those resources. The Final EIS cumulative effects sections have been updated, where appropriate, to include more information on the effects of leasing in combination with other reasonably foreseeable future actions, including climate change.

42.	Becky	Long	—	69710	9	Climate and Meteorology	The oil and gas industry states that methane emissions from production are unavoidable. In a r 12/18/2018 Alaska Oil and Gas Conservation Commission hearing on methane emissions, Kara Moriarty, the Executive Director of the Alaska Oil and Gas Association which is an industry trade lobbying group testified to the following. "The venting or flaring of some natural gas is practically an unavoidable consequence of oil and gas development. Routine and continuous flaring of pilot and purged gas during the non-emergency situations is a key component to the safe development of oil and gas reserves." Additionally, flaring of the gas associated with drilling and production produces black carbon which is a known and recognized localized warming impact on ice and snow thus creating more climate impacts.	Text has been added to the Final EIS to indicate that some of the natural gas produced would be flared for safety purposes. The GMT2 emissions analysis, on which Coastal Plain projects relied for the direct emissions estimates, includes flaring emissions. The BLM agrees that some GHG and black carbon emissions from petroleum production are unavoidable.
43.	Becky	Long	—	69710	11	Climate and Meteorology	Comment-P. 3-9 Chapter 3.2.1. Social Costs of GHG Emissions The Social Cost of Carbon (SCC) Protocol should be used to quantify impacts. The SCC protocol should be used to analyze possible climate change impacts. Tribal climate adaption planning efforts in the North Slope could be used as inputs into the protocol. The communities of Kaktovik, Nuiqsut, Atqasak, and Wainwright have completed Impact Assessments. Utqiagvik has had workshops and webinars.	The BLM has reviewed this comment and determined that the social cost of carbon (SCC) is not appropriate for this programmatic level of analysis, as described in Section F2.1 in Appendix F of the EIS.

44.	Rebecca	Rom	—	69711	3	Climate and Meteorology	Nowhere are the impacts of climate change felt more acutely than the Arctic, which is warming at more than double the rate of the rest of the country. As villages erode, permafrost melt weakens infrastructure, and food sources disappear, the draft EIS fails to assess how expanding fossil fuel development could exacerbate the impacts of climate change already at the front door of Arctic communities.	The Draft EIS presents estimated GHG emissions in a global context, so the reader can gauge the portion of the cumulative global GHG emissions that would be due to the proposed action. The ongoing effects of climate change on specific natural and human resources in the Arctic are described in the Climate Change subsection of the Affected Environment for those resources. The Final EIS cumulative effects sections have been updated, where appropriate, to include more information on the effects of leasing in combination with other reasonably foreseeable future actions, including climate change.
45.	Jennifer	Bradford	—	69764	2	Climate and Meteorology	The DEIS significantly underestimates the amount of carbon pollution that oil leasing and development would add to atmosphere, and fails to truthfully address the implications of exacerbating the climate crisis.	The Draft EIS presents estimated GHG emissions in a global context, so the reader can gauge the portion of the cumulative global GHG emissions that would be due to the proposed action. The ongoing effects of climate change on specific natural and human resources in the Arctic are described in the Climate Change subsection of the Affected Environment for those resources. The Final EIS cumulative effects sections have been updated, where appropriate, to include more information on the effects of leasing in combination with other reasonably foreseeable future actions, including climate change.

46.	MaryRose	Randall	—	69773	2	Climate and Meteorology	You have severely underestimated the amount of carbon pollution that would be added to the atmosphere, and its effect on climate change.	The Draft EIS presents estimated GHG emissions in a global context, so the reader can gauge the portion of the cumulative global GHG emissions that would be due to the proposed action. The ongoing effects of climate change on specific natural and human resources in the Arctic are described in the Climate Change subsection of the Affected Environment for those resources. The Final EIS cumulative effects sections have been updated, where appropriate, to include more information on the effects of leasing in combination with other reasonably foreseeable future actions, including climate change.
47.	Withheld	Withheld	—	70934	17	Climate and Meteorology	There are numerous and significant differences in the climate, hydrology and wildlife of the Arctic Refuge and the Colville Delta (GMT-2). If development decisions are being based on the assumption that the climate is the same, then there will be significant errors in judgment. Climate data for the Arctic Refuge should be used, rather than relying on an erroneous proxy 150 - 200 miles to the west. Kaktovik is an acceptable data-point for the coastal region but without data for Kavik or any location inland, BLM is essentially shooting in the dark and should be required to gather additional data prior to leasing.	The BLM does not assume that the climate in the Arctic Refuge is analogous to the climate in the Colville Delta. The Draft EIS includes climate data for Kaktovik and areas inland from Kaktovik on pages 3-2 to 3-4; it does not rely on climate data from the Colville Delta. NEPA analyses for future site-specific development proposals would include the collection of location-specific meteorological data if needed for that analysis.

50.	Withheld	Withheld	Kachemak Bay Conservation Society	72060	3	Climate and Meteorology	<p>The DEIS significantly underestimates carbon emissions that would result from drilling in the Arctic Refuge. The estimate of impacts in the is based on the expected increase in demand that would result from developing the Refuge, but it does not account for burning all of the oil projected to be extracted. The final EIS cannot evade the common-sense of an assessment of the impacts of the burning of the fossil fuels extracted. The Center for American Progress has analyzed the project proposal and estimates that roughly 62 million tons of CO2 would be released into the atmosphere: the impact of these emissions to the global climate, to the arctic, and to the Refuge must be accounted for in a final EIS.</p>	<p>The Draft EIS presents estimated GHG emissions in a global context, so the reader can gauge the portion of the cumulative global GHG emissions that would be due to the proposed action. Appendix R, Table R-3, of the Final EIS, shows total consumption-related GHG emissions of the Coastal Plain development, prior to discounting to account for market supply and demand effects, based on BOEM's MarketSim analysis. The ongoing effects of climate change on specific natural and human resources in the Arctic are described in the Climate Change subsection of the Affected Environment for those resources. The Final EIS cumulative effects sections have been updated, where appropriate, to include more information on the effects of leasing in combination with other reasonably foreseeable future actions, including climate change.</p> <p>The Draft EIS analysis accounts for the estimated incremental amount of oil and gas burned on a global scale, and the resulting estimates of GHG emissions. Because the increase is small in a global context, the proposed action, by itself, would not measurably affect climate change adaptation or mitigation challenges in the Arctic or globally.</p>

S. Public Comments and BLM Responses (Climate and Meteorology)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
51.	Withheld	Withheld	The North Face	72063	1	Climate and Meteorology	The Arctic is ground zero for climate change - temperatures there are rising at twice the rate of the rest of the planet.[1 National Oceanic and Atmospheric Administration: Arctic Report Card] According to The Intergovernmental Panel on Climate Change (IPCC), there is no room in the carbon budget for new fossil fuel extraction anywhere in the United States[2 IPCC Fifth Assessment Report], as we are the world's largest historic emitter of greenhouse gas pollution, responsible for 26 percent of cumulative global CO2 emissions since 1870, and are currently the world's second highest emitter on an annual and per capita basis[3 Global Carbon Project - Global Carbon Budget]. The draft EIS inadequately evaluates how expanding fossil fuel development could further the on the ground impacts of climate change.	The scientific evidence suggests that most of the observed warming in Alaska over the past few decades is due to a natural ocean circulation feature known as the Pacific Decadal Oscillation (PDO; see page 3-3 of the Draft EIS). Restricting GHG emissions, especially in just the U.S., which now represents a small and shrinking portion of global emissions, would not have a measurable effect on climate change globally or regionally in Alaska.
52.	Withheld	Withheld	—	72087	1	Climate and Meteorology	The DEIS significantly underestimates the greenhouse gas emissions that would result from drilling the Arctic Refuge. Extrapolating from ratios in Table 3-4 (volume 1, p.78) the total annual indirect GHG emissions from the oil produced in the Arctic Refuge, under their 'high-end case' scenario, would be approximately 128 million metric tons of CO2 equivalent, or the annual emissions of approximately 32 coal fired power plants or 27 million cars, not 0.7- 5 million metric tons stated.	The Draft EIS analysis accounts for the estimated incremental amount of oil and gas burned on a global scale, and the resulting estimates of GHG emissions. Because the increase is small in a global context, the proposed action, by itself, would not measurably affect climate change adaptation or mitigation challenges in the Arctic or globally.

S. Public Comments and BLM Responses (Climate and Meteorology)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
53.	Withheld	Withheld	—	73209	1	Climate and Meteorology	The Trans Alaska Pipeline is over forty years old and was designed for a 30-year service life. It operates on borrowed time and is fragile and subject to catastrophic failure at any time. It was also designed not to melt the existing permafrost along its corridor, but not to survive severe stresses of melting permafrost due to global warming. The Climate Change section of the EIS does not address this vital aspect that underlies the economic viability of all oil and gas programs on the North Slope and there is no known plan to replace TAPS. This is a severe deficiency in the EIS because without TAPS, no oil will leave the Coastal Plain of the Arctic Refuge. This program will be defunct.	TAPS is regulated by state and federal authorities in terms of its safety and viability for continued use. TAPS is maintained to provide for long-term continued use.
54.	Lisa	Baraff	Northern Alaska Environmental Center	74306	24	Climate and Meteorology	The BLM significantly underestimates carbon emissions that would result from drilling in the Arctic Refuge, estimating only 56,739 to 378,261 metric tons of annual direct GHG emissions (from extraction, transport, etc.) and 0.7 to 5 million metric tons of annual indirect GHG emissions (from combustion and downstream use of the oil) - measured in CO2 equivalent. (Vol. 1, Table 3-5 p.78) This is misleading and only calculated from the increase from oil demand that the analysis predicts will result from developing the Coastal Plain and does not account for burning all of the oil BLM projects will be extracted. That number is much larger.	The Draft EIS presents estimated GHG emissions in a global context, so the reader can gauge the portion of the cumulative global GHG emissions that would be due to the proposed action. The ongoing effects of climate change on specific natural and human resources in the Arctic are described in the Climate Change subsection of the Affected Environment for those resources. The Final EIS cumulative effects sections have been updated, where appropriate, to include more information on the effects of leasing in combination with other reasonably foreseeable future actions, including climate change.
55.	Lisa	Baraff	Northern Alaska Environmental Center	74306	25	Climate and Meteorology	The DEIS fails to assess individual and cumulative impacts of the GHG emissions that will result from the oil and gas program. There is no assessment of the climate change impact associated with the anticipated emissions.	The Draft EIS specifically estimates the GHG emissions impacts of the proposed action in a global context, which is by definition cumulative in accounting for all other global GHG sources.

56.	Allen E.	Smith	—	74324	1	Climate and Meteorology	The DEIS does not consider that development there would hasten climate change on the coastal plain, is inadequate in its analysis of these negative outcomes, and does not meet the requirements of NEPA.	The Draft EIS presents estimated GHG emissions in a global context, so the reader can gauge the portion of the cumulative global GHG emissions that would be due to the proposed action. The ongoing effects of climate change on specific natural and human resources in the Arctic are described in the Climate Change subsection of the Affected Environment for those resources. The Final EIS cumulative effects sections have been updated, where appropriate, to include more information on the effects of leasing in combination with other reasonably foreseeable future actions, including climate change.
57.	Allen E.	Smith	—	74324	13	Climate and Meteorology	the DEIS fails to address climate change impacts from oil and gas leasing activities on the ANILCA protected resources of the Arctic Refuge coastal plain and fails to evaluate climate change impacts on the safety and long-term productivity of oil and gas leasing activities there.	The Draft EIS presents estimated GHG emissions in a global context, so the reader can gauge the portion of the cumulative global GHG emissions that would be due to the proposed action. The ongoing effects of climate change on specific natural and human resources in the Arctic are described in the Climate Change subsection of the Affected Environment for those resources. The Final EIS cumulative effects sections have been updated, where appropriate, to include more information on the effects of leasing in combination with other reasonably foreseeable future actions, including climate change.

S. Public Comments and BLM Responses (Climate and Meteorology)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
58.	Rosa	Brown	Vuntut Gwitchin Government	74326	24	Climate and Meteorology	Climate change and stressors: Lack of Climate Change impact analysis In its assessment of the impacts of climate change on the Porcupine caribou herd, the draft EIS primarily speaks in speculative future generalities, for example “could result in...” The draft EIS fails to synthesize the results of research and Traditional Knowledge on past and present climate change effects on the Porcupine caribou herd, their habitats and migration behaviour. The draft EIS does not include assessment of the combined and synergistic impacts of climate change and Coastal Plain oil and gas activities, infrastructure, and production in the future on the Porcupine caribou herd. Nor does it consider the trajectory of climate change under the range of different IPCC scenarios and their impact on environmental change in the region and caribou, and consider the added risk due to the changing climate from oil and gas development over the 85 - 130 year life oil and gas activities and infrastructure in the Coastal Plain.	Traditional knowledge has been shared with the BLM throughout development of the EIS, including during scoping, public meetings on the Draft EIS, and government-to-government and ANCSA consultations, and through the Section 106 process. This information has been used to help inform development of the EIS and ensure a more robust analysis. In addition, more information on the synergistic effects of development and climate change on wildlife and other resources has been added to the cumulative effects sections in the Final EIS.
59.	Philip	Wight	—	74333	3	Climate and Meteorology	Furthermore, the methods employed by the DEIS in calculating cumulative carbon emissions-- both in terms of upstream development and emissions from consumption--relies upon flawed methods and analysis. The analysis must consider how the extra potentially billions of barrels of oil will induce demand and cause emissions beyond the baseline status quo. The DEIS must include a comprehensive analysis of extra greenhouse gas emissions that will result from both upstream development and downstream demand.	The Draft EIS analysis accounts for the estimated incremental amount of oil and gas burned on a global scale, and the resulting estimates of GHG emissions, based on BOEM's MarketSim analysis provided in Appendix R of the Final EIS. Because the increase is extremely small in a global context, the proposed action, by itself, would not measurably affect climate change adaptation or mitigation challenges in the Arctic or globally.

60.	Renae	Smith	Counsel for Environmental Protection	74336	25	Climate and Meteorology	Second, despite recognizing the inherent difficulties and uncertainties in economic projections, the DEIS's greenhouse gas emissions analysis assumes without reasonable explanation that oil production will increase over the next 70 years without acknowledging significant efforts to move toward cleaner energy sources. 137 As discussed above, movement toward cleaner energy has the potential to contribute toward lower oil prices, which would make Coastal Plain development uneconomic. 138 Clean energy policy and greenhouse gas reduction goals and state legislative mandates together with technological developments are depressing both the U.S. and global demand for oil, resulting in a projected 2 billion barrel per day decline from current levels over the next 5 to 15 years.139	The BLM used the best available information for oil production at the time of the EIS preparation. At this time, world oil production is on an upward trajectory, despite contributions by cleaner energy sources to total energy production. Assuming the demand for oil and the production rate will continue to climb provides a realistic estimate of GHG emissions.
61.	Renae	Smith	Counsel for Environmental Protection	74336	28	Climate and Meteorology	artificially minimizes the potential impacts of greenhouse gas emissions and related climate impacts from the proposed Leasing Program.	The Draft EIS presents estimated GHG emissions in a global context, so the reader can gauge the portion of the cumulative global GHG emissions that would be due to the proposed action. The ongoing effects of climate change on specific natural and human resources in the Arctic are described in the Climate Change subsection of the Affected Environment for those resources. The Final EIS cumulative effects sections have been updated, where appropriate, to include more information on the effects of leasing in combination with other reasonably foreseeable future actions, including climate change.

S. Public Comments and BLM Responses (Climate and Meteorology)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
62.	Renae	Smith	Counsel for Environmental Protection	74336	28	Climate and Meteorology	Third, BLM downplays the proposed Leasing Program's climate impacts by misleadingly oscillating between U.S. and global comparisons. Although the DEIS acknowledges that petroleum is a "global commodity," the DEIS unreasonably narrows its greenhouse gas emission analysis to United States supply and demand for petroleum. 162 Then the DEIS looks to global petroleum liquids production to determine the percentage of global oil production that may result if the proposed Leasing Program reaches peak production.163 Based on this comparison to the global market, the DEIS concludes that at peak production, "post-lease oil and gas activities could supply in the range of 0.1 to 0.5 percent of global oil production" and that this percentage is likely to decrease over time "[g]iven that global oil production continues to increase."164 BLM cannot have it both ways. BLM cannot look to global production to minimize the proposed Leasing Program's contribution to overall production and then focus only on United States demand for purposes of estimating total greenhouse gas emissions with and without Coastal Plain development.165 By shifting the bases of comparison, BLM's analysis unreasonably and	The U.S. supply and demand are a subset of global supply and demand, given oil is now imported and exported from the U.S.; therefore, U.S. projections necessarily account for the global oil market. By basing it on U.S. supply and demand, the Draft EIS analysis is not compromised by the analysis of incremental oil production for the proposed action.

S. Public Comments and BLM Responses (Climate and Meteorology)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
63.	Renae	Smith	Counsel for Environmental Protection	74336	29	Climate and Meteorology	BLM ignores a recent study finding that methane emissions were 60 percent higher than the EPA inventory estimate, likely because existing inventory methods miss emissions released during abnormal operating conditions. 168 BLM's incomplete and cursory summary fails to satisfy NEPA's requirement that BLM take a hard look at and robustly analyze greenhouse gas emission impacts from methane emissions associated with any natural gas and oil development under the proposed Leasing Program.	The BLM's projections of oil production and GHG emissions are necessarily order-of-magnitude accuracy. Methane emissions globally are a small part of total CO2e; furthermore, most of that methane is due to livestock and other (non-petroleum) methane sources. The methane leaks associated with Coastal Plain production are expected to be a small portion of CO2e emissions.
64.	Renae	Smith	Counsel for Environmental Protection	74336	32	Climate and Meteorology	[comment:74336-32; 237.01]BLM's other reasons for rejecting the social cost of carbon protocol lack a reasonable basis. First, BLM implies that because the NEPA review process is not a rulemaking process for which the social cost of carbon tool was originally created and because federal policy has changed,...[comment end]	The BLM has reviewed this comment and determined that SCC is not appropriate for this programmatic level of analysis, as described in Section F2.1 in Appendix F of the EIS.
65.	Renae	Smith	Counsel for Environmental Protection	74336	32	Climate and Meteorology	BLM has no obligation to calculate the social cost of carbon. 177 That reasoning is inconsistent with legal precedent requiring agencies to quantify both the costs and benefits of a proposed action. 178 BLM cannot rely on a general change in policy to refuse to comply with legal precedent interpreting NEPA's requirements.	The BLM has reviewed this comment and determined that SCC is not appropriate for this programmatic level of analysis, as described in Section F2.1 in Appendix F of the EIS.

S. Public Comments and BLM Responses (Climate and Meteorology)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
66.	Renaë	Smith	Counsel for Environmental Protection	74336	33	Climate and Meteorology	BLM's criticism that the social cost of carbon protocol does not allow for the "incremental impact" of a project on the environment or is not useful because it generates a range of dollar cost figures lacks support and contradicts BLM's previous statement that it sometimes "describes impacts using ranges of potential impacts." ¹⁷⁹ If BLM uses ranges to describe impacts elsewhere in its analysis, then BLM should also be willing to use a range of dollar cost figures generated by the social cost of carbon. Moreover, NEPA does not allow federal agencies to simply refuse to quantify carbon costs based on such claims of uncertainty or incomplete information. ¹⁸⁰	The BLM has reviewed this comment and determined that SCC is not appropriate for this programmatic level of analysis, as described in Section F.2.1 in Appendix F of the EIS.

S. Public Comments and BLM Responses (Climate and Meteorology)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
67.	Renaë	Smith	Counsel for Environmental Protection	74336	34	Climate and Meteorology	<p>BLM's cumulative impacts analysis fails to consider the reasonably foreseeable cumulative impacts of the proposed Leasing Program's greenhouse gas emissions when combined with other regional oil and gas development. Although Appendix F identifies ten other "reasonably foreseeable future onshore oil and gas projects" and claims that these projects were included in its cumulative effects analysis, BLM's cumulative impacts analysis of greenhouse gas emissions does not include consideration of these other projects. 185 For example, although Appendix F identifies the Willow Oil and Gas Project within the National Petroleum Reserve in Alaska (NPR-A) as a reasonably foreseeable project subject to its cumulative impacts analysis, BLM's discussion of cumulative impacts from greenhouse gas emissions does not discuss the Willow Project.186 BLM does, however, discuss the Willow Project in its analysis of cumulative economic impacts, along with the Point Thomson project on the eastern North Slope, the Greater Mooses Tooth One and Two Projects.187 Similarly, although BLM identifies the Alaska LNG Project, which would include a gas treatment plant at Prudhoe Bay and an 800-mile pipeline, BLM does not assess the cumulative climate impacts of that project and gas development in the proposed Leasing Area.188 It is arbitrary for BLM to identify these other projects as part of its cumulative impacts analysis and then fail to conduct that analysis with respect to greenhouse gas emissions and resulting climate change impacts.189</p>	<p>Other production projects, whether in Alaska or across the globe, are implicitly included in the supply and demand analysis. Given the global nature of the GHG concern, it does not matter where the emissions occur; therefore, other reasonably foreseeable projects that happen to be on the North Slope are not relevant to the GHG analysis.</p>

S. Public Comments and BLM Responses (Climate and Meteorology)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
68.	Renae	Smith	Counsel for Environmental Protection	74336	36	Climate and Meteorology	BLM cannot rely on incorporation of its analysis of cumulative impacts in the Greater Mooses Tooth Two Final Supplemental EIS to remedy these deficiencies because that analysis too is flawed. The Greater Mooses Tooth Two EIS contains an inadequate assessment of the cumulative impacts of greenhouse gas emissions and climate change, ¹⁹² does not consider the social cost of carbon, ¹⁹³ and does not account for the impacts of the proposed Leasing Program, ¹⁹⁴ which BLM projects to be significantly larger than the Greater Mooses Tooth Two project. ¹⁹⁵ Accordingly, BLM cannot rely on the Greater Mooses Tooth Two to satisfy its obligation to consider the cumulative impacts of greenhouse gas emissions on climate change. ¹⁹⁶	Other production projects, whether in Alaska or across the globe, are implicitly included in the supply and demand analysis. Given the global nature of the GHG concern, it does not matter where the emissions occur; therefore, other reasonably foreseeable projects that happen to be on the North Slope are not relevant to the GHG analysis. Because the GHG analysis considers the incremental petroleum production on a national (and by extension global) basis, it is a cumulative analysis.
69.	Withheld	Withheld	—	75139	1	Climate and Meteorology	First, it minimizes the true severity of decades of climate change-related impacts on natural and human ecosystems and the public health that will be experienced through further oil and gas development such as that proposed in the presented alternatives. In particular, the rationale for not providing a social cost of carbon calculation is not justified. Furthermore, the severity of both local and global landscape changes such as surface erosion, loss of sea ice, impacts on precipitation patterns, and loss of habitat are dramatically understated when considering these alternatives in the context of global climate change related to all sources of GHG emissions.	Potential climate change impacts on natural resources (including landscapes), human resources, and public health are addressed in appropriate sections of the Final EIS. BLM's reason's for not including SCC calculations are documented in Appendix F.

S. Public Comments and BLM Responses (Climate and Meteorology)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
70.	Jessica	Wentz	Sabin Center for Climate Change Law	75152	1	Climate and Meteorology	<p>BLM has acknowledged that this leasing proposal will generate direct GHG emissions from construction, drilling, production, processing, and transport of petroleum products as well as indirect emissions from the combustion of those products in the global marketplace. We appreciate that BLM has quantified these emissions but there are four key deficiencies in the GHG inventory which should be remedied in the final EIS. First, for indirect emissions from oil and gas combustion, BLM has failed to quantify gross emissions from the combustion of the oil and gas products that will be extracted pursuant to the proposed leasing program. Instead, BLM states that it has used a model ("MarketSim") to estimate how the increase in production will affect US demand for petroleum products and then used a second model ("GHG Model") to estimate the corresponding emissions of those market impacts. There are several problems with BLM's approach: * As BLM acknowledges, "the MarketSim model considers only the US supply and demand for petroleum; thus, the accuracy of the change (increase) in petroleum demand estimated from MarketSim projections is limited, given its scope is just the US market; however, any type of supply and demand projections must be considered as quite uncertain, given the inherent difficulties in economic projections."¹ * The EIS contains very little information about the inputs, assumptions, and functions for both models, making it impossible for a reader to understand how BLM actually calculated emissions. * The EIS does not contain the full results from this modelling exercise. For example, with respect to the MarketSim outputs, BLM simply states</p>	<p>MarketSim simulates end-use domestic consumption of oil, natural gas, coal, and electricity in four sectors (residential, commercial, industrial, and transportation); primary energy production; and the transformation of primary energy into electricity. MarketSim mostly represents U.S. energy markets, but it also captures interaction with world energy markets as appropriate. BOEM recognizes the uncertainty in its projections and the further uncertainty in attempting to model the entire set of energy market substitutions that would occur globally. BOEM also does not have sufficient data to support estimates of the GHG emissions likely to result from changes in foreign oil consumption. In regards to inputs, assumptions, and functions for the MarketSim and GHG models, this information is contained in BOEM's documentation for these models: https://www.boem.gov/ESPIS/5/5612.pdf https://www.boem.gov/OCS-Report-BOEM-2016-065/. For the MarketSim model, the Final EIS has been revised to say that MarketSim estimated the percentage of proposed action-related GHG emissions that would be incremental in the U.S. energy (not just oil) market. Thus, the 3.9 percent in the high-end case and the 3.4 percent in the low-end case are not the increase in oil demand; they are the increase in domestic energy demand, as a percentage of the total energy in petroleum that would be produced in the Coastal Leasing area. In regards to how the BLM accounted for factors such as the effects of climate policies on oil demand, BOEM's MarketSim model uses the EIA Annual Energy</p>

S. Public Comments and BLM Responses (Climate and Meteorology)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
70. (cont.)	(see above)	(see above)	(see above)	(see above)	(see above)	(see above)	that the model projects an increase in oil demand equivalent to 3.4% (low-end case) to 3.9% (high-end case) of the projected Coastal Plain leasing production. * The model results are presented as a uniform annual projection for the anticipated 70- year duration of oil and gas production, despite the fact that baseline US oil demand will almost certainly decrease dramatically over this period due to the compelling need to reduce GHG emissions and fossil fuel consumption. It is unclear whether and how BLM accounted for factors such as the effect of climate policies on oil demand when applying the model due to the problems noted above. We recommend that BLM address these deficiencies by: (i) quantifying gross combustion emissions, (ii) more fully disclosing the assumptions, inputs, functions, and outputs of the models used in its net emissions analysis, and (iii) adjusting its model parameters to provide more accurate emissions estimates (e.g., by expanding geographic coverage and energy sources, 1 DEIS at 3-7. 3 3 and by accounting for long-term effects of climate policies on petroleum demand in baseline projections).	Outlook baseline data in the model. EIA's forecast looks at existing policies and does not forecast future laws or policies. BOEM uses the EIA projections as the official government estimates of future energy consumption. Any potential climate policy would be too uncertain at this stage to fully estimate into the model. There are currently no reliable methodologies for forecasting foreign energy cross-price elasticities and oil/gas price shock substitution responses to arrive at a global GHG emissions impact from associated domestic changes. Also, the D.C. Circuit has held that agencies are not required to model how their actions will affect global energy markets and how those market changes will, in turn, affect foreign greenhouse gas emissions (Sierra Club, 867 F.3d at 202). That kind of analysis is simply "too speculative" and infeasible to be required under NEPA. In sum, the EIS has been updated to include the gross combustion emissions, to add full results tables, to reference the Lifecycle paper and MarketSim documentation, and to provide information as to why alternative future carbon policies and foreign consumption aren't modeled.
71.	Jessica	Wentz	Sabin Center for Climate Change Law	75152	2	Climate and Meteorology	it is unclear whether BLM considered all transportation emissions. BLM states that the direct emissions estimate includes transport emissions, but it does not specify whether the estimate is confined to transport within the project area or whether it also includes transport from the project area to end users. BLM should disclose the parameters of its analysis and should incorporate estimates of indirect transport emissions (from project location to end use) if they are not already included in the inventory.	The GHG emissions of the proposed action are only approximations, given detailed design information of the pipeline infrastructure and more are not available at this stage. Subsequent NEPA actions for specific developments within the Coastal Plain would provide more detail; however, as with the GMT2 analysis of indirect GHG emissions, the lifecycle analysis tool used for the Coastal Plain includes the indirect emissions from transport of the oil.

72.	Jessica	Wentz	Sabin Center for Climate Change Law	75152	3	Climate and Meteorology	BLM acknowledges that methane emissions will be generated as a result of methane leaks during transport and estimates that these emissions will be equal to roughly 5% of indirect emissions from combustion. However, BLM does not include these emissions in its emissions inventory (i.e., the tables summarizing indirect and direct emissions). BLM should include these emissions in its inventory.	The BOEM's modeling tool used for "indirect" lifecycle GHG emissions includes CO2 emissions, nitrous oxide emissions, and methane emissions; therefore, the data presented in the Draft EIS already include methane emissions from transport, refining, and consumption of petroleum products.
73.	Jessica	Wentz	Sabin Center for Climate Change Law	75152	4	Climate and Meteorology	BLM has failed to quantify total emissions across the lifetime of the project. While BLM does provide annual estimates of direct and indirect emissions, the total lifetime emissions are not readily apparent. BLM should disclose these to give decision-makers and public a more comprehensive sense of potential emissions impacts.	The GHG emissions were presented on an annual basis to allow a comparison with global, U.S., and Alaska emissions, which are reported annually. Total GHG emissions for the life of the development can be derived by multiplying annual emissions by the assumed 70-year production period. See Appendix R for MarketSim analysis.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
76.	Jessica	Wentz	Sabin Center for Climate Change Law	75152	6	Climate and Meteorology	approved by the courts, which can be used to assign a dollar value to the potential impacts of these emissions. ⁷ * The Environmental Protection Agency (EPA)'s quantification threshold of 25,000 tons per year of CO ₂ e to identify major emitters for the purposes of GHG reporting (as noted by EPA, facilities that surpass this threshold are considered the "largest emitters" in the country). ⁸ * The EPA's GHG Equivalencies Calculator, which would allow BLM to compare emissions from the proposal with, e.g., emissions from household electricity use or vehicle miles driven. ⁹	The comparisons with state, national, and global GHG emissions provided in the Draft EIS were considered the most objective comparisons with potential Coastal Plain emissions. Equivalency calculators provide a changing metric, as the average motor vehicle mileage changes rapidly and household electricity use trends toward lower GHG production.
77.	Jessica	Wentz	Sabin Center for Climate Change Law	75152	6	Climate and Meteorology	The analysis of GHG emissions contains no discussion or conclusion on the significance of those emissions. The only analytical technique BLM uses to assess the magnitude of the emissions is a comparison to global and national total emissions - a technique which produces misleading results, insofar as the project emissions are expressed as a relatively small percentage of these much larger totals (e.g., BLM estimates that the Coastal Plain direct emissions are approximately 0.0001 to 0.0008 % of global emissions). CEQ explicitly rejected this approach in its 2016 Final Guidance on the Consideration of Climate Change in NEPA Reviews, explaining that: [A] statement that emissions from a proposed Federal action represent only a small fraction of global emissions is essentially a statement about the nature of the climate change challenge, and is not an appropriate basis for deciding whether or to what extent to consider climate change impacts under NEPA. Moreover, these comparisons are also not an appropriate method for characterizing the potential impacts associated with a proposed action and its alternatives	There is no basis to assess the significance of GHG emissions, as there are no impact thresholds of acceptability. The context and intensity of impacts guidance is not helpful for GHG emissions. This is because it is not possible to attribute individual proposed action impacts on climate. SCC is not used for reasons explained in Section F.2 of Appendix F of the Draft EIS.

77. (cont.)	(see above)	(see above)	(see above)	(see above)	(see above)	(see above)	and mitigations because this approach does not reveal anything beyond the nature of the climate change challenge itself: the fact that diverse individual sources of emissions each make a relatively small addition to global atmospheric GHG concentrations that collectively have a large impact. ⁵ We recognize that this guidance has been rescinded, but the CEQ's reasoning holds true: comparisons to global and national totals are at best unhelpful and at worst misleading to decisionmakers and the public. To assess the significance of these emissions, BLM should refer to NEPA regulations defining the criteria to be used in significance determinations (which instruct agencies to consider both the context and intensity of the impacts). ⁶ Contextual factors which are relevant to any proposal which would increase the production of fossil fuels include: (i) the fact that climate change is such a massive environmental problem; (ii) the broad scope of interests that will be adversely affected by this problem, and (iii) the compelling need to rapidly reduce dependency on fossil fuels to address this problem. With regards to intensity, BLM should use the following tools to assess and disclose the magnitude of the emissions impact: * The Social Cost of Carbon (SC-CO2), Methane (SC-CH4), and Nitrous Oxide (SC-N2O) metrics that were developed through a federal interagency consultation process and	(see above)

78.	Jessica	Wentz	Sabin Center for Climate Change Law	75152	7	Climate and Meteorology	<p>BLM acknowledges that many commenters have urged it to use the social cost metrics in its NEPA analyses, but maintains that this is in appropriate because: (i) the metrics were developed for a rulemaking context, (ii) NEPA does not require a cost-benefit analysis or monetization of costs; (iii) the metrics don't accurately reflect the incremental emissions impact of the proposal; and (iv) the metrics are not useful to decision-makers. With regards to the first point: the metrics may have been developed for a rulemaking context, but they can readily be used in an environmental analysis to better understand the potential costs associated with greenhouse gas emissions - and those cost estimates are a useful proxy for the actual impacts of climate change. The fact that the metrics were developed for rulemaking are irrelevant to the question of whether they would be useful in NEPA analyses. With regards to the second point: while it is true that NEPA does not require cost-benefit analysis or monetization of all adverse environmental impacts, an agency cannot arbitrarily monetize some costs and benefits while ignoring others in its EIS. Recognizing this, courts have held NEPA analyses to be inadequate where economic costs and benefits are monetized and the effect of GHG emissions is not monetized.</p>	<p>The BLM has reviewed this comment and determined that SCC is not appropriate for this programmatic level of analysis, as described in Section F2.1 in Appendix F of the EIS.</p>

S. Public Comments and BLM Responses (Climate and Meteorology)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
79.	Jessica	Wentz	Sabin Center for Climate Change Law	75152	9	Climate and Meteorology	BLM asserts that the "SCC protocol does not measure the actual incremental impacts of a project on the environment and does not include all damages or benefits from carbon emissions." This statement is partially incorrect. The SC-CO2, SC-CH4, and SC-N2O measure the actual incremental impacts of a project on the physical and human environment by specifying the incremental costs associated with an incremental increase in greenhouse gas emissions. These impacts are expressed as monetary costs rather than specific physical impacts because this is a reasonable and comprehensible way to aggregate many different impacts in a single metric. While it is true that the metrics do not capture all costs associated with GHG emissions, they at least capture a portion of those costs (and BLM can always disclose the costs that are not covered).	The BLM has reviewed this comment and determined that SCC is not appropriate for this programmatic level of analysis, as described in Section F2.1 in Appendix F of the Draft EIS.
80.	Jessica	Wentz	Sabin Center for Climate Change Law	75152	10	Climate and Meteorology	13 While we agree that there is no significance threshold defined for GHGs, this is true for many different types of impacts that are evaluated in NEPA reviews - there are no bright line rules for assessing significance, and agencies typically must use their discretion to determine when impacts pass the threshold of significance. The monetization of climate change impacts, however, is useful in informing significance determinations insofar as it provides a standard metric for comparing different impacts.	The BLM has reviewed this comment and determined that SCC is not appropriate for this programmatic level of analysis, as described in Section F2.1 in Appendix F of the EIS.

S. Public Comments and BLM Responses (Climate and Meteorology)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
81.	Jessica	Wentz	Sabin Center for Climate Change Law	75152	10	Climate and Meteorology	BLM states that “the dollar cost figure is generated in a range and provides little benefit in assisting the BLM Authorized Officer’s decision for program or project-level analyses, especially given that there are no current criteria or thresholds that determine a level of significance for social cost of carbon monetary values.”	The BLM has reviewed this comment and determined that SCC is not appropriate for this programmatic level of analysis, as described in Section F2.1 in Appendix F of the EIS.
82.	Jessica	Wentz	Sabin Center for Climate Change Law	75152	11	Climate and Meteorology	The emissions far surpass the reporting and quantification threshold of 25,000 tons per year of CO2e which has previously been used by CEQ and EPA to identify major emitters. Indeed, the annual emissions in the first year are 30x higher under the low case and 215x higher under the high case. * According to EPA’s GHG Equivalencies Calculator, the annual emissions from this proposal are equivalent to the emissions from: (i) approximately 160,000 - 1,142,000 passenger vehicles driven each year, or (ii) approximately 132,000 - 938,000 homes’ electricity use for one year. Again, these are very large numbers which would be viewed as significant in other contexts.	The BLM does not dispute that the Coastal Plain development projected GHG emissions are significant in the context of existing regulations, such as the cited EPA mandatory rule reporting threshold of 25,000 tons/year.
83.	Jessica	Wentz	Sabin Center for Climate Change Law	75152	11	Climate and Meteorology	We recognize that it may be difficult to precisely define a significance threshold for GHG emissions - but such a precise definition is unnecessary for this project because the total lifetime emissions and corresponding costs clearly surpass any reasonable threshold of significance. The following facts support this finding: * The total lifetime costs of emissions generated as a result of this proposal would range from approximately \$3.3 billion (low case) to \$23.4 billion (high case). These are significant costs by any measure. The annual costs (\$32 to \$159 million) are also significant by any measure.	The BLM has reviewed this comment and determined that SCC is not appropriate for this programmatic level of analysis, as described in Section F2.1 in Appendix F of the Draft EIS.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
84.	Jessica	Wentz	Sabin Center for Climate Change Law	75152	13	Climate and Meteorology	BLM's analysis of the cumulative impacts of GHG emissions simply refers readers back to its analysis of direct and indirect emissions and the comparisons to global and national GHG totals. BLM does not consider the cumulative GHG effects across multiple leasing decisions at any geographic scope. BLM should update this analysis to account for the cumulative effects of oil and gas leasing decisions in Alaska and the entire United States, as well as the cumulative effects of all federal fossil fuel development. We are not suggesting that BLM should conduct an entirely new nationwide analysis of GHG impacts from fossil fuel leasing for each leasing plan and decision - rather, the federal government should prepare such an analysis, update it regularly, and incorporate it into NEPA reviews for fossil fuel leasing decisions.	Other production projects, whether in Alaska or across the globe, are implicitly included in the supply and demand analysis. Given the global nature of the GHG concern, it does not matter where the emissions occur; therefore, other reasonably foreseeable projects that happen to be on the North Slope are not relevant to the GHG analysis.
85.	Jessica	Wentz	Sabin Center for Climate Change Law	75152	14	Climate and Meteorology	In the EIS, BLM references general climate change effects pertinent to the specific categories of affected environment and environmental consequences. However, these references provide insufficient information to evaluate the significance of these impacts on the project or how the project will cumulatively affect the environment and vulnerable species in combination with these climate impacts. BLM should ensure its assessment reflects the latest climate science and risks, further analyze how the cumulative impacts of climate change and energy development could negatively affect species and ecosystems, and more substantively address how climate change will impact oil and gas infrastructure and how those effects can be mitigated to reduce the risk of fuel leaks and fires.	Infrastructure for oil and gas development is not expected to be subject to any greater rate of change than it already has been over the past 40 plus years on the North Slope. There has been no measurable increase in the rate of spills on the North Slope over this period. For other natural and human resources, the Final EIS cumulative effects sections have been updated to include more information on the synergistic effects of Coastal Plain development and climate change where applicable.

86.	Jessica	Wentz	Sabin Center for Climate Change Law	75152	15	Climate and Meteorology	BLM notes a number of climate change impacts in passing, but should expand evaluation of the increased risks of wildfire, thawing permafrost, flooding, coastal erosion, loss of wetlands, and sea level rise as discussed in the most recent reports of the U.S. Global Change Research Program: * U.S. Global Change Research Program, Arctic Changes and their Effects on Alaska and the Rest of the United States. In Climate Science Special Report: Fourth National Climate Assessment, Volume I, at 303-332, available at https://science2017.globalchange.gov/ . 30 * U.S. Global Change Research Program, Chapter 26: Alaska, in the Fourth National Climate Assessment, Volume II, at 1185-1241, available at https://nca2018.globalchange.gov/ .	The Draft EIS incorporated by reference the climate change impacts noted by the commenter, including reports by the IPCC and NOAA. More information on the effects of development and climate change on natural and human resources has been added to the cumulative effects sections in the Final EIS.
87.	Jeannie	Ambrose	—	75238	6	Climate and Meteorology	Underestimation of carbon emissions released during O&G operations. Calculate how expansion of oil and gas development in the Coastal Plain will contribute to worsening of climate changes. The Arctic is warming faster than predicted and at twice the rate of the country.	The Draft EIS analysis accounts for the estimated incremental amount of oil and gas burned on a global scale, and the resulting estimates of GHG emissions. Because the increase is small in a global context, the proposed action, by itself, would not measurably affect climate change adaptation or mitigation challenges in the Arctic or globally. Regarding Arctic warming in recent decades, it is within the bounds of natural warming that has occurred apart from human activities since the last major ice age.

S. Public Comments and BLM Responses (Climate and Meteorology)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
88.	DJ	Schubert	Animal Welfare Institute	75588	9	Climate and Meteorology	<p>BLM failed to take a hard look at the climate change impacts from oil and gas leasing and development in the Coastal Plain. The DEIS partially discloses the amount of carbon dioxide pollution that may result from oil and gas leasing and development.⁶ However, BLM must take a hard look at the climate change impacts from emissions that would result from allowing extraction of oil and gas resources in the Coastal Plain. Production, transportation, refinement, and eventual combustion of this oil and gas would emit large quantities of greenhouse gases. BLM must therefore consider the climate impacts of this additional oil and gas production in its NEPA analysis. Courts have held that where agency actions make additional resources available to consumers, the effects of consumption of that resource must be considered. <i>Mid States Coalition for Progress v. Surface Transportation Board</i>, 345 F.3d 520 (8th Cir. 2003). Yet BLM has avoided performing an analysis of the greenhouse gas emissions that would result from oil and gas development that is reasonably foreseeable. See <i>New Mexico ex rel. Richardson v. Bureau of Land Mgmt.</i>, 565 F.3d 683, 718 (10th Cir. 2009) (assessment of all “reasonably foreseeable” impacts must occur at the earliest practicable point).</p>	<p>Section 3.2.1 of the Draft EIS discloses potential direct and indirect GHG emissions associated with oil and gas-related activities on the Coastal Plain. The scope of climate analyses has been raised in many prior EIS efforts, with the resulting guidance from federal officials that it is not possible to attribute global climate consequences to a single project. The state of the science is not capable of predicting whether there will be detrimental impacts from specific GHG emissions on specific areas. The BLM took a hard look by presenting estimates of the incremental global GHG emissions that could result from development and subsequent combustion of oil produced in the proposed leasing area.</p>

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
89.	DJ	Schubert	Animal Welfare Institute	75588	11	Climate and Meteorology	<p>It is well settled that where an agency action causes greenhouse gas pollution, NEPA mandates that agencies analyze and disclose the impacts of that pollution. As the Ninth Circuit has held: "the fact that climate change is largely a global phenomenon that includes actions that are outside of [the agency's] control . . . does not release the agency from the duty of assessing the effects of its actions on global warming within the context of other actions that also affect global warming." <i>Ctr. for Biological Diversity</i>, 538 F.3d at 1217 (quotations and citations omitted); see also <i>Border Power Plant Working Grp. v. U.S. Dep't of Energy</i>, 260 F. Supages 2d 997, 1028-29 (S.D. Cal. 2003) (finding agency failure to disclose project's indirect carbon dioxide emissions violates NEPA). The need to evaluate such impacts is bolstered by the fact that "[t]he harms associated with climate change are serious and well recognized," and environmental changes caused by climate change "have already inflicted significant harms" to many resources around the globe. <i>Massachusetts v. EPA</i>, 549 U.S. 497, 521 (2007); see also <i>id.</i> at 525 (recognizing "the enormity of the potential consequences associated with manmade climate change."). "Conclusory remarks" "do not equip a decisionmaker to make an informed decision about alternative courses of action." <i>Natural Resources Defense Council v. Hodel</i>, 865 F.2d 288, 298 (D.C. Cir. 1988). Similarly, "[p]erfunctory references do not constitute analysis useful to a decisionmaker in deciding whether, or how, to alter the program to lessen cumulative environmental impacts."</p>	<p>The BLM agrees that the proposed action could contribute cumulatively to climate change through the production and subsequent downstream combustion of oil and gas extracted from the Coastal Plain. Because it is not possible to attribute the global climate consequences to a single project, reporting potential GHG emissions from a plan or project and comparing these emissions with emissions at larger scales provides context for decision makers and the public. The ongoing effects of climate change on specific natural and human resources in the Arctic were described in the Climate Change subsection of the Affected Environment for those resources in the Draft EIS. The Final EIS cumulative effects sections have been updated, where applicable, to include more information on the synergistic effects of Coastal Plain development and climate change on these resources.</p>

90.	DJ	Schubert	Animal Welfare Institute	75588	13	Climate and Meteorology	<p>Additionally, the DEIS fails to take a hard look at the impact of methane pollution specifically from oil and gas development in the Coastal Plain. Oil and natural gas systems are the biggest contributor to methane emissions in the United States, accounting for over one quarter of all methane emissions, or 129.9 million metric tons of carbon dioxide equivalent each year.⁷ This does not include methane that has been flared, captured, or otherwise controlled.⁸ However, methane emission rates can differ quite dramatically from one oil and gas field to the next, and, depending on the type of mitigation and emission controls employed, emissions can range anywhere from 1 percent to 12 percent of production.⁹ In order to sufficiently understand the scope of methane emission impacts, BLM should quantify estimated emission rates and analyze alternatives that would mitigate these impacts.</p>	<p>The BLM recognizes that some methane emissions are unavoidable with oil and gas development; however, it is not possible to make detailed estimates specific to potential development, given that specific types of processing equipment, and even the amounts of natural gas present in the oil reservoir, are not known. Therefore, attempting to further quantify methane emissions, beyond the methane contribution already included in BOEM's lifecycle GHG model, would be highly speculative at this point.</p>
91.	DJ	Schubert	Animal Welfare Institute	75588	33	Climate and Meteorology	<p>BLM's conclusory treatment of the cumulative impacts of greenhouse gas emissions fails to meet the hard look requirement under NEPA. See <i>Morris v. U.S. Nuclear Reg. Comm'n</i>, 598 F.3d 677, 681 (10th Cir. 2010).</p>	<p>The Draft EIS presents estimated GHG emissions in a global context, so the reader can gauge the portion of the cumulative global GHG emissions that would be due to the proposed action. The ongoing effects of climate change on specific natural and human resources in the Arctic are described in the Climate Change subsection of the Affected Environment for those resources. The Final EIS cumulative effects sections have been updated, where appropriate, to include more information on the effects of leasing in combination with other reasonably foreseeable future actions, including climate change.</p>

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
92.	Deanna	Noel	Defenders Of Wildlife	75598	4	Climate and Meteorology	it does not account for the 16 impacts of carbon emissions. It does count it, but 17 it does not extrapolate what these impacts are.	The Draft EIS presents estimated GHG emissions in a global context, so the reader can gauge the portion of the cumulative global GHG emissions that would be due to the proposed action. The ongoing effects of climate change on specific natural and human resources in the Arctic are described in the Climate Change subsection of the Affected Environment for those resources. The Final EIS cumulative effects sections have been updated, where appropriate, to include more information on the effects of leasing in combination with other reasonably foreseeable future actions, including climate change.
93.	Withheld	Withheld	—	75601	5	Climate and Meteorology	The assumptions used to calculate the carbon emissions resulting from drilling are misleading, and significantly underestimate total emissions. The calculations are based on only the net increase in oil demand that would result from developing the Refuge. To more realistically and accurately account for the carbon emissions of the oil and gas leasing, the calculations should account for the combustion of all oil and gas that would be extracted as a result of oil and gas leasing in the Refuge.	The Draft EIS analysis accounts for the estimated incremental amount of oil and gas burned on a global scale, and the resulting estimates of GHG emissions. Because the increase is small in a global context, the proposed action, by itself, would not measurably affect climate change adaptation or mitigation challenges in the Arctic or globally. In addition, the BOEM's MarketSim analysis shown in Appendix R, Table R-3, of the Final EIS, shows total consumption-related GHG emissions of the Coastal Plain development, prior to discounting to account for market supply and demand effects.
94.	Campbell	Webb	—	75610	1	Climate and Meteorology	* Please note: I also believe the DEIS is in error in its calculations in Table 3-4, by a factor of ten. According to the EPA (https://www.epa.gov/energy/greenhouse-gases-equivalencies-calculator-calculations-and-references) and other sources, 1 barrel of crude produces 0.43 tCO ₂ e. 10,000,000,000 barrels x 0.43 tCO ₂ e/barrel / 70 years = ~61 million tCO ₂ e/year, not 5 million. A serious and misleading error!	The commenter's calculation presumes the entire production is additive on a global basis. This is not correct; the oil production of the field would not be additive in the global market, as explained in Section 3.2.1 of the Draft EIS.

S. Public Comments and BLM Responses (Climate and Meteorology)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
95.	Withheld	Withheld	World Wildlife Fund	75613	2	Climate and Meteorology	BLM also omits a meaningful analysis of the cumulative impacts of industrial disturbance and degradation of permafrost, increased thermokarsting, altered precipitation patterns and hydrology, shortened winter seasons and other manifestations of a changing climate.	Permafrost degradation was addressed in the Draft EIS (Soils section). The trend (none) in annual precipitation was addressed in the Climate and Meteorology section of the Draft EIS. Additional information regarding the increasing temperature trend on the North Slope has been added to the Climate and Meteorology section of the Final EIS. Hydrology and thermokarsting are addressed in Soils and Water Resources sections of the Final EIS as appropriate.
96.	Andrew	Ogden	—	75704	9	Climate and Meteorology	The BLM significantly underestimates carbon emissions that would result from drilling the Arctic Refuge, estimating only 56,739 to 378,261 metric tons of annual direct GHG emissions (from extraction, transport, etc) and 0.7 to 5 million metric tons of annual indirect GHG emissions (from combustion and downstream use of the oil) - measured in CO2 equivalent. (Volume 1, Table 3-5 p.78) This is a very misleading set of numbers and is calculated only from the increase from oil demand that the analysis predicts will result from developing the Refuge. It does not account for burning all of the oil they project will be extracted. That number is much larger. CAP estimates that the equivalent to the annual emissions of 16 coal fired power plants would be emitted - roughly 62 million tons.	The Draft EIS analysis accounts for the estimated incremental amount of oil and gas burned on a global scale, and the resulting estimates of GHG emissions. Because the increase is small in a global context, the proposed action, by itself, would not measurably affect climate change adaptation or mitigation challenges in the Arctic or globally. In addition, BOEM's MarketSim analysis shown in Appendix R, Table R-3, of the Final EIS, shows total consumption-related GHG emissions of the Coastal Plain development, prior to discounting to account for market supply and demand effects.

97.	Andrew	Ogden	—	75704	10	Climate and Meteorology	This DEIS completely fails to assess how expanding oil and gas development in the Refuge will further exacerbate climate adaptation and mitigation challenges in an Arctic that is warming at twice the rate of the rest of the country.	The Draft EIS analysis accounts for the estimated incremental amount of oil and gas burned on a global scale, and the resulting estimates of GHG emissions. Because the increase is small in a global context, the proposed action, by itself, would not measurably affect climate change adaptation or mitigation challenges in the Arctic or globally. Regarding Arctic warming in recent decades, it is within the bounds of natural warming that has occurred apart from human activities since the last major ice age.
98.	Stephen	Harvey	—	75722	1	Climate and Meteorology	In section 3.4.10, Table 3-37 shows the calculations of beneficial economic impacts up to the national level. In section 3.2.1 Climate and Meteorology the non beneficial social cost of GHG emissions is not calculated. This is a bias in the EIS analysis that favors development of oil and gas resources at the expense of society impacted by GHG emissions. The geographical scope of economy and environment should be the same. The EIS should use the existing methodology to calculate the social cost of GHG emissions to provide readers with a fair analysis of the economic impacts of oil and gas extraction.	The BLM has reviewed this comment and determined that SCC is not appropriate for this programmatic level of analysis, as described in Section F2.1 in Appendix F of the Draft EIS.
99.	Lin	Davis	—	75891	5	Climate and Meteorology	The EIS does not address the current high rate of climate change in Alaska and the dangers it poses to oil and gas infrastructure.	Rates of climate change are described in BLM 2018a, incorporated by reference on page 3-2 of the Draft EIS, and is also stated in the Final EIS. The impacts of climate change on oil and gas infrastructure are described on page 3-9 of the Draft EIS, Impacts of Climate Change on Potential Development.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
100.	Lin	Davis	—	75891	6	Climate and Meteorology	Nor does it address the critical concern that oil and gas development in ANWR will exacerbate climate change by adding great amounts of black carbon from all the combustion activities inherent in just the development phase. The DEIS does not add in the burning of the oil extracted which is likely equivalent to the chugging of 16 new coal power plants.	The Draft EIS analysis accounts for the estimated incremental amount of oil and gas burned on a global scale, and the resulting estimates of GHG emissions. Because the increase is small in a global context, the proposed action, by itself, would not measurably affect climate change adaptation or mitigation challenges in the Arctic or globally.
101.	Chandra	Turner	Inuvialuit Game Council	75904	34	Climate and Meteorology	We note that potential errors in the DEIS' calculating of GHG emissions as a result of the proposed project activities have been published. (https://www.americanprogress.org/issues/green/news/2019/01/10/464819/interior-department-cutting-corners-ignoring-science-arctic-national-wildlife-refuge/) Cumulative effects (especially as they pertain to ongoing climate change) are not adequately considered or analyzed throughout the DEIS. At best, the species-specific sections summarize the possible effects from the proposed project and other outside activities and make qualitative statements about cumulative impacts. No rigorous cumulative effects analysis that considers synergistic and accumulative effects has been undertaken (NRC 2003). Cumulative effects on Canadian environmental measures and plans are not considered.	The Draft EIS appropriately provides a comparison of the GHG emissions of the proposed action versus the No Action Alternative (i.e., the incremental GHG emissions), as prescribed by NEPA. The BLM has reviewed the NRC 2003 document and incorporated information from this report in the cumulative effects sections of the Final EIS.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
102.	Chandra	Turner	Inuvialuit Game Council	75904	35	Climate and Meteorology	Climate change impacts to the leasing program and related activities are considered in a limited and qualitative manner. The treatment of this issue in the DEIS is insufficient.	The Draft EIS presents estimated GHG emissions in a global context, so the reader can gauge the portion of the cumulative global GHG emissions that would be due to the proposed action. The ongoing effects of climate change on specific natural and human resources in the Arctic are described in the Climate Change subsection of the Affected Environment for those resources. The Final EIS cumulative effects sections have been updated, where appropriate, to include more information on the effects of leasing in combination with other reasonably foreseeable future actions, including climate change.
103.	Brenna	Bell	—	77500	1	Climate and Meteorology	While the EIS did give some numbers of greenhouse gas emissions generated from the oil & gas extraction, these were not paired with any helpful analysis as to how these emissions would contribute to the already urgent climate change crisis. It also gave a few general cites to other, non-NEPA documents that discuss the global impacts of climate change. Was the BLM attempting to tier its discussion to these documents? If so, it cannot tier to non-NEPA analysis. Otherwise, generally citing other existing resources does not lift the obligation from the agency to include site-specific analysis and best available science in the body of its NEPA analysis. This is the record upon which a court will determine if the BLM took a hard look at all relevant issues.	Pages 3-6 through 3-9 of the Draft EIS showed estimated direct GHG emissions from post-lease oil and gas activities and indirect GHG emissions from the combustion of net fuels production exported to market. Because it is not possible to assign location-specific climate consequences to a single project or projects, GHG emissions were compared with emissions at larger scales to provide a context for decision makers and the public. The Final EIS cumulative effects sections have been updated, where appropriate, to include more information on the synergistic effects of Coastal Plain development and climate change impacts on the natural and human environment. On the second concern raised in this comment, the NEPA assessment for this proposed action was not attempting to tier off non-NEPA documents; it incorporated them by reference.

S. Public Comments and BLM Responses (Climate and Meteorology)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
104.	Brenna	Bell	—	77500	2	Climate and Meteorology	<p>Not only does the EIS need a more thorough analysis of the existing impacts of change and how the oil & gas projects will make significant cumulative additions to this crisis, it also must take a more thorough look at the impacts of climate change on the project area - beyond the difficulty of using large machinery when the permafrost melts. A very recent California case discussed the government's failure to take a hard look at how a changing climate exacerbates the adverse impacts of the proposed project, finding that to meet the hard look requirement, "NEPA requires an evaluation of the impact of climate change." <i>AquAlliance v. U.S. Bureau of Reclamation</i>, 287 F.Supages3d 969, 1028 (E.D. Cal. 2018). The court found that failure to consider climate change is a "failure to consider an important aspect of the problem" facing the proposed action. <i>Id.</i> at 1032, citing <i>Wild Fish Conservancy v. Irving</i>, 221 F.Supages3d 1224, 1233 (E.D. Wa. 2016) (Biological Opinion was arbitrary and capricious for failing to adequately consider impacts of climate change). In its EIS, the BLM similarly failed to recognize that an intact Arctic National Wildlife Refuge provides important habitat refugia for organisms stressed by a changing climate. AR14422, 17574. In this context, an ecologically intact ANWR takes on new significance, thus road construction, drilling, etc has an even greater impact.</p>	<p>The Draft EIS presents estimated GHG emissions in a global context, so the reader can gauge the portion of the cumulative global GHG emissions that would be due to the proposed action. The ongoing effects of climate change on specific natural and human resources in the Arctic are described in the Climate Change subsection of the Affected Environment for those resources. The Final EIS cumulative effects sections have been updated, where appropriate, to include more information on the effects of leasing in combination with other reasonably foreseeable future actions, including climate change. Regarding climate change impacts on ecological resources, impacts on these resources are discussed in Section 3.3 of the EIS.</p>

105.	Michael	Harris	Friends of Animasl	78288	1	Climate and Meteorology	Nowhere are the impacts of climate change felt more acutely than the Arctic, which is warming at more than double the rate of the rest of the country. The draft EIS fails to assess how expanding fossil fuel development could exacerbate the impacts of climate change already at the front door of Arctic communities.	The Draft EIS analysis accounts for the estimated incremental amount of oil and gas burned on a global scale, and the resulting estimates of GHG emissions. Because the increase is small in a global context, the proposed action, by itself, would not measurably affect climate change in the Arctic or globally. Regarding Arctic warming in recent decades, it is within the bounds of natural warming that has occurred apart from human activities since the last major ice age.
106.	Withheld	Withheld	—	79888	9	Climate and Meteorology	The DEIS failed to address climate impacts. ?The DEIS fails to provide any analysis of how expanding fossil fuel development in the Arctic Refuge would exacerbate the impacts of climate change already occurring across the Arctic. The DEIA fails to address how to minimize the impacts on climate. Developing oil and gas in the Arctic Refuge is inconsistent with the urgent need to address climate change.?	The Draft EIS presents estimated GHG emissions in a global context, so the reader can gauge the portion of the cumulative global GHG emissions that would be due to the proposed action. The ongoing effects of climate change on specific natural and human resources in the Arctic are described in the Climate Change subsection of the Affected Environment for those resources. The Final EIS cumulative effects sections have been updated, where appropriate, to include more information on the effects of leasing in combination with other reasonably foreseeable future actions, including climate change.

107.	Cherise	Gaffney	Alaska Oil and Gas Association, and American Petroleum Institute	79893	14	Climate and Meteorology	the FEIS should acknowledge that specific oil development practices on Alaska's North Slope result in lower potential fugitive emissions compared to national estimates. ⁷¹ Generally, North Slope development projects must provide environmental enclosures for equipment, which aids in leak prevention. For example, emissions from pigging operations in North Slope projects are typically captured and collected. As another example, Alaska state requirements prohibit what is defined as "unnecessary and wasteful" venting and flaring of gas. These practices should be accounted for in the FEIS.	The BLM acknowledges this comment. Specific mitigation practices will be analyzed in site-specific NEPA analyses for future project development proposals.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
108.	Withheld	Withheld	—	80022	2	Climate and Meteorology	<p>1. The BLM significantly underestimates carbon emissions resulting from drilling in the Arctic Refuge. The document does not address how expanding oil and gas development in this region of the Arctic will further exacerbate climate adaptation and mitigation challenges in the Arctic. The recent 4th National Climate Assessment report lays out increasing and substantial risks to the US economy, communities, and ecosystems. How will new oil and gas development in the Arctic Refuge contribute to and impact the risks and costs faced due to climate change in the US and globally?</p>	<p>The Draft EIS presents estimated GHG emissions in a global context, so the reader can gauge the portion of the cumulative global GHG emissions that would be due to the proposed action. The ongoing effects of climate change on specific natural and human resources in the Arctic are described in the Climate Change subsection of the Affected Environment for those resources. The Final EIS cumulative effects sections have been updated, where appropriate, to include more information on the effects of leasing in combination with other reasonably foreseeable future actions, including climate change.</p> <p>The Fourth National Climate Assessment was released in November 2018, after the BLM completed the Draft EIS for publication. The BLM has reviewed this publication and compared it against the climate trends described in BLM 2018a, which were incorporated by reference. As these trends are similar, a sentence has been added to the Final EIS stating that the Fourth National Climate Assessment confirms the climate trend information reported in BLM 2018a.</p>
109.	Jason	Schwartz	Institute for Policy Integrity	80216	4	Climate and Meteorology	<p>BLM takes an inconsistent approach to time scales in its analysis, which misrepresents the damages caused by greenhouse gas emissions over the projected 70-year lifetime of fossil fuel development in the Coastal Plain. For direct emissions, the agency compresses the timeline of emissions to 37 years, based on the analysis for the Greater Mooses Tooth 2 project, even though Coastal Plain development is expected to extend 50-100 years, or longer.</p>	<p>The use of GMT2 proportional estimates for “direct” emissions in the Draft EIS is a conservative aspect of the analysis, in that the analysis presents estimates of annual emissions totals. If production happens over a longer period, the annual direct emissions from the Coastal Plain would be less, and the project would represent a smaller portion of state, national, and global emissions.</p>

S. Public Comments and BLM Responses (Climate and Meteorology)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
110.	Jason	Schwartz	Institute for Policy Integrity	80216	5	Climate and Meteorology	members of the public would be unable to meaningfully distinguish between the climate risks of 56,739 versus 378,261 metric tons of CO ₂ e. While decisionmakers and the public certainly can discern that one number is higher, without any context it may be difficult to weigh the relative magnitude of the climate risks. In contrast, the different climate risks would have been readily discernible through application of the social cost of greenhouse gas metrics.	The BLM compared direct and indirect GHG emissions with emissions at larger scales to provide context for decision makers and the public as to the scale of potential emissions attributable to activities on the Coastal Plain. The BLM has reviewed this comment and determined that SCC is not appropriate for this programmatic level of analysis, as described in Section F2.1 in Appendix F of the Draft EIS.
111.	Jason	Schwartz	Institute for Policy Integrity	80216	8	Climate and Meteorology	The DEIS also takes an arbitrarily inconsistent approach by monetizing economic benefits like royalties without applying an energy substitution analysis, while using substitution analysis to make downstream climate effects appear small.	The Draft EIS analysis accounts for the estimated incremental amount of oil and gas burned on a global scale, and the resulting estimates of GHG emissions. Because the increase is small in a global context, the proposed action, by itself, would not measurably affect climate change adaptation or mitigation challenges in the Arctic or globally.
112.	Jason	Schwartz	Institute for Policy Integrity	80216	13	Climate and Meteorology	BLM considers all greenhouse gas emissions that is has quantified in the DEIS relative to carbon dioxide (expressed as tons of carbon dioxide equivalent); however, BLM should estimate emissions from methane leaks and account for these gases separately	The BOEM's modeling tool used for "indirect" lifecycle GHG emissions includes CO ₂ emissions, nitrous oxide emissions, and methane emissions. The proportioned GMT ₂ "direct" emissions also include all these gases; therefore, the data presented in the Draft EIS already include methane emissions from transport, refining, and consumption of petroleum products.
113.	Jason	Schwartz	Institute for Policy Integrity	80216	14	Climate and Meteorology	BLM monetized a number of other effects of the program, including royalties and labor income, and must give climate effects the same consideration. When an agency monetizes a proposed action's potential benefits-as BLM does here-the potential climate costs must be treated with proportional rigor. Additionally, simply because not every effect can be monetized does not mean that monetization is not a useful analytical tool.	The BLM has reviewed this comment and determined that SCC is not appropriate for this programmatic level of analysis, as described in Section F2.1 in Appendix F of the EIS.

S. Public Comments and BLM Responses (Climate and Meteorology)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
114.	Jason	Schwartz	Institute for Policy Integrity	80216	15	Climate and Meteorology	Yet the DEIS for the Coastal Plain leasing proposal overlooks all that and instead goes on to argue that “the dollar cost figure [from using the social cost of greenhouse gas metrics] is generated in a range and provides little benefit in assisting the BLM Authorized Officer’s decision for program or project-level analyses, especially given that there are no current criteria or thresholds that determine a level of significance for social cost of carbon monetary values.” Yet numerous other agencies have had no trouble applying the manageable range of estimates of the social cost of greenhouse gases to assess the significance of the climate impacts of their actions. NEPA requires BLM to use its judgment and available tools, and the agency cannot use uncertainty as a red herring to escape its statutory obligations.	The BLM has reviewed this comment and determined that SCC is not appropriate for this programmatic level of analysis, as described in Section F.2.1 in Appendix F of the EIS.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
115.	Jason	Schwartz	Institute for Policy Integrity	80216	16	Climate and Meteorology	<p>BLM quantifies that downstream greenhouse gas emissions from this program could reach millions of metric tons per year.⁷⁴ But BLM refuses to take the straightforward next step of applying the social cost of greenhouse gas values to those quantified tons. Furthermore, BLM claims that “there are no current criteria or thresholds that determine a level of significance for social cost of carbon monetary values.”⁷⁵ In making this claim, BLM implies that it cannot rely on its professional judgement to make a reasonable determination of significance, which is inconsistent with how BLM approaches other such determinations and with the practice of other federal agencies in making similar decisions. While there may not be a bright-line test for significance, the emissions BLM estimates for this program are clearly significant and warrant monetization. This is especially true since, once emissions have been quantified, the additional step of monetization through application of the Interagency Working Group’s 2016 estimates entails a simple arithmetic calculation.⁷⁶ It is difficult to understand how NEPA’s mandate that an agency take a “hard look” at the environmental impacts of its actions can be satisfied if BLM fails to analyze the impacts of the greenhouse gas emissions that it quantifies.</p>	<p>The BLM has reviewed this comment and determined that SCC is not appropriate for this programmatic level of analysis, as described in Section F2.1 in Appendix F of the EIS.</p>

S. Public Comments and BLM Responses (Climate and Meteorology)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
116.	Jason	Schwartz	Institute for Policy Integrity	80216	17	Climate and Meteorology	Finally, while BLM claims that there are no criteria to determine the significance of climate damages once they are monetized, BLM routinely evaluates the relative importance of monetized benefits, weighing them against qualitative impacts. For example, the DEIS explains that a “drop in oil prices in late 2014 resulted in a significant decline in State government revenues” ⁸⁴ ; the DEIS reports that the portion of capital and operating costs to be paid to Alaskan companies would be “significant” ⁸⁵ ; and the DEIS weighs monetized values like income and revenue against qualitative impacts like noise in determining the “overall” and “lasting effects” on subsistence uses and resources. ⁸⁶ Translating over 5 million metric tons per year of operational, upstream, and downstream emissions into over \$250 million per year in climate damages certainly would have contextualized the impact, making it more accessible to the public and decisionmakers, and aiding BLM’s significance determination. It is arbitrary for BLM to ascribe significance to certain monetized values and yet claim it is impossible to determine the significance of monetized climate damages.	The BLM has reviewed this comment and determined that SCC is not appropriate for this programmatic level of analysis, as described in Section F2.1 in Appendix F of the EIS.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
117.	Withheld	Withheld	—	80930	5	Climate and Meteorology	The BLM significantly underestimates carbon emissions that would result from drilling in the Arctic Refuge. The DEIS only calculates the increase from oil demand predicted as a result of developing the Refuge. It does not account for burning all of the oil the BLM projects will be extracted, which is a much greater quantity. The Center for American Progress estimates that this proposal would result in emissions equivalent to that produced annually by 16 coal fired power plants - roughly 62 million tons. The DEIS completely fails to assess how expanding oil and gas development in the Refuge will further exacerbate climate adaptation and mitigation challenges in an Arctic that is warming at twice the rate of the rest of the country.	The Draft EIS analysis accounts for the estimated incremental amount of oil and gas burned on a global scale, and the resulting estimates of GHG emissions. Because the increase is small in a global context, the proposed action, by itself, would not measurably affect climate change adaptation or mitigation challenges in the Arctic or globally.
118.	Megan	Williams	o.b.o. Trustees for Alaska	81368	20	Climate and Meteorology	The DEIS' findings are based on the Bureau of Ocean Energy Management's (BOEM) Market Simulation Model (MarketSim, primarily used for estimates of indirect greenhouse gas emissions from potential future development). We identify two major shortcomings with the findings reported in the DEIS. First, while acknowledging petroleum is a global commodity, the DEIS states that "the model considers only the U.S. supply and demand for petroleum" and admits "thus, the accuracy of the change (increase) in petroleum demand estimated from MarketSim projections is limited" (p. 3-7). Second, no information is provided on the model assumptions and parameter values essential to arriving at market response estimates, such as the source of baseline energy production and consumption data, short-term and long-term demand and supply elasticities, energy prices, model limitations, etc.	BOEM's MarketSim model uses the EIA Annual Energy Outlook baseline data in the model. The model estimates the impacts on global oil markets and in doing so calculates changes in U.S. demand for oil, natural gas, coal, and electricity from others sources, as well as the global change in oil demand. BOEM recognizes the uncertainty in its projections and the further uncertainty in the attempt to model the entire set of energy market substitutions that would occur globally. Details on the BOEM model can be found in the documentation for the model: https://www.boem.gov/ESPIS/5/5612.pdf https://www.boem.gov/OCS-Report-BOEM-2016-065/ .

S. Public Comments and BLM Responses (Climate and Meteorology)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
119.	Brook	Brisson	Trustees for Alaska	81368	23	Climate and Meteorology	global and national oil and gas price trends and forecasts were not mentioned in the DEIS. The fact that there is very little chance that oil production from the Coastal Plain would have any significant effect on global oil prices or gas prices for consumers should have been noted. The effect on national oil prices would be brief and minimal at best, largely because prices are determined in the global market. At best, any short-term decreases in world (and thus domestic) oil prices associated with production areas currently closed to development "are likely to be on the order of one percent, and would thus not have a significant impact on prices that consumers pay at the gasoline pump now or in the future." ²⁰	The BLM acknowledges this comment. The BLM agrees that production from the Coastal Plain region will not affect global oil prices. The Economy section was focused on potential economic impacts on jobs, income, and revenues at the local, regional, and statewide level. Impacts on national and global petroleum markets are not part of the analysis.
120.	Withheld	Withheld	Arctic Slope Regional Corporation	83317	34	Climate and Meteorology	In this analysis BLM should also consider the countervailing impacts that oil and gas leasing and development have on climate change at the local level. Across the North Slope, this translates into funding for scientific research, community infrastructure and other activities which aid the local climate change needs and priorities.	The BLM acknowledges this comment. Currently, there are no regulations or lease stipulations requiring that potential federal or state revenues from leasing and post-leasing activities in the Coastal Plain be used to address climate change impacts at the local level.
121.	Withheld	Withheld	—	55252	3	Climate and Meteorology	on page 3-9, the DEIS talks about the area of Arctic ice extent, but it does not discuss the changes in the thickness or average age of the ice. This information is crucial to understanding polar bear, walrus and seal impacts going forward.	Text has been added to the Final EIS to provide a source for information on sea ice thickness. The seasonal impacts of the ice sheet position on local marine mammal populations, whether positive or negative, will occur with or without development of the petroleum resources of the Coastal Plain.

S. Public Comments and BLM Responses (Climate and Meteorology)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
122.	Aladdine	Joroff	Harvard Law School Emmett Environmental Law & Policy Clinic	82876	4	Climate and Meteorology	Furthermore, the DEIS notes that “[e]ach of the hypothetical development scenarios could affect over 2,000 acres of soils and permafrost.” Id. at 3-48. However, while the DEIS contemplates oil-and-gasrelated permafrost loss, it neglects to discuss the corresponding climate impacts of this permafrost reduction. The FEIS should estimate the GHG emissions from permafrost loss associated with the Proposed Action.	The effects of development would not be the total loss of permafrost over a 2,000-acre area. There could be minor increases in active layer (thawed layer) thickness during the summer, and less rapid refreeze during the fall. This disturbed area represents less than 0.13 percent of the 1.6 million-acre Coastal Plain proposed leasing area. The GHG emissions associated with any slight permafrost degradation over this 2,000-acre development area cannot be accurately estimated, but it would be small in comparison with other global and regional GHG emissions.
123.	Withheld	Withheld	—	59766	1	Climate and Meteorology	The pollution that would ensue is significantly minimized in the DEIS, both in terms of the carbon that would be released into the atmosphere, as well as the impact that this unnecessary exploitation would have on the limited supply of fresh water.	The Draft EIS analysis accounts for the estimated incremental amount of oil and gas burned on a global scale, and the resulting estimates of GHG emissions. Because the increase is small in a global context, the proposed action, by itself, would not measurably affect climate change adaptation or mitigation challenges in the Arctic or globally.
124.	Steven	Amstrup	Polar Bears International	81368	112	Climate and Meteorology	Natural gas and petroleum systems are the biggest contributor to methane emissions in the United States, accounting for close to one third of all methane emissions. ⁷³ Although it has a relatively short atmospheric lifetime of about a decade, methane is nonetheless a potent greenhouse gas with impacts concentrated in the near-term. EPA assumes that each molecule of methane is 28-36 times as potent as carbon dioxide (CO ₂) over a 100-year time horizon and 84-87 times as potent as CO ₂ over a 20-year time horizon. ⁷⁴ BLM should consider the 20-year global warming potential for methane since shorter timeframes more accurately reflect the climate-forcing impacts of methane emissions.	The primary concern with GHG emissions is long-term climate change, leading to rising ocean levels and gradual warming of the oceans and atmosphere over longer time scales; therefore, the 20-year horizon effect of GHGs is less of a concern than the 100-year horizon. The primary moderator of Earth’s temperatures is the oceans, which embody the vast majority of the thermal inertia of the whole land-ocean-cryosphere-atmosphere system. It takes time to change the bulk average ocean temperature because of its huge thermal inertia; therefore, a relatively short-lived GHG like methane cannot have a large impact on global climate. Nonetheless, if the BLM considers

124. (cont.)	(see above)	(see above)	(see above)	(see above)	(see above)	(see above)	(see above)	<p>the 20-year GWP horizon, and the commenter's multiplier of 2.7 is correct for methane (compared with the 100-year horizon), the methane portion of the Coastal Plain development-related GHG emissions would be 5 percent (methane portion of CO₂e from Draft EIS) multiplied by 2.7, or 13.5 percent of the CO₂e for a 20-year horizon. Given the GHG estimates for the Coastal Plain program area are order of magnitude estimates (given the uncertainty in recoverable oil), this marginal change would not appreciably affect the estimated GHG emissions and the portion of national or global emissions represented by the development.</p> <p>Finally, regarding methane's overall importance to the climate, modeled estimates of methane's radiative forcing (RF) over the last several decades show that it has essentially flattened out, despite the large increase in U.S. drilling activity in the last decade, and the increased production of natural gas. In contrast, the calculated RF for CO₂ continues to increase rapidly (see Figure 2-5 of the Fourth National Climate Assessment); therefore, it is more important to focus on CO₂ emissions and the effects of all GHGs combined over long (100-year) time horizons.</p>

S. Public Comments and BLM Responses (Climate and Meteorology)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
125.	Steven	Amstrup	Polar Bears International	81368	114	Climate and Meteorology	product of fossil fuel combustion - may have significant impacts on climate change, especially in the Arctic region. According to the Arctic Council, an intergovernmental forum of Arctic States, there is sufficient evidence to support the reduction of black carbon emissions as a means to slow the rate of warming in the Arctic over the next few decades. ⁷⁶ And since black carbon is a component of particulate matter, and pollutants that are co-emitted with black carbon are also constituents of PM, black carbon also adversely impacts air quality and health. Primary emissions sources of black carbon in the oil and gas industry include diesel engines, e.g., associated with seismic surveying, drilling, etc., and flares.	Black carbon tends to fall out of the atmosphere relatively quickly. The primary concern with this substance in the Arctic is that when it deposits on snow and ice, it can increase melting rates by increasing absorption of solar energy. The proposed action is not expected to result in large amounts of black carbon emissions, as modern equipment, including flares, are designed to minimize these particulate matter emissions. Also, the EPA's low sulfur diesel standards have decreased emissions of such particulates from engines using diesel fuel. Furthermore, any black carbon that does deposit on snow and ice has a relatively short lifetime of a year to perhaps a few years, before the particles become part of the soil or the ocean sediment.
126.	—	—	Alaska Department of Natural Resources	94102	51	Climate and Meteorology	26 Chapter 3, Page 3-4 Justify analysis The statement that dispersion and turbulence increase with wind speed, should be amended to read ...'thereby locally decreasing air pollutant concentrations resulting from an emitted plume of pollutant.' The statement otherwise is too broad and is not supported by any of the information provided.	The statement is not too broad, due to the basic principle that increasing wind speed alone, with other factors held constant, will decrease pollutant concentrations in the plume at all distances downwind, not just locally.

S. Public Comments and BLM Responses (Climate and Meteorology)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
127.	—	—	Alaska Department of Natural Resources	94102	52	Climate and Meteorology	27 Chapter 3, Page 3-6 Justify analysis Paragraph two on this page discusses “Direct GHG Emissions from Future Development” and appears to use the ConocoPhillips GMT-2 project as a scaling proxy for the proposed future development in the ANWR Coastal Plain. It is not clear why the GMT-2 project is used as a proxy, because it was not discussed in any detail in the hypothetical development scenario in Appendix B. It would make the hypothetical development scenario much easier to understand if it was compared in size and impacts to a similar project on the North Slope.	The GMT2 project was used for scaling because it represents one of the more recent projects for which direct GHG emissions were inventoried. Larger-scale North Slope projects are generally much older, and the GHG emissions were not inventoried on those.
128.	—	—	Alaska Department of Natural Resources	94102	53	Climate and Meteorology	28 Chapter 3, Page 3-6 Justify analysis - inconsistencies The last sentence on this page notes that “This is because the Coastal Plain development would still represent approximately 9 to 59 times the estimated oil production and therefore 9 to 59 times the direct GHG emissions of the GMT2 development.” This statement implies a very wide range of possible impacts appears to imply that the proposed development could be up to 60 times larger than the proposed GMT-2 project. If is not clear how a development of this magnitude could occur on the 2,000 surface acres allowed by the Tax Act. Please explain.	Because the development could occur over a period of many years, acreage allocated to older developments would become available again once those developments were shut down and reclaimed. Based on BLM’s interpretation of the Tax Act, no more than 2,000 acres of surface development would occur at any one time, but the BLM would not place a restriction on total acreage that could be used for development overall as long as no more than 2,000 acres is disturbed at one time. For example, based on projected production rates for GMT2, estimated total production of 170 million barrels could be reached within 15 years, after which the wells would be plugged and the site reclaimed. No change.
129.	Kevin	Kane	Sierra Club, Western Watersheds	96216	2	Climate and Meteorology	Effects of escape methane and all other gases must be analyzed in terms of climate and air quality.	GHG estimates provided in the Draft EIS include methane emissions.

130.	Withheld	Withheld	Native Village of Venetie Tribal Government	81748	95	Climate and Meteorology	Climate Change. The DEIS misrepresents the rapid change in the Arctic's climate by presenting temperature and precipitation data as monthly averages without including historic data. (DEIS, at Table 3-1). Data and down-scaled global climate models from the Scenarios Network for Alaska and Arctic Planning, at the University of Alaska-Fairbanks, show a very different picture, as demonstrated in figures 5 and 6:	The purpose of presenting the monthly climate normals is to present the typical current climate conditions (most recent three decades), not to address "climate change." Climate trends for the region are summarized in the text discussion of Section 3.2.1 of the Draft EIS, and more detail on these is provided by reference to data on the UAF/ACRC website. A down-scaled climate model output is not useful, as it fails to accurately reproduce past climatic conditions at regional scales. However, the observed temperature trend data from UAF are informative and are appropriately referenced in this section of the Draft EIS.
131.	Withheld	Withheld	Native Village of Venetie Tribal Government	81748	98	Climate and Meteorology	The DEIS must accurately represent and consider these historical and projected future changes. Additionally, the DEIS fails to cite more current available sources, which provide more up-to-date information.69 (DEIS, at 3-9).	The purpose of presenting the monthly climate normals is to present the typical current climate conditions (most recent three decades), not to address "climate change." Climate trends for the region are summarized in the text discussion of Section 3.2.1 of the Draft EIS, and more detail on these is provided by reference to data on the UAF/ACRC website. A down-scaled climate model output is not useful, as it fails to accurately reproduce past climatic conditions at regional scales. 132.	Mary	S.	—	82785	1	Climate and Meteorology	<p>Rising temperatures in the Arctic are established scientific fact and it is established that the sea ice in the Arctic is melting at a more rapid rate than in previous decades. As stated in the EIS, temperature records taken from the weather station in Utqiagvik on the North Slope, “show an increase in annual average temperature of 6.3 degrees F from 1949 to 2016; a 5.9 degree F increase has occurred since the PDO shift in 1977.” Furthermore, “...it is likely that a reduction in ice cover along the north coast of Alaska has had a disproportionate effect on temperature trends since 1977...” (pg. 74). Reduction in sea ice is the biggest threat to the continued survival of the SBS stock of polar bears commonly found within the program area. Any oil and gas development would contribute to continued rising temperatures and reduction of sea ice in the Arctic by contributing to the greenhouse effect. The reference to the “so-called greenhouse effect” on pg. 75 is inaccurate. The greenhouse effect is established scientific fact and the words “so-called” must be removed.</p>	<p>Climate trends, including warming temperatures and melting sea ice, are incorporated by reference on page 3-2 of the Draft EIS; the ongoing and projected effects of climate change on Arctic species are described in detail in the Climate Change subsections of Section 3.3, Biological Resources. The BLM acknowledges the proposed action’s contribution to climate change in the form of GHG emissions and thus quantifies and presents these emissions. The use of the phrase “so-called” was not intended to imply that there is no atmospheric greenhouse effect; it has been deleted from the Final EIS.</p>

133.	Withheld	Withheld	—	82848	2	Climate and Meteorology	I am also concerned that the draft EIS does not adequately consider climate change in the development of the draft EIS. While the EIS describes (in paragraph form) some of the projected changes to the region, in developing an appropriate plan it is critical that the EIS consider potential future changes in the region due to climate change in a spatially explicit fashion. Numerous research efforts have developed spatially explicit projections for how the North Slope may be affected by climate change into the future and these mapping efforts include vegetation change and permafrost change projections. Given that the North Slope of Alaska is one of the most rapidly warming regions in the world, and that it will continue see dramatic change even during the lifespan on the proposed leases, it is critical that the EIS effort include spatially explicit climate change projections in the EIS. The BLM needs to consider not only where critical habitat and resources are located today, but where they are projected to be located fifty years from now given rapid climate change. In the North Slope of Alaska, significant climate change impacts will be observed during the lifespan of these leases.	It is speculative to perform a spatial modeling analysis of climate-related parameters over a 70-year time horizon given the uncertainties in such projections. The state-of-the-science is not capable of predicting whether there will be detrimental impacts from specific GHG emissions. "In climate research and modeling, we should recognize that we are dealing with a coupled non-linear chaotic system, and therefore that long-term prediction of future climate states is not possible." (IPCC Third Assessment Report [2001], Section 14.2.2.2, page 774).
134.	Aladdine	Joroff	Harvard Law School Emmett Environmental Law & Policy Clinic	82876	1	Climate and Meteorology	NEPA-required environmental review for federal actions, such as the Proposed Action, that are anticipated to lead to significant emissions of GHGs must estimate both direct and indirect GHG emissions (See e.g. <i>WildEarth Guardians v. U.S. Bureau of Land Mgmt.</i> , 870 F.3d 1222, 1228-29, 1234-35 (10th Cir. 2017) (combustion of coal is indirect effect and must be included in the EIS)). In doing so, federal courts have held that agencies must consider "the best available science" and consider climate change information in a "meaningful or logical	Regarding the claim of underestimated emissions, the Draft EIS analysis accounts for the estimated incremental amount of oil and gas burned on a global scale, and the resulting estimates of GHG emissions. Because the increase is small in a global context, the proposed action, by itself, would not measurably affect climate change adaptation or mitigation challenges in the Arctic or globally. Regarding production alternatives, all of them are expected to result in

134. (cont.)	(see above)	(see above)	(see above)	(see above)	(see above)	(see above)	<p>way.” (AquAlliance v. U.S. Bureau of Reclamation, 287 F. Supages 3d 969, 1031 (E.D. Cal. 2018) (citing Wild Fish Conservancy v. Irving, 221 F. Supages 3d 1224, 1233 (E.D. Wash. 2016)) (emphasis original)). Moreover, when conducting an analysis of impacts, agencies cannot “put a thumb on the scale” by selectively considering or quantifying negative impacts. (Ctr. for Biological Diversity v. Nat’l Highway Traffic Safety Admin., 538 F.3d 1172, 1198 (9th Cir. 2008)). In direct conflict with past practice and guidance from federal courts, the DEIS distorts the climate change analysis by: (i) Significantly underestimating GHG emissions, including by neglecting to consider the impacts of the Proposed Action with respect to the continued operation of the Trans-Alaska Pipeline System and melting permafrost; and (ii) Failing to present GHG emissions data in a meaningful or logical way, including by neglecting to estimate GHG emissions for each alternative, presenting misleading annual emissions figures, and using metrics that obscure the significance of the Proposed Action’s GHG emissions.</p>	<p>total production within the range of 1.5 to 10 billion barrels of oil over the lifetime of the development. The Draft EIS analysis provided GHG estimates commensurate with these bounds. Given that GHG emissions will be essentially proportional to production, the reader can estimate the GHG emissions of any hypothetical production amount between these bounds. Estimates of recoverable oil by alternative are not available, but EIS Section 3.2.6, Petroleum Resources provides a qualitative discussion of the potential for reduced production among Alternatives B, C, D1, and D2. Surface access to significant portions of the Coastal Plain area would be precluded under the more restrictive options, Alternatives D1 and D2; however, much of the potentially non-leased portion of the program area under these alternatives (34 percent of the total area) has a lower production potential. Also, horizontal drilling from adjacent areas can reach some acreage restricted from surface development; therefore, production potential, and related greenhouse gas emissions, would be only marginally reduced under Alternatives D1 and D2, and are expected to be essentially unchanged between Alternatives B and C.</p> <p>Regarding TAPS, it is regulated by state and federal authorities in terms of its safety and viability for continued use. TAPS is maintained to provide for long-term continued use.</p> <p>Regarding annual vs. lifetime emissions, the GHG emissions are presented on an annual basis to</p>

134. (cont.)	(see above)	(see above)	(see above)	(see above)	(see above)	(see above)	(see above)	allow a comparison with global, US, and Alaska emissions, which are reported annually. Total GHG emissions for the life of the development, prior to global supply and demand discounting, are provided in the Final EIS in Appendix R, Table R-3.
135.	Aladdine	Joroff	Harvard Law School Emmett Environmental Law & Policy Clinic	82876	2	Climate and Meteorology	The status of TAPS is strongly correlated with the future of Alaskan oil production, and is thus an impact that must be factored into the analysis of environmental impacts from Coastal Plain leasing. The FEIS should thus consider the Proposed Action's impacts on TAPS and resulting GHG emissions in both (i) the "baseline" of the no-action Alternative A, and (ii) the analysis of the action alternatives (B, C, D1 and D2). As described by BLM, "Alternative A [the no-action alternative] is being carried forward for analysis to provide a baseline for comparing impacts under the action alternatives, as required by the [Council on Environmental Quality ("CEQ")] NEPA regulations." (BUREAU OF LAND MANAGEMENT, COASTAL PLAIN OIL AND GAS LEASING PROGRAM: DRAFT ENVIRONMENTAL IMPACT STATEMENT, at Vol. 1, 2-2 (Dec. 2018) [hereinafter, "DEIS"]; see also 40 C.F.R. § 1502.14(c)). As discussed above, absent new supply into TAPS, the no-action alternative baseline should reflect the strong possibility that TAPS would become inoperable in the coming years. By ignoring the future of TAPS in the analysis of Alternative A, the DEIS omits a crucial consideration and distorts the baseline against which the environmental impacts of the Proposed Action are measured. If TAPS were to shut down, tens of millions of barrels of oil would be either stuck in Alaska or would need to be transported to market by	The continued supply of oil needed to keep TAPS in operation does not depend on the proposed action. There are several other in-progress and planned new developments on the North Slope that can keep TAPS economically viable. TAPS economic viability is therefore not dependent on the proposed action versus no-action decision. TAPS is maintained to provide for long-term continued use.

135. (cont.)	(see above)	(see above)	(see above)	(see above)	(see above)	(see above)	other, potentially costlier and higher emitting methods. The FEIS' Alternative A "baseline" analysis should account for the impacts on GHG emissions from the projected closure of TAPS. This would allow for a more accurate calculation of the relative increase in emissions from the Proposed Action.	(see above)
136.	Aladdine	Joroff	Harvard Law School Emmett Environmental Law & Policy Clinic	82876	3	Climate and Meteorology	The FEIS should also address the Proposed Action's impact on GHG emissions from the continued operation of TAPS in the analysis of the action alternatives (Alternatives B, C, D1, and D2). Shutting down TAPS would significantly reduce the economic feasibility of oil production in Alaska and would likely reduce GHG emissions. As a corollary, keeping TAPS open would result in higher GHG emissions relative to a TAPS-free baseline. Insofar as the action alternatives would increase the likelihood of TAPS remaining open and operational (by facilitating additional oil and gas production and throughput for the pipeline system), they would foreseeably lead to higher GHG emissions compared to the no-action alternative. Because this issue is not addressed in the DEIS, it likely underestimates the impact the action alternatives would have on GHG emissions and, consequently, climate change. If additional throughput from Coastal Plain oil has the effect of keeping TAPS operational, the net increase in oil production (and resulting GHG emissions) would be much higher than is reflected in the DEIS. The inextricable tie between the issuance of oil and gas leases on the Coastal Plain and the future of TAPS should be reflected in the FEIS in order to fully assess the environmental impacts of the Proposed Action.	The continued supply of oil needed to keep TAPS in operation does not depend on the proposed action. There are several other in-progress and planned new developments on the North Slope that can keep TAPS economically viable. TAPS economic viability is therefore not dependent on the proposed action versus no-action decision. TAPS is maintained to provide for long-term continued use..

S. Public Comments and BLM Responses (Climate and Meteorology)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
137.	Aladdine	Joroff	Harvard Law School Emmett Environmental Law & Policy Clinic	82876	5	Climate and Meteorology	The DEIS neglects to calculate GHG emissions for each alternative considered, despite the directive in the NEPA implementing regulations for agencies to present the alternatives analysis in a comparative form so that the environmental impacts of the alternatives can be reasonably compared. See 40 C.F.R. § 1502.14 (describing the analysis of alternatives as “the heart of the environmental impact statement”). Instead, the DEIS estimates one value for the minimum and maximum carbon dioxide equivalent (“CO ₂ e”) emissions from Coastal Plain oil and gas production, asserting that “hypothetical production rates and estimated ultimate recovery are not expected to change significantly under any of the alternatives.” DEIS, supra note 9, at Vol. II, Appendices B through O, B-18. However, without further elaboration this is not a logical explanation. For example, Alternatives D1 and D2 offer only 1,037,200 acres for lease, compared to 1,563,500 acres under Alternatives B and C. If the total ultimate recovery is the same across each alternative, Alternatives B and C would not recover any additional oil in the 526,300 acres not leased under Alternatives D1 and D2. This raises the question as to why, then, BLM would offer those additional areas for lease under any alternative if they are estimated not to contain or lead to additional recoverable oil and gas. Relatedly, Alternative C has 932,500 acres subject to a no surface occupancy (NSO) restriction whereas under Alternative B, only 359,400 acres are subject to an NSO restriction. Prohibiting surface occupancy forces producers to use more expensive extraction techniques, such as directional drilling. See, e.g., Timothy Fitzgerald, Evaluating Split	The range of GHG emission estimates presented encompasses the potential differences in recoverable oil among alternatives. Portions of this comment dealing with the basis for selection of alternatives for assessment in the Draft EIS are addressed in the discussion of alternatives elsewhere in the Draft EIS.

S. Public Comments and BLM Responses (Climate and Meteorology)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
137. (cont.)	(see above)	(see above)	(see above)	(see above)	(see above)	(see above)	Estates in Oil and Gas Leasing, 86 Land Economics 294, 308 (May 2010), https://www.jstor.org/stable/pdf/27821425.pdf?refreqid=excelsior3Ac01792291aa4bafbe38755e2f9e4c264 . In the FEIS, BLM should explain its assumption that the same amount of oil could be profitably recovered with such techniques despite the higher cost of directional drilling. Because the DEIS estimates GHG emissions based on economically recoverable oil-and not based on total reserve-higher recovery costs could result in fewer GHG emissions under Alternative C compared to B. If total oil and gas recovery is different across alternatives, the FEIS needs to detail the estimated GHG emissions of each.	(see above)
138.	Aladdine	Joroff	Harvard Law School Emmett Environmental Law & Policy Clinic	82876	6	Climate and Meteorology	The total projected GHG emissions from the Proposed Action, both direct (from construction, extraction, and transportation) and indirect (from downstream combustion of oil and gas), is not contingent on the assumed production duration for the Coastal Plain leases. DEIS, supra note 9, at Vol. I, 3-6. However, because the DEIS presents GHG impacts as annual emissions, compared to annual emissions at the United States and global level, the assumed production duration influences the perception of the significance of the Proposed Action's impact on GHG emissions. For example, doubling the number of production years halves the annual emissions. In this instance, presentation matters: misleading or arbitrary assumptions are insufficient to meet NEPA requirements. City of Romulus v. Wayne Cty., 392 F. Supages 578, 594 (E.D. Mich. 1975), order dissolved, (E.D. Mich. Oct. 31, 1975), vacated, 634 F.2d 347 (6th Cir. 1980). The DEIS presents annual GHG emissions from the Proposed Action based on a 70-year	Halving or doubling the production period would correspondingly double or halve the annual GHG estimates, assuming the amount of recoverable oil is a fixed amount. Given the recoverable oil is assumed to be a fixed amount, the ultimate consequences in terms of the total GHG emissions is essentially the same. The point of estimating annual GHG emissions is to provide a scale for comparison of the proposed action with statewide, national, and global annual emissions. Factor of two changes in the annual rate of GHG emissions are not relevant, given the outcome for the global atmosphere is essentially the same when production is complete.

S. Public Comments and BLM Responses (Climate and Meteorology)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
138. (cont.)	(see above)	(see above)	(see above)	(see above)	(see above)	(see above)	<p>construction, drilling, and production period. DEIS, supra note 9, at Vol. I, 3-7. However, this long a production period is not supported by other estimates in the DEIS. For example: * As described in Appendix B, "the timeframe for production could be more or less than 50 years given the speculative nature of the development scenarios" and peak production from the Coastal Plain "is anticipated at some point before 50 years, potentially as early as 20 years after the first lease sale." DEIS, supra note 9, at Vol. II, Appendices B through O, B-7. Production from a field could continue, at declining rates, for up to 35 years after peak production is reached; Id. and * The DEIS assumes that the life of production facilities or access roads for the Coastal Plain will be approximately 50 years. The FEIS should assume a shorter production duration that better reflects the discussion in the DEIS. If the FEIS assumes a production duration of 35 years, its estimated annual CO2e emissions range would double to 1.4 - 10.0 million metric tons. Relatedly, the FEIS should: 1. Separate estimated annual GHG emissions for pre-production and post-production years. BLM estimates that direct emissions from construction and drilling during pre-production years would be around 85 times smaller than indirect emissions from consumption, which only occur during production years. DEIS, supra note 9, at Vol. I, 3-8 (0.06 million metric tons for direct emissions and 5.0 million metric tons for indirect emissions in Table 3-5). By lumping the pre-production and production years together, the DEIS distorts the estimated annual GHG emissions rate. 2. Present the total estimated GHG emissions over the lifespan of the Proposed Activity without comparison</p>	(see above)

S. Public Comments and BLM Responses (Climate and Meteorology)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
138. (cont.)	(see above)	(see above)	(see above)	(see above)	(see above)	(see above)	to annual figures. This approach would be consistent with BLM's approach in the EIS for the nearby Greater Mooses Tooth 2 Development Project (The DEIS' prediction of GHG emissions per barrel of available oil from Coastal Plain oil and gas production is based on estimates that were calculated for the nearby Greater Mooses Tooth 2 GMT 2 Development Project ("GMT2"). However, the GMT2 project was able to utilize existing infrastructure, which does not exist in the Coastal Plain, to support production. The FEIS should account for this discrepancy and adjust projected emissions from the Coastal Plain leasing up to reflect the need for new infrastructure). Such changes would improve the transparency and utility of the information presented in the FEIS. Such changes would improve the transparency and utility of the information presented in the FEIS.	(see above)

S. Public Comments and BLM Responses (Climate and Meteorology)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
139.	Aladdine	Joroff	Harvard Law School Emmett Environmental Law & Policy Clinic	82876	8	Climate and Meteorology	<p>more meaningful evaluation of the significance of effects of leasing in the Coastal Plain would use additional metrics to evaluate the Proposed Action's impacts. For example, rather than compare projected GHG emissions from the Proposed Action to total emissions in the United States, the FEIS should explain the emissions in the context of energy consumption in the United States. For example, in 2017, the United States consumed a total of 7.28 billion barrels of petroleum products (FAQ: How much oil is consumed in the United States?, U.S. ENERGY AND INFO. ADMIN. (Oct. 3, 2018), https://www.eia.gov/tools/faqs/faq.php?id=33&t=6) and CO2 emissions from these products represented 81 percent of total U.S. transportation sector CO2 emissions and 30 percent of total U.S. energy-related CO2 emissions. FAQ: How much carbon dioxide is produced from U.S. gasoline and diesel fuel consumption?, U.S. ENERGY AND INFO. ADMIN. (Dec. 27, 2018) https://www.eia.gov/tools/faqs/faq.php?id=307&t=10. Leasing on the Coastal Plain is expected to produce up to 10 billion barrels of oil equivalent. Consequently, indirect GHG emissions from oil and gas extracted from the Coastal Plain could represent more than 30 percent of total U.S. energy-related CO2 emissions in one year.</p>	<p>Comparison of estimated emissions with state, national, and global emissions is an accepted method of analysis for providing context to decision makers and the public in a NEPA analysis.</p>

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
140.	Withheld	Withheld	Arctic Slope Regional Corporation	83317	35	Climate and Meteorology	In order to address this concern more fully, BLM should include the following facts with respect to resource development in the Arctic and its impact on global climate change: ? Oil produced from the Program Area under the United States robust environmental regulatory regime will displace oil imported from areas with less strict environmental requirements. ? The average barrel of Alaska North Slope crude produces 564 kilograms of CO2 throughout its life, oil produced from the Program Area is estimated to only contribute an additional 0.5 kilograms per barrel. ? Emissions from industry sources in Alaska saw a decline of approximately 17% from 2005- 2015, with gross emissions reduced by approximately 24% and net emissions reduce by 33% over the same period.36 ? Alaska ranks 40th in emissions amongst states and Washington D.C.37 36 Alaska Greenhouse Gas Emissions Inventory 1990-2015. Alaska Department of Environmental Conservation. Pg 13.	While the Alaska-specific data in this comment and the referenced report are interesting, they provide additional detail that is not needed in the EIS for the proposed action. The proposed action comparisons with Alaska, U.S., and global GHG emissions are already presented in the Draft EIS; they provide the appropriate context.

S. Public Comments and BLM Responses (Climate and Meteorology)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
141.	Sayers	Tuzroyluk	Voice of the Arctic Inupiat	83318	38	Climate and Meteorology	We also feels that it would be beneficial, based on testimony shared in recent public meetings on the DEIS, for the BLM to further expand their analysis of greenhouse gas emissions (GHG) and "upstream" carbon impact of develop-ment and production of oil and gas in the Coastal Plain. While the DEIS does ad-dress that developing ANWR to its full potential will not actually add 390 thou-sand barrels per day to the world's oil consumption, there could be more clarity around resource development in the Arctic and its relationship to climate change, including: ? North Slope crude will offset dirtier crude produced elsewhere ? North Slope's legacy of environmental responsibility is the gold standard among the world's prolific oilfields. ? The most effective way to reduce greenhouse gases worldwide is to re-duce demand through changing individual habits ? While our communities bear the brunt and are on the front lines of climate change, our communities and industry activity on the North Slope contribute very marginally to global GHG emissions.	The BLM cannot be sure whether North Slope crude would offset dirtier crude produced elsewhere, but it does agree that the North Slope contributes marginally to global GHG emissions, as demonstrated in the Draft EIS. The BLM agrees that coastal communities on the North Slope may bear a greater impact than other U.S. communities due to climate change, regardless of the causes of that change.
142.	Matt	Krogh	Stand.earth	83321	6	Climate and Meteorology	It is not sufficient for BLM to merely mention that climate change literature exists? a DEIS needs to also include an analysis of cumulative climate impacts associated with drilling in the Arctic Refuge and the subsequent transport, shipping, refining, and consumption of the oil produced. As the courts have made clear, mere references to nonNEPA documents is not enough.	The BLM has referenced both non-NEPA and NEPA documents as sources for information used in this Draft EIS. As the BLM has done in the Draft EIS, it is appropriate to highlight specific impacts that climate change may have or is having in the region affected by the proposed action.

S. Public Comments and BLM Responses (Climate and Meteorology)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
143.	Matt	Krogh	Stand.earth	83321	8	Climate and Meteorology	As is typical of this DEIS, the climate information is outdated and relies on previous analyses done on other areas outside the Arctic Refuge. This is concerning given that the pace of global warming is not uniform across the globe? the polar regions are experiencing the effects of climate change at a faster rate.	The BLM has reviewed more recent literature, such as the Fourth National Climate Assessment, which confirms the trends data incorporated by reference in BLM 2018. In addition, the climate data for the Arctic Refuge do not differ substantially from other North Slope developments recently assessed; therefore, this information is still relevant.
144.	Matt	Krogh	Stand.earth	83321	9	Climate and Meteorology	The DEIS also fails to meaningfully account for and analyze the cumulative impacts of greenhouse gas emissions associated with oil and gas development in the coastal plain. This omission includes the downstream emissions caused by consumption of the extracted oil and gas. As noted: "Even though greenhouse gas emissions from the proposed program may look minor when viewed on scale of the global climate crisis, when considered cumulatively with all of the other GHG emissions from BLMmanaged land, they become significant and cannot be ignored."	The Draft EIS analysis accounts for the estimated incremental amount of oil and gas burned on a global scale, and the resulting estimates of GHG emissions. Because the increase is small in a global context, the proposed action, by itself, would not measurably affect climate change adaptation or mitigation challenges in the Arctic or globally.
145.	Withheld	Withheld	—	84753	1	Climate and Meteorology	The IPCC SP15 report released in October 2018 (https://www.ipcc.ch/sr15/) outlines the consequences of failing to constrain global warming to levels below 1.5°C. Specifically, it explains the importance of drastically reducing CO2 emissions in the coming decade. The Coastal Plain Draft EIS fails to take into account how the development of petroleum from ANWR would contribute to Climate Change, and specifically how it will make it more difficult to achieve the carbon reductions necessary to minimize the impacts of Climate Change in the coming decade.	The Draft EIS analysis accounts for the estimated incremental amount of oil and gas burned on a global scale, and the resulting estimates of GHG emissions. The scope of climate analyses has been raised in many prior EIS efforts, with the resulting guidance from federal officials that it is not possible to attribute global climate consequences to a single project.

S. Public Comments and BLM Responses (Climate and Meteorology)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
146.	Withheld	Withheld	—	84826	1	Climate and Meteorology	The effects of fossil fuel development upon climate change must be considered as a direct consequence of leasing actions. Why permit leases if not to develop the land? The EIS failed to explore in detail the effects upon localized climate changes and the contribution to global climate changes. Greenhouse emissions do not stay in one place. The EIS also failed to consider the future effects of fossil fuel extraction upon the climate 10 years from now as the oil comes on line and how these effects will alter the environment, wildlife and ecology of the area.	The Draft EIS analysis accounts for the estimated incremental amount of oil and gas burned on a global scale, and the resulting estimates of GHG emissions. The scope of climate analyses has been raised in many prior EIS efforts, with the resulting guidance from federal officials that it is not possible to attribute global climate consequences to a single project.
147.	Daniel	Varsano	—	91130	1	Climate and Meteorology	The EIS dramatically understates the impact on climate change development this oil field would cause. This is a serious issue with global consequences, any new hydrocarbon extraction project needs a realistic assessment of it's impacts on climate change. This EIS is incomplete and misleading on this subject. The EIS understates the likelihood and possible impacts of oil spills. Again, there needs to be a realistic and unbiased assessment of this impact	The Draft EIS analysis accounts for the estimated incremental amount of oil and gas burned on a global scale, and the resulting estimates of GHG emissions. Because the increase is small in a global context, the proposed action, by itself, would not measurably affect climate change adaptation or mitigation challenges in the Arctic or globally. Oil spill history and statistics for existing Noprth Slope developments are discussed in Section 3.2.11 of the Final EIS.
148.	Janee	Middlesworth	—	91927	4	Climate and Meteorology	The DEIS underestimates the carbon pollution\ added, and fails to address the implications of exacerbating the climate crisis.	The Draft EIS analysis accounts for the estimated incremental amount of oil and gas burned on a global scale, and the resulting estimates of GHG emissions. Because the increase is small in a global context, the proposed action, by itself, would not measurably affect climate change adaptation or mitigation challenges in the Arctic or globally.

149.	Stephen	Harvey	—	92094	2	Climate and Meteorology	<p>I am writing to comment on section 3.2.1 Climate and Meteorology. Table 3-5 quantifies indirect emissions, but it does not put those emissions into context. Representative Concentration Pathway (RCP) scenarios describe four different 21st century pathways of greenhouse gas (GHG) emissions and atmospheric concentrations, air pollutant emissions and land use*. RCPs show how decisions regarding management of GHG emissions will have implications for the entire 21st century. This context of which climate scenario the earth is headed towards is important to comprehend. I think the EIS should describe the RCP scenarios, depict which scenario the globe is currently on, and identify which RCP scenario(s) each action alternative best aligns with. This would include direct and indirect GHG emissions of each action alternative over the next 50 years. It is important to know what GHG emission pathway the globe headed towards and RCP scenarios are the internationally accepted standard. The draft EIS methodology of only presenting annual emissions and percent contribution to global emissions does not adequately describe the impact to climate. Adding RCP scenarios would help readers better understand the context of GHG emissions and climate. Thank you for your time and consideration. * IPCC, 2014: Climate Change 2014: Synthesis Report. Contribution of Working Groups I, II and III to the Fifth Assessment Report of the Intergovernmental Panel on Climate Change [Core Writing Team, R.K. Pachauri and L.A. Meyer (eds.)]. IPCC, Geneva, Switzerland, 151 pages</p>	The requested analysis is outside the scope of this EIS.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
152.	Withheld	Withheld	Government of the Northwest Territories	92862	57	Climate and Meteorology	The BLM's discussion and use of climate change in its analysis/assessment of the leasing program is contradictory throughout the EIS, despite the EIS initially stating that it will only rely on historical data rather than forward-looking projections for analyzing the interactions between the environment and this project even though the project is projected to last for up to 70 years. The EIS expressly states that it will not consider forward-looking projections of local weather, ocean levels, etc. based on current, widely-accepted projections based on climate change. As the vast bulk of research and analysis regarding climate change suggests that historical weather and other patterns will be altered in the immediate future, historical data cannot predict a future project's and the climate's impacts on each other and so is irrelevant; relying on this data exclusively is incapable of accurately predicting these impacts. Also, as the arctic and coastal regions are predicted to be especially likely to experience significant impacts from climate change, this analysis ignores prospective changes to the area in which the project will take place without offering an accurate, convincing justification for doing so.	The state of the science is not capable of predicting whether there will be detrimental impacts from specific GHG emissions. "In climate research and modeling, we should recognize that we are dealing with a coupled non-linear chaotic system, and therefore that long-term prediction of future climate states is not possible" (IPCC Third Assessment Report [2001], Section 14.2.2.2, p. 774).
153.	Withheld	Withheld	Government of the Northwest Territories	92862	58	Climate and Meteorology	Additionally, the EIS later cites likely prospective changes based on climate change to suggest, among other things, that the project may have a positive impact on caribou forage by decreasing the duration of snow cover. Dismissing climate change to ignore its potential negative interactions with the project, but later citing it to support allegedly positive aspects of the program is directly contradictory.	The BLM has attempted in this EIS to provide a balanced approach to the resource-specific climate change analyses and feels it is not contradictory to point out both the positive and negative impacts of potential climate change.

S. Public Comments and BLM Responses (Climate and Meteorology)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
154.	Withheld	Withheld	Government of the Northwest Territories	92862	59	Climate and Meteorology	The GNWT recommends climate change be considered in determining how key aspects of the environment, like ocean levels, rain fall, wind patterns, and other aspects of the environment; therefore, climate change must be addressed and discussed throughout the EIS in a consistent manner to determine what the likely impacts on/interactions between the environment and the project will be during its future life. The EIS should consider data on climate change regarding the prospective changes to the environment in which the project will take place and how this will affect its projected environmental impacts.	The BLM agrees with this comment and has sought to present this kind of analysis in the Draft EIS.
155.	Karen	Bollinger	—	94054	6	Climate and Meteorology	· The BLM significantly underestimates carbon emissions that would result from drilling the Arctic Refuge, estimating only 56,739 to 378,261 metric tons of annual direct GHG emissions (from extraction, transport, etc) and 0.7 to 5 million metric tons of annual indirect GHG emissions (from combustion and downstream use of the oil) - measured in CO2 equivalent. (Volume 1, Table 3-5 p.78) · This is a very misleading set of numbers and is calculated only from the increase from oil demand that the analysis predicts will result from developing the Refuge. It does not account for burning all of the oil they project will be extracted. That number is much larger. CAP estimates that the equivalent to the annual emissions of 16 coal fired power plants would be emitted - roughly 62 million tons.	The comment questions the Draft EIS analysis methodology, which considers only the incremental global amount of petroleum production that could result from the proposed leasing, rather than looking at the total production as if it were isolated from global markets. The Draft EIS appropriately provides a comparison of the GHG emissions of the proposed action versus the No Action Alternative (i.e., the incremental GHG emissions), as prescribed by NEPA. BOEM's MarketSim analysis is shown in Appendix R of the Final EIS. Table R-3 of that appendix shows total consumption-related GHG emissions of the Coastal Plain development, prior to discounting to account for market supply and demand effects.

156.	Karen	Bollinger	—	94054	7	Climate and Meteorology	This document completely fails to assess how expanding oil and gas development in the Refuge will further exacerbate climate adaptation and mitigation challenges in an Arctic that is warming at twice the rate of the rest of the country.	The Draft EIS analysis accounts for the estimated incremental amount of oil and gas burned on a global scale, and the resulting estimates of GHG emissions. Because the increase is small in a global context, the proposed action, by itself, would not measurably affect climate change adaptation or mitigation challenges in the Arctic or globally.
157.	Malcolm	Boothroyd	CPAWS Yukon Chapter	94061	28	Climate and Meteorology	A full life cycle analysis of greenhouse gas emissions projections corresponding to a range of scenarios for possible recoverable oil and gas reserves in the Arctic National Wildlife Refuge. (Including life cycle accounting of the potential upstream and downstream emissions associated with exploration, production and combustion of fossil fuel reserves). * Analysis of the implications from potential oil and gas activities in the Arctic Refuge on state, federal and global efforts to reduce greenhouse gas emissions.	As described on pages 3-7 and 3-8 of the Draft EIS, the BLM used BOEM's MarketSim model to perform a lifecycle analysis of GHG emissions.
158.	Lisa	Jodwalis	—	94072	10	Climate and Meteorology	Inadequate discussion of the synergistic effects of proposed oil and gas activities combined with climate warming in the 1002 Area where climate warming is already negatively affecting wildlife, specifically eiders and other sea ducks and seabirds, marine mammals such as polar bears and seals, and other marine life dependent on multi-year sea ice.	Discussions of climate change and cumulative effects have been expanded, including clarification that habitat changes already have been documented. Effects of climate change on polar bears and other marine mammals were discussed in Draft EIS Section 3.3.5, Marine Mammals, Affected Environment, Climate Change; additional text has been inserted to expand that discussion in the Final EIS, citing more references on the subject.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
159.	Amy	Gulick	—	94077	7	Climate and Meteorology	7) The draft EIS fails to assess how expanding oil and gas development in the Arctic Refuge will exacerbate climate adaptation and mitigation challenges in an Arctic that is warming at a much faster rate than the rest of the United States.	The Draft EIS analysis accounts for the estimated incremental amount of oil and gas burned on a global scale, and the resulting estimates of GHG emissions. Because the increase is small in a global context, the proposed action, by itself, would not measurably affect climate change adaptation or mitigation challenges in the Arctic or globally.
160.	David	Levine	—	94087	1	Climate and Meteorology	The Draft EIS does not adequately address the effects of global warming/climate change on the North Slope and the implications for arctic engineering and oil development practices. Some examples of these concerns include shorter winter seasons, less snow cover for winter seismic exploratory activities, increased stress/risk to wildlife, and less stable permafrost. The Department of the Interior needs to thoroughly research, understand and have a credible plan to address the impact of climate change on arctic conditions including permafrost, wildlife, snow fall and arctic engineering practices. Such information and analysis are currently lacking throughout the Draft EIS.	The full scope of analysis requested by the commenter is outside the scope of this EIS. The BLM addressed potential impacts from climate change on page 3-9 of the Draft EIS under Impacts of Climate Change on Potential Development. Future site-specific development proposals will be evaluated in site-specific NEPA analyses and through state permitting processes.
161.	—	—	Alaska Department of Natural Resources	94102	55	Climate and Meteorology	30 Chapter 3, Page 3-9 Justify analysis - inconsistencies Paragraph five on this page discussed the potential for sea level rise within the approximate 50-year life of the production facilities or access roads. This is confusing because the discussion of greenhouse gas emissions on page 3-7 is based on a 70-year period for the potential production. Please clarify which time period is being used for forecasting impacts.	The final EIS corrects the paragraph in question to say "70-year life of the production . . ."

S. Public Comments and BLM Responses (Climate and Meteorology)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
162.	Kennon	Meyer	—	94105	9	Climate and Meteorology	The DEIS fails to make any significant analysis of how the utilization of the leases will contribute to climate change and then in turn analyze how those additions to climate change will impact the United States, including impacts beyond Alaska. Analyzing the impact of climate change on arctic drilling practices is only meaningful if it is paralleled by an analysis of how the drilling will itself increase the effects of climate change. The DEIS states, "Climate change can be driven by natural forces...or by human activity, such as land use changes or GHG emissions."32 As such, the impacts of human activity must also be taken into consideration.	The Draft EIS analysis accounts for the estimated incremental amount of oil and gas burned on a global scale, and the resulting estimates of GHG emissions. Because the increase is small in a global context, the proposed action, by itself, would not measurably affect climate change adaptation or mitigation challenges in the Arctic or globally.
163.	Kennon	Meyer	—	94105	11	Climate and Meteorology	any EIS must carefully and thoroughly consider all aspects of climate change impacts. The DEIS does not meet the mark, offering only a myopic and ambiguous analysis (for all alternatives) of how climate change may "potentially" impact potential development in the Coastal Plain. The DEIS completely ignores how the activities resulting from oil and gas leasing would contribute to overall warming of the earth. As discussed below, the DEIS must consider how drilling and the associated human activities in the arctic region will increase GHG emissions and further fuel climate change.	The Draft EIS analysis accounts for the estimated incremental amount of oil and gas burned on a global scale, and the resulting estimates of GHG emissions. Because the increase is small in a global context, the proposed action, by itself, would not measurably affect climate change adaptation or mitigation challenges in the Arctic or globally.

164.	Kennon	Meyer	—	94105	12	Climate and Meteorology	While such information is quantitatively valuable, the BLM's anemic attempt to examine the qualitative environmental consequences of increased GHG emissions (e.g., increased surface temperatures, expediated sea ice reductions), lays bare the inadequacies of the range of alternatives. Indeed, no attempt is made to distinguish between the alternatives in this regard, as the BLM simply provides a rote list of possible effects common to all alternatives, thus rendering impossible a meaningful comparative analysis. ⁴⁸	The Draft EIS presents the range of estimated GHG emissions for all alternatives in a global context, so the reader can gauge the portion of the cumulative global GHG emissions that would be due to the proposed action.

165.	Kenyon	Meyer	—	94105	13	Climate and Meteorology	<p>studies show that the impacts of climate change are disproportionately felt in the arctic northern latitudes. Specifically, Alaska is undergoing rapid changes. 51 Substantial atmospheric warming has occurred at more northern latitudes over the last half-century.52 "Fire patterns are changing, permafrost is thawing, and Arctic summers are now warmer than at any other time in the last 400 years. Most climate models predict that high latitudes will experience a much larger rise in temperature than the rest of the globe over the coming century."53 Arctic surface and atmospheric temperatures have demonstrated substantial increases. 54 "Multiple observation sources, including land-based surface stations since at least 1950 and available meteorological reanalysis datasets, provide evidence that arctic near-surface air temperatures have increased more than twice as fast as the global average."55 According to the observed records, the arctic region shows a remarkable recent rapid temperature trend in comparison with other regions.56 The BLM has recognized arctic warming in northern Alaska through the National Petroleum Reserve-Alaska ("NPR-A") Climate Change analysis calculated on behalf of the agency. Both summer and winter temperatures are expected to increase across the NPR-A throughout the century, with the greatest increases in winter. 57 Summer temperatures are projected to rise across the NPR-A by approximately 3°F by the 2040s, and by approximately 5-6°F by the 2090s.58 However, the DEIS fails to fully analyze increased temperatures in the arctic by considering them in any of the alternatives.</p>	<p>The Draft EIS analysis accounts for the estimated incremental amount of oil and gas burned on a global scale, and the resulting estimates of GHG emissions. Because the increase is small in a global context, the proposed action, by itself, would not measurably affect climate change adaptation or mitigation challenges in the Arctic or globally.</p>

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
166.	Kennon	Meyer	—	94105	14	Climate and Meteorology	<p>the increased temperatures throughout the Arctic are expedited by the GHG emissions released during the thawing of permafrost. The DEIS identifies that both climate change and potential impacts of the oil and gas lease drilling in the area could lead to a thawing of permafrost.⁶⁵ Indeed, throughout Alaska, there is evidence that warming is causing a reduction in permafrost. "Rising Alaskan permafrost temperatures are causing permafrost to thaw and become more discontinuous."⁶⁶ This thawing process then in turn releases additional carbon dioxide and methane, resulting in an amplifying feedback and additional warming.⁶⁷ As such, this creates another way by which the oil and gas leases will result in the release of additional GHG emissions into the environment.⁶⁸ The DEIS fails entirely to address this foreseeable death spiral.</p>	<p>Decreases in permafrost extent and increasing active layer depth in Alaska have happened during many warmer times in Arctic geologic history, including earlier during the current interglacial period, when the Arctic Ocean has been ice free or nearly so in summers (Park et al 2018). Such changes have never led to a "death spiral" of warming due to associated methane emissions.</p>
167.	Mark	Jorgenson	—	94411	5	Climate and Meteorology	<p>A more complete and graphic presentation of existing data are needed. The climate data trends for Kaktovik should be presented graphically to better support interpretation of trends. Data from the USGS weather stations at Niguanak, Marsh Creek, and Camden Bay (Urban and Clow 2018) should be summarized and used to assess climate variability from the coast to the mountains. It is insufficient to simply reference the 2018 USGS report; the data need to be analyzed and used in a meaningful way to assess the implications of the analyses for the evaluation of Alternatives.</p>	<p>Accurate long-term temperature and precipitation trend charts for Kaktovik/Barter Island are not feasible, given there are missing data over the period of record going back to 1948, including in the past couple of decades. However, the trend data referenced and discussed, which are included on the UAF climate website for Barrow and Interior Alaska locations, provide a good description of climate trends for the North Slope region.</p>

S. Public Comments and BLM Responses (Climate and Meteorology)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
168.	Mark	Jorgenson	—	94411	6	Climate and Meteorology	Precipitation data from the NRCS Wyoming snow gauge at Kaktovik should be analyzed. In addition, it would be useful to include to longer-term trends at Barrow where the climate data record extends to 1900. Below is a chart of mean annual air temperatures for Barrow, with smoothing to highlight trends (Figure 1). Finally, the discussion that attributes most of the recent warming to the 1977 PDO shift is misleading.	Accurate long-term temperature and precipitation trend charts for Kaktovik/Barter Island are not feasible, given there are missing data over the period of record going back to 1948, including in the past couple of decades. However, the trend data referenced and discussed, which are included on the UAF climate website for Barrow and Interior Alaska locations, provide a good description of climate trends for the North Slope region.
169.	Mark	Jorgenson	—	94411	7	Climate and Meteorology	Additional weather stations should be installed and monitored for at least 5 years as part of the EIS process. There is likely a strong inland temperature gradient from the coast to the mountains. This needs to be documented because it can affect engineering design, permafrost temperatures, ground stability, winter travel requirements, and ecological patterns and processes. Data on temperature gradients are needed to adequately assess Alternatives that vary substantially in their climatic regimes.	Existing development on the North Slope has already had to cope with temperature gradients at various times of year between the coast and the mountains. No additional measurements are expected to be needed for engineering purposes at this time; however, the EIS does not preclude the development of additional weather stations if needed in support of engineering or other purposes.
170.	Mark	Jorgenson	—	94411	9	Climate and Meteorology	Future climate projections need to be included and sufficiently discussed, such as those from the SNAP downscaled climate projections (https://www.snap.uaf.edu/). The projected climate warming in northern Alaska is projected to be large due to arctic amplification, and will likely have serious coastal, permafrost, and ecological impacts (Reidmiller et al. 2018). The projected warming also has huge implications for engineering design, facility stability, ice road seasons, and road maintenance. These need to be properly evaluated. As ice roads are an essential part of the infrastructure design, the effect of a warming climate is critical.	Each developer would need to address climate-dependent facility design and maintenance issues closer to the time of development, using the latest available data at that time. It is not expected that design issues and the current rate of warming would preclude development of the resource.

S. Public Comments and BLM Responses (Climate and Meteorology)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
171.	Mark	Jorgenson	—	94411	10	Climate and Meteorology	The information on sea ice is inadequate and misleading. Graphs should be presented for past trends and future projections. The section is misleading by highlighting a decrease in sea ice extent for July between 2005 and 2018. To dispel this misleading approach to minimizing the impacts of rapid sea ice loss, the DEIS must present the entire graphic record of sea ice changes in seasonal minimum extent since the satellite record began, as well as review recent studies on projected sea ice loss. The implications of the loss of summer sea ice are huge for nearshore wave climate, coastal erosion, inland temperatures, and effects on numerous species, particularly marine mammals. This attempt to minimize impacts through selective cherry picking of data is unconscionable.	The text referenced (presented on page 3-9 of the Draft EIS) was presented in respect to the potential impact of climate changes on potential development, including changes in sea ice. The changes in sea ice cover and the implication of these changes on species, including marine mammals, are discussed further in those respective sections of the Draft and Final EISs.
172.	Withheld	Withheld	—	94435	8	Climate and Meteorology	The DEIS failed to address climate impacts. The DEIS fails to provide any analysis of how expanding fossil fuel development in the Arctic Refuge would exacerbate the impacts of climate change already occurring across the Arctic. The DEIA fails to address how to minimize the impacts on climate. Developing oil and gas in the Arctic Refuge is inconsistent with the urgent need to address climate change.	The Draft EIS analysis accounts for the estimated incremental amount of oil and gas burned on a global scale, and the resulting estimates of GHG emissions. Because the increase is small in a global context, the proposed action, by itself, would not measurably affect climate change adaptation or mitigation challenges in the Arctic or globally.
173.	Withheld	Withheld	—	94593	2	Climate and Meteorology	No information or assessment on impacts of climate change on coastal plain ecosystems relative to new impacts. Information about snow depth, permafrost, etc. is dated and does not project changes in these factors.	Data on permafrost trends was presented in Section 3.2.8 (Soil Resources) of the Draft EIS. As stated in Section 3.2.1 of the Draft EIS, there is no discernable trend in annual precipitation for the North Slope climate division from 1925 through 2016. Thus, snow depth is not likely to be showing significant trends, apart from later initiation and earlier melt due to a lengthened warm season.

S. Public Comments and BLM Responses (Climate and Meteorology)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
174.	Jason	Schwartz	Institute for Policy Integrity	94627	13	Climate and Meteorology	<p>BLM reports that, according to its analysis, reducing the supply of oil and gas under the no action alternative by up to 10 billion barrels of oil and 2.4 TCF of natural gas will only reduce total demand for oil and gas by 3.9%.⁶⁴ Instead, BLM predicts that over 80% of the forgone oil and gas from Coastal Plain will be offset by increased foreign imports of oil and gas.⁶⁵ First, we have been unable to reproduce these results using the copies of MarketSim 2016 and documentation of MarketSim 2017 that are available to us. The challenges of reproducing and critiquing BLM's analysis are compounded by the fact that BLM has not made available as part of its public docket on ePlanning the complete runs of its energy substitution analysis. Indeed, we only obtained the summary document, labeled "BOEM 2018a" in the DEIS, by specific e-mail request. BLM must make the full energy substitution analysis available to the public to fulfill the requirement for meaningful public review under NEPA.</p>	<p>The 3.9 percent quoted in the comment is the percentage of the Coastal Plain project that would not be replaced by substitute energy sources. BOEM released the MarketSim to IPI through a FOIA request based on BOEM's use of it in different contexts. FOIA doesn't require BOEM to ensure that those who request the model be able to replicate results; there may be reasons why the results are not equivalent; however, the BLM agrees that more detail regarding the MarketSim analysis should be provided and has included these details in Appendix R of the Final EIS.</p>

S. Public Comments and BLM Responses (Climate and Meteorology)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
175.	Jason	Schwartz	Institute for Policy Integrity	94627	15	Climate and Meteorology	the Department of the Interior never explains why it could not make a reasonable assumption about average emissions from total foreign consumption of oil. The MarketSim documents claim that "oil is consumed in a variety of products, which have a wide range of emissions factors," ⁷⁴ and yet the emissions factors for oil that BLM has used elsewhere show a rather manageable range of between a low of 5.72 kilograms of carbon dioxide per gallon to a high end of 14.64 kilograms per gallon. ⁷⁵ BLM could easily apply either EIA tables of U.S. exports by petroleum product, ⁷⁶ or could simply give a lower-bound estimate of the net emissions effect. ⁷⁷ Either option would be much more accurate and reasonable than a complete omission.	The range of CO2 emitted per unit of oil is well established and not the issue at hand; rather, the issue is the uncertainty and lack of reliable data for the oil substitutes available in other countries and those countries' substitution patterns (cross-price elasticities) and resulting energy mix of oil and the various substitutes. The DC Circuit has held that agencies are not required to model how their actions will affect global energy markets and how those market changes will, in turn, affect foreign greenhouse gas emissions (Sierra Club, 867 F.3d at 202). That kind of analysis is simply "too speculative" and infeasible to be required under NEPA.

S. Public Comments and BLM Responses (Climate and Meteorology)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
176.	Jason	Schwartz	Institute for Policy Integrity	94627	17	Climate and Meteorology	<p>While the DEIS does calculate some direct emissions from the upstream “construction, drilling, production, processing, and transportation” of oil and gas from Coastal Plain,⁸⁹ the substitution analysis apparently does not calculate comparable upstream emissions from substitute energy sources. For the sake of completeness and accuracy, that omission should be rectified in any final analysis. However, in correcting that omission, BLM must be sure to address two other issues at the same time. First, the DEIS also currently omits any quantification or monetization of the climate damages from methane leaks. The DEIS admits this omission with respect to methane leaks “during the drilling, production, processing and transport of natural gas,”⁹⁰ though there could also be significant methane leaks during the drilling, production, processing, and transport of oil which are also not currently accounted for in the DEIS. The DEIS speculates that methane leaks from gas production could be “roughly 5 percent of the estimate indirect emissions from combustion”-which would be a significant increase. Yet the DEIS never actually quantifies, let alone monetizes, the methane leaks from gas, and says nothing of methane leaks from oil production. These errors should be rectified in combination with any broader refinements to the calculation of upstream and direct emissions.</p>	<p>If substitute energy sources have significant upstream emissions, that would make the BLM’s analysis in the Draft EIS slightly conservative. This is because it would slightly overestimate the emissions increment between the no action and a proposed action alternative. Regarding the estimation of methane emissions, BOEM’s modeling tool used for “indirect” lifecycle GHG emissions includes CO2 emissions, nitrous oxide emissions, and methane emissions; therefore, the data presented in the Draft EIS already include methane emissions.</p>

S. Public Comments and BLM Responses (Climate and Meteorology)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
177.	Jason	Schwartz	Institute for Policy Integrity	94627	18	Climate and Meteorology	<p>there obvious problems with the assumption that 80% of forgone production will be offset by increased foreign imports. For one, MarketSim assumes that "other oil producing countries will supply" this offsetting production "without additional restraints," which BLM admits is a "highly uncertain" assumption about the effects on foreign production of this U.S. leasing decision.⁹² MarketSim does not, for example, consider whether OPEC countries will behave competitively or not, nor does it consider possible global regulatory changes in response to climate change. It is also unclear how to square this 80% import estimate with EIA projections that the United States will be a net exporter-projections that EIA made both before and after the moratorium on drilling in ANWR was lifted, thus suggesting that the status of the United States as a net exporter does not depend on the production from ANWR.⁹³ BLM's use of MarketSim also assumed that a decrease in onshore Alaskan production could not be offset by an increase in new offshore U.S. production, which is an unrealistic assumption and may have arbitrarily increased the portion of substitutes assigned to foreign imports. BLM should model all significant direct, indirect, upstream, and downstream emissions from the proposed leasing action and from substitution energy sources under the no action alternative, but should not selectively pick and choose which categories of emissions to model or not. If BLM does not address these issues, a selective calculation of the non-downstream emissions from a substitution analysis could skew the comparison of the no action alternative versus the leasing proposals.</p>	<p>This relates to the issue of uncertainty and the lack of reliable data for the oil substitutes available in other countries and those countries' substitution patterns (cross-price elasticities) and resulting energy mix of oil and the various substitutes. The DC Circuit has held that agencies are not required to model how their actions will affect global energy markets and how those market changes will, in turn, affect foreign greenhouse gas emissions (Sierra Club, 867 F.3d at 202). That kind of analysis is simply "too speculative" and infeasible to be required under NEPA.</p> <p>Furthermore, the greenhouse gas analysis used for the BLM project only considers the emissions from refining and consumption. A barrel of oil produced domestically from the onshore or offshore or a barrel of oil produced through imports and transported to the U.S. has the same amount of emissions when consumed. Therefore, the substitution of imports versus additional onshore production versus additional offshore production is irrelevant. The substitutions used in the lifecycle model are only from consumption of the fuel, and the only relevant substitution information is the proportion of oil, natural gas, coal, electricity, and reduced demand.</p>

178.	Jason	Schwartz	Institute for Policy Integrity	94627	19	Climate and Meteorology	<p>Many of the “key assumptions”⁹⁵ that BOEM makes in modeling lifecycle greenhouse gas emissions based on its MarketSim results are obviously problematic or could be straightforwardly refined with further study: * Number 1 assumes near constant demand for oil and gas for up to 70 years into the future, based on EIA’s reference case. However, not only has the EIA recently projected “decreasing domestic demand” for petroleum products through 2034,⁹⁶ but EIA’s reference case estimates are intended to reflect trends and are not necessarily firm predictions about the future. As such, these trends should not be used in isolation as point estimates; instead, agencies should conduct sensitivity analysis over reasonable assumptions and scenarios. * Number 2 assumes engines used to produce and consume oil and gas will not become more efficient, and oil and gas will remain primary energy sources. The first half of the assumption ignores standard best practices for cost-benefit analysis that instruct agencies to make reasonable assumptions about technological growth.⁹⁷ The second half of that assumption again ignores recent EIA outlooks for declining demand for oil. * Numbers 5, 7, and 9 assume that production gains are equal across all petroleum products; that offshore oil will be refined into petroleum products in the same proportions as nationally; and that the percent of oil that remains uncombusted will remain the same. These are empirical questions that can be studied and answered for Alaskan onshore production. * Numbers 6 and 10 relate to foreign versus domestic consumption, and the problems with these assumption have been addressed above.</p>	<p>MarketSim requires a substantial amount of baseline data; without that information, sensitivity tests would be unable to model. Because of the long time horizon, additional assumptions could lead to wild inaccuracies and underestimating emissions. BOEM’s approach was to take a worst-case scenario and consider the maximum emissions and not account for future improvements for which future emission rates are unknown.</p>

179.	Matthew	DePaolis	—	95032	3	Climate and Meteorology	Additionally, many of the requisite evaluations in the DEIS have been excluded or glossed over. Climate change effects are mentioned in a cursory matter in section 3-6 of the DEIS, but no real ramifications or effects are explored	The scope of climate analyses has been raised in many prior EIS efforts, with the resulting guidance from federal officials that it is not possible to attribute global climate consequences to a single project. The Final EIS cumulative effects sections have been updated to include more information on the synergistic effects of Coastal Plain development and climate change.
180.	Matthew	DePaolis	—	95032	4	Climate and Meteorology	Furthermore, the document referenced, GMT2 FEIS, also does not explore the actual indirect effects or costs of climate change on the United States or the world. Pg. 108 of GMT2 references positive feedback loops and how they may be affected but does not explain in any detail what effect they will have on the environment, nor their exacerbating effect on global climate change. Pg. 109 of GMT2 references potential “changes to fish and wildlife habitat” but does not explore these changes in any specific detail. These negative effects of the drilling leases must be explored in detail to satisfy the requirements set forth in NEPA.	The BLM determined that evaluating the cost of carbon emissions is not appropriate for this programmatic level of analysis, as described in Section F2.1 in Appendix F of the Draft EIS. The Final EIS cumulative effects sections have been updated to include more information on the synergistic effects of Coastal Plain development and climate change.
181.	Tim	Whitehouse	PEER	95601	75	Climate and Meteorology	What do we need to know and why regarding subjects? Development decisions that will be affected by snow/climate information include; seismic exploration*, water availability, and ice road construction*. To better inform decisions on these issues we will need to understand: 1. Snow Depth/Density/Distribution/Snow Water Equivalent to minimize the impacts on vegetation from tundra travel. (short-term) 2. Active Layer cycles/depths and their dependence on soil types to better plan routes of tundra travel. (short-term) 3. Late Season/ Fall Hydrologic Regimes and end of season snowpack to inform water availability for ice roads. (intermediate/long-term)	This Leasing EIS will not result in the authorization of any on-the-ground activities. Accordingly, the environmental baseline will be preserved throughout the lease sale process. Any on-the-ground activities will require additional NEPA analysis. At that time, the BLM will determine which baseline studies may be necessary.

182.	Tim	Whitehouse	PEER	95601	77	Climate and Meteorology	<p>What are key information gaps? 1. Snow Cover and Composition across both local and regional gradients of coastal plain a. Basic Climatology (i.e., precipitation, wind, temperature) b. Remote-sensing information to capture snow depth (e.g., Structure from motion, LiDAR, high-resolution satellite imagery) c. Snow density (e.g., what condition does the snow need to be in to minimize impacts of tundra travel) d. Snow water equivalent e. How snow cover, depth, and wind operate in concert to produce conditions amenable to tundra travel. 2. Active Layer Information a. How long does the subsurface need to be frozen and at what temperature/depth? Currently DNR uses a rough standard where ground temps need to be approximately -5° at 30 cm depth. Typically BLM follows this standard. b. How do active layer dynamics change based on soil type? 3. End of season snowpack and changing hydrologic regimes in late season (Fall). a. How do current climate trends impact alluvial water availability for winter activity in 1002? b. How does end of season snowpack contribute to lake recharge potential and water deficit? c. How does groundwater connectivity contribute to lake recharge potential?</p>	<p>This Leasing EIS will not result in the authorization of any on-the-ground activities. Accordingly, the environmental baseline will be preserved throughout the lease sale process. Any on-the-ground activities will require additional NEPA analysis. At that time, the BLM will determine which baseline studies may be necessary.</p>
183.	Tim	Whitehouse	PEER	95601	78	Climate and Meteorology	<p>What studies/surveys need to be conducted to fill those information gaps? 1. A 2016 review of methods to quantify common snow parameters can be found here. A combination of in-situ measurements (e.g., SNOTEL site, weather stations spanning N-S gradient), ground surveys, and remote sensing information will need to be collected. Currently LiDAR and structure from motion (SFM) are promising technologies that could be expanded this winter (FY 18) with limited operations currently scheduled</p>	<p>This Leasing EIS will not result in the authorization of any on-the-ground activities. Accordingly, the environmental baseline will be preserved throughout the lease sale process. Any on-the-ground activities will require additional NEPA analysis. At that time, the BLM will determine which baseline studies may be necessary.</p>

183. (cont.)	(see above)	(see above)	(see above)	(see above)	(see above)	(see above)	<p>for April. In addition, SFM sensors could be mounted to FLIR aircraft for ~ \$10,000 plus processing. Operating a SNOTEL site costs approximately \$3,000/yr and approximately \$24,000 - \$30,000 for installation. Some of the installation may be offset by NRCS. Long-term access costs will need to be addressed in advance of siting. 2. Active layer can be monitored via weather stations but will also need to be measured with ground surveys. Soil surveys will need to be produced at a finer spatial resolution than is currently available in order to capture some of the variability in the 1002. 3. Compared to Prudhoe Bay, Kuparuk, and the NPR-A, the 1002 area lacks surface water storage in lakes which provide the main water source for ice roads. Much of the water to support winter activity in the 1002 may need to come from isolated lakes, alluvial aquifers, and/or floodplain gravel pits. End of season snowpack surveys and watershed delineation will be important to understand lake recharge potential and water deficiency. Hydrologic monitoring will need to be implemented in selected river basins (e.g., Canning). In the longer term, there is potential to develop late season monitoring technology and methods in more accessible watersheds where stations are already in place and where there is a long-term record (e.g., Kaparuk) and this could be emphasized in 2018 field efforts.</p>	(see above)

S. Public Comments and BLM Responses (Climate and Meteorology)

184.	Harry K.	Brower Jr.	North Slope Borough	95612	55	Climate and Meteorology	The DEIS refers to climate as “the most recent 30-year averages of meteorological parameters” (DEIS at 3-2), and as the “longer-term (30 years or more) variations in meteorological conditions” (Id. at 3-5). These statements should be clarified and further explained as they could be interpreted to suggest that BLM's analysis may not have adequately captured or examined the climate-related effects at the relevant scale for purposes of assessing effects on the Coastal Plain.	The cited statements are the practical definition of climate as used by meteorologists. This concept encompasses both the average weather data over a 30-year period, and the variability of the data (e.g., extremes) within a 30-year period.
185.	Harry K.	Brower Jr.	North Slope Borough	95612	56	Climate and Meteorology	3.2.1 3-9 “GHG emissions disperse through the global atmosphere relatively quickly relative to the time scales of concern for climate . The potential cumulative climate impacts of global development and associated GHG emissions have been discussed extensively in the published literature, . and therefore are not repeated here (BLM 2018a· IPCC 2014; Melillo et al. 2014; ACIA 2005).” These sentences constitute a simplistic assessment of cumulative effects. Rather than simply citing literature the Final EIS should provide an analysis on reasonable foreseeable activities that will contribute to cumulative impacts of GHG emissions.	The Draft EIS analysis accounts for the estimated incremental amount of oil and gas burned on a global scale, and the resulting estimates of GHG emissions. Because the increase is small in a global context, the proposed action, by itself, would not measurably affect climate change adaptation or mitigation challenges in the Arctic or globally.

186.	Withheld	Withheld	—	96175	2	Climate and Meteorology	The EIS must address the proposed project and related impacts under the subject of climate change, not locally but world-wide. 3.2 PHYSICAL ENVIRONMENT 3.2.1 Climate and Meteorology Affected Environment Climate is described by the National Weather Service (NWS) as the most recent 30-year averages of meteorological parameters, such as temperature, precipitation, humidity, and winds; thus, climate change is treated here as the longer-term change in such variables. Climate change can be driven by natural forces, such as volcanic activity, solar output variability, and the earth's orbital variations, or by human activity, such as land use changes or GHG emissions. Much attention in recent decades has focused on the potential climate change effects of GHGs, especially carbon dioxide (CO2), which has been increasing in concentration in the global atmosphere since the end of the last ice age.	The Draft EIS analysis accounts for the estimated incremental amount of oil and gas burned on a global scale, and the resulting estimates of GHG emissions. Because the increase is small in a global context, the proposed action, by itself, would not measurably affect climate change adaptation or mitigation challenges in the Arctic or globally.

187.	Withheld	Withheld	—	96183	1	Climate and Meteorology	The DEIS estimates 56,739 to 378,261 metric tons of annual direct greenhouse gas (GHG) emissions and 0.7 to 5 million metric tons of annual indirect GHG emissions. To put that in perspective, five million metric tons of GHG emissions would equate to one million annual emissions from new vehicles. There is no doubt that this amount of emissions will drive further climate change. The people of the Arctic see these climatic changes too. Temperatures in the Arctic are rising at twice the rate of the rest of the nation. Villages are eroding into the sea, permafrost melt is damaging infrastructure, and food sources are disappearing. Drilling for fossil fuels will only compound these existing devastating impacts. I do not believe we should drill the Arctic Refuge for fossil fuels that will only lead to increased GHG emissions responsible for these very climatic changes. Oil and gas development activities should not be allowed on the Coastal Plain. I urge the Bureau of Land Management to consider the No Action Alternative as well as the impacts of climate change and the associated costs of climate damages.	Comment noted.
188.	Kevin	Kane	Sierra Club, Western Watersheds	96216	1	Climate and Meteorology	Where is the climate change analysis? What will be the results of leasing land that will produce oil and gas that will be burned for energy? How does this leasing lead to further warming and it's effects? Climate scientists have said 80% of known oil reserves need to stay in the ground to prevent exceeding 1.5 deg C. How will these leases impact the climate? The leases and climate change are inextricably linked	As projected in the Draft EIS, the oil and gas produced from the Coastal Plain would largely just offset other global production, with only a small portion (< 4 percent) of the total production representing a global increase in GHG emissions. Because the increase in GHG emissions is extremely small in a global context, the proposed action, by itself, would not measurably affect climate change adaptation or mitigation challenges in the Arctic or globally.

S. Public Comments and BLM Responses (Climate and Meteorology)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
189.	Withheld	Withheld	—	96867	7	Climate and Meteorology	3-9 Given the fast rate at which perma-frost is thawing in Alaska, it is irresponsible to suggest that “Permafrost is not likely to disappear in the program area during the life of any oil and gas development in the program area” ... there is no precedent for this	Projections for the maximum active layer depth show it increasing from 2 feet in the 1990–2000 period to about 3 feet in the 2090–2100 period (Arctic Climate Impact Assessment, Chapter 16, November 2004). This rate of change would not be expected to eliminate permafrost in North Slope areas within the current century.
190.	Withheld	Withheld	—	96867	8	Climate and Meteorology	3-9 “At current rates of sea level rise, from around 7 inches per century (tide gauge record) to 12 inches per century (satellite measurements), sea waters are not expected to encroach on any potential development within an approximate 50-year life of production facilities or access roads for the program area.” Apparently the authors of this report are very optimistic and have missed recent studies and reports on sea level rise. I suggest much more study is needed to support this statement.	The sea level rise figures are established in the scientific literature (e.g., Church and White 2011). This literature also shows little change in the rate of sea level rise over the past century.
191.	Brook	Brisson	Trustees for Alaska	96981	51	Climate and Meteorology	The draft EIS concedes that oil and gas extraction from the Coastal Plain has a magnitude that would result in increased net demand, resulting in a net increase in greenhouse gas (GHG) emissions relative to the no leasing alternative.159 However, as described in Part V.A. of these comments, the draft EIS fails to provide any analysis of how that increase in emissions, and the timing of those emissions, considered either individually or cumulatively, would affect the severity or timing of climate change impacts on any scale.	Pages 3-6 through 3-9 of the Draft EIS show the direct GHG emissions from post-lease oil and gas activities and indirect GHG emissions from combustion of net fuels production exported to market. It is not possible to attribute global climate consequences to a single project. As such, reporting potential GHG emissions from a plan or project and comparing these emissions with emissions at larger scales provide context for decision makers and the public. The potential cumulative effects of climate change due to greenhouse gas emissions are addressed extensively in referenced documents; the BLM does not need to repeat these voluminous discussions in the Draft EIS.

192.	Deanna	Noel	Defenders Of Wildlife	97156	3	Climate and Meteorology	count for impacts 38of carbon emissions. Although the DIS -- the DEISestimates the carbon emissions resulting from theproduction and consumption of oil and gas resourcesdeveloped on the coastal plain, and fails to fullyassess the importance of these emissions on globalclimate change, which already is dramaticallyaffecting Arctic ecosystems.	Pages 3-6 through 3-9 of the Draft EIS show the direct GHG emissions from post-lease oil and gas activities and indirect GHG emissions from combustion of net fuels production exported to market. It is not possible to attribute global climate consequences to a single project. As such, reporting potential GHG emissions from a plan or project and comparing these emissions with emissions at larger scales provide context for decision makers and the public. The potential cumulative effects of climate change due to greenhouse gas emissions are addressed extensively in referenced documents; the BLM does not need to repeat these voluminous discussions in the Draft EIS.
193.	Marueen	Longworth	—	97918	1	Climate and Meteorology	Large amounts of black carbon from combustion will be added to the atmosphere during the ANWR development phase. The DEIS does not mention this	Black carbon tends to fall out of the atmosphere relatively quickly. The primary concern with this substance in the Arctic is that when it deposits on snow and ice, it can increase melting rates by increasing absorption of solar energy. The proposed action is not expected to result in large amounts of black carbon emissions, as modern equipment, including flares, are designed to minimize these particulate matter emissions. Also, the EPA's low sulfur diesel standards have decreased emissions of such particulates from engines using diesel fuel. Furthermore, any black carbon that does deposit on snow and ice has a relatively short lifetime of a year to perhaps a few years, before the particles become part of the soil or the ocean sediment.

196.	Brook	Brisson	Trustees for Alaska	98269	81	Climate and Meteorology	The release of vented and flared gas from oil and gas operations contributes to greenhouse gas emissions, with vented gas contributing as methane and flared gas causing localized impacts from particulates deposited on snow and ice as black carbon. The Alaska Oil and Gas Conservation Commission collects data on vented and flared gas releases greater than one hour. BLM should analyze these data - similar to how BLM analyzed spill data for the North Slope - and quantify the rate and total projected quantity of these releases. Additionally, BLM should reduce the releases of vented and flared gas to the maximum extent through stringent requirements to reduce venting and flaring.	Flaring and vented emissions are already minimized to the extent practical by North Slope oil and gas producers, considering the needs for safe operations. The direct GHG emissions from these operations are already accounted for in the analysis presented in the Draft EIS. Black carbon tends to fall out of the atmosphere relatively quickly. The primary concern with this substance in the Arctic is that when it deposits on snow and ice, it can increase melting rates by increasing absorption of solar energy. The proposed action is not expected to result in large amounts of black carbon emissions, as modern equipment, including flares, are designed to minimize these particulate matter emissions. Also, the EPA's low sulfur diesel standards have decreased emissions of such particulates from engines using diesel fuel. Furthermore, any black carbon that does deposit on snow and ice has a relatively short lifetime of a year to perhaps a few years, before the particles become part of the soil or the ocean sediment.
197.	Brook	Brisson	Trustees for Alaska	98269	99	Climate and Meteorology	It is well established that when an agency considers a decision that will result in greenhouse gas emissions, NEPA requires the agency to analyze and disclose the effects of these emissions, including emissions from fossil fuels that will be burned because they will be produced or delivered to market as a result of the agency's decision.528 ... Although a cost-benefit analysis is not necessarily the ideal or exclusive method for assessing contributions to an adverse effect as enormous and potentially catastrophic as climate change, a tool to determine the costs of carbon pollution has been developed by the	The BLM has reviewed this comment and determined that SCC is not appropriate for this programmatic level of analysis, as described in Section F2.1 in Appendix F of the EIS.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
198.	Brook	Brisson	Trustees for Alaska	98269	100	Climate and Meteorology	<p>BLM's analysis of greenhouse gas emissions relies on a misuse of the MarketSim model that drastically underestimates the greenhouse gas (GHG) pollution that will result from oil and gas leasing in the Arctic Refuge. One of the flaws in BLM's use of the model is its assumption that Arctic Refuge drilling will only affect the U.S. market for oil, rather than the global market. ... Unfortunately, BLM has deprived the public of the opportunity to meaningfully comment on the GHG analysis by hiding the calculations that led to these numbers in a white paper that is not part of the draft EIS and is not publicly available.⁵⁴¹ What BLM does make clear, however, is that the calculations are based on changes in U.S. demand for oil, despite the fact that "petroleum is obviously a global commodity."⁵⁴² The choice to exclude foreign markets greatly skews the results of the analysis to make the GHG consequences of Arctic Refuge drilling appear much less significant than they are. BLM claims that the MarketSim model on which it relies only models changes in US demand: "[t]he MarketSim model considers only the US supply and demand for petroleum; thus, the accuracy of the change (increase) in petroleum demand estimated from MarketSim projections is limited, given its scope is just the US market."⁵⁴³ This is not true. "MarketSim models oil as a global market with supply and demand specified separately for the U.S. and the rest of the world."⁵⁴⁴ BOEM in fact used MarketSim's global market capabilities when it calculated the GHG pollution from the 2017-2022 Five Year Plan for offshore oil and gas in 2016.⁵⁴⁵</p>	<p>Regarding global oil and energy demand, the BLM lacks reliable data for the oil substitutes available in other countries and those countries' substitution patterns (cross-price elasticities) and resulting energy mix of oil and the various substitutes. The DC Circuit has held that agencies are not required to model how their actions will affect global energy markets and how those market changes will, in turn, affect foreign greenhouse gas emissions (Sierra Club, 867 F.3d at 202). That kind of analysis is simply "too speculative" and infeasible to be required under NEPA. Regarding documentation of the MarketSim analysis, the BLM agrees that the Draft EIS was short on details in this regard; the BLM has provided supplemental information in the Final EIS main text and Appendix R to rectify that shortfall.</p>

201.	Brook	Brisson	Trustees for Alaska	98269	103	Climate and Meteorology	<p>BLM's justification for its failure to utilize the social cost of carbon (or otherwise quantify the cost of carbon emissions) is arbitrary and capricious. In Appendix F, the agency claims that a) current protocols do not require applying the social cost of carbon metric to the DEIS; b) NEPA does not require cost-benefit analysis; c) that the DEIS does, in fact, analyze non-monetary impacts from carbon emissions; d) that this approach is justified because it is easier to understand; and e) that, regardless, the social cost of carbon is flawed.⁵⁵³ As an initial matter, BLM cannot hide behind the fact that current protocols do not require a particular social cost of carbon metric or that prior guidance on the Interagency Working Group's social cost of carbon metric has been retracted. That metric remains a readily available means of analyzing a potentially significant impact. (Indeed, it is worth noting that BLM used estimates of the social cost of carbon in NEPA reviews prior to release of the Interagency Working Group's protocol in 2010.⁵⁵⁴) Additionally, BLM cannot justify its omission of social cost by simply claiming that they chose a different methodology. The DEIS provides no meaningful quantitative analysis of the social cost of GHG pollution, despite quantifying the economic benefits of the program leading to such pollution.</p>	<p>The BLM has reviewed this comment and determined that SCC is not appropriate for this programmatic level of analysis, as described in Section F2.1 in Appendix F of the EIS.</p>

203. (cont.)	(see above)	(see above)	(see above)	(see above)	(see above)	(see above)	the model it relies on allows BLM to irrationally conclude that increased oil production from the Arctic Refuge would lead to only a negligible increase in emissions over the No Action Alternative.	have sufficient data to support estimates of the GHG emissions likely to result from changes in foreign oil consumption. In regards to inputs, assumptions, and functions for the MarketSim and GHG models, this information is contained in BOEM's documentation for these models: https://www.boem.gov/ESPIS/5/5612.pdf https://www.boem.gov/OCS-Report-BOEM-2016-065/ . For the MarketSim model, the Final EIS has been revised to say that MarketSim estimated the percentage of proposed action-related GHG emissions that would be incremental in the U.S. energy (not just oil) market. Thus, the 3.9 percent in the high-end case and the 3.4 percent in the low-end case are not the increase in oil demand; they are the increase in domestic energy demand, as a percentage of the total energy in petroleum that would be produced in the Coastal leasing area. In regards to how the BLM accounted for factors such as the effects of climate policies on oil demand, BOEM's MarketSim model uses the EIA Annual Energy Outlook baseline data in the model. EIA's forecast looks at existing policies and does not forecast future laws or policies. BOEM uses the EIA projections as the official government estimates of future energy consumption. Any potential climate policy would be too uncertain at this stage to fully estimate into the model. There are currently no reliable methodologies for forecasting foreign energy cross-price elasticities and oil/gas price shock substitution responses to arrive at a global GHG emissions impact from associated domestic changes. Also, the DC Circuit has

203. (cont.)	(see above)	(see above)	(see above)	(see above)	(see above)	(see above)	(see above)	held that agencies are not required to model how their actions will affect global energy markets and how those market changes will, in turn, affect foreign greenhouse gas emissions. Sierra Club, 867 F.3d at 202. That kind of analysis is “too speculative” and infeasible to be required under NEPA. In sum, the EIS has been updated to include the gross combustion emissions, to add full results tables, to reference the Lifecycle paper and MarketSim documentation, and to provide information as to why alternative future carbon policies and foreign consumption aren’t modeled.
204.	Brook	Brisson	Trustees for Alaska	98269	106	Climate and Meteorology	In sum, numerous scientific and economic analyses show that the assumption of near-perfect substitution for U.S. oil and gas production is unfounded and unreasonable, and dramatically misrepresents the significant greenhouse gas and climate impacts from oil and gas leasing.	BOEM’s model makes a reasonable approximation of the emissions from consumption associated with the Coastal Plain production and the energy substitutes under the No Action Alternative. BOEM continually reviews its models and assumptions and may make further changes.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
205.	Brook	Brisson	Trustees for Alaska	98269	107	Climate and Meteorology	The DEIS underestimates methane emissions by failing to address or account for available scientific information indicating that the EPA inventory emissions estimates on which BLM relies vastly underestimate emissions. As described above, the estimate of methane emissions from the proposed Coastal Plain program in the DEIS is calculated using data from the U.S. EPA Inventory of US Greenhouse Gas Emissions and Sinks 1990-2016 (April 2018). Recent scientific science published in June of 2018 indicates that the magnitude of methane leakage in 2015 from oil and gas supply chain emissions were about 60% higher than the U.S. Environmental Protection Agency inventory estimate for that year. ⁵⁷⁶ The study suggests that this discrepancy exists because current EPA inventory methods miss emissions that occur during abnormal operating conditions. ...	The EPA's Greenhouse Gas Inventory Report is the best available published source for reporting annual U.S. greenhouse gas emissions and is appropriate for use in this EIS.
206.	Brook	Brisson	Trustees for Alaska	98269	109	Climate and Meteorology	Global Warming Potential ("GWP") is a concept that is critical to understanding any estimate of methane emissions made for the purpose of assessing climate change impacts. ... Notably, the DEIS makes no mention of this concept whatsoever in its discussion of methane. ...	The final EIS has been edited to include a discussion of GWP.
207.	Brook	Brisson	Trustees for Alaska	98269	110	Climate and Meteorology	The US EPA Inventory uses the GWPs for the 100-year time frame only. Consequently, the calculations in the DEIS present methane emissions only in terms of the equivalence to CO2 over a 100-year timeframe. If the DEIS also considered the climate change impacts of its actions over a shorter time frame, and calculated the methane emissions in light of the GWP for a 20 year timeframe, the methane emissions, expressed in CO2 equivalents, would be approximately 2.7 times greater than the amount	The primary concern with GHG emissions is long-term climate change, leading to rising ocean levels and gradual warming of the oceans and atmosphere over longer time scales; therefore, the 20-year horizon effect of GHGs is less of a concern than the 100-year horizon. The primary moderator of Earth's temperatures is the oceans, which embody the vast majority of the thermal inertia of the whole land-ocean-cryosphere-atmosphere system. It takes time to change the

207. (cont.)	(see above)	(see above)	(see above)	(see above)	(see above)	(see above)	presented in the DEIS. Notably, EPA itself makes clear that the use of the 100-year timeframe in its inventory is based on a political agreement between nations to standardize how emissions are reported under the United Nations Framework Convention on Climate Change, and that other time horizons are available. ⁵⁸¹ BLM itself has at times considered the 20-yr GWP in addition to the 100-yr GWP. ⁵⁸²	<p>bulk average ocean temperature because of its huge thermal inertia; therefore, a relatively short-lived GHG like methane cannot have a large impact on global climate. Nonetheless, if the BLM considers the 20-year GWP horizon, and the commenter's multiplier of 2.7 is correct for methane (compared with the 100-year horizon), the methane portion of the Coastal Plain development-related GHG emissions would be 5 percent (methane portion of CO₂e from Draft EIS) multiplied by 2.7, or 13.5 percent of the CO₂e for a 20-year horizon. Given the GHG estimates for the Coastal Plain program area are order of magnitude estimates (given uncertainty in recoverable oil), this marginal change would not appreciably affect the estimated GHG emissions, and the portion of national or global emissions represented by the development.</p> <p>Finally, regarding methane's overall importance to the climate, modeled estimates of methane's radiative forcing (RF) over the last several decades show that it has essentially flattened out, despite the large increase in U.S. drilling activity in the last decade, and the increased production of natural gas. In contrast, the calculated RF for CO₂ continues to increase rapidly (see Figure 2-5 of the Fourth National Climate Assessment); therefore, it is more important to focus on CO₂ emissions and the effects of all GHGs combined over long (100-year) time horizons.</p>

S. Public Comments and BLM Responses (Climate and Meteorology)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
208.	Brook	Brisson	Trustees for Alaska	98269	112	Climate and Meteorology	By ignoring the importance of GWP timeframe entirely, the DEIS has failed to take a hard look at the impacts of methane from the Coastal Plain program. The impacts of increased methane emissions over a timeframe of 20 years are highly relevant in particular in light of the most recent report from the IPCC, which concluded that significant emissions reduction are necessary by 2030 to avoid the most devastating impacts of climate change as discussed in detail below. In particular, deep reductions of methane and other short-lived GHG emissions are required to limit global warming to 1.5°C with no or limited overshoot (at least 35% reductions in both methane and black carbon by 2050 relative to 2010).	The primary concern with GHG emissions is long-term climate change, leading to rising ocean levels and gradual warming of the oceans and atmosphere over longer time scales; therefore, the 20-year horizon effect of GHGs is less of a concern than the 100-year horizon. The primary moderator of Earth's temperatures is the oceans, which embody the vast majority of the thermal inertia of the whole land-ocean-cryosphere-atmosphere system. It takes time to change the bulk average ocean temperature because of its huge thermal inertia. Nonetheless, if the BLM considers the 20-year GWP horizon, and the commenter's multiplier of 2.7 is correct for methane (compared with the 100-year horizon), the methane portion of the Coastal Plain development-related GHG emissions would be 5 percent (methane portion of CO ₂ e from Draft EIS) multiplied by 2.7, or 13.5 percent of the CO ₂ e for a 20-year horizon. Given the GHG estimates for the Coastal Plain program area are order of magnitude estimates (given uncertainty in recoverable oil), this marginal change would not appreciably affect the estimated GHG emissions, and the portion of national or global emissions represented by the development.

209.	Brook	Brisson	Trustees for Alaska	98269	113	Climate and Meteorology	BLM also fails to estimate black carbon emissions from Arctic Refuge drilling, despite the fact that our groups provided detailed information about black carbon and its impacts in our scoping comments. According to EPA, black carbon "is now recognized as an important climate-forcing agent with particular impact on the arctic region."585	Black carbon tends to fall out of the atmosphere relatively quickly. The primary concern with this substance in the Arctic is that when it deposits on snow and ice, it can increase melting rates by increasing absorption of solar energy. The proposed action is not expected to result in large amounts of black carbon emissions, as modern equipment, including flares, are designed to minimize these particulate matter emissions. Also, the EPA's low sulfur diesel standards have decreased emissions of such particulates from engines using diesel fuel. Furthermore, any black carbon that does deposit on snow and ice has a relatively short lifetime of a year to perhaps a few years, before the particles become part of the soil or the ocean sediment.

210.	Brook	Brisson	Trustees for Alaska	98269	114	Climate and Meteorology	<p>Several types of fuel sources, including fossil and biomass, emit black carbon, but in differing ratios. Diesel engines are a particularly important source, with up to 80% of its sub-2.5 micrometer particulate matter (PM2.5) composed of black carbon.⁵⁹³ PM2.5 (and smaller), in addition to being a climate-forcing material through altered albedo, is also associated with human health impacts, particularly cardiovascular and respiratory ailments.⁵⁹⁴ The flaring of natural gas is another important source of black carbon, particularly in the Arctic, where it contributes 42% of the annual mean black carbon concentration, and 52% of the concentration in March,⁵⁹⁵ when it could have significant effects on early spring ice dynamics. Given these impacts, the eight-nation Arctic Council in April 2015 adopted a framework agreement to hasten reduction of black carbon and methane emissions, in which those nations (including the U.S.) committed to taking "enhanced, ambitious, national and collective action to accelerate the decline in our overall black carbon emissions." ⁵⁹⁶</p>	<p>Black carbon tends to fall out of the atmosphere relatively quickly. 211.	Brook	Brisson	Trustees for Alaska	98269	115	Climate and Meteorology	BLM fails to estimate the emissions of black carbon from Arctic Refuge drilling or identify potential mitigation measures when discussing air quality impacts and climate change.	Black carbon tends to fall out of the atmosphere relatively quickly. The primary concern with this substance in the Arctic is that when it deposits on snow and ice, it can increase melting rates by increasing absorption of solar energy. The proposed action is not expected to result in large amounts of black carbon emissions, as modern equipment, including flares, are designed to minimize these particulate matter emissions. Also, the EPA's low sulfur diesel standards have decreased emissions of such particulates from engines using diesel fuel. Furthermore, any black carbon that does deposit on snow and ice has a relatively short lifetime of a year to perhaps a few years, before the particles become part of the soil or the ocean sediment.
212.	Brook	Brisson	Trustees for Alaska	98269	116	Climate and Meteorology	The DEIS fails to assess the individual and cumulative impacts of the GHG emissions that will result from the program. There is no assessment of the climate change impact associated with the anticipated emissions. Nor does the DEIS adequately analyze the impacts of climate change on the resources of the Refuge. Moreover, there is no assessment of how the proposed action, cumulatively with other similar actions being taken by BLM nationwide, will cause impacts through climate change, or undermine attainment of the carbon budget and emissions reductions that are urgently necessary to address disastrous climate change impacts.	Pages 3-6 through 3-9 of the Draft EIS show the direct GHG emissions from post-lease oil and gas activities and indirect GHG emissions from combustion of net fuels production exported to market. It is not possible to attribute global climate consequences to a single project. As such, reporting potential GHG emissions from a plan or project and comparing these emissions with emissions at larger scales provide context for decision makers and the public.

S. Public Comments and BLM Responses (Climate and Meteorology)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
214.	Brook	Brisson	Trustees for Alaska	98269	118	Climate and Meteorology	Courts have made clear that agencies cannot incorporate non-NEPA documents by reference as a substitute for providing analysis of an impact in the EIS itself, as BLM has attempted to do here. ⁵⁹⁸ Further, agencies cannot avoid analysis by purporting to “tier” to other NEPA documents that themselves do not contain analysis that evaluates the specific impact in question. ⁵⁹⁹ BLM’s reference to the SEIS for the GMT2 project (“BLM 2018a”) does not provide an analysis of the cumulative effects of Coastal Plain leasing on climate change. Most obviously, the GMT2 SEIS evaluates a project producing vastly less oil and gas than BLM projects for the Coastal Plain leasing program. ⁶⁰⁰	The reference to GMT2 and other non-NEPA documents was for discussion of the general cumulative effects of climate change. Because global climate change by its nature is only a cumulative issue, and not an issue for which an individual project’s climate impacts can be parsed out, it is scientifically justified to provide reference to other NEPA and non-NEPA documents for description of the potential effects of cumulative GHG emissions associated with climate change. The impacts that can be attributed specifically to the proposed action are the GHG emissions associated with the action; those impacts are disclosed in the Draft EIS.

S. Public Comments and BLM Responses (Climate and Meteorology)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
215.	Brook	Brisson	Trustees for Alaska	98269	119	Climate and Meteorology	<p>Moreover, in lieu of an actual cumulative impacts analysis, the GMT2 SEIS merely compares the proportion of oil produced by the GMT2 to the total oil production for Alaska and the US.601 The DEIS concedes that Coastal Plain production will result in a net increase in downstream oil emissions by stimulating demand for oil. For "scale" it presents the net emissions from increased demand as a proportion relative to 2015 total GHG emissions from Alaska, the United States, and the world. Merely presenting emissions or oil volumes relative to totals from other sources, which is what both the GMT2 SEIS and present DEIS do, cannot constitute an adequate analysis of cumulative impacts. In <i>San Juan Citizens All. v. United States Bureau of Land Mgmt.</i>, No. 16-CV-376-MCA-JHR, 2018 WL 2994406, at *14 (D.N.M. June 14, 2018), the district court found that BLM had violated NEPA's requirement to consider cumulative impacts of oil and gas leasing on climate change by asserting that the emissions associated with combustion of all of the oil and gas from the parcels in question would not be different from the no leasing alternative because the total amount of emissions was small compared to total national and global emissions. ...Here, BLM provides even less analysis than what the court rejected in that case, as it draws no conclusion whatsoever about the climate change exacerbating consequences of increased emissions resulting from the Coastal Plain leasing program.</p>	<p>The scope of climate analyses has been raised in many prior EIS efforts, with the resulting guidance from federal officials that it is not possible to attribute global climate consequences to a single project. Section 3.2.1 of the Draft EIS discloses potential direct and indirect (downstream) GHG emissions associated with oil and gas-related activities on the Coastal Plain. Reporting potential GHG emissions from a plan or project and comparing these emissions with emissions at larger scales provide context for decision makers and the public; it is appropriate for a NEPA analysis.</p>

217.	Brook	Brisson	Trustees for Alaska	98269	131	Climate and Meteorology	<p>Instead of conducting an actual analysis of direct, indirect and cumulative effects, the EIS simply resorts to repeating the following sentence: "The effects of climate change described under Affected Environment above, could influence the rate or degree of the potential direct and indirect impacts" under "Direct and Indirect Impacts" and "The effects of climate change described under Affected Environment above, could influence the rate or degree of the potential cumulative impacts" under "Cumulative Impacts" ...</p> <p>Nowhere does the EIS reckon with the nature of these impacts or how the impacts of climate change will interact with the impacts of oil and gas leasing and exploration. This failure to do an even qualitative assessment violates NEPA's requirement to take a "hard look" at these impacts.</p>	<p>The ongoing effects of climate change on specific natural and human resources in the Arctic are described in the Climate Change subsection of the Affected Environment resource sections. The Final EIS cumulative effects sections have been updated to include more information on the synergistic effects of Coastal Plain development and climate change on affected resources.</p>

S. Public Comments and BLM Responses (Climate and Meteorology)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
218.	Brook	Brisson	Trustees for Alaska	98269	132	Climate and Meteorology	The DEIS also entirely fails to examine how the program will undermine attainment of the carbon budgets necessary to stabilize climate change. The DEIS totally fails to consider the cumulative impacts in light of the recent (2018) IPCC reports outlining the urgent need for drastic and sustained GHG reductions by 2030 to avoid the most disastrous consequences of climate change. BLM has totally failed to consider how the impact of the Coastal Plain leasing, cumulatively with reasonably foreseeable emissions from the federally managed mineral estate within BLM's jurisdiction, will influence the severity and timing of climate change impacts. This information is of obvious relevance to BLM's decision-making because BLM retains broad discretion to impose stipulations on the Coastal Plain leasing to defer the timing of production activities. A proper analysis of the cumulative impacts of the proposed action on climate change would provide information needed to evaluate how the timing of production could be delayed or otherwise conditioned to, inter alia, avoid stimulating demand.	Oil produced as a result of the proposed action would in large part displace oil production from other global deposits, with only a small effect on market demand. Thus, delaying production from this resource would have a negligible effect on the potential for global climate change due to GHG emissions.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
219.	Brook	Brisson	Trustees for Alaska	98269	133	Climate and Meteorology	In sum, oil and gas development in the Arctic is a critical issue for the current administration to reexamine as it assesses how to bring its supply-side policies in line with international commitments to combat climate change, and how to meet climate targets based on sound science and economics. This analysis must assess how reducing the supply of oil from federal lands can affect global oil markets and lead to a reduction in demand and a resulting reduction in GHG pollution. Oil and gas production requires investments in capital-intensive, high-carbon fuel infrastructure that resists being shut down and locks in long-term fuel supplies, making it more difficult and expensive to later shift to a low-carbon pathway and reach greenhouse gas targets. ⁶⁴⁰ BLM must acknowledge that drilling in the Arctic Refuge is inconsistent with maintaining a livable planet.	The BLM does not agree that the proposed development is inconsistent with maintaining a livable planet (i.e., there is not a climate crisis). The planet was much warmer within the past 1,000 years, prior to the Little Ice Age, based on extensive archaeological evidence (such as farming in Greenland and vineyards in England). This warmth did not make the planet unlivable; rather, it was a time when societies prospered.

S. Public Comments and BLM Responses (Climate and Meteorology)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
220.	Brook	Brisson	Trustees for Alaska	98269	134	Climate and Meteorology	Therefore, even though greenhouse gas emissions from the proposed program may look minor when viewed on the scale of the global climate crisis, when considered cumulatively with all of the other GHG emissions from BLM-managed land, they become significant and cannot be ignored. Moreover, this analysis is of obvious relevance to determinations within BLM's discretion here, such as how to condition lease terms, and qualifying the rights associated with any leases issued to ensure that BLM meets its substantive mandates to, inter alia, prevent undue and unnecessary degradation, ensure that its actions do not jeopardize ESA-listed species, use its resources to recover such species, and preserve the values of the Refuge for its priority purposes, as required by the Improvement Act and ANILCA. In particular, this analysis is relevant to the question of whether the lease terms should defer production until such as time as carbon reduction requirements to address climate change have been met.	The BLM does not agree that the proposed development is inconsistent with maintaining a livable planet (i.e., there is not a climate crisis). The planet was much warmer within the past 1,000 years, prior to the Little Ice Age, based on extensive archaeological evidence (such as farming in Greenland and vineyards in England). This warmth did not make the planet unlivable; rather, it was a time when societies prospered.
221.	Brook	Brisson	Trustees for Alaska	98269	135	Climate and Meteorology	In assessing the cumulative impact, BLM must consider recent climate science and carbon budgeting, and must consider how opening additional lands to fossil fuel leasing, in combination with other reasonably foreseeable and occurring BLM leasing, will undermine attainment of the emissions reductions necessary now to prevent the worst impacts of climate change from occurring.	The BLM does not agree that the proposed development is inconsistent with maintaining a livable planet (i.e., there is not a climate crisis). The planet was much warmer within the past 1,000 years, prior to the Little Ice Age, based on extensive archaeological evidence (such as farming in Greenland and vineyards in England). This warmth did not make the planet unlivable; rather, it was a time when societies prospered.

S. Public Comments and BLM Responses (Climate and Meteorology)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
222.	Brook	Brisson	Trustees for Alaska	98269	136	Climate and Meteorology	To meet NEPA's requirements for the consideration of cumulative impacts, BLM must consider the emissions anticipated from the Coastal Plain program in light of the urgent need for reductions identified by the IPCC.	The BLM does not agree that the proposed development is inconsistent with maintaining a livable planet (i.e., there is not a climate crisis). The planet was much warmer within the past 1,000 years, prior to the Little Ice Age, based on extensive archaeological evidence (such as farming in Greenland and vineyards in England). This warmth did not make the planet unlivable; rather, it was a time when societies prospered.
223.	Brook	Brisson	Trustees for Alaska	98269	137	Climate and Meteorology	Moreover, BLM's consideration of alternatives must include alternatives that consider how BLM can use its discretion to mitigate these [climate change] impacts, for example, by lease terms that defer production.	The BLM does not agree that the proposed development is inconsistent with maintaining a livable planet (i.e., there is not a climate crisis). The planet was much warmer within the past 1,000 years, prior to the Little Ice Age, based on extensive archaeological evidence (such as farming in Greenland and vineyards in England). This warmth did not make the planet unlivable; rather, it was a time when societies prospered.
224.	Brook	Brisson	Trustees for Alaska	98269	138	Climate and Meteorology	Though calculating the positive economic impacts of the projected oil and gas extraction, the DEIS fails to ascertain the costs associated with the contribution to climate change resulting from its decision, or the economic benefits of avoiding or delaying carbon emissions. Consequently, the economic analysis is slanted and misrepresents the economic consequences of the proposed action. The DEIS fails to provide the information necessary to assess the magnitude of the negative consequences associated with the plan's contribution to climate change, and to assess those impacts in economic terms.	The BLM has reviewed this comment and determined that SCC is not appropriate for this programmatic level of analysis, as described in Section F2.1 in Appendix F of the Draft EIS.

S. Public Comments and BLM Responses (Climate and Meteorology)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
225.	Brook	Brisson	Trustees for Alaska	98269	139	Climate and Meteorology	The DEIS also fails to provide the information necessary to assess the economic benefits from the avoided emissions that would result from deferring production under the leases. In other words, the DEIS fails to consider whether delaying production is a more economically efficient way of keep carbon sequestered, and therefore remaining within carbon budgets, than other methods of reducing carbon emissions. Without adequate information to make such comparisons, the EIS is skewed, inflating the apparent economic benefits of the oil and gas production while obscuring its economic harms.	The BLM has reviewed this comment and determined that SCC is not appropriate for this programmatic level of analysis, as described in Section F2.1 in Appendix F of the Draft EIS.

S.3.7 Cooperating Agency Relationships

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
1.	Peter	Stern	—	69296	96	Cooperating Agency relationships	It is interesting that no where in the document is there a reference to consulting with the FAA. Restrictions to flight operations or safety of flights within the lease area would involve the FAA. When permitting for development phases occurs, BLM must involve the FAA to ensure good safety standards for flight operations are in place. Flying weather in this part of the north slope can be poor at certain times of the year. Aircraft tracking ADSB/GPS, ground based transceiver (GBT) equipment and instrument approaches for airports must be required. FAA should ensure that the ASOS/AWOS equipment in Kaktovik is modernized and under maintenance.	The BLM will consult with the appropriate entities on future oil and gas activities. See footnote 1, Table 2-2. All permitted oil and gas activities must comply with FAA requirements.

2.	Withheld	Withheld	—	72125	13	Cooperating Agency relationships	The role of the Fish and Wildlife Service must be documented. Under DOI regulations at 43 CFR § 46.225(d), bureaus should work with Cooperating Agencies to develop and adopt an Memorandum of Understanding that describes their respective roles, assignment of issues, schedules, and staff commitments. The Fish and Wildlife Service must control surface use decisions. In administering the Arctic National Wildlife Refuge, the Fish and Wildlife Service is required to control and direct the Refuge by regulating human access in order to conserve the entire spectrum of wildlife found in the Refuge. Abdicating or transferring surface resource planning and management responsibilities from the Fish and Wildlife Service to the Bureau of Land Management would be contrary to the refuge administration requirements of the Refuge Administration Act and ANILCA.	The USFWS continues to be responsible for managing all federal lands on the Coastal Plain as part of the Arctic Refuge, including both leased and unleased areas. However, the BLM is responsible for managing all aspects of the oil and gas program, including the issuance and administration of oil and gas leases, and permitting of all oil and gas activities. Although the BLM intends to consult with the USFWS as noted in Table 2-2 (footnote 1) when making oil and gas program decisions, Section 20001(a)(2) and (b)(2)(A) of the Tax Act assigns the BLM the sole responsibility for making such decisions.
3.	Withheld	Withheld	—	72125	18	Cooperating Agency relationships	The legislative direction for a 2,000-acre limit is for the purpose of limiting impacts to surface resources. As such, the Fish and Wildlife Service should provide guidance for applying this direction to oil and gas developments within the Arctic Refuge. The Fish and Wildlife Service must approve reclamation plans and monitor restoration results to ensure that the function of disturbed areas once again provide for the conservation of fish and wildlife in their natural diversity.	Although the BLM intends to consult with the USFWS as noted in footnote 1 of Table 2-2, Section 20001(a)(2) the Tax Act assigns the BLM the sole responsibility for making oil and gas program decisions.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
4.	Withheld	Withheld	—	72125	37	Cooperating Agency relationships	(Section 2.2): * The DEIS describes in this section that the Fish and Wildlife Service role for surface resource decisions as that of only coordination for such actions as plan development. The BLM has erred in not recognizing the Fish and Wildlife Service authority and responsibility to protect surface resources through comprehensive conservation planning, while coordinating with the BLM for the refuge purpose of providing for an oil and gas program on the Coastal Plain.	The USFWS continues to be responsible for managing all federal lands on the Coastal Plain as part of the Arctic Refuge, including both leased and unleased areas. However, the BLM is responsible for managing all aspects of the oil and gas program, including the issuance and administration of oil and gas leases, and permitting of all oil and gas activities. Although the BLM intends to consult with the USFWS as noted in Table 2-2 (footnote 1) when making oil and gas program decisions, Section 20001(a)(2) and (b)(2)(A) of the Tax Act assigns the BLM the sole responsibility for making such decisions.

5.	Cherise	Gaffney	Alaska Oil and Gas Association, and American Petroleum Institute	79893	13	Cooperating Agency relationships	the Associations request that the FEIS include a transparent description of the relationship between BLM's oil and gas program authority and FWS's land management authority. Specifically, BLM has the duty to fully administer the oil and gas program mandated by Congress, including the authority to directly manage lands in the Coastal Plain as necessary to do so. Although FWS is the manager of ANWR, its management of the Coastal Plain is subject to the provisions of the Tax Act and the revised purpose of ANWR "to provide for an oil and gas program on the Coastal Plain." ⁶⁵ This new direction and purpose from Congress controls management of the Coastal Plain, and FWS's authority must be exercised accordingly. ⁶⁶ 65 Pub. L. No. 115-97, § 20001(b)(2)(B) (amending purpose of ANWR in ANILCA section 303(2)(B)). ⁶⁶ It is important to note that FWS's 2015 Comprehensive Conservation Plan for ANWR, which refused to consider oil and gas development, has been superseded with respect to management of the Coastal Plain by the Tax Act and the revised purpose of the Coastal Plain under ANILCA. The Wildlife Refuge Administration Act of 1966 requires a wildlife refuge to be managed in a manner which "first protects the purposes of the refuge"- now, "to provide for an oil and gas program on the Coastal Plain." See 16 U.S.C. § 668dd(A)(3)(D); ANILCA § 303(b)(2). The purposes of a refuge are defined by reference to the law(s) which created it. See 16 U.S.C. § 668ee(10). Management of the Coastal Plain of ANWR must now conform to the actions of Congress as set forth in the Tax Act and its revision of ANILCA section 303(b)(2) for the Coastal Plain.	The USFWS continues to be responsible for managing all federal lands on the Coastal Plain as part of the Arctic Refuge, including both leased and unleased areas. However, the BLM is responsible for managing all aspects of the oil and gas program, including the issuance and administration of oil and gas leases, and permitting of all oil and gas activities. Although the BLM intends to consult with the USFWS as noted in Table 2-2 (footnote 1) when making oil and gas program decisions, Section 20001(a)(2) and (b)(2)(A) of the Tax Act assigns the BLM the sole responsibility for making such decisions. The USFWS CCP (2015) will be revised to reflect all purposes of the Arctic Refuge within the Coastal Plain, as amended by the Tax Act. All action alternatives are designed to meet the purpose and need, and to account for all purposes of the Arctic Refuge, including "to provide for an oil and gas program on the Coastal Plain."

S. Public Comments and BLM Responses (Cooperating Agency Relationships)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
6.	Withheld	Withheld	Arctic Slope Regional Corporation	83317	1	Cooperating Agency relationships	BLM and FWS should explain the dual agency management of the 1002 Area While the legislation opening the 1002 Area to resource development clearly authorizes BLM to administer leasing in the Program Area, the DEIS is not clear on BLM's role over unleased land, or how unleased land will be managed in the Coastal Plain consistent with the direction of Congress. ASRC encourages BLM to clearly delineate its and FWS jurisdiction and roles with respect to managing activity in the Program Area. Without this clear designations of roles, ASRC is concerned there will be uncertainty on how future oil and gas programs are managed, permitted, and guaranteed Right of Ways and access. BLM and FWS should specifically consider the instance of Program Area-wide seismic program as is assumed in the Reasonably Foreseeable Development Scenario, road and pipeline access through unleased land, gravel excavation, and leases surrounded by unleased land.	The USFWS continues to be responsible for managing all federal lands on the Coastal Plain as part of the Arctic Refuge, including both leased and unleased areas. However, the BLM is responsible for managing all aspects of the oil and gas program, including the issuance and administration of oil and gas leases, and permitting of all oil and gas activities. Although the BLM intends to consult with the USFWS as noted in Table 2-2 (footnote 1) when making oil and gas program decisions, Section 20001(a)(2) and (b)(2)(A) of the Tax Act assigns the BLM the sole responsibility for making such decisions.
7.	Sayers	Tuzroyluk	Voice of the Arctic Iñupiat	83318	33	Cooperating Agency relationships	VOICE and others brought forward local concerns in scoping comments that the BLM should revisit in the Final EIS. The BLM should work closely with the residents of Kaktovik on pressing access issues that have restricted the community since the creation of ANWR. For leasing and development to be successful, these issues must be resolved and the BLM's action on the following topics through the NEPA process would be a great show of respect to the Kaktovikmiut and their 14,000 years of history as owners of these lands.	The BLM worked with Native Village of Kaktovik throughout the development of the EIS through the cooperating agency process and government-to-government consultation. See footnote 1 of Table 2-2.

S. Public Comments and BLM Responses (Cooperating Agency Relationships)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
8.	Sayers	Tuzroyluk	Voice of the Arctic Inupiat	83318	36	Cooperating Agency relationships	In our scoping comments, based on conversations that we had with the Native Village of Kaktovik, VOICE recommend the BLM work to find ways to assist NVK in increasing their capacity to engage effectively and provide meaningful feed-back throughout the NEPA process. Currently, the NVK has two employees that are struggling to make sure the views of Kaktovik are adequately considered and addressed in this process and are overwhelmed by the FWS, who speak on behalf of the Refuge, and the Native American Rights Fund, who are providing technical assistance to cooperating agencies representing Gwich'in communities. Effective engagement from Kaktovik, the only community in the Coastal Plain, is essential and should be of primary importance to the BLM. We hope that the BLM will continue this conversation and will work with NVK to identify re-sources that are available to them and how they can take advantage of those resources. This assistance only becomes more important as the BLM moves to subsequent stages of development and authorization for on the ground activities in the Coastal Plain.	The BLM worked with Native Village of Kaktovik throughout the development of the EIS through the cooperating agency process and government-to-government consultation. See footnote 1 of Table 2-2.
9.	—	—	Alaska Department of Natural Resources	94102	4	Cooperating Agency relationships	The State and North Slope Borough each also have permitting authority and responsibilities for work proposed within the Coastal Plain. The overlapping federal, State, and local jurisdictions result in a robust regulatory framework that BLM must anticipate during development of this programmatic EIS.	Appendix D of the Draft EIS summarizes the requirements of federal, state, and local laws and regulations associated with future development in the Coastal Plain.

S. Public Comments and BLM Responses (Cooperating Agency Relationships)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
10.	—	—	Alaska Department of Natural Resources	94102	93	Cooperating Agency relationships	We have appreciated the opportunity to participate as a cooperating agency and contribute technical staff resources to the IDT during development of the EIS to date. To ensure our continued coordination in developing a responsible and competitive oil and gas leasing program, we specifically request the following opportunities for coordination as we approach the conclusion of the NEPA process: * Invite State IDT members to participate on the strike team in addressing substantive comments received on the Draft EIS, and * Provide cooperating agencies with an administrative review period of the preliminary Final EIS, to include BLM's preferred alternative with the complete terms and conditions proposed to be included in the Record of Decision.	The BLM invited representatives from the State of Alaska to participate in the interdisciplinary team, which included addressing substantive comments on the Draft EIS. All cooperating agencies, including the State of Alaska, were provided the opportunity to review the administrative draft Final EIS, which included the BLM's responses to substantive Draft EIS public comments.
11.	Withheld	Withheld	—	94547	1	Cooperating Agency relationships	The DEIS does not appear to answer the following questions (1, 3, 4, 5 below) or address item (2) below. 1. How will oil and gas development affect USFWS administration of the coastal plain?	The USFWS continues to be responsible for managing all federal lands on the Coastal Plain as part of the Arctic Refuge, including both leased and unleased areas. However, the BLM is responsible for managing all aspects of the oil and gas program, including the issuance and administration of oil and gas leases, and permitting of all oil and gas activities. Although the BLM intends to consult with the USFWS as noted in Table 2-2 (footnote 1) when making oil and gas program decisions, Section 20001(a)(2) and (b)(2)(A) of the Tax Act assigns the BLM the sole responsibility for making such decisions.

S. Public Comments and BLM Responses (Cooperating Agency Relationships)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
12.	Edward	Rexford	Native Village of Kaktovik	95607	13	Cooperating Agency relationships	NVK is concerned about the management of any unleased land in the Coastal Plain. The final EIS should make clear who is responsible for management decisions on those lands. Currently, the FWS, through their CCP, manages land in the Coastal Plain as wilderness, which we find incompatible with the purpose of the Leasing Program - to establish and administer a competitive oil and gas program for the leasing, development, production, and transportation of oil and gas in and from the Coastal Plain. The CCP must be updated prior to a lease sale to be compatible with this purpose set forth in the Tax Act. The FWS has a responsibility not to hinder the pursuit of a successful oil and gas program through burdensome restrictions on adjacent lands that would ultimately hurt local stakeholders - as well as the State of Alaska and the federal government, whom each have a 50% revenue interest in ANWR. Further, dual management of the 1002 Area would create a "patchwork" of land managers - between privately held KIC lands, BLM managed leased lands, and FWS managed unleased lands, NVK feels that this could be burdensome to right of ways and create confusion around subsistence access.	The FWS continues to be responsible for managing all federal lands on the Coastal Plain as part of the Refuge, including both leased and unleased areas. However, BLM is responsible for managing all aspects of the oil and gas program, including the issuance and administration of oil and gas leases, and permitting of all oil and gas activities. Although BLM intends to consult with the USFWS as noted in Table 2-2 (footnote 1) when making oil and gas program decisions, Section 20001(a)(2) and (b)(2)(A) of the Tax Act assigns BLM the sole responsibility for making such decisions. The USFWS CCP (2015) will be revised to reflect all purposes of the Refuge within the Coastal Plain, as amended by the Tax Act
13.	Brook	Brisson	Trustees for Alaska	98269	17	Cooperating Agency relationships	CEQ regulations call for early and significant involvement by other federal agencies with jurisdiction by law or special expertise. ²⁹² While the draft EIS lists the Environmental Protection Agency and U.S. Fish & Wildlife Service as other federal cooperating agencies, it inexplicably does not include the U.S. Geological Survey (USGS) or the National Marine Fisheries Service (NMFS) - both of which have significant and critical expertise relevant to the development of an oil and gas program for the Coastal Plain.	The BLM made a reasonable effort to identify and invite any federal, state, local, and tribal entities possessing jurisdiction by law or special expertise concerning the Coastal Plain EIS. The BLM invited the USGS to be a cooperating agency, but they declined the invitation. The BLM did not receive a request from the NMFS to be a cooperating agency.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
15.	Brook	Brisson	Trustees for Alaska	98269	24	Cooperating Agency relationships	Despite having raised this issue during scoping, BLM fails to fully acknowledge or explain FWS's role. While BLM states that FWS "is the predominate land manager in the program area," ³²² BLM does not explain what this means. To be clear, FWS is the sole administrator of the Arctic Refuge. BLM has failed to explain how FWS's superior role impacts both BLM's management of the oil and gas program as well as how the oil and gas program fits into FWS's administration of the Refuge overall. In other situations where DOI has granted some measure of jurisdiction over refuge management to agencies other than FWS, courts and Congress have clarified that the ultimate decisions about resource uses, impacts, mitigation, and regulatory compliance must be made by FWS. ³²³ In particular, as the court recognized in <i>Trustees v. Watt</i> , ANILCA and the NWRSAA mandate that refuges be administered solely by FWS; split administration is not permitted. ³²⁴ As the sole administrator of the Arctic Refuge, FWS has a superior role to BLM, and no administration functions may be performed by BLM. The EIS must be revised to explain and accurately characterize this structure.	The USFWS continues to be responsible for managing all federal lands on the Coastal Plain as part of the Arctic Refuge, including both leased and unleased areas. However, the BLM is responsible for managing all aspects of the oil and gas program, including the issuance and administration of oil and gas leases, and permitting of all oil and gas activities. Although the BLM intends to consult with the USFWS as noted in Table 2-2 (footnote 1) when making oil and gas program decisions, Section 20001(a)(2) and (b)(2)(A) of the Tax Act assigns the BLM the sole responsibility for making such decisions.
16.	Brook	Brisson	Trustees for Alaska	98270	6	Cooperating Agency relationships	We reiterate those concerns by reference here, and urge BLM not only to rectify the DEIS' errors in this regard but also to clarify and improve its proposed mitigation measures, ¹⁵⁹⁹ and add the National Marine Fisheries Service as a cooperating agency, ¹⁶⁰⁰ to ensure that the DEIS, lease stipulations, and required operating procedures are grounded in the best available scientific information on large whales and that lease stipulations and required operating procedures scrupulously adhere to the requirements of the ESA and MMPA.	The BLM made a reasonable effort to identify and invite any federal, state, local, and tribal entities possessing jurisdiction by law or special expertise concerning the Coastal Plain EIS. The BLM did not receive a request from the NMFS to be a cooperating agency. As stated in the EIS, project approval would be on a case-by-case basis, in consultation with the USFWS or NMFS, or both, as appropriate.

S. Public Comments and BLM Responses (Cooperating Agency Relationships)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
17.	Brook	Brisson	Trustees for Alaska	98270	182	Cooperating Agency relationships	The U.S. Coast Guard has both jurisdiction and special expertise regarding the risks and impacts of the shipping activities associated with the proposed action.1975 For example, the Coast Guard has broad legal authorities relating to discharges of oil and hazardous substances.1976 It is, in fact, the lead agency for such issues in the "coastal zone" (as opposed to the "inland zone" where EPA authority takes precedence).1977 The Coast Guard also inspects, certifies, and regulates vessels with respect to a wide range of pollution and environmental standards,1978 and it has extensive authority over and expertise relating to navigation safety, ship routing, and vessel traffic management.1979 Further, the Coast Guard plays an important role in protecting fisheries and marine life through its enforcement authorities under several wildlife and marine conservation laws,1980 as well as its capabilities and resources for responding to wildlife strandings, entanglements, and other similar situations.1981 For all these reasons, we urge BLM to add the U.S. Coast Guard as a cooperating agency in the preparation of the Coastal Plain Oil and Gas Leasing Program EIS and to give it sufficient time and opportunity to participate meaningfully in the development of a revised EIS.	The BLM made a reasonable effort to identify and invite any federal, state, local, and tribal entities possessing jurisdiction by law or special expertise concerning the Coastal Plain EIS. The BLM did not receive a request from the Coast Guard to be a cooperating agency.

18.	Brook	Brisson	Trustees for Alaska	98270	183	Cooperating Agency relationships	Additionally, NMFS has both jurisdiction and special expertise concerning the risks and impacts of shipping activities on marine mammals.1982 As such, NMFS should be added as a cooperating agency for this NEPA process just as it served as a cooperating agency in connection with the Liberty oil and gas project discussed above.1983 BLM appears to be consulting with NMFS with respect to ESA issues,1984 but that is not a substitute for full cooperating agency status to ensure that NMFS's expertise is utilized and incorporated into the EIS with respect to the wide range of risks and impacts arising from shipping activities near the program area and along the 1,600 mile marine barge route.1985	The BLM made a reasonable effort to identify and invite any federal, state, local, and tribal entities possessing jurisdiction by law or special expertise concerning the Coastal Plain EIS. The BLM did not receive a request from the NMFS to be a cooperating agency. As stated in the Draft EIS, project approval would be on a case-by-case basis, in consultation with the USFWS or NMFS, or both, as appropriate

S.3.8 Cultural Resources

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
1.	F	Chapin	—	29337	4	Cultural Resources	As the EIS correctly notes (pages 3-152, 3-156, and 3-157), there has been only one 20-day systematic survey to search for archeological and other historical and cultural sites in the ANWR coastal area. Additional surveys would be required to adequately evaluate the impact of oil development on historical and cultural sites in the region. In addition, the interaction of development and climate change will make these sites more vulnerable to erosion than if no development were to occur. The extent of this increased vulnerability due to interaction of climate change and development is not considered in the EIS.	Additional information regarding the vulnerability of cultural resources due to climate change has been added.

S. Public Comments and BLM Responses (Cultural Resources)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
2.	F	Chapin	—	29337	6	Cultural Resources	As the EIS correctly notes (pages 3-156, 3-157, 3-175, and 3-201), the extensive landscape impacts of oil development on the 1002 region will impact cultural resources well beyond the direct footprint of development, and these impacts could occur throughout the construction, operation, and remediation phases of the program. The development will therefore have extensive permanent impacts (pages 3-248 and 3-249) on the lands that these people consider as sacred. The importance of these extensive permanent changes is not adequately considered in the EIS.	The EIS analyzes the potential indirect impacts as a result of all phases of an oil and gas leasing program, as well as identification of mitigation measures to mitigate potential impacts (Table 2-2). In addition, when projects are proposed, a site-specific NEPA analysis will identify additional mitigation measures to ensure cultural resources are protected as necessary.
3.	Matthew	Rexford	Native Village of Kaktovik	74308	8	Cultural Resources	Section 3.4.2 Cultural Resources This section biases the Gwich'in people of the Interior over the Iñupiat people, the Kaktovikmiut, who are the actual residents of the Coastal Plain. The Kaktovikmiut subsist, live, raise our families within the bounds of the Program Area but are barely mentioned in the section. This presents a subjective, biased analysis, is insulting and must be fixed.	Additional information regarding the importance of the Coastal Plain to the Kaktovikmiut has been added to this section and Section 3.4.3
4.	Rosa	Brown	Vuntut Gwitchin Government	74326	12	Cultural Resources	Cultural Resources The cultural resources section fails to provide the traditional knowledge to address potential impacts on the Gwich'in people from industrial activities in "The Sacred Place Where Life Begins," that could harm this significant ethnographic cultural resource. The National Historic Preservation Act requires BLM to meaningfully pursue consultation for all Gwich'in communities along the historic migration path of the Porcupine Caribou Herd. ²⁹ The geographic scope for cultural resources, both existing environmental baseline and impact analysis, was too limited because it only included the Coastal Plain (program area) for direct/indirect impacts, and the "North Slope" (in the US) for cumulative impacts (draft EIS Vol. II. p. F-31). By definition, Bureau of Land Management	The EIS has been revised to more fully analyze transboundary impacts, where applicable. This Leasing EIS utilizes the best available information and will not result in the authorization of any on-the-ground activities. Accordingly, the environmental baseline will be preserved throughout the lease sale process. Any on-the-ground activities will require an additional NEPA analysis. At that time, the BLM will determine which baseline studies may be necessary.

S. Public Comments and BLM Responses (Cultural Resources)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
4. (cont.)	(see above)	(see above)	(see above)	(see above)	(see above)	(see above)	excluded the Vuntut Gwitchin First Nation in the direct cultural resources analysis despite the transboundary cultural effects and our reliance on the Porcupine caribou herd. The draft EIS assumed that "all surveyed areas of the program area could include cultural resources. Furthermore, past surveys have been cursory and likely did not adequately identify cultural resources." (draft EIS Vol II p. F-31) It is possible that additional cultural periods are represented on the Coastal Plain, and evidence could be revealed with adequate surveys. Note: the chronology of archeology survey periods, "Cultural themes and period of the Arctic Refuge Area," (Table 3-25) fail to list the Gwich'in and their distinct language and homelands. The Alaska Heritage Resource Sites list shows most are historic or Modern, while others are "prehistoric," or "Protohistoric" without any indication of their heritage (Iñupiat, Gwich'in, or others) see Table L-1). Only Iñupiat Traditional Land Use Sites for the Coastal Plain itself were listed (Table L-2; source listed is for IHLC, Iñupiat History, language and Cultural Division, TLUIS, 2018).	(see above)
5.	Chandra	Turner	Inuvialuit Game Council	75904	26	Cultural Resources	Despite multiple assertions that the EIS reviewed scoping submission comments, references to Inuvialuit subsistence, sociocultural, and historic use of the North Slope are cursory at best. The list of sources consulted in Section 3.4.2 (3-151) does not include any Inuvialuit sources as referred to in the scoping submission. The list of relevant regulations for evaluating the effects on cultural resources (3-151) does not include any relevant international agreements or treaties (see Part 4, above)	The EIS has been revised to more fully analyze transboundary impacts, were applicable. The EIS gives due consideration to the IPCA, and the DOI has conducted consultation with the IPCB and with Canadian officials.

S. Public Comments and BLM Responses (Cultural Resources)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
6.	Tim	Whitehouse	PEER	95601	80	Cultural Resources	What are key information gaps? * Currently there is no complete synthesis of cultural work (subsistence, historical, and archaeological) that has been conducted in the Arctic Refuge as a whole or in particular for the northern half of the Refuge. A limited number of archeological and historical resource surveys have taken place on the Refuge due to funding, logistical difficulties of working in remote locations and lack of infrastructure to support investigations in the Refuge. A more thorough and complete synthesis of what work has been completed and in what areas would help identify informational gaps and help set priorities for future work.	As identified in the comment, limited survey work has been conducted in the program area; the EIS text identifies this fact. Reference to the USACE coastal survey has been added.
7.	Tim	Whitehouse	PEER	95601	82	Cultural Resources	In 2010, Morgan Grover of the US Army Corps of Engineers conducted a survey of 70 known cultural sites along the coastal areas from Flaxman Island to the Canadian border (including the 1002 area) to examine the effects of environmental changes and erosion has had on these sites over the past 30 years. The study concluded that of the 69 previously reported cultural sites, 21 were found to be impacted to some extent by erosion or thermokarsting, and 20 had been completely eroded away. She concludes that many of the remaining cultural sites are in imminent threat of eroding in the next decade. Follow-up studies and research is needed to recover cultural information before it is lost to erosion. The report strongly recommended that selected threatened sites be documented and potentially excavated after consultation and agreement with Tribal leaders.	Additional discussion related to the Grover/USACE report has been added.

S. Public Comments and BLM Responses (Cultural Resources)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
8.	Tim	Whitehouse	PEER	95601	83	Cultural Resources	In 1982, Ed Hall conducted an inventory and survey of archaeological and historical resources in the 1002 area examining areas of high archaeological and historical potential. The areas surveyed were focused on areas proposed for exploratory drilling for oil and gas and areas more likely to have cultural sites such as coastal areas and barrier islands, and along rivers and streams that crossed the 1002 area, and high points of land that have overlooks above the surrounding tundra. There is a need to reassess these areas since visitors and users have reported several graves, human remains and artifacts in these areas that have not been documented and record by professional cultural resource staff.	The process for conducting cultural resource surveys associated with the Coastal Plain program area is being developed as part of the Section 106 programmatic agreement.
9.	Withheld	Withheld	Native Village of Venetie Tribal Government	81748	5	Cultural Resources	The Section 106 process has not informed the BLM's development, evaluation, and selection of the development alternatives contained in the DEIS, in contravention of the NHPA and its implementing regulations. Furthermore, the DEIS fails to address how the Section 106 process and future consultations will alter and modify the currently-described alternatives and inform the BLM's selection of the ultimate development scenario.	In developing the alternatives, the BLM considered means to protect all key resources, including cultural resources. A primary component of alternatives development was providing for protection of the area the Gwich'in identify as Izhik Gwats'an Gwandaii Goodlit through protection of the caribou calving and post-calving areas. Additional mitigation measures that further avoid, minimize, or mitigate adverse effects on historic properties may be incorporated during site-specific project NEPA analysis.
10.	Withheld	Withheld	Native Village of Venetie Tribal Government	81748	11	Cultural Resources	The DEIS defines cultural resources as "the remains of sites, structures, or objects used by humans in the past, historic or prehistoric." (DEIS, at Glossary-4). This definition is confusing and antiquated. It appears to be derived from language in the Antiquities Act of 1906 and does not comply with requirements outlined in the NEPA regulations.	The glossary definition for cultural resources has been revised.

S. Public Comments and BLM Responses (Cultural Resources)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
11.	Withheld	Withheld	Native Village of Venetie Tribal Government	81748	14	Cultural Resources	Because the BLM's definition for archaeological resources includes buildings and districts, it is broader than the definition of cultural resources. This is inaccurate and confusing because archaeological resources are a type of cultural resource. (See Figure 1).	The glossary definition for archaeological resources has been revised.
12.	Withheld	Withheld	Native Village of Venetie Tribal Government	81748	15	Cultural Resources	The DEIS defines archaeological resources as: places where remnants, such as artifacts, of a past culture survive in a physical context that allows for their interpretation. Archaeological resources can be districts, sites, buildings, structures, or objects and can be prehistoric or historic. (DEIS, at Glossary-1). This definition for archaeological resources is problematic. BLM should explain how buildings and structures are archaeological resources.	The glossary definition for archaeological resources has been revised.
13.	Withheld	Withheld	Native Village of Venetie Tribal Government	81748	17	Cultural Resources	Because the DEIS improperly defines cultural resources, it relies on limited data sources and inadequately analyzes impacts on such cultural resources.	The glossary definition for cultural resources has been revised.
14.	Withheld	Withheld	Native Village of Venetie Tribal Government	81748	19	Cultural Resources	The BLM also fails to follow its own guidance, which states that the BLM "must describe the analytical methodology sufficiently so that the reader can understand how the analysis was conducted and why the particular methodology was used." ¹⁰ The BLM has failed in this regard because it has not sufficiently described the impact criteria for assessing impacts to cultural resources. This exacerbates the issues with the BLM's methodology and scientific accuracy. The BLM must clearly define impact intensity, duration, context, geographic extent, and magnitude for cultural resources. The BLM did this in its Final Supplemental EIS for the Alpine Satellite Development Plan for the Proposed Greater Mooses Tooth One Development Project. ¹¹	The organization and approach to analysis in Chapter 3 have been standardized across all resources. See Appendix F for definitions of context, intensity, and duration, and descriptions of impact criteria by resource.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
15.	Withheld	Withheld	Native Village of Venetie Tribal Government	81748	20	Cultural Resources	<p>The DEIS describes the limited data sources it reviewed in analyzing impacts to cultural resources. (DEIS, at 3-151). These sources are insufficient. BLM must also review Alaska Native Claims Settlement Act (ANCSA) Section 14(h)(1) records. The U.S. Fish and Wildlife's (USFWS) 2015 ANWR Revised Comprehensive Conservation Plan and Final EIS states that there are: "27 parcels totaling 3,284.34 acres [that] have been conveyed as cemetery sites or historical places. Another five parcels (totaling 1,144.31 acres) are selected but not yet conveyed."¹² In addition, the BLM must include locations with Indigenous place names in their cultural resources analysis for this EIS. As the U.S. Army Corps of Engineers stated in its Supplemental EIS for the Alaska Stand Alone Pipeline: Indigenous place names are the manifestation of a systematic approach to mapping a group's environment. Place names can provide information about natural and social environments as well as about human populations and their histories. Place names also provide insights into a culture's worldview and its perceptions of features of the environments it inhabits. Place names are a key component for identifying cultural resources in an area, as well as for establishing territorial range and means of travel throughout a traditional territory (Kari 2006).¹³ Excluding locations with Indigenous place names is a significant data gap that the BLM must address. For example, one Gwich'in place name in the Program Area is Sallute (Point Collinsion).¹⁴ Furthermore, BLM has not integrated cultural data (e.g., traditional use areas, trails, camping locations) from oral histories and subsistence research into the DEIS's cultural resource analysis.</p>	<p>There are no 14(h)(1) selections within the program area in that ASRC elected not to submit any 14(h)(1) applications to the BIA. The 27 and 5 parcels referred to in the USFWS EIS fall within Doyon region lands, and are not part of the program area.</p> <p>The EIS acknowledges the history, cultural and spiritual connection, and importance of the Coastal Plain to Gwich'in (see Sections 3.4.2, 3.4.3, 3.4.4, 3.4.5, and 3.4.11).</p> <p>Additional documentation of place names in the program area would not change the cultural resource section conclusion; thus, while place names would inform the magnitude of impacts and may be essential at a later stage in the implementation of an oil and gas program, such information is not essential to a reasoned choice among alternatives at the leasing stage (see Appendix Q).</p>

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
16.	Withheld	Withheld	Native Village of Venetie Tribal Government	81748	21	Cultural Resources	The BLM also needs to consider Canadian Indigenous communities. Any cultural resource analysis for the Program Area is incomplete without taking into account Canadian Indigenous cultural resources. As the Inuvialuit Game Council (IGC), Wildlife Management Advisory Council (North Slope), Wildlife Management Advisory Council (Northwest Territories), and Fisheries Joint Management Committee stated in their scoping comments for this EIS: Many Aklavik Inuvialuit tell stories about travelling, watching the weather, safe havens, and changing conditions along the 200 km of coastline from Herschel Island to Kaktovik. There are also many well-known and documented burial places, cabin sites, and other cultural use sites all along this important traditional travel route. ¹⁵	The EIS has been revised to more fully analyze transboundary impacts, where applicable. This Leasing EIS utilizes the best available information and will not result in the authorization of any on-the-ground activities. Accordingly, the environmental baseline will be preserved throughout the lease sale process. Any on-the-ground activities will require an additional NEPA analysis. At that time, the BLM will determine which baseline studies may be necessary.

S. Public Comments and BLM Responses (Cultural Resources)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
17.	Withheld	Withheld	Native Village of Venetie Tribal Government	81748	22	Cultural Resources	Another significant data gap is the BLM's failure to address submerged cultural resources in the offshore area of the Program Area beyond a single mention in the DEIS. (DEIS, at 3-159). A single, vague mention is inadequate. BLM needs to review, consider, and include the Bureau of Ocean Energy Management's (BOEM) findings and recommendations regarding offshore cultural resources in its 2017-2022 Outer Continental Shelf Oil and Gas Leasing Program Final Programmatic EIS. The BOEM describes the types of submerged cultural resources this way: Submerged cultural resources within the Alaska program areas [Beaufort Sea, Chukchi Sea, Cook Inlet] include shipwrecks that date from early exploration and settlement of the Pacific Arctic region by Europeans as early as the mid-18th century. Submerged pre-contact sites dating between 20,000 and 3,000 years before present (B.P.) also could be present within the Alaska program areas, depending on regional landform variation. ¹⁶	The text has been revised to incorporate information from BOEM's 2017–2022 EIS.

S. Public Comments and BLM Responses (Cultural Resources)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
18.	Withheld	Withheld	Native Village of Venetie Tribal Government	81748	23	Cultural Resources	In summarizing the potential for offshore archaeological resources in the Beaufort and Chukchi Seas, BOEM stated: Some areas near barrier islands or areas protected by shorefast ice would exhibit less gouging and have a greater potential for intact archaeological resources . . . [while] . . . the greatest potential for offshore site preservation is in those areas >70 km (43 mi) offshore and in depths >30 m (98 ft) . . . [although] . . . deleterious effects of sea ice on archaeological sites has less of an impact than previously assumed.17 The BLM's proposed leasing program has the potential to impact offshore cultural resources and the agency must address these potential impacts because: (1) the Program Area extends offshore where submerged cultural resources may exist; (2) there are numerous barrier islands in the Program Area and offshore areas around them have greater potential for submerged archaeological resources; and (3) the ability of sea ice to destroy submerged archaeological resources has been overestimated.	The text has been revised to incorporate information from BOEM's 2017–2022 EIS.
19.	Withheld	Withheld	Native Village of Venetie Tribal Government	81748	24	Cultural Resources	In addition to data gaps in the DEIS's cultural resource impact section, there are gaps in the BLM's list and description of applicable cultural resource legislation and EOs. The DEIS states that there are EOs and legislation beyond the NEPA and Section 106 of the NHPA that are "relevant" (DEIS, at 3-151); which is true. Because these EOs and other legislation are "relevant," the BLM must explain how they are relevant and the efforts the agency is putting forth to address cultural resources under these other EOs and legislation. As the DEIS reads now, the BLM merely lists "relevant" legislation and EOs without explanation. The BLM must correct these errors of omission.	The BLM is required to comply with all applicable laws, regulations, and executive orders when making decisions. NEPA does not require explanation of said compliance with each applicable legal requirement.

S. Public Comments and BLM Responses (Cultural Resources)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
20.	Withheld	Withheld	Native Village of Venetie Tribal Government	81748	25	Cultural Resources	For example, the BLM needs to demonstrate in the DEIS how the agency is consulting with tribal governments (including the Native Village of Venetie Tribal Government, Arctic Village Council, and Venetie Village Council) through government-to-government consultation to address Indian Sacred Sites under EO 13007.18 The BLM must also include and explain how it is addressing the Federal Lands Management Policy Act of 1976 (43 U.S.C. §§ 1701-1784), the Religious Freedom Restoration Act (42 U.S.C. 21b), EO 12898 Environmental Justice, and EO 13175 Consultation and Coordination with Indian Tribal Governments in the list of “relevant” cultural resource legislation and EOs.	The BLM is required to comply with all applicable laws, regulations, and executive orders when making decisions. NEPA does not require explanation of said compliance with each applicable legal requirement. Government-to-government consultation is documented in Appendix C.
21.	Withheld	Withheld	Native Village of Venetie Tribal Government	81748	26	Cultural Resources	Another glaring deficiency is the BLM's cursory description of how the agency is coordinating the NEPA and the Section 106 processes: The Section 106 process for addressing effects on historic properties is occurring concurrently with the NEPA process and will include the development of a programmatic agreement to address the process for identifying historic properties and resolving potential adverse effects through avoidance, minimization, or mitigation. (DEIS, at 3-157). This is not sufficient. The BLM must describe in the Cultural Resources section what has occurred in the Section 106 process for its undertakings related to the Program Area. As BLM knows, this is because the agency “should ensure that . . . an EIS and record of decision (ROD) includes appropriate scoping, identification of historic properties, assessment of effects upon them, and consultation leading to resolution of any adverse effects.	All statutory obligations have been met, and will continue to be met through the EIS process. The BLM initiated consultation for the Section 106 process on April 23, 2018. The BLM is working with the ACHP, SHPO, USFWS, and consulting parties (which include all interested tribal governments, ANCSA corporations, and local governments) in development of a programmatic agreement for Section 106 compliance.

S. Public Comments and BLM Responses (Cultural Resources)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
22.	Withheld	Withheld	Native Village of Venetie Tribal Government	81748	27	Cultural Resources	The CEQ and ACHP provide additional guidance on including information from the Section 106 process in the DEIS: The agency should include any information obtained from the Section 106 consultation in the draft EIS sections on affected environment and impacts, subject to the confidentiality provisions of Section 304 of the NHPA. This ensures that determinations regarding which alternatives to advance for detailed analysis and which alternative is selected as the preferred alternative are made with an appropriate awareness of historic preservation concerns.20 BLM must include a discussion of its Section 106 activities related to the Program Area and how the Section 106 process is influencing the choice of alternatives in the DEIS.	All statutory obligations have been met, and will continue to be met through the EIS process. The BLM initiated consultation for the Section 106 process on April 23, 2018. The BLM is working with the ACHP, SHPO, USFWS, and consulting parties (which include all interested tribal governments, ANCSA corporations, and local governments) in development of a programmatic agreement for Section 106 compliance.
23.	Withheld	Withheld	Native Village of Venetie Tribal Government	81748	29	Cultural Resources	The BLM provided better developed cultural contexts in its EISs for Point Thompson, NPR-A, and Greater Mooses Tooth projects; albeit these cultural contexts failed to include Indigenous perspectives. The BLM must revise the DEIS to provide a more comprehensive cultural context that includes Indigenous perspectives. For example, the BLM needs to include Gwich'in oral histories about the Program Area as part of the cultural context because it is incomplete without it.	Traditional knowledge, including oral histories, has been shared with the BLM throughout development of the EIS, including during scoping, public meetings on the Draft EIS, government-to-government and ANCSA consultations, and through the Section 106 process. The BLM has used this information to help inform development of the EIS and ensure a more robust analysis. See Appendix C for details on how consultation and traditional knowledge have been incorporated into the EIS process.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
24.	Withheld	Withheld	Native Village of Venetie Tribal Government	81748	30	Cultural Resources	<p>Indigenous cultural contexts are equal to Western science perspectives. The BLM should review the use of oral histories throughout the Cultural Resources Affected Environment and Environmental Consequences sections for the U.S. Department of Agriculture's ("USDA") DEIS for the Roca Honda Mine project.²¹ There, the USDA clarifies the importance of including Indigenous oral/ethno histories: ²¹ USDA, Draft Environmental Impact Statement for Roca Honda Mine 296-360 (2013). ²² Id. at 305. Information from ethnohistories can be paired with other sources of information (such as archaeological or archival) to develop a fuller picture of history than would be possible when taken alone. Ethnohistory is another source of information that helps form a context within which cultural resources are understood and given meaning.²² Because the DEIS does not include Indigenous oral histories in the cultural resources section, it presents an incomplete picture of the cultural heritage of the Program Area. BLM must correct this omission.</p>	<p>Traditional knowledge, including oral histories, has been shared with the BLM throughout development of the EIS, including during scoping, public meetings on the Draft EIS, government-to-government and ANCSA consultations, and through the Section 106 process. The BLM has used this information to help inform development of the EIS and ensure a more robust analysis.</p>

S. Public Comments and BLM Responses (Cultural Resources)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
25.	Withheld	Withheld	Native Village of Venetie Tribal Government	81748	31	Cultural Resources	In the Previously Documented Sites section of the DEIS, BLM states: Tent ring complexes, consisting of arrangements of stones used to secure skin tents to the ground, often with associated hearths in and outside the ring; these features are found along river corridors on elevated terraces and likely relate to seasonal caribou hunting by coastal people; in some cases, these complexes are near or next to caribou drive lines or fences. (DEIS, at 3-153) (emphasis added). It is incorrect to assume that tent ring complexes in the Program Area are only affiliated with "coastal people." It is likely many of these tent ring complexes are a result of ancestral Gwich'in people camping while traveling to hunt, trade, and war. Traveling from winter territory in the Brooks Range to the spring and summer range of the Coastal Plain would take longer than a day and would necessitate camping. ²³	Text has been revised to remove the phrase "coastal people."
26.	Withheld	Withheld	Native Village of Venetie Tribal Government	81748	32	Cultural Resources	BLM needs to also make note in the Locations of Previously Documented Sites section of the DEIS that a vast majority of the archaeological sites documented in the Program Area were documented prior to use of global positioning systems (GPS). These sites will therefore need to be relocated prior to any oil and gas exploration activities, including seismic work. Establishing a 500-foot safety buffer around sites based on their current location in the state's Alaska Heritage Resources Survey (AHRS) database will not be an effective mitigation strategy because the actual locations of these sites could be off by up to twenty miles, like some other North Slope sites in the AHRS.	Text has been revised to identify potential site location inaccuracies.

S. Public Comments and BLM Responses (Cultural Resources)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
27.	Withheld	Withheld	Native Village of Venetie Tribal Government	81748	33	Cultural Resources	BLM limits its assessment of the impacts to previously documented sites based on the idea that these sites are discrete entities and not part of a larger whole. This misguided concept has resulted in an incomplete analysis because it is likely many of the sites are contributing features to archaeological and historic districts and cultural landscapes. The BLM must correct its faulty reasoning in this DEIS and analyze the previously documented sites as contributing features to districts and landscapes.	This Leasing EIS utilizes the best available information and will not result in the authorization of any on-the-ground activities. Accordingly, the environmental baseline will be preserved throughout the lease sale process. Any on-the-ground activities will require an additional NEPA analysis. At that time, the BLM will determine which baseline studies may be necessary.
28.	Withheld	Withheld	Native Village of Venetie Tribal Government	81748	34	Cultural Resources	It is apparent from the DEIS's Cultural Resources section that the BLM is downplaying the significance of these archaeological sites and other cultural resources to understanding the cultural heritage of the Arctic. The BLM should review the USFWS's findings on the cultural importance of these resources in the first EIS for oil and gas exploration in the Program Area: Former surveys focused on very limited geographic areas and, generally, selectively sampled only some of the locales where archeologists expected to find sites, thereby skipping areas assumed to have low site frequencies. This has left large gaps in the data base regarding settlement system and changing land use patterns and the basic chronology of the cultural occupation sequences. Many questions remain unanswered regarding the cultural processes that produced the sequences of human occupations (now represented only in archeological sites), environmental influences on these processes, and the social behavior that resulted from and produced these processes. Even though the previous investigations have been limited in scope and intensity, they have identified over 50 prehistoric and historic sites representing at least 6,000 years of human occupation within ANWR.	The EIS presents an objective discussion of the known cultural resources available to the BLM. A lack of refined cultural chronologies, settlement patterns, social processes, and land use patterns through time and space are not unique to the program area. The BLM's Draft EIS refers the reader to the USFWS findings. This Leasing EIS utilizes the best available information and will not result in the authorization of any on-the-ground activities. Accordingly, the environmental baseline will be preserved throughout the lease sale process. Any on-the-ground activities will require an additional NEPA analysis. At that time, the BLM will determine which baseline studies may be necessary.

S. Public Comments and BLM Responses (Cultural Resources)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
28. (cont.)	(see above)	(see above)	(see above)	(see above)	(see above)	(see above)	Research in adjacent areas in north Alaska and Canada clearly indicate that the ANWR study area is within one of the two most probable northern entry routes for the first human inhabitants of the Western Hemisphere from the mainland of Asia. Thus, it can be expected that sites representing at least 12,000 years of human occupation, from Paleoindian times to the present, may be found within the coastal plain study area of ANWR. These sites, both early and recent, could yield data of great scientific and cultural value because so little is known of the sequence of human occupations and culturally defined land use patterns for this region. ²⁴	(see above)
29.	Withheld	Withheld	Native Village of Venetie Tribal Government	81748	35	Cultural Resources	It is of fundamental importance that the DEIS addresses impacts to lizhik Gwats'an Gwandaii Goodlit. Indeed, the DEIS acknowledges that: In summary, given the information currently available and the undetermined location and nature of development in the program area, potential impacts on traditional belief systems/religious practices and other ethnographic cultural resources, such as TCPs and cultural landscapes, particularly for the Gwich'in people, would be adverse, regional, and long term. (DEIS, at 3-157). It is unclear why the DEIS first mentions lizhik Gwats'an Gwandaii Goodlit in the Direct and Indirect Impacts subsection of the Cultural Resource section. (DEIS, at 3-156). As the DEIS acknowledges, lizhik Gwats'an Gwandaii Goodlit is a known cultural resource: "The Gwich'in people . . . hold the program area as sacred ground." (DEIS, at 3-156). This sentence provides the basics for what constitutes a cultural resource: (1) its location (the Program Area); and (2) its importance (it is sacred ground). The name should also clue the BLM in as to why lizhik Gwats'an Gwandaii Goodlit is a cultural resource.	Text has been modified to include specific reference to lizhik Gwats'an Gwandaii Goodlit in the affected environment.

S. Public Comments and BLM Responses (Cultural Resources)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
30.	Withheld	Withheld	Native Village of Venetie Tribal Government	81748	36	Cultural Resources	The BLM has examined the NEPA scoping comments and conducted background research. Regardless of the limited analysis in the DEIS, the agency has enough information to know that a TCP (or cultural landscape) encompasses the Program Area. The BLM must address lizhik Gwats'an Gwandaii Goodlit in the Ethnographic Resources subsection of the DEIS as a known cultural resource and properly assess impacts to the lizhik Gwats'an Gwandaii Goodlit.	The EIS focuses on and provides detailed discussion of the characteristics of, and impacts on, the Coastal Plain project area, and thereby to the lizhik Gwats'an Gwandaii Goodlit landscape because the Coastal Plain project area comprises all aspects of it. Section 3.4.2 discusses the importance of the lizhik Gwats'an Gwandaii Goodlit landscape to the Gwich'in people. Mitigation measures have been developed in consideration of information that has been shared regarding this area, and in collaboration with the cooperating agencies. Consideration of a TCP may occur for Section 106 of NHPA compliance, in consideration of site-specific projects and subsequent NEPA analysis.
31.	Withheld	Withheld	Native Village of Venetie Tribal Government	81748	40	Cultural Resources	These stories reveal that lizhik Gwats'an Gwandaii Goodlit is a cultural landscape of traditional religious and cultural significance to the Gwich'in of Arctic Village and Venetie. The DEIS fails to address how the BLM is taking into account effects to lizhik Gwats'an Gwandaii Goodlit in the Section 106 process.	In developing the alternatives, the BLM considered means to protect all key resources, including cultural resources. A primary component of alternatives development was providing for protection of the area the Gwich'in identify as lizhik Gwats'an Gwandaii Goodlit through protection of the caribou calving and post-calving areas. Additional mitigation measures that further avoid, minimize, or mitigate adverse effects on historic properties may be incorporated during site-specific project NEPA analysis.

S. Public Comments and BLM Responses (Cultural Resources)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
32.	Withheld	Withheld	Native Village of Venetie Tribal Government	81748	42	Cultural Resources	The DEIS attempts to downplay the impacts to Gwich'in cultural resources by describing the cultural importance of Iizhik Gwats'an Gwandaii Goodlit only in terms of subsistence resources. For example, the DEIS states that "the presence of development in the Program Area would constitute a cultural impact on the Gwich'in people. This is because they believe that development in the Program Area would harm the caribou and other migratory resources (such as waterfowl) that migrate to the Coastal Plain to give birth." (DEIS, at 3-156). The impacts of development within the Coastal Plain are more than impacts to caribou-it is an assault on the Gwich'in and their sense of self. Nonetheless, the Coastal Plain is the birthing grounds of many resources. Moreover, these impacts are associated with a greater view of land and environment, not just a single resource. Contemporary expressions of sacredness have been shown through ceremonies held by the Gwich'in about and on the Coastal Plain.	Information provided from the comment has been incorporated to include other aspects of the environment that contribute to the importance of Iizhik Gwats'an Gwandaii Goodlit.
33.	Withheld	Withheld	Native Village of Venetie Tribal Government	81748	43	Cultural Resources	The DEIS also states that the Gwich'in people have identified the Program Area and adjacent areas of the Coastal Plain as a cultural landscape. (DEIS, at 3-157). The Program Area is not precluded from being a cultural landscape simply because it is also part of a TCP. Indeed, the DEIS defines landscapes as: The sum total of the characteristics that distinguish a certain area on the earth's surface from other areas; these characteristics are a result not only of natural forces, but also of human occupancy and use of the land. An area composed of interacting and interconnected patterns of habitats (ecosystems), which are repeated because of geology, landforms, soils, climate, biota, and human influences throughout the area. (DEIS, at	The EIS focuses on and provides detailed discussion of the characteristics of, and impacts on, the Coastal Plain project area, and thereby to the Iizhik Gwats'an Gwandaii Goodlit landscape because the Coastal Plain project area comprises all aspects of it. Section 3.4.2 discusses the importance of the Iizhik Gwats'an Gwandaii Goodlit landscape to the Gwich'in. Mitigation measures have been developed in consideration of information that has been shared regarding this area, and in collaboration with the cooperating agencies. 33. (cont.)	(see above)	(see above)	(see above)	(see above)	(see above)	(see above)	Glossary-10). While this definition touches on the cultural aspect of a landscape, the National Park Service (NPS) provides a clearer definition of cultural landscapes: a geographic area, including both cultural and natural resources and the wildlife or domestic animals therein, associated with a historic event, activity, or person, or exhibiting other cultural or aesthetic values. There are four kinds of non-mutually exclusive types of cultural landscapes: historic sites, historic designed landscapes, historic vernacular landscapes, and ethnographic landscapes. ³¹ 31 NPS, Management Policies 2006 157 (2006); see also Charles A. Birnbaum, Preservation Briefs: Protecting Cultural Landscapes: Planning, Treatment and Management of Historic Landscapes 1 (1994). 32 NPS, Management Policies 2006, supra at 157. A review of the definitions for the NPS's four types of cultural landscapes indicates that the Program Area is part of an "ethnographic landscape," which the NPS defines as: an area containing a variety of natural and cultural resources that traditionally associated people define as heritage resources. The area may include plant and animal communities, structures, and geographic features, each with their own special local names. ³² The BLM must provide a thorough discussion on the landscape characteristics and the potential impacts to lizhik Gwats'an Gwandaii Goodlit.	site-specific projects and subsequent NEPA analysis.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
39.	Elizabeth	Ballard	—	90951	35	Cultural Resources	The DEIS does not acknowledge impacts to the MPA's cultural resources. One of the main purposes of an MPA is "the ecologically and economically sustainable use of the marine environment for future generations," ⁵⁹ including the sustainable harvest and consumption of fish and other marine resources. But the DEIS completely lacks any reference to the importance of protecting the MPA for cultural reasons. The agency must explain that the MPA is a protected area that is intended to conserve marine resources for both natural and cultural reasons, and explain how fossil fuel development in the 1002 Area will impact the cultural resources contained within the MPA.	The text has been revised to incorporate information from BOEM's 2017–2022 EIS, which addresses the potential for cultural resources in nearshore areas of the program area.
40.	Bernadette	Demientieff	Gwich'in Steering Committee	94080	48	Cultural Resources	Because only limited areas of the Arctic Refuge have been studied for cultural resources, the vast majority of lands may contain cultural resources that are unknown. The potential to discover unknown sites is high in the Arctic Refuge and BLM must conduct a survey prior to issuing any leases. As part of these cultural resource inventories, BLM should consider whether locations are eligible for listing in the National Register of Historic Places based on their significance to the Gwich'in people.	The process for conducting cultural resource surveys associated with the Coastal Plain program area is being developed as part of the Section 106 programmatic agreement.
41.	Bernadette	Demientieff	Gwich'in Steering Committee	94080	49	Cultural Resources	The EIS is deficient as it presents an incomplete picture of the Coastal Plain's prehistoric and historic sites; the agency cannot sufficiently protect the unknown. Information currently available is outdated, insufficient, and incomplete. A full, comprehensive study of the Coastal Plain's cultural resources, including specific consideration archeological resources and historic resources is required to make informed decisions and to comply with the NHPA.	The process for conducting cultural resource surveys associated with the Coastal Plain program area is being developed as part of the Section 106 programmatic agreement. The EIS presents the best available summary of known sites and resources.

42.	Tim	Whitehouse	PEER	95601	30	Cultural Resources	What studies/surveys need to be conducted to fill those information gaps? Cultural resource investigations will be necessary to sufficiently identify cultural resource sites, determine the significance of such sites, to evaluate effects to sites determined eligible under National Register of Historic Places criteria, and to determine avoidance, minimization and mitigation standards for eligible sites that would be adversely affected by oil and gas activities. USFWS should commit one full-time GS-0193-11 archeologist to oversee agency cultural resource investigation permitting and Section 106 responsibilities during the duration of oil and gas exploration and extraction operations development.	The process for conducting cultural resource surveys associated with the Coastal Plain program area is being developed as part of the Section 106 programmatic agreement.
43.	Withheld	Withheld	—	97253	7	Cultural Resources	BLM acknowledges, on p. 3-157 to 3-159 of the EIS, that effects to cultural resources under most of the alternatives would be adverse, long term, and in some cases, regional in scope. Instead of addressing this serious concern fully through consultations and proposed mitigation actions in the EIS, BLM essentially punts the issue for later consideration in future consultation processes. This is unacceptable.	Government-to-government and Section 106 consultation (including development of a programmatic agreement) are being done to address concerns. Mitigation is also included in the EIS to address cultural concerns.
44.	Chamie	Brown	University of Florida	98022	5	Cultural Resources	The remains of sites, structures, and objects in the Arctic Refuge Coastal Plain are subject to damages from post-lease activities associated with the Coastal Plain Oil and Gas Leasing Program. Large areas of land included in the program have not been surveyed, making it likely that sacred sites and other structures will be disturbed or destroyed completely during development. Traditional harvest sites and dwellings built by indigenous peoples are also subject to disturbances. A strong possibility exists that unsurveyed areas of land in the coastal region may also contain important resources. The National	The process for conducting cultural resource surveys associated with the Coastal Plain program area is being developed as part of the Section 106 programmatic agreement.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
50.	Tracy	Rempel	—	98181	1	Cultural Resources	The Bureau of Land Management's Draft Environmental Impact Statement (DEIS) fails to address the environmental and cultural damage that could be caused by oil drilling in the Arctic Refuge.	The EIS addresses the impact on cultural resources in Section 3.4.2.
51.	Brook	Brisson	Trustees for Alaska	98270	83	Cultural Resources	BLM cannot engage in cultural resource protection without surveys and a baseline understanding of the resources. The EIS is deficient as it presents an incomplete picture of the Coastal Plain's prehistoric and historic sites, and cannot sufficiently protect the unknown. Information currently available is outdated, insufficient, and incomplete. A full, comprehensive study of the Coastal Plain's cultural resources, including specific consideration of archeological resources and historic resources is required, not only to make informed decisions, but it is required by NHPA.1729	The process for conducting cultural resource surveys associated with the Coastal Plain program area is being developed as part of the Section 106 programmatic agreement.
52.	Brook	Brisson	Trustees for Alaska	98270	84	Cultural Resources	BLM must document the broader cultural ties to the coastal plain for the Inupiat and Gwich'in. Ethnographic resources also require protections, including ethnographic landscapes, traditional cultural properties, Native American sacred sites, and intangible cultural resources (e.g. oral traditions, indigenous knowledge, and traditional skills).1730	The EIS documents the Inupiat and Gwich'in cultural ties to the Coastal Plain. The process for avoiding, minimizing, or mitigating adverse effects on ethnographic resources associated with the Coastal Plain program area is being developed as part of the Section 106 programmatic agreement and associated consultation.
53.	Brook	Brisson	Trustees for Alaska	98270	85	Cultural Resources	the EIS states that [a]ny potential impacts on [Izhih Gwats'an Gwandaii Goodlit, "The Sacred Place Where Life Begins"] would constitute a cultural effect" on the Gwich'in people.1732 Deference should be given to traditional knowledge, which "is built on millennia of residence in the region."1733 The lack of research must be remedied before BLM undergoes any disruption or oil and gas activities that could potentially harm the Coastal Plain, a significant ethnographic cultural resource.	The BLM is actively compiling traditional knowledge related to the Izhih Gwats'an Gwandaii Goodlit, "The Sacred Place Where Life Begins," and Inupiat ethnographic resources associated with the Coastal Plain program area. This information is being developed as part of the Section 106 programmatic agreement and associated consultation.

54.	Brook	Brisson	Trustees for Alaska	98270	86	Cultural Resources	BLM identifies that the Gwich'in people in Arctic Village and Venetie requested consultation, specifically on ethnographic knowledge.1734 The NHPA requires BLM to meaningfully comply, not only with regard to the communities of Arctic Village and Venetie's requests, but it must pursue consultation for all Gwich'in communities along the historic migration path of the Porcupine Caribou Herd and for Iñupiat communities as well.1735	The BLM has consulted with and continues to consult with potentially affected communities as a result of the Coastal Plain oil and gas leasing program though government-to-government consultation and the Section 106 consultation process.
55.	Brook	Brisson	Trustees for Alaska	98270	89	Cultural Resources	Currently, in its rush to hurry forward this EIS, BLM has not completed "surveys and research to identify and document potential sacred sites, TCPs, ethnographic landscapes, or intangible resources have not been completed to date in the program area."1738 Any archeological resources discovered through the required studies are also protected by the ARPA as an "irreplaceable part of the Nation's heritage."1739 BLM must perform obtain the necessary information and conduct the required surveys to accurately analyze the impacts of an oil and gas program on cultural resources. By not completing these surveys, BLM fails to comply with NEPA and Section 106 NHPA, and cannot adequately consider the impacts of the proposed alternatives it has set forth in the EIS.1740	The process for conducting cultural resource surveys associated with the Coastal Plain program area is being developed as part of the Section 106 programmatic agreement.
56.	Kevin	Fisher	North Slope Borough	98272	1	Cultural Resources	A number of important references appear not to have been consulted. The term "historic" is used to refer to sites that post-date Euro-American contact. It would be preferable to use the term "post-contact" for such sites. Simply because history is not written does not mean it is not history.	It is unclear what references are missing. The text has been revised to use the term "post-contact."

S. Public Comments and BLM Responses (Cultural Resources)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
57.	Kevin	Fisher	North Slope Borough	98272	2	Cultural Resources	Pg. 3-153, para. 1: The bullet list is an extensive verbatim quote from the referenced USFWS report. However, it leaves out graves, which certainly do exist in the program area, not necessarily in conjunction with any residential site.	The text has been revised to include graves.
58.	Kevin	Fisher	North Slope Borough	98272	4	Cultural Resources	Pg. 3-153, para. 2: The tables referred to here (in Appendix L) need to be updated prior to finalizing the EIS. There are a number of sites with new or updated information collected at recent NSB TLUI workshops which does not appear to be correct in the AHRS as of 3/2019. The TLUI table (Appendix L, Table L-2) suffers from what appears to be issues with conversion from Inu fonts to whatever is used in the table, resulting in multiple misspellings. This can be remedied by getting a PDF of the output from a source with Inu fonts installed, and manually entering the correct spellings. If Inu fonts are not installed and used, a digital transfer will not work correctly. There are no Bs or Fs in Inupiaq.	Updated TLUI data and proper Inupiaq spellings have been incorporated into the Final EIS.
59.	Kevin	Fisher	North Slope Borough	98272	5	Cultural Resources	Pg. 3-154, para. 1: Although the coastal erosion in the program area is quite rapid, it is not the case that all precontact sites near the coast have eroded. There are areas that are protected or even accreting. If the area has not been subject to systematic survey, the possible existence of intact eligible cultural resources should not be ruled out.	The text has been revised to reference variable coastal processes and differential effects on coastal archaeological sites.
60.	Kevin	Fisher	North Slope Borough	98272	6	Cultural Resources	Pg. 3-155, para. 2: Additional information has been collected at NSB TLUI workshops, but it was clear at the time that there was a great deal more information out there unrecorded. It should either be made much more clear that much work remains to be done (since it often doesn't seem to be clear to readers of final EIS documents) or additional efforts need to be made at this point.	The text has been revised to acknowledge data gaps and ongoing NSB TLUI workshops.

S.3.9 Cumulative Impacts

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
1.	Prisks	Wettstein	Form Letter 1 - Email	44	1	Cumulative Impacts	The Draft Environmental Impact Statement fails to comprehensively analyze the trans-boundary impacts of oil and gas leasing in the Arctic National Wildlife Refuge. The U.S. Government must fully address the consequences of drilling on the Porcupine caribou herd, and impacts to the livelihood of the Gwich'in who rely on the herd.	The EIS has been revised to more fully analyze transboundary impacts, where applicable.
2.	Donald	Walker	—	68	17	Cumulative Impacts	While the Tax Act authorized an oil and gas leasing program in the 1002 Area, Congress passed the tax reform bill with assurances that the environmental quality of this region will be maintained. As discussed below, the terrain and vegetation of this region are highly vulnerable to the impacts of 3D-seismic surveys, the cumulative impacts of development that would follow, as well as the impacts of climate change. A more thorough evaluation of potential cumulative effects of 3D seismic surveys is needed to understand the full potential consequences of moving forward with seismic.	Appendix B explains the different types of seismic exploration that are analyzed in the EIS. Seismic exploration can be done absent a lease (a lease is not required). Even if areas are not available for lease, companies may conduct seismic exploration there. Separate NEPA analyses would be completed for all seismic exploration applications, which would analyze the site-specific impacts. Additionally, seismic exploration projects are also considered in the cumulative analysis (see Appendix F).
3.	F	Chapin	—	29337	2	Cumulative Impacts	The EIS does not evaluate the extent of cumulative landscape impacts beyond the roads and pads. At Prudhoe Bay, these extensive cumulative impacts have altered a large proportion of the Prudhoe Bay landscape, including creation of new drainage ways and a change in the channel of the Sagavanirktok River. Given that the coastal plain is a relatively narrow band in the 1002 area, cumulative extensive impacts might have substantial impacts on the people and animals that depend on this area. There has been extensive research on cumulative impacts in the Prudhoe Bay region (including a review by the National Academy of Sciences—NRC 2003) that is not adequately considered in this EIS.	Appendix F describes the cumulative analysis area for each resource, all of which extend beyond just the roads and pads.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
4.	Malkolm	Boothroyd	—	54092	2	Cumulative Impacts	The DEIS utterly fails in its assessment of cumulative impacts. Cumulative impacts are not defined by species: for instance the Porcupine caribou herd is lumped in with all other terrestrial mammals and all bird species are amalgamated. The terrestrial mammal cumulative impact section is a mere five sentences long. According to the CEQ, cumulative effects are “the impact on the environment which results from the incremental impact of the action when added to other past, present, and reasonably foreseeable future actions” (40 CFR ~ 1508.7). Cumulative effects sections in the DEIS are limited to a cursory identification of some factors which may constitute cumulative effects. Nowhere does the DEIS provide quantitative assessments of how cumulative effects may impact species, ecosystems, communities or the climate.	At this programmatic scale, quantitative analysis is not appropriate. It is unknown where development might occur and at what levels. This analysis can only disclose potential impacts. Site-specific analysis lends itself to quantitative forecasts.
5.	Withheld	Withheld	—	55252	8	Cumulative Impacts	the DEIS does not adequately include an analysis of all foreseeable impacts from climate change on the Coastal Plain of the Arctic National Wildlife Refuge, and potential development thereon, including: tundra fires, more intense storms, lightening, greater evaporation from lakes, and more erratic weather. These need to be included and analyzed.	Resource trends resulting from a changing climate are discussed in the affected environment.

S. Public Comments and BLM Responses (Cumulative Impacts)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
6.	Withheld	Withheld	—	56769	3	Cumulative Impacts	Combustion of fossil fuels from any hydrocarbons extracted will exacerbate global climate change, will warm the atmosphere and will thus warm oceans even further, leading to sea level rise from simple expansion of oceanic waters as well as increased input of melting ice structures such as ice sheets and glaciers. Already native Alaskan seaside communities have been affected by this process and increased erosion and invasion by the ocean onto the land will occur in the near future. This DEIS proposal has made no serious estimate of the human, cultural, and economic losses associated with this process.	At the programmatic level, the EIS considers the effects of climate change and discloses the impacts on relevant resource topics. See Chapter 3 and Appendix F.
7.	Withheld	Withheld	—	57064	1	Cumulative Impacts	Cumulative effects must be fully considered, negative impacts both culturally and for impacted species of caribou, fishery, and multitudes of migratory birds. Must examine similar impacts at Prudoe Bay and other areas where drilling has occurred.	At the programmatic level, the EIS considers the effects of climate change and discloses the impacts on relevant resource topics. See Chapter 3 and Appendix F.

S. Public Comments and BLM Responses (Cumulative Impacts)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
8.	Withheld	Withheld	—	59376	22	Cumulative Impacts	<p>Cumulative Effects Analysis & Cumulative Effects Project List. (1) Cumulative effects analysis is general, cursory, and not project specific. First, determine the list of relevant actions (means other state, federal, private projects) that in combination with the proposed action could result in combined effects breaching a level of significance. Table F-1 just speaks to activities in a general manner, not specific projects. After developing your project list, then focus the CEA on the combinatory effect of certain actions with the proposed action. Do this rather than what appears in the Draft EIS (see e.g., climate change analysis at p. 3-9). The CEQ does, however, allow for some aggregation of past actions since this aspect of an analysis is sometimes problematic as past actions may also result in the baseline conditions. (2) Statements of “no cumulative impacts” does not make sense since no action is continuation of past/ present effects - I assume things will still go on affecting the environment even under the no action. A more plausible statement would be - there is not potentially significant cumulative effects warranting further analysis, although effects would continue to accrue from specific past/present actions.</p>	<p>Cumulative impact analyses have been revised as suggested where applicable. This Leasing EIS will not result in the authorization of any on-the-ground activities, and analysis is based on a hypothetical development scenario. This is because there are no specific project proposals to analyze. The cumulative analysis anticipates development to occur as described in the hypothetical development scenario.</p>

9.	Withheld	Withheld	—	68965	24	Cumulative Impacts	<p>3. Inadequate Cumulative Effects Analyses. Appendix F, pages F-4 to F-11 lays-out the expected structure and content of cumulative effects analyses in the draft EIS. The material presented in Appendix F provides a sound framework for cumulative effects analysis. In practice, however, cumulative effects analyses for specific resources presented in each section of the draft EIS generally do not conform to this framework and generally do not provide thoughtful and thorough analyses of the potential cumulative effects associated with other projects and ongoing and planned activities listed in Appendix F (pgs. F-5 to F-11). For example, why don't any of the cumulative effects analyses for any of the resources considered include analysis of the liquid natural gas transport pipeline scheduled to come on-line in 2025, which is described in Appendix B (pg. B-17) and Appendix F (pg. F-9)? Appendix B is titled "Reasonably Foreseeable Development Scenario for Oil and Gas Resources in the Public Law 115-97 Coastal Plain, Alaska," clearly indicating that this liquid natural gas pipeline is a reasonably foreseeable action. The description on pages B-17 and B-18 indicates that if natural gas is found in the program area, it is likely to be transported via this proposed pipeline, establishing a clear connection between this pipeline and the Coastal Plain oil and gas program. This is just one of many examples of profound deficiencies in cumulative effects analyses in the draft. Please revise cumulative effects analyses throughout the draft EIS to conform to the structure and content presented in Appendix F.</p>	<p>Cumulative impact analyses have been revised as suggested where applicable.</p>

10.	Withheld	Withheld	The Wildlife Society - Alaska Chapter	72005	7	Cumulative Impacts	The DEIS provides only a cursory analysis of individual industrial and climate impacts and does not explicitly assess how these impacts may be additive and interactive across the Arctic landscape and beyond. For example, there is an inadequate cumulative effects analysis for caribou and polar bear populations that use the coastal plain of the Refuge. Polar bears—listed as “threatened” under the Endangered Species Act—are already struggling with deteriorating sea ice and increasingly are forced to den on land on the eastern Beaufort Sea coast, including the coastal plain of the Arctic Refuge. In fact, three-fourths of the Refuge coastal plain is designated as critical habitat for polar bears, which are highly vulnerable to disturbance due to oil and gas activities	Cumulative impact analyses have been revised as suggested where applicable.
11.	Richard	Edwards	—	74281	44	Cumulative Impacts	According to Appendix B (page B-12), during exploration, over 900 square miles of the Coastal Plain would be subject to seismic testing with equipment access using roads spaced 320-1,320 feet apart. What is the cumulative impact of the resulting network of compacted surfaces?	Impacts as a result of seismic exploration have been revised in the EIS as appropriate. Site-specific NEPA analyses would be done for any proposed seismic explorations. Additionally, seismic exploration projects are also considered in the cumulative analysis (see Appendix F). Individual resource sections, as applicable, discuss potential impacts (direct/indirect/cumulative) related to soil compaction.
12.	Rosa	Brown	Vuntut Gwitchin Government	74326	18	Cumulative Impacts	Yet, the Draft EIS only addresses climate change impacts on the affected environment (i.e. current conditions) and fails to address cumulative effects of climate change and oil and gas on cultural resources, including on unknown traditional land use sites/archeological sites in the Coastal Plain and the broader region of cultural landscapes significant to the Vuntut Gwich'in relationship with the Porcupine caribou herd. (Draft EIS Vol. I 3-159).	At the programmatic level, the EIS considers the effects of climate change and discloses the impacts on relevant resource topics. See Chapter 3 and Appendix F.

S. Public Comments and BLM Responses (Cumulative Impacts)

13.	Rosa	Brown	Vuntut Gwitchin Government	74326	23	Cumulative Impacts	<p>Cumulative Impacts: The draft EIS fails to address how oil and gas activities on the Coastal Plain will cumulatively impact the Vuntut Gwich'in who have already weathered incredible waves of change in only a few generations, and are facing more significant social and economic changes with youth living in two worlds, and climate change impacts to the weather, land, water and wildlife. The draft EIS fails to describe the negative impacts the threat of oil and gas development in the Coastal Plain has on the Gwich'in in the analysis for Alternative A, No Action. The statement "Gwich'in sociocultural systems would likely continue to evolve as a result of existing forces of change..." (Draft EIS Vol. 1 p. 3-187) is vague, and fails to describe changes that could result from accelerating climate change. The National Research Council's 2003 report, Cumulative environmental effects of oil and gas activities on Alaska's North Slope, found there had already been major cumulative effect across the Gwich'in Nation as a result of the debate over oil and gas development in the Refuge Coastal Plain. Proposals to explore and develop oil resources in the Arctic National Wildlife Refuge have resulted in perceived risks to Gwich'in culture in Alaska and the Yukon Territory that are widespread, intense, and themselves are accumulating effects. The Gwich'in have a centuries-old nutritional and cultural relationship with the Porcupine Caribou Herd and oppose new onshore petroleum development that they believe threatens the caribou.³² The National Research Council also documented major impacts to the landscape and Indigenous Peoples that are relevant to our concerns regarding the Porcupine caribou calving grounds. Many activities associated with petroleum development have changed</p>	<p>At the programmatic level, the EIS considers the effects of climate change and discloses the impacts on relevant resource topics. See Chapter 3 and Appendix F. Further, the purpose of the cumulative analysis is to disclose the additive effects of this potential action with other past, present, and reasonably foreseeable actions, including climate change. This EIS does not analyze the direct impacts of climate change alone.</p>

13. (cont.)	(see above)	(see above)	(see above)	(see above)	(see above)	(see above)	the North Slope landscape in ways that have had aesthetic, cultural, and spiritual consequences that accumulate. The consequences have increased along with the area of tundra affected by development and they will persist as long as the landscape remains altered... Human-health effects, including physical, psychological, cultural, spiritual, and social, have not been adequately addressed or studied. ³³ The draft EIS failed to identify data gaps or to analyze past, present and potential cumulative effects of oil and gas activity on the Porcupine caribou herd and its habitats. There is no analysis of past, present or future impacts on the herd's size, migrations, range, habitat quality, productivity or energetics. ³² NRC 2003 p. 148. ³³ NRC 2003 p. 148.	(see above)
14.	Philip	Wight	—	74333	2	Cumulative Impacts	Most critically, the DEIS neglects any mentions of tankers in Prince William Sound, the Gulf of Alaska, or the West Coast of the United States. Moving oil by tanker is the only way to export ANS crude once it travels through TAPS to Valdez. Between 1977 and 2019, over 14 million gallons of crude were spilled in tanker accidents from Prince William Sound (namely the Exxon Valdez and other spills) to the Puget Sound, to Southern California and Panama. The DEIS makes no mention of these "downstream" ecological effects, even though they are fundamentally linked to TAPS and drilling on the Coastal Plain. This is a major omission that obscures the environmental impact of drilling in the Arctic Refuge. How would drilling on the Coastal Plain effect the frequency and destination of TAPS tanker trips? How would this movement impact the coastal ecosystems of Prince William Sound and regular TAPS tanker destinations?	The hypothetical development scenario is applicable to the program area, and speculation beyond where marine vessel traffic would go is beyond the scope of this analysis. Direct and indirect impacts cannot be analyzed on a site-specific basis within this EIS, but they are analyzed for the program area generally based off the hypothetical development scenario. A discussion of tankers was added to the Final EIS.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
15.	Renae	Smith	Counsel for Environmental Protection	74336	35	Cumulative Impacts	the projects identified by BLM in the DEIS exclude consideration of important offshore oil and gas activity in the Chukchi and Beaufort Seas, including the Bureau of Ocean Energy Management's (BOEM) plan for a 2019 lease sale in the Beaufort Sea. 190 This project is reasonably foreseeable and should be considered in the cumulative impacts analysis. 191	This action has been included in the list of reasonably foreseeable future actions in Appendix F.
16.	Withheld	Withheld	—	75145	13	Cumulative Impacts	The DEIS failed to consider proposed seismic surveys. ?SAExploration LLC plans to conduct seismic exploration surveys on the Coastal Plain during the winters of 2019 and 2020, but the DEIS fails to analyze the impacts of their proposed seismic exploration. The scope of the DEIS is too limited and did not consider the full range of oil and gas activities. BLM is required to consider all of the environmental impacts of the proposed oil and gas program	Appendix B explains the different types of seismic exploration that are analyzed in the EIS. Seismic exploration can be done across the full area of the Coastal Plain, even if an area is not available for lease. Site-specific NEPA analyses would be done for any proposed seismic explorations. Additionally, seismic exploration projects are also considered in the cumulative analysis (see Appendix F).
17.	Jessica	Wentz	Sabin Center for Climate Change Law	75152	16	Cumulative Impacts	decreased algal production which negatively impacts a wide variety of species up the foodchain. ³² Drier conditions will also affect migratory birds dependent on wetlands. ³³ These stressors are additional to the negative impacts of potential oil and gas development on species in ANWR. ³⁴ While BLM's analysis makes reference to some of the climate impacts on species and habitats in different sections of the DEIS, it should more fully analyze how the combination of climate impacts and development may cumulatively impact species and habitat.	Sections have been revised as appropriate.

S. Public Comments and BLM Responses (Cumulative Impacts)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
18.	Jessica	Wentz	Sabin Center for Climate Change Law	75152	16	Cumulative Impacts	The cumulative effects of oil and gas activities on species and their habitats in conjunction with climate change impacts should also be considered as part of environmental review. For example, declining sea ice will directly and negatively impacts polar bears and walrus and also causes	At the programmatic level, the EIS considers the effects of climate change and discloses the impacts on relevant resource topics. See Chapter 3 and Appendix F. Further, the purpose of the cumulative analysis is to disclose the additive effects of this potential action with other past, present, and reasonably foreseeable actions, including climate change. This EIS does not analyze the direct impacts of climate change alone. Because current management would not authorize any oil and gas leasing in the Coastal Plain, there are no additive effects of an oil and gas program with other ongoing actions, including climate change.
19.	DJ	Schubert	Animal Welfare Institute	75588	12	Cumulative Impacts	BLM's conclusory treatment of the cumulative impacts of greenhouse gas emissions fails to meet the hard look requirement under NEPA. See <i>Morris v. U.S. Nuclear Reg. Comm'n</i> , 598 F.3d 677, 681 (10th Cir. 2010)	The BLM considered greenhouse gas emissions and climate change in its cumulative effects analysis.
20.	Chandra	Turner	Inuvialuit Game Council	75902	29	Cumulative Impacts	No Canadian plans or measures were referred to in the DEIS and thus impacts to present and future terrestrial and marine conservation measures in Canada were not considered. See Appendix A1 from our scoping submission for references.	Discussions of transboundary impacts have been added to resource sections in Chapter 3, where applicable.
21.	Chandra	Turner	Inuvialuit Game Council	75902	30	Cumulative Impacts	Cumulative effects (especially as they pertain to ongoing climate change) are not adequately considered or analyzed throughout the DEIS. At best, the species-specific sections summarize the possible effects from the proposed project and other outside activities and make qualitative statements about cumulative impacts. No rigorous cumulative effects analysis that considers synergistic and accumulative effects has been undertaken (NRC 2003). Cumulative effects on Canadian environmental measures and plans are not considered.	At the programmatic level, the EIS considers the effects of climate change and discloses the impacts on relevant resource topics. See Chapters 3 and Appendix F. At the programmatic level, a quantitative analysis is not possible as it is unknown where development and disturbance will take place. A qualitative discussion of cumulative impacts is appropriate. The EIS has been revised to more fully analyze transboundary impacts, where applicable.

S. Public Comments and BLM Responses (Cumulative Impacts)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
22.	Withheld	Withheld	—	81063	1	Cumulative Impacts	EIS does not adequately address the impacts of this leasing program on the ecosystem over time, with forecast changes in climate and in relation to the development of the landscape to the west (Prudhoe Bay developments.) Impacts to wide ranging arctic species need to be evaluated at a landscape level. What role is the refuge currently playing as a refugia for wildlife from the west in currently developed areas? How will the loss of wild refuge habitat constrain the options for species in need of wide landscapes to survive in the dynamic and changing arctic environment? For example - what are the potential impacts of the entire coastal plain being subject to human disturbance on species such as polar bears and the PCH? The scope needs to include a significant portion of the coastal plain to the west of the Canning River.	Cumulative impact analyses have been revised as appropriate to account for these factors.

S. Public Comments and BLM Responses (Cumulative Impacts)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
23.	Withheld	Withheld	World Wildlife Fund	81184	1	Cumulative Impacts	s. A major omission is the agency's incomplete analysis of direct, indirect, and cumulative impacts of oil and gas activity on the Coastal Plain. For example, BLM fails to examine the cumulative effects of climate change on polar bears, including the impacts that increased ice-free days, coupled with intensive industrial activity on their prime terrestrial denning habitat, will have on the viability of the Southern Beaufort Sea polar bear subpopulation. Baseline information on polar bears, caribou, and the impacts from shipping associated with the proposed development is insufficient in scope to serve as a point of comparison, such that WWF and the public have "no way to determine what effect the proposed action will have on the environment," (Western Watersheds Project v. U.S. Bureau Land Mgmt., 552 F. Supages 2d 1113, 1126-27 (D. Nev. 2008) (citing Half Moon Bay Fishermans' Marketing Ass'n v. Carlucci, 857 F.2d 505, 510 (9th Cir. 1988))) as NEPA requires. See 40 C.F.R. § 1502.15	At the programmatic level, the EIS considers the effects of climate change and discloses the impacts on relevant resource topics. See Chapter 3 and Appendix F. Further, the purpose of the cumulative analysis is to disclose the additive effects of this potential action with other past, present, and reasonably foreseeable actions, including climate change. This EIS does not analyze the direct impacts of climate change alone. Because current management would not authorize any oil and gas leasing in the Coastal Plain, there are no additive effects of an oil and gas program with other ongoing actions, including climate change.
24.	Withheld	Withheld	Native Village of Venetie Tribal Government	81748	158	Cumulative Impacts	The DEIS fails to adequately address the international impacts of the proposed oil and gas development. From an ecological perspective, the Program Area provides important habitat for an array of migratory species, including Beluga, Bowhead, caribou, and waterfowl. The failure to include maps in the DEIS that show the full range and migratory paths of these species underscores its deficient analysis of the international impacts of development in the Coastal Plain.	The EIS has been revised to more fully analyze transboundary impacts, where applicable. As described in Appendix F, the cumulative impact analysis area for marine mammals is the range of the affected species population/stock.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
25.	Matt	Krogh	Stand.earth	83321	6	Cumulative Impacts	It is not sufficient for BLM to merely mention that climate change literature exists? a DEIS needs to also include an analysis of cumulative climate impacts associated with drilling in the Arctic Refuge and the subsequent transport, shipping, refining, and consumption of the oil produced. As the courts have made clear, mere references to nonNEPA documents is not enough.	A downstream emissions analysis was completed for this EIS. As described in Appendix F, the BLM assumes that the Coastal Plain oil production would not significantly increase the global market (i.e., it would not significantly alter global demand and consumption of fossil fuels).
26.	Matt	Krogh	Stand.earth	83321	9	Cumulative Impacts	The DEIS also fails to meaningfully account for and analyze the cumulative impacts of greenhouse gas emissions associated with oil and gas development in the coastal plain. This omission includes the downstream emissions caused by consumption of the extracted oil and gas. As noted: "Even though greenhouse gas emissions from the proposed program may look minor when viewed on scale of the global climate crisis, when considered cumulatively with all of the other GHG emissions from BLMmanaged land, they become significant and cannot be ignored."	A downstream emissions analysis was completed for this EIS. As described in Appendix F, the BLM assumes that the Coastal Plain oil production would not significantly increase the global market (i.e., it would not significantly alter global demand and consumption of fossil fuels).
27.	Matt	Krogh	Stand.earth	83321	15	Cumulative Impacts	The DEIS is inadequate in describing and analyzing the impacts of shipping associated with oil and gas activity in the Coastal Plain. In determining the scope of the vessel traffic impacts, it is inappropriate to only include vessel transit routes in Bering and Chukchi seas associated with servicing of the oil production facilities. As noted under Impact Analysis, ES4: "The geographic scope of the analysis includes marine vessel traffic from the shore of the refuge to Dutch Harbor, Alaska. Direct and indirect impacts cannot be analyzed on a sitespecific basis within this EIS, but they are analyzed for the program area generally, based on the hypothetical development scenario. Additional sitespecific analyses would be conducted during the permit review process for subsequent exploration and development applications." As with the	The EIS anticipated that a potential production pipeline would be constructed to connect a CPF to the TAPS to move produced oil to market. The cumulative impact analysis area for resources, such as marine mammals, includes the range of the species, taking into account a full range of activities. A discussion of tankers was added to the Final EIS.

27. (cont.)	(see above)	(see above)	(see above)	(see above)	(see above)	(see above)	DEIS fiction that the leasing program cannot be held responsible for the subsequent drilling and oil production, it is also fictional that the oil will make it to market without being transported by both pipeline and tanker. The leasing DEIS must also acknowledge that new pipeline construction will be required to connect the Arctic Refuge to TAPS, and that at its southern end, all oil will be shipped to market by tankers that call on TAPS. It is likely that virtually every barrel of oil leaving the Arctic Refuge by TAPS will get loaded onto a ship in Valdez, AK, site of the horrific Exxon Valdez tragedy. Each of these oil tankers could serve markets in Asia or the US, but current vessels from TAPS largely travel to Washington and California. Any opening of the Arctic Refuge to oil drilling needs to examine the total possible production and what that means for vessel traffic that Arctic Refuge drilling would create. It is not appropriate to pretend that Refuge vessels will simply substitute for existing vessels servicing purportedly dwindling North Slope supplies, when in fact continuing exploration may create additional production, and TAPS capacity has the possibility to increase.	(see above)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
28.	Withheld	Withheld	WWF-Canada	85059	7	Cumulative Impacts	Cumulative Impacts Assessment: BLM's draft EIS fails to include a rigorous analysis of the cumulative impacts of development of the Coastal Plain and its potential adverse effects on caribou. Describing the general background and past activities are not adequate enough to substitute as an analysis of cumulative impacts. Adequate baseline data upon which future activities can be quantified and analyzed are missing and must be provided in a revised draft EIS. Further, there is no analysis of the cumulative impacts of development west of the Coastal Plain, in the range of the Central Arctic Herd. A revised draft EIS should analyze these foreseeable impacts, as the draft EIS itself states that further development in the range of the Central Arctic Herd may be necessary due to oil exploration in the Coastal Plain.	Baseline information is provided in the affected environment of the EIS. Each of the EISs for the development activities in the NPR-A include a cumulative impact analysis for those activities. This EIS includes a qualitative assessment of cumulative impacts of this potential action plus other past, present, and reasonably foreseeable actions.
29.	Withheld	Withheld	WWF-Canada	85059	24	Cumulative Impacts	Furthermore, the absence of information regarding shipping and shipping-related impacts in the draft EIS is especially problematic because the number of vessels transiting the Arctic is increasing over time, including vessels serving oil and gas exploration areas in the Beaufort and Chukchi Seas, as well as vessels serving the military, research, tourism, mining, and other industries. The draft EIS must describe and analyze oil and gas-related shipping associated with the proposed development of the Coastal Plain in conjunction with a meaningful discussion of this larger picture of dramatically increasing shipping activities in the Arctic over the next 50 years. Such analysis cannot be postponed until future site-specific NEPA reviews because these will not capture the big picture of cumulative shipping impacts over the 50-year timeframe for the proposed action.	Increases in marine shipping in general were considered in the cumulative impacts analysis. See Table F-1. Direct and indirect impacts cannot be analyzed on a site-specific basis within this EIS, but they are analyzed for the program area generally based off the hypothetical development scenario. The BLM does not have authority to regulate marine traffic outside the Coastal Plain.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
30.	Withheld	Withheld	Government of the Northwest Territories	92862	91	Cumulative Impacts	F.3.2 Past, Present, and Reasonably Foreseeable Future Actions Oil and Gas Exploration, Development, and Production "Onshore oil development has been a primary agency of industrial change on the North Slope. Oil and gas exploration has occurred on the North Slope since the early 1900s, and oil production started at Prudhoe Bay in 1977." Comments Development activities have been happening for a long time and technology was not available to monitor the impacts was not in place. It is hard to find a clear description and shapefiles of the progress of development on the North slope over time and the distribution of caribou during those same periods. The CAH now has two separate calving areas on either side of the development. The descriptions of the reasonably foreseeable activities could include more details about what is already happening (e.g. when did Point Thomson start producing) and maps showing these areas would helpful to understand the spatial and temporal aspects of development on the North Slope in order to evaluate cumulative impacts.	This level of detail for cumulative actions is not necessary to meet NEPA requirements.
31.	Withheld	Withheld	Government of the Northwest Territories	92862	92	Cumulative Impacts	The GNWT recommends the BLM complete a comprehensive review of the oil and gas development on the North Slope and the changes in wildlife distribution during that time to inform the cumulative effects assessment. This should include maps showing the temporal aspect of development on the North Slope	This information forms the basis for the affected environment. Maps depicting this information are not necessary to describe the cumulative effects.
32.	Malkolm	Boothroyd	CPAWS Yukon Chapter	94061	29	Cumulative Impacts	The BLM does not consider how impacts detrimental to birds could impact the ecosystems, economies and communities that rely on Arctic-nesting birds.	The cumulative analysis acknowledges that the cumulative effects on migratory birds are experienced beyond the Coastal Plain (see Appendix F).

S. Public Comments and BLM Responses (Cumulative Impacts)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
33.	Bernadette	Demientieff	Gwich'in Steering Committee	94080	13	Cumulative Impacts	BLM also failed to consider the cumulative impacts from development and other activities in other areas in the Arctic and what that might mean for the Porcupine Caribou Herd, as development to the west has already caused changes to the migratory patterns and health of the caribou herds there. BLM should include an analysis of how subsistence resource abundance and habitat quality have been impacted by a changing Arctic and expanding oil and gas activities. Additionally, BLM must discuss how a changed climate is expected to impact caribou in the future. These analyses should be coupled with the cumulative industrial impacts of oil development on the North Slope.	The cumulative analysis describes the additive impacts of an oil and gas leasing program when combined with other relevant past, present, and reasonably foreseeable projects. Historic development in other parts of the Arctic makes up the current affected environment where applicable. This EIS does not describe the effects of climate change independent of an oil and gas program in the Arctic.
34.	Bernadette	Demientieff	Gwich'in Steering Committee	94080	45	Cumulative Impacts	There is absolutely no discussion of the three reasonably foreseeable future actions identified by BLM. BLM completed failed to analyze or even discuss impacts from development activities in the Colville-Canning Area, Alpine, a road and pipeline between Kaktovik and the Dalton Highway/Trans-Alaska Pipeline. BLM also limits its discussion on development in Alpine to existing oil and gas development activities. This does not adequately account for the potential cumulative impacts to subsistence users or reasonably foreseeable projects, such as ConocoPhillips' Willow project near Nuiqsut.	These actions are considered in the cumulative analysis. Each action making up the cumulative impact analysis scenario is not called out by name. This is because the cumulative analysis does not discuss specific direct and indirect impacts of each action. The cumulative analysis looks at all cumulative actions holistically.

S. Public Comments and BLM Responses (Cumulative Impacts)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
35.	Bernadette	Demientieff	Gwich'in Steering Committee	94080	46	Cumulative Impacts	Besides oil and gas development across the North Slope, BLM must also consider all reasonably foreseeable future actions that may impact the Porcupine Caribou Herd throughout its migratory range. BLM should not arbitrarily limit the scope of its analysis to the geographic area on or immediately adjacent to the Coastal Plain. BLM must consider any impacts to the herd from activities south of Brooks Range and within Canada.	All known reasonably foreseeable actions were considered in the analysis.
36.	Pamela	Miller	—	94107	4	Cumulative Impacts	The geographic scope of impacts is illogical. Why does the DEIS include “marine vessel traffic from the shore of the refuge to Dutch Harbor, Alaska?” (DEIS ES-4). Why not Seattle, China, or other destinations where goods and services would originate. Why not consider the geographic scope of the entire North Slope for oil and gas cumulative impacts? Why not the Trans-Alaska Pipeline System including the tanker terminal and tankers along the West Coast shipping routes, as well as those of tanker exports to the Asian markets? Would oil or gas be transported from the Arctic Ocean and not Valdez? The cumulative impacts analysis is generally limited to the geographic scope of the planning area (DEIS ES-4), but it does not make sense to exclude the nearshore State waters adjacent to the Refuge Coastal Plain, nor the federal OCS waters beyond the State 3 mile zone.	Appendix F describes the geographic scope, or cumulative impact analysis area, for all resources. For some, that includes the range of a species. Other resources are limited in scope to the project area.

S. Public Comments and BLM Responses (Cumulative Impacts)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
37.	Mark	Jorgenson	—	94411	2	Cumulative Impacts	The limiting of potential development in the 1002 Area to 2000 acres and 19 well sites is not reasonable. In the Alpine experience, future expected expansion and cumulative impacts were downplayed in the EA/EIS process, contrary to the reasonable and easily foreseeable scenario that development would extend to the north, south, and west of the initial facilities, as is currently happening. While the Tax Cuts and Jobs Act of 2017 (Tax Act) specified a limitation of 2000 acres, this could easily be amended by future legislation to increase permitted acreage. The cumulative impacts analysis needs to address the likelihood for expansion if large oil reserves are found.	Because the Tax Act limits the area of development to 2,000 acres, this EIS analyzes that area of impact. NEPA does not require analysis based on speculation of future legislation.
38.	Harry K.	Brower Jr.	North Slope Borough	95612	30	Cumulative Impacts	Finally, we note that BLM is working on a Cumulative Alaska North Slope Air Quality Regional Model, to assess the cumulative effects of BLM-authorized oil and gas development on the North Slope, including on the Coastal Plain. While the DEIS does not indicate when this study will be completed, we urge that any results (even if preliminary) be analyzed in the Final EIS or, if not available by that time, in any subsequent National Environmental Policy Act (NEPA) documents relating to BLM activities on the North Slope.	The North Slope Air Quality Regional Model is being prepared to support management actions affecting the NPR-A, the North Slope, Prudhoe Bay, and other oil and gas-producing areas, such as the Coastal Plain. The model is being developed with input from the air quality technical workgroup. It will model air quality and AQRV impacts as oil and gas development progresses over time, which will support decision-making for oil and gas-related actions throughout the North Slope, including actions in the Coastal Plain. Future site-specific NEPA analyses will take available modeling results into consideration, if available.

S. Public Comments and BLM Responses (Cumulative Impacts)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
39.	Brook	Brisson	Trustees for Alaska	96981	63	Cumulative Impacts	Overall, and as explained in greater detail below for specific resources, the BLM's cumulative impacts analysis fails to contain the "quantified or detailed information" required. Instead, it largely consists of general statements regarding potential effects and contains very little substantive information. ...Instead, in some resource sections, BLM avoids discussing the cumulative impacts associated with reasonably foreseeable post-lease oil and gas activity by suggesting those would be discussed in later NEPA analysis. ¹⁸⁶ In others, it avoids the discussion by making mere conclusory statements about the cumulative impacts. These statements acknowledge the potential for cumulative impacts, but fail to provide any explanation or analysis of what they would be. ¹⁸⁷ ...The agency also avoids discussing the cumulative impacts for this project by referring readers to cumulative impacts analysis done for other projects. ...Similarly, BLM asserts there is existing information on cumulative impacts to some resources, but fails to explain whether or how that information has been considered in this planning process. ...Overall, this approach is insufficient to satisfy NEPA and fails to acknowledge and account for the considerable cumulative impacts of oil and gas activities. ¹⁹¹ BLM must identify and describe, with specificity, the projects and impacts.	Where the cumulative impact analysis area is limited to the program area (see Appendix F), there are few actions that contribute to any cumulative effects. This is because there is little activity occurring in the Coastal Plain area. Where the cumulative impact analysis area is broader than the program area, actions are considered cumulatively, not individually.

S. Public Comments and BLM Responses (Cumulative Impacts)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
40.	Brook	Brisson	Trustees for Alaska	96981	64	Cumulative Impacts	BLM defines the geographic scope of the cumulative impacts analysis as the program areas and the North Slope of Alaska, but notes that for some resources the impacts areas is broader. ¹⁹² But in setting out the agency's approach to impacts analysis, it is clear that the agency is limiting its impacts analysis improperly to the program area, i.e., the Coastal Plain. ¹⁹³ BLM must properly define the geographic scope of its impacts analysis by resource issues, taking into consideration geographic formations, habitat and resources uses, migrations, and landscapes.	BLM has defined the geographic scope of the cumulative effects analysis for the various resources taking into account the factors cited. See Appendix F for the cumulative impact analysis area for each program area.
41.	Brook	Brisson	Trustees for Alaska	96981	65	Cumulative Impacts	BLM defined the temporal scope of the cumulative impacts analysis as from the 1970s through realization of the hypothetical development scenario, which it estimated at 50 years. ¹⁹⁴ This is an insufficient temporal scope as it does not necessarily account for full reclamation, including ongoing monitoring, of oil and gas development on the Coastal Plain. It is also inconsistent with the development scenario that BLM puts forth. The timeline considered there indicates that additional oil fields could be developed as many as 85 years after the ROD is signed, and that abandonment and reclamation could occur up to 130 years after the ROD. ¹⁹⁵ BLM's temporal scope of the cumulative impacts should be at least as long as the timeline the agency identifies could follow its implementation of an oil and gas program.	Timeframes, like geographic scope, can vary by resource. Timeframes are based on the duration of the direct and indirect effects of the proposed action and alternatives, rather than the duration of the action itself. NEPA requires that cumulative impacts consider all past, present and reasonably foreseeable actions.
42.	Brook	Brisson	Trustees for Alaska	96981	66	Cumulative Impacts	BLM also improperly excludes oil and gas activities on non-federal lands, including State of Alaska lands adjacent to the Coastal Plain and private lands within the boundaries of the Coastal Plain, asserting that it is not reasonably foreseeable. ¹⁹⁶ These both should be analyzed to the extent practicable in the leasing program EIS.	Appendix F includes all past, present, and reasonably foreseeable actions.

S. Public Comments and BLM Responses (Cumulative Impacts)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
43.	Brook	Brisson	Trustees for Alaska	96981	67	Cumulative Impacts	With regards to the oil and gas activities on non-federal lands, it does not appear that BLM considered 3D seismic exploration proposed by SAExploration and permitted by the Alaska Department of Natural Resources to take place this winter on State of Alaska lands immediately adjacent to the Coastal Plain as a present action.197	The SAExploration proposal is listed as a reasonably foreseeable project analyzed in Appendix F. Appendix F has been updated to reflect changes in the proposed project.
44.	Brook	Brisson	Trustees for Alaska	96981	68	Cumulative Impacts	Additionally, there is information available regarding leases in marine waters, including State of Alaska leases and federal Outer Continental Shelf leases.198 BLM must analyze what the cumulative impacts of oil and gas activities on these leases could be to resources in the Coastal Plain. [198 See https://www.boem.gov/National-OCS-Program/ (proposal for a new leasing plan that would include six lease sales by 2024 in federal waters of the Arctic Ocean); http://dog.dnr.alaska.gov/Documents/Leasing/Legislature5YearLeasingReport_20180130.pdf (showing planned Alaska lease sales in state waters); http://dog.dnr.alaska.gov/Documents/Maps/ActivityMaps/NorthSlope/NS_ActivityMap_Oct2018.pdf (showing activities in state waters); Audubon Alaska, Ecological Atlas of the Bering, Chukchi, and Beaufort Seas at 280-281 (2017), https://ak.audubon.org/sites/g/files/amh551/f/arctic_atlas_composite_144ppi-final.pdf (describing impacts of offshore oil and gas activity); Nuka Research & Planning Group, LLC, Oil Spill Prevention and Response in the U.S. Arctic Ocean: Unexamined Risks, Unacceptable cumulative impacts of oil and gas activities on these leases could be to resources in the Coastal Plain.]	The existence of issued leases alone does not indicate that oil and gas activities are reasonably foreseeable on those leases. Many leases on the North Slope and offshore thereof never experience exploration or development activities. Regardless, the cumulative impact analysis includes such offshore leased areas generally (see Table F-1), but focuses on those specific actions that have been identified and are likely to occur (see Appendix F).

45.	Brook	Brisson	Trustees for Alaska	96981	69	Cumulative Impacts	<p>It is unclear from BLM's description whether it is excluding consideration of projects on State lands or only inholdings owned by Alaska Native Corporations. As explained above, there are plans to undertake oil and gas activities on adjacent State lands and BLM must analyze them. Additionally, excluding oil and gas activities and development on inholdings held by Kaktovik Inupiat Corp. and Arctic Slope Regional Corp. is unreasonable. BLM and DOI are well aware that ASRC has advocated for years to be able to develop these lands, and were a leading voice in advocating for passage of the Tax Act.199 It is therefore reasonably foreseeable that the corporations will act quickly to do so. We also note that provisions of the Chandler Lake Agreement grant ASRC extensive rights to develop and sell sand and gravel from their lands. BLM must analyze the likely impacts from the exercise of those rights as currently written.200 Additionally, SAExploration's pending 3D seismic proposal includes operations on these lands.201 Because facilities to support a Coastal Plain oil and gas program could be located on these lands (such as gravel mines, pipelines, road, central processing facilities), BLM must analyze that.202 Related to this point, BLM seems to acknowledge that uses of these lands related to and oil and gas program will increase.203 BLM's conclusions and assumptions are, therefore, inconsistent.</p>	<p>The EIS takes into account oil and gas activities that may occur on Native owned lands in the Coastal Plain. The reasonably foreseeable development scenario recognizes that such development may interact with development on Federal lands. The cumulative impact analysis includes other North Slope oil and gas activities generally (see Table F-1), but focuses on those specific actions that have been identified and are likely to occur (see Appendix F), including those on State and Native-owned lands (e.g., Point Thompson, Alpine CD-5, and Greater Mooses Tooth). There are no specific proposals to develop oil and gas or gravel resources on Native-owned lands in the Arctic Refuge, so such future activity necessarily must be described in general terms.</p>

46.	Brook	Brisson	Trustees for Alaska	96981	70	Cumulative Impacts	<p>BLM also excludes the Alaska Strategic Transportation and Resources (ASTAR) project from its cumulative impacts analysis.²⁰⁴ BLM should analyze the impacts of this project on the Coastal Plain. First, BLM states that the cumulative impacts analysis is often based on plans, permits, or fiscal appropriations, and that projects should be considered even if there is a degree of uncertainty.²⁰⁵ The State of Alaska currently has \$7.3 million in funding allocated for the project and the FY2020 Governor's Amended Budget includes an additional \$2.5 million.²⁰⁶ As currently proposed, in addition to other roads across the North Slope, there would be an access road running up and adjacent to the western boundary of the Coastal Plain.²⁰⁷ A pilot program for the project was conducted last winter. A purpose of the project is also to invest in new infrastructure that supports the value of the Trans-Alaska Pipeline System,²⁰⁸ which the BLM assumes would transport oil developed from the Coastal Plain. The Alaska Department of Natural Resources indicated in an update to the Alaska Legislature in early 2018 that state and federal permitting process are underway.²⁰⁹ Additionally, in a recently-initiated NEPA process for the NPR-A, the BLM indicates that it will be considering the ASTAR project.²¹⁰ Including it in one planning process but excluding it here is unreasonable. In sum, there is sufficient information and certainty for BLM to use to analyze the impacts of the ASTAR project in the draft EIS.</p>	<p>The ASTAR project has been added to the list of reasonably foreseeable future actions to be analyzed (see Appendix F).</p>

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
47.	Brook	Brisson	Trustees for Alaska	96981	71	Cumulative Impacts	Finally, BLM states that the permitting requirements of other agencies would reduce cumulative impacts.211 BLM makes the assertion without any analysis, citation, or support. Unless BLM actually analyzes the impacts resulting from various agencies permitting requirements, BLM cannot make this conclusion. BLM must explain the basis for this conclusion, including conducting the necessary analysis to support it.	The statement is not found on page F-3 of Appendix F as referenced. The EIS makes clear that all oil and gas activities will be subject to other federal, state and local laws and associated permit conditions required by other permitting agencies. Such requirements reduce impacts, including cumulative impacts, and are incorporated into the impact analysis.
48.	Brook	Brisson	Trustees for Alaska	96981	97	Cumulative Impacts	BLM completely ignores the fact that it is currently preparing to approve an extensive pre-leasing seismic proposal from SAExploration (SAE) throughout the Coastal Plain.776 That is a reasonably foreseeable-and connected-action that, if it goes forward as proposed, will itself have significant impacts to soil and permafrost and cumulatively combine with and exacerbate other impacts to soils and permafrost.777 The EIS estimates that there will be around 900 square miles of impacts from seismic activities. But SAE's proposal alone would directly impact 150,000 acres and would involve around 37,800 miles of seismic lines.778 Given the near certainty of other seismic testing proposals, BLM's conclusion that there will be only 900 square miles of impacts is unsupported by, and contrary to, the record. It does not take into consideration the fact that seismic exploration is not a one-time operation. It is often repeated as companies move to subsequent oil and gas phases, with exploration in some areas occurring on a yearly basis. It also does not take into account the proprietary nature of seismic survey results, which can lead to different companies repeating seismic surveys across the same area to gather their own data.	The hypothetical development scenario has been revised to consider seismic activity across the entire Coastal Plain, though it is highly unlikely that leasees would conduct seismic activity on areas outside their leasehold. Where existing seismic data is available for purchase, lessees typically purchase the data in lieu of collecting it themselves, as doing so is generally more cost and time effective. Companies that collect seismic data over large unleased areas generally do so with the intention to sell the data to potential bidders and lessees. For these reasons, the likelihood of overlapping 3D seismic surveys is low. SAE's proposal is considered in the EIS as a reasonably foreseeable future action as it relates to cumulative actions.

49.	Brook	Brisson	Trustees for Alaska	96981	99	Cumulative Impacts	BLM's discussion of the impacts to the Coastal Plain that occurred from the seismic program in the 1980s is also inadequate. BLM notes in passing in its cumulative impacts section that previous seismic exploration and an exploratory test well disturbed the surface vegetation and impacted the thaw of permafrost, changed drainage patterns, and changed vegetation growth for over 25 years after disturbance.779 BLM then goes on to state that, while improvements have been made to avoid impacts on the ground surface, future seismic surveys may have similar impacts.780 This is not an adequate assessment of the impacts. BLM has not provided any indication that it has fully analyzed the potential cumulative impacts from seismic surveys, as evidenced by the fact that the agency does not even account for the current seismic proposal before the agency. BLM's cursory acknowledgement that there are likely to be similar impacts does nothing to lay out why those impacts previously occurred, whether there are specific ways in which impacts could be avoided now, how those impacts are likely to cumulatively impact the region, or any other information. BLM's note that technologies have improved also ignores the reality of SAE's proposal and is not supported. SAE's proposal involves much of the same equipment that caused significant impacts in the 1980s, but its proposal is substantially more intense than that conducted in the 1980s.781 That means that it is likely to lead to even more extensive damage on the Coastal Plain.782 BLM needs to fully discuss and analyze the impacts of the previous seismic program from the 1980s as part of its current assessment.	An analysis of direct and indirect impacts of seismic exploration will be done for specific seismic exploration actions. The impacts of the previous seismic program make up the current affected environment, and this EIS documents the affected environment. The hypothetical development scenario has been revised to consider seismic activity across the entire Coastal Plain. SAE's proposal is considered in the EIS as a RFFA as it relates to cumulative actions.

50.	Withheld	Withheld	—	97404	3	Cumulative Impacts	5. The cumulative effects section needs additional information. Just as a likely O&G development scenario was produced for federal lands, a comparable effort must be made for state and tribal lands in the coastal plain in order to fully disclose the cumulative effects of your proposed action O&G development on tribal lands is a reasonably foreseeable future action, and it is a connected action whose effects must be considered. As a minimum, this development scenario must be completed in order to conduct consultation with the FWS under ESA. The development of tribal lands would not occur BUT FOR the development in your proposed action. Without this step you cannot determine the cumulative effects of your proposed action on any threatened or endangered species, or any species of state concern.	The cumulative impact analysis considers all reasonably foreseeable actions (see Appendix F). Connected actions are limited to actions that are currently proposed (ripe for decision). Actions that are not yet proposed are not connected actions, but they may need to be analyzed in the cumulative effects analysis if they are reasonably foreseeable. The EIS takes into account oil and gas activities that may occur on Native owned lands in the Coastal Plain. The reasonably foreseeable development scenario recognizes that such development may interact with development on Federal lands. There are no state owned lands in the Coastal Plain,
51.	—	—	United States Fish and Wildlife Service	97942	71	Cumulative Impacts	Page 3-133: The DEIS states that post-lease activities could include seismic, but fails to consider the fact that due to the future leasing activities analyzed in the DEIS, seismic surveys could occur prior to leasing. We recommend correcting this in the final EIS.	The hypothetical development scenario has been revised to consider seismic activity across the entire Coastal Plain, including both before and after leasing. Appendix B explains the different types of seismic exploration that are analyzed in the EIS. Seismic exploration can be done across the full area of the Coastal Plain, even if an area is not available for lease. Site-specific NEPA analyses would be done for any proposed seismic explorations. Additionally, seismic exploration projects are also considered in the cumulative analysis (see Appendix F).
52.	—	—	United States Fish and Wildlife Service	97942	202	Cumulative Impacts	Be explicit about what offshore actions are planned so that these can be considered in the range of effects.	All reasonably foreseeable actions are disclosed in Appendix F.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
53.	Pamela	Miller	—	98116	3	Cumulative Impacts	The other alternative is sea water treatment plants; however, there is no information about the potential impacts of withdrawing zillions of gallons of estuary water, making it fresh, and then disposing of that effluent out into the ocean. It will be warmer. It will be saltier. It will affect the nearshore estuary of the aquatic system that supports migrating fish, both anadromous and otherwise in the lagoons. It will affect the habitat for birds in the lagoons and nearshore waters. None of that has been addressed.	Additional text has been added to Section 3.3, Biological Resources.
54.	Pamela	Miller	—	98116	6	Cumulative Impacts	There is no conclusions about impacts being major, minor or moderate or the magnitude of the impacts. The cumulative impact analysis is token, at best, and does not provide a long-term view of what this full potential oil development with where the potential oil -- all the oil prospect are, what it could look like into the future.	A classification of impacts as major, minor, moderate, or negligible is not required under NEPA, particularly when no scale for such classification can be identified.
55.	Brook	Brisson	Trustees for Alaska	98270	148	Cumulative Impacts	Due to the narrow scope of the affected environment discussions, there is very little baseline information in the DEIS regarding the important marine areas along the marine shipping corridor to the west and south of the program area that could be adversely affected by shipping activities associated with the proposed action. Some important marine areas left out of the DEIS are in the Beaufort Sea and Chukchi Sea regions, including the Chukchi Corridor, Hanna Shoal, Herald Shoal, Barrow Canyon East, Smith Bay, Harrison Bay-Colville Delta, Beaufort Shelf Break, and Oliktok Point to Demarcation Bay, which are described in the attached reports. 1890 Other important marine areas not addressed in the DEIS are in the Bering Sea region, such as the Bering Strait and the waters surrounding King Island, St. Lawrence Island, and Nunivak Island, as described in the attached report	The hypothetical development scenario is applicable to the program area, and speculation beyond where marine vessel traffic would go is beyond the scope of this analysis. Direct and indirect impacts cannot be analyzed on a site-specific basis within this EIS, but they are analyzed for the program area generally based off the hypothetical development scenario. Project specific actions will be analyzed in subsequent NEPA analyses when exploration and development projects are proposed.

56.	Brook	Brisson	Trustees for Alaska	98270	151	Cumulative Impacts	Shipping-related oil and hazardous substance spills and resulting impacts are not discussed in any substantive way in the DEIS. While the potential for oil and hazardous substance spills is evaluated in the solid/hazardous waste section of the DEIS, this section focuses on terrestrial and freshwater impacts resulting from spills associated with onshore operations.1899 There are also a few sentences referring to the potential for marine impacts from oil spills in the water resources section, but this language refers to spills from onshore barge docking sites, not from shipping.1900 The apparent rationale for the general exclusion of shipping-related spills from the DEIS analysis is buried in the marine mammal section. The narrative strongly downplays the potential likelihood, extent, and harm of any oil or hazardous substance spill by suggesting that (1) there is a "low risk" of spilled fuel if a vessel carrying fuel were to run aground during barging, (2) a large oil spill in the Arctic marine environment is unlikely because "[t]o date," such as a spill has "not occurred," (3) spill risks will be reduced through "safeguards" specified in the required oil spill prevention and contingency plans, (4) the quantities of oil or hazardous substances likely to be released would be "relatively small," and (5) potential spills during refueling at sea would be only "small, accidental" spills.1901 This rationale is deeply flawed. While bulk fuel has historically been delivered to the North Slope by tanker truck along the haul road, bulk fuel deliveries by barge have commenced and are likely to become the preferred option in the future. The first large-scale fuel delivery by barge took place in September 2018, and it carried 2 million gallons of fuel from Valdez to Deadhorse.1902 A collision, grounding, or other accident resulting in	It is assumed that barging is to provide supplies and modules. Barging is not discussed as a shipping method for crude oil in Appendix B. The hypothetical development scenario anticipates that barging will be very limited.

S. Public Comments and BLM Responses (Cumulative Impacts)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
56. (cont.)	(see above)	(see above)	(see above)	(see above)	(see above)	(see above)	the discharge of even half the cargo of a fuel barge of this size (i.e., 1 million gallons) would be 10 times greater than BLM's own threshold for a "very large" spill, 1903 and it would constitute a major spill by any other estimation as well. Moreover, as the ice-free, open water season lengthens due to warming temperatures in the Arctic, transporting fuel by barge is likely to be viewed as a more convenient and/or cost-effective method of transporting fuel compared to the much smaller and more frequent 10,000-gallon increments that can be transported via tanker truck. 1904 Barge deliveries may even be the only feasible way of transporting fuel in support of Coastal Plain oil and gas operations because of the lack of a road between Deadhorse and Kaktovik. 1905	(see above)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
57.	Brook	Brisson	Trustees for Alaska	98271	181	Cumulative Impacts	In addition, it is surprising that no mention or analysis is made of the Arctic Strategic Transportation and Resources (ASTAR) project in the cumulative effects section. Appendix F states that "ASTAR is in its preliminary stages"1301 but does not otherwise justify ignoring the project in analyses of cumulative effects. The DEIS defines reasonably foreseeable future actions as those that are likely, or reasonably certain, to occur based on plans, permit applications, and fiscal appropriations.1302 While the ASTAR project has not yet secured funding to build infrastructure, it has acquired funding from the Alaska State Legislature to conduct a planning process. The November 2, 2018 letter from the Alaska Department of Natural Resources and North Slope Borough to the DOI Assistant Secretary for Land and Minerals Management1303 requesting BLM revise the Integrated Activity Plan (IAP) for the National Petroleum Reserve - Alaska (NPR-A), in part because of the ASTAR process, seems to clearly indicate intention to proceed. Furthermore, since the ASTAR project first started posting maps displaying potential futures for the project, the maps have included potential roads that stretch up to the western edge of the Arctic Refuge Coastal Plain. These maps have changed multiple times since they were initially posted in 2017, but the most recent map1304 still shows roads passing along the edge of the program area, which falls within the range of both the CAH and PCH. This warrants inclusion in the cumulative effects analysis.	The ASTAR project has been added to the list of reasonably foreseeable future actions to be analyzed (see Appendix F).

S.3.10 Direct/Indirect Impacts

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
1.	Donald	Walker	—	68	50	Direct/Indirect Impacts	A study of impacts to upland tundra from current exploration on the MacKenzie River Delta, Canada, reported that initial impacts are similar to or somewhat greater than those reported from 2D surveys in the same area 30 years previously. ^{70,71} A recent BLM Environmental Assessment for seismic surveys in northern Alaska stated that “seismic exploration may vary from having no observable effects in some situations to damaging vegetation to the extent that it may take years or even decades to heal. These impacts occur despite existing stipulations on operations, and cannot be further mitigated, given the types of equipment currently used.” ⁷²	The EIS has been updated to include more recent data and studies related to seismic exploration activities.

S. Public Comments and BLM Responses (Direct/Indirect Impacts)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
2.	Douglas	Fruge	—	30574	2	Direct/Indirect Impacts	On Page 1-6 the Leasing EIS describes the BLM's interpretation of the 2,000 surface acre facility limit specified by the US Congress in PL 115-97 as only those areas to be covered by production and support facilities. I believe this interpretation to be too restrictive since any and all types of surface disturbance and structures can potentially affect the environment --- not just those directly associated with oil and gas production and distribution facilities. In addition, there are potential effects from some types of structures that may not actually be in direct contact with the ground surface (e.g., elevated portions of pipelines) and therefore not subject to the 2,000 surface acre limitation. It is also not clear whether the BLM evaluated the impacts of all disturbances in evaluating the alternatives or only those included in its interpretation of the 2,000 surface acre limitation. If the BLM did not consider the effects of all potential structures or facilities, the actual levels of environmental impacts may be underestimated in the document.	Section 1.9.1 has been revised to identify the production and support facilities that would count toward the 2,000-acre limit, which now includes gravel mines, and the rationale as to why certain facilities may not be included. Rationale as to why certain facilities may not be included is contained in Section S.1.2 of this Appendix.
3.	Russell	Oates	—	31550	1	Direct/Indirect Impacts	Failure to include and adequately account for the distribution of the pipeline corridors as part of the development footprint in the caribou calving area is a fatal flaw to this EIS. Numerous studies (several of which you have cited) have demonstrated avoidance behavior of pipelines by cows and calves. In the restricted confines of the calving area available to this herd, a spider web of pipelines will spell long-term disaster.	Section 3.3.4 includes impacts on caribou from oil and gas development, including from pipelines.

S. Public Comments and BLM Responses (Direct/Indirect Impacts)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
4.	Withheld	Withheld	—	41048	1	Direct/Indirect Impacts	The draft EIS illegally violates the statutory language of Section 20001(c)(3) of PL 115-97 in section 1.9.1. Congress mandated that no more than 2000 acres have above ground oil and gas drilling infrastructure for production and support facilities (including air strips, gravel berms or piers for support of pipelines). The Bureau of Land Management (BLM) illegally amends the statutory limit by adding to the 2000-acre limit, the phrase "at any given time," which would allow the amount of acres damaged by above ground infrastructure to be drastically expanded beyond the 2000-acre limit in the law. Further, with no statutory authority, BLM excludes gravel mines and pipelines from the 2000-acre limit. The law specifically references pipelines and gravel.	As stated in Section 1.9.1, the BLM interprets the language "during the term of the leases" in Section 20001(c)(3) of PL 115-97 as indicating Congress intended a temporal limit. Under this interpretation, the reclaimed acreage of federal land formerly containing production and support facilities would no longer count toward the 2,000-acre limit, which has been revised to include gravel mines.
5.	Walter	Bala	—	44941	1	Direct/Indirect Impacts	I hope and trust the "HARD LOOK" has included extensive analysis of "measures to mitigate adverse impacts." This should have included extensive financial provisions to protect the direct impact of construction, operation and eventual restoration. The cost if extraction must include a cost of restoration - if possible - with funds held in escrow.	. The BLM believes that the objective is appropriate. Operators would be required to submit a reclamation plan that satisfies the objective of the ROP. Bonding would be determined and required with the specific oil and gas authorization (43 CFR 3134; the BLM would also apply these NPR-A regulations to the Coastal Plain).
6.	James	Warren	—	45446	6	Direct/Indirect Impacts	This discrepancy in acres impacted is important because the "2000 acres" is being used to convince the public that the impacts are NOT SIGNIFICANT. That is, the birds and the mammals, terrestrial and marine, won't be SIGNIFICANTLY IMPACTED. But this is not a true measure. "2000 acres" doesn't include the gravel mining operations and the various other industrial-scale operations, such as seismic testing operations, that will impact the Arctic Refuge Coastal Plain.	Section 1.9.1 has been revised to identify the production and support facilities that would count toward the 2,000-acre limit, which now includes gravel mines. Rationale as to why certain facilities may not be included is contained in Section S.1.2 of this Appendix.

S. Public Comments and BLM Responses (Direct/Indirect Impacts)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
7.	Gregg	Spindler	—	45493	9	Direct/Indirect Impacts	far more than the 2000 acre allotment will be subjected to irreversible industrial development. Once removed, the landscape can never be truly “restored” without replacement of the mined materials. Gravel and sand pits after grading should never be considered as “restored”.	Operators would be required to submit a reclamation plan that satisfies the objective of the ROP. Bonding would be determined and required with the specific oil and gas authorization (43 CFR 3134; the BLM would also apply these NPR-A regulations to the Coastal Plain).
8.	Withheld	Withheld	—	48698	4	Direct/Indirect Impacts	It is erroneous to claim that ice roads, elevated pipelines, and gravel mines do not count as surface development, as each of these have been shown to have impacts on ecology and wildlife (see attached documents for examples). Therefore these and all similiar development-related infrastructure must be included in the 2000 acre development cap.	The BLM has revised Section 1.9.1 to include gravel mines as support facilities subject to the 2,000-acre limit. The language of each lease stipulation has been revised to indicate whether gravel mines are allowed.
9.	Tim	Hogan	—	54587	1	Direct/Indirect Impacts	Proponents of drilling predict a total full-development infrastructure footprint of 2000 acres in the 1002 Area. This estimate is not based on realistic scenarios of how the oil is distributed and where facilities will need to be located. It ignores many types of impact that will likely occur - including the impacts of ice roads, gravel roads, gravel mines, pipelines, powerlines, infrastructure-related flooding, thermokarst, road dust, and seismic trails.	The BLM has revised Section 1.9.1 to include gravel mines as support facilities subject to the 2,000-acre limit. The language of each lease stipulation has been revised to indicate whether gravel mines are allowed.
10.	Eric	Parsons	—	55143	1	Direct/Indirect Impacts	The interperatation of 2000 acres is misleading. I believe it should be as the total amount of ground effected by development. Sites such as gravel quaries and road borrow sites are equally disturbed as construction of a gravel production pad. Secondly, the term should be 2000 acres for all time, not just under active lease. It opens the question to what state of reclamation is given to previously used acerage after a lease term is up. A gravel pad being used is the same destroyed land as a gravel pad not being used.	The BLM has revised Section 1.9.1 to include gravel mines as support facilities subject to the 2,000-acre limit. The language of each lease stipulation has been revised to indicate whether gravel mines are allowed.

S. Public Comments and BLM Responses (Direct/Indirect Impacts)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
11.	Withheld	Withheld	—	55209	5	Direct/Indirect Impacts	The draft EIS interprets that ice roads and pads, elevated pipelines, and gravel mines do NOT count as surface disturbance and, therefore, are not considered in the 2,000-acre limit of surface acres. BLM is also only counting 2000 acres “at any given time” This interpretation would allow for the entire coastal plain to see the impacts of development over time!	Section 1.9.1 has been revised to identify the production and support facilities that would count towards the 2,000-acre limit, which now includes gravel mines. Rationale as to why certain facilities may not be included is contained in Section S.1.2. Additionally, as stated in Section 1.9.1, the BLM interprets the language “during the term of the leases” in Section 20001(c)(3) of PL 115-97 as indicating Congress intended a temporal limit. Under this interpretation, the reclaimed acreage of federal land formerly containing production and support facilities would no longer count toward the 2,000-acre limit.
12.	Withheld	Withheld	—	55252	7	Direct/Indirect Impacts	gravel pits will have a major impact on the environment, and it is not reasonable to exclude them from the 2,000 acre development limitation.	The BLM has revised Section 1.9.1 to include gravel mines as support facilities subject to the 2,000-acre limit. The language of each lease stipulation has been revised to indicate whether gravel mines are allowed.
13.	Michael	Boyd	—	55303	1	Direct/Indirect Impacts	The BLM's failure to include pipelines, drill pads, and gravel mines as part of 2000 acre limit on oil infrastructure development is sophistry. If those features don't represent part of oil and gas facilities, then they should not be allowed	Section 1.9.1 has been revised to identify the production and support facilities that would count toward the 2,000-acre limit, which now includes gravel mines. Rationale as to why certain facilities may not be included is contained in Section S.1.2 of this Appendix.
14.	Paul	Reichardt	—	55513	4	Direct/Indirect Impacts	The proposal that gravel mines do not qualify as surface disturbance (because they are not directly related to leasing and development) doesn't pass the “sniff test.” While elevated pipelines themselves can arguably be excluded from surface disturbance, what about the maintenance roads associated with them (e.g., roads like those along and under long stretches of the pipeline along the Dalton Highway)? It was not clear to me that they were included in the estimate of road surface associated with leasing and development.	The BLM has revised Section 1.9.1 to include gravel mines as support facilities subject to the 2,000-acre limit. The language of each lease stipulation has been revised to indicate whether gravel mines are allowed.

S. Public Comments and BLM Responses (Direct/Indirect Impacts)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
15.	Paul	Reichardt	—	55513	5	Direct/Indirect Impacts	The idea that the phrase “during the term of the leases” in the Tax Act requires, or even allows, ‘temporal limits’ on surface disturbances implies that over time all of the leasing area could have surface disturbance as long as all but 2,000 acres of it has been “reclaimed.”	As stated in Section 1.9.1, the BLM interprets the language “during the term of the leases” in Section 20001(c)(3) of PL 115-97 as indicating Congress intended a temporal limit. Under this interpretation, the reclaimed acreage of federal land formerly containing production and support facilities would no longer count toward the 2,000-acre limit, which has been revised to include gravel mines.
16.	Dave	Gordon	—	55523	1	Direct/Indirect Impacts	The Tax Act claims only 2000 acres will be developed. This is an absurd claim. The DEIS needs to account for all lands that could be modified, including river beds for gravel extraction, roadways, pipelines, airfields, not just the structures to be built. It also needs to adequately address the impacts a spider web of development will have upon all animal communities. As development has expanded in Prudhoe Bay & elsewhere in the Arctic, caribou & other wildlife have been restricted from vast areas because they have been cut off.	Section 1.9.1 has been revised to identify the production and support facilities that would count towards the 2,000-acre limit, which now includes gravel mines. Rationale as to why certain facilities may not be included is contained in Section S.1.2.
17.	Richard	Sumner	—	56477	3	Direct/Indirect Impacts	The DEIS provides little information about the practicability and effectiveness of mitigation to offset large-scale disturbance to landscape connectivity and functions (e.g., hydrological flows at “break-up” and wildlife migration patterns). Successful, large scale ecological restoration of North Slope oil and gas development infrastructure has not been demonstrated.	The action alternatives analyze the effectiveness of proposed lease stipulations and ROPs as they relate to oil and gas activities on the Coastal Plain. Future site-specific mitigation will be tailored to the specific location of development and resources or activity.

S. Public Comments and BLM Responses (Direct/Indirect Impacts)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
18.	Richard	Sumner	—	56477	4	Direct/Indirect Impacts	The DEIS does not describe an adaptive management strategy whereby environmental monitoring information is specifically used to inform program implementation on a project by project basis, for each program alternative. A fundamental component of adaptive management is the adoption of management response options used with monitoring information shows unanticipated environmental harm and a corresponding lack of mitigation opportunity or performance.	Exceptions, waivers, and modifications provide an effective means of applying “adaptive management” techniques to oil and gas leases and associated permitting activities to meet changing circumstances. The BLM or operators can initiate adaptive management modifications. See Instruction Memorandum 2008-032 and 43 CFR 3101.1-4 for additional details.
19.	Nancy	Waterman	—	56488	2	Direct/Indirect Impacts	these 2,000 acres may not be one contiguous spot; they could be spread throughout the coastal plain relative to locations of desired oil prospects. BLM must identify all production and support facilities that would be included in this limitation and explain how it will be implemented and enforced. Alternatives and analyses must include all possible site scenarios for the 2,000 acres limit across the entire coastal plain, including analyses specific to each potential 400,000 acre lease sale.	Section 1.9.1 has been revised to identify the production and support facilities that would count towards the 2,000-acre limit, which now includes gravel mines. Rationale as to why certain facilities may not be included is contained in Section S.1.2.
20.	Randy	Oliver	—	56583	9	Direct/Indirect Impacts	The 2,000-acre limit should include, rather than exclude, any gravel mines, or other permanent disturbances to the landscape.	The BLM has revised Section 1.9.1 to include gravel mines as support facilities subject to the 2,000-acre limit. The language of each lease stipulation has been revised to indicate whether gravel mines are allowed.
21.	Chad	Hansen	—	56842	3	Direct/Indirect Impacts	BLM needs to include all oil and gas development-related infrastructure in its 2,000 acre calculation.	Section 1.9.1 has been revised to identify the production and support facilities that would count towards the 2,000-acre limit, which now includes gravel mines. Rationale as to why certain facilities may not be included is contained in Section S.1.2.

S. Public Comments and BLM Responses (Direct/Indirect Impacts)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
22.	Catherine	Coward	—	56854	1	Direct/Indirect Impacts	The proposed numbers of acres to be developed is misleading at best. Because the acreage count does not include roads or above ground pipeline, and because the drilling platforms will be “postage stamped” across the plain, the entire coastal area will be effected, and ultimately destroyed.	Section 1.9.1 has been revised to identify the production and support facilities that would count towards the 2,000-acre limit, which now includes gravel mines. Rationale as to why certain facilities may not be included is contained in Section S.1.2.
23.	Catherine	Coward	—	56854	2	Direct/Indirect Impacts	It is stated that slant/directional drilling may be used, but there is nothing in the draft to require its use. Because slant/directional drilling is more expensive, it is unlikely, and therefore misleading, to assume it will be used.	The EIS utilizes the best available information in developing the hypothetical development scenario. Technologies will evolve over the life of the program and may be utilized in the future.
24.	Withheld	Withheld	—	57064	4	Direct/Indirect Impacts	The 100 year impacts need consideration or the worse case scenario.	NEPA does not require analysis of a worst-case scenario.
25.	Withheld	Withheld	Denver Audubon	57090	4	Direct/Indirect Impacts	Public Law 115-97 limits to 2,000 acres the areas which may be covered by production and support facilities at any given time. But it also provides for the issuance of easements and rights-of-way across any lands, whether leased or not, and production and support facilities may be associated with those easements and rights of way. Since the 2,000 acre limit applies to lands covered by production and support facilities at any given moment, reclaimed federal land would not count towards this limit. Thus oil and gas production could move across the Coastal Plain, over a period of years affecting far more than 2,000 acres, as long as only that acreage was covered at any given moment of time. (EIS, 1-6). Obviously oil and gas development could impact a much greater acreage of the Refuge than just the 2,000 acres often cited.	As stated in Section 1.9.1, the BLM interprets the language “during the term of the leases” in Section 20001(c)(3) of PL 115-97 as indicating Congress intended a temporal limit. Under this interpretation, the reclaimed acreage of federal land formerly containing production and support facilities would no longer count toward the 2,000-acre limit, which has been revised to include gravel mines.

S. Public Comments and BLM Responses (Direct/Indirect Impacts)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
26.	Alex	Johnson	—	57132	1	Direct/Indirect Impacts	The process is fundamentally flawed due to the conclusion that leasing itself does not cause any significant impacts. Leasing itself will cause significant socioeconomic impacts to the people and communities of the Coastal Plain, the North Slope, and the state of Alaska as a whole. Leasing affects the psychological well-being of community members, recreationists, wilderness, and wildlife enthusiasts across the country. Increased leasing destabilizes the management regime that has been in place since ANILCA's passage. Leasing and corresponding exploration associated with those leases within the Arctic National Wildlife Refuge 1002 area will also directly impact the wildlife resources within the refuge.	The passage of ANILCA set aside the 1002 Area for oil and gas exploration. In a report to Congress in 1987, the USFWS made the recommendation that the area be made available for oil and gas leasing. While there are no direct impacts from leasing, indirect impacts that will occur as a result of leasing have been analyzed.
27.	Withheld	Withheld	—	57179	1	Direct/Indirect Impacts	While the law that opened up this wilderness area to development specifies only 2000 acres will be devoted to drilling, it does not include infrastructure disturbances such as roads, pipelines, gravel mines and other structures that will cut across the refuge and reach much more than the 2000 designated acres. The EIS does not address the impact of this extended "footprint" across a much wider area of the Refuge. This must be taken into account in the EIS.	Section 1.9.1 has been revised to identify the production and support facilities that would count towards the 2,000-acre limit, which now includes gravel mines. Rationale as to why certain facilities may not be included is contained in Section S.1.2.
28.	Joan	Norberg	Yukon Conservation Society	57318	3	Direct/Indirect Impacts	The DEIS does not provide references for its assertion of the footprint or how it defines the zone of influence. However, assuming that 2000 acres is accurate, simply applying the zone of influence included in the DEIS means the effective footprint is much larger. Therefore, YCS respectfully recommends that the footprint of the project be recalculated to include the zone of influence	Section 20001(c)(3) only applies the 2,000-acre limit to land that is directly occupied by production and support facilities. This is made clear by the Tax Act's reference to areas covered by piers for support of pipelines; however, the EIS does analyze broader indirect impacts associated with these production and support facilities.

S. Public Comments and BLM Responses (Direct/Indirect Impacts)

29.	JOSEPH	Kohn MD	We Are One, Inc. - WAO	57795	1	Direct/Indirect Impacts	The EIS should include scientific studies AND Indigenous traditional science.	Traditional knowledge has been shared with the BLM throughout development of the EIS, including during scoping, public meetings on the Draft EIS, government-to-government and ANCSA consultations, and through the Section 106 process. The BLM has used this information to help inform development of the EIS and to ensure a more robust analysis.
30.	Pamela	Weaver	—	58188	1	Direct/Indirect Impacts	I do not agree that gravel mining should be excluded from infrastructure consideration. These pads cannot exist without gravel and these gravel mines would not exist without development, therefore they are an essential part of any plan for development and must be included in the footprint.	The BLM has revised Section 1.9.1 to include gravel mines as support facilities subject to the 2,000-acre limit. The language of each lease stipulation has been revised to indicate whether gravel mines are allowed.
31.	Charlotte	Basham	—	58396	5	Direct/Indirect Impacts	The DEIS does not include ice roads and pads, elevated pipelines, and gravel mines in its assessment of necessary infrastructure. All structure should be included in your analysis; otherwise, the document is inaccurate and deceiving.	Section 1.9.1 has been revised to identify the production and support facilities that would count towards the 2,000-acre limit, which now includes gravel mines. Rationale as to why certain facilities may not be included is contained in Section S.1.2.
32.	Withheld	Withheld	—	58633	2	Direct/Indirect Impacts	It contains proposed infrastructure requirements but allows companies to obtain waivers, exceptions, and modifications of any of these requirements. It is impossible to comment on the impacts of development if the public does not know what requirements actually will be imposed.	Operators are required to submit a written request for an exception, waiver, or modification and information demonstrating that (1) the factors leading to the inclusion of the stipulation in the lease have changed sufficiently to make the protection provided by the lease stipulation no longer needed or (2) the proposed operation would not cause unacceptable impacts. The criteria for approval of exceptions, waivers, and modifications should be supported by NEPA analysis, and may require site-specific environmental review. Requests should contain, at a minimum, a plan that includes related on-site or off-site mitigation efforts to adequately protect affected resources; data collection and

32. (cont.)	(see above)	(see above)	(see above)	(see above)	(see above)	(see above)	(see above)	monitoring efforts; and timeframes for initiation and completion of construction, drilling, and completion operations. The operator's request may be included in an Application for Permit to Drill, Notice of Staking, Sundry Notice, or letter. The BLM may also proactively initiate the process. During the review process, BLM coordination with other local, state, or federal agencies (e.g., ADFG, NSB, and local governments) should be undertaken, as appropriate, and documented. The BLM will also consult with the federal surface management agency (e.g., USFWS). Approval or disapproval is made by the Authorized Officer, and the decision is documented. If the waiver, exception, or modification is approved, any necessary mitigation is also documented. The applicant is then provided with a written notification of the decision. See Instruction Memorandum 2008-032 and 43 CFR 3101.1-4 for additional details.
33.	Withheld	Withheld	—	58633	3	Direct/Indirect Impacts	The tax law Congress passed authorizing development in the refuge limits "surface disturbance" to 2,000 acres. BLM has interpreted the 2,000 acre limitation to exclude ice roads, hundreds of miles of elevated pipelines, gravel mines and other types of infrastructure, however. BLM needs to include all oil and gas development-related infrastructure in its 2,000 acre calculation.	Section 1.9.1 has been revised to identify the production and support facilities that would count towards the 2,000-acre limit, which now includes gravel mines. Rationale as to why certain facilities may not be included is contained in Section S.1.2.
34.	Martha	Raynolds	—	67039	5	Direct/Indirect Impacts	The exclusion of pipelines (except for piers) and gravel mines from the 2000 acres is ludicrous. These are obviously areas that are not available for any other uses due to oil & gas activities. This glaring error is included in all the Alternatives presented.	Section 1.9.1 has been revised to identify the production and support facilities that would count towards the 2,000-acre limit, which now includes gravel mines. Rationale as to why certain facilities may not be included is contained in Section S.1.2.

S. Public Comments and BLM Responses (Direct/Indirect Impacts)

35.	Joelle	Buffa	—	67158	3	Direct/Indirect Impacts	Excluding snow or ice roads from counting toward the 2,000 acre maximum surface facility limitation further grossly underestimates the project's impacts on polar bears.	Section 1.9.1 has been revised to identify the production and support facilities that would count towards the 2,000-acre limit, which now includes gravel mines. Rationale as to why certain facilities may not be included is contained in Section S.1.2.
36.	Withheld	Withheld	—	67539	3	Direct/Indirect Impacts	More than 2000 acres would be impacted. BLM needed to include infrastructure like pipelines and gravel mines and it did not so so	Section 1.9.1 has been revised to identify the production and support facilities that would count towards the 2,000-acre limit, which now includes gravel mines. Rationale as to why certain facilities may not be included is contained in Section S.1.2.
37.	Bill	Sherwonit	—	67644	2	Direct/Indirect Impacts	development on the coastal plain limits "surface disturbance" to 2,000 acres. But it's my understanding that BLM has interpreted that limitation to exclude ice roads, many miles of elevated pipelines, gravel mines and other infrastructure. BLM should include all oil and gas development-related infrastructure in its 2,000-acred determination.	Section 1.9.1 has been revised to identify the production and support facilities that would count towards the 2,000-acre limit, which now includes gravel mines. Rationale as to why certain facilities may not be included is contained in Section S.1.2.
38.	Withheld	Withheld	—	68965	22	Direct/Indirect Impacts	2. The effects analysis in Chapter 3 lacks depth and continuity. Appendix B in Volume 2 of the draft EIS presented the BLM's hypothetical development scenario. This scenario identified five phases in this proposed action; (1) leasing, (2) exploration, (3) development, (4) production, and (5) abandonment and reclamation. Different types of activities will occur during each of these phases, and differences in the temporal overlap and spatial juxtaposition of sites in each of these phases across the Coastal Plain will yield a shifting pattern of effects through time. This potentially very complex pattern of variation is exactly what I assumed the BLM's hypothetical development scenario was meant to address. Amid the resulting "cloud" of potential effects, the hypothetical development scenario would provide a	The organization and approach to analysis in Chapter 3 have been standardized across all resources.

38. (cont.)	(see above)	(see above)	(see above)	(see above)	(see above)	(see above)	<p>representative “point” that could be the focus of a standardized analytical approach. This typology of phases and standardized analytical approach for dealing with spatial and temporal variation makes sense and sets up an expectation for readers about the structure and content of the corresponding effects analyses. Similarly, Appendix F lists resource impacts and indicators. Combined with Appendix B, this further refines the reader’s expectations about the structure and content of analyses of program effects on resources by identifying resource-specific impact mechanisms and the indicators that will be used to measure relative impacts across action alternatives. Again, this analytical framework is a sensible approach for dealing with the broad uncertainty inherent in a programmatic draft EIS such as this one. The effects analyses in Chapter 3, however, do not fulfill the expectations established by this framework. Execution of the sensible approach intended by appendices B and F is extremely inconsistent. For example, the first resource analysis in Chapter 3 is for Air Quality. Rather than adopt the phases identified in the hypothetical development scenario, the air quality analysis introduces a new typology of phases, including: (1) seismic survey, (2) exploratory drilling, (3) development, and (4) production (pg. 3-13), but omits the important phase (5) abandonment and reclamation (in general, this phase of the program is largely ignored throughout the draft EIS, despite its potential to result in significant impacts). It uses virtually none of the timelines, spatial predictions, or assumptions that are included in the hypothetical development scenario to refine estimates of the magnitude and duration of effects, and makes only one</p>	(see above)

S. Public Comments and BLM Responses (Direct/Indirect Impacts)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
38. (cont.)	(see above)	(see above)	(see above)	(see above)	(see above)	(see above)	reference to the scenario. Actions and impacts presented in Appendix F, section F.4.2 are tracked in the narrative with moderate fidelity, but the analysis includes only one sentence that deals with temporal aspects of impacts (pg. 3-14; Thus, potential emissions in the short term would be less than emissions in the long term, assuming that exploration ultimately led to the buildout of oil and gas facilities as described by the hypothetical development scenario (Appendix B). The next resource analyzed, Acoustic Environment, makes no reference to the hypothetical development scenario, and is written in a way that suggests the authors of this analysis were unaware of the existence of the scenario. Similarly, the analysis of effects to the acoustic environment does not mention important indicators listed in Appendix F, section F.4.3 such as sound intensity index and distance to inaudibility. It's as if each discipline is analyzing their own unique version of the proposed program. This pattern of incomplete fidelity or total disregard for the Appendices B and F continues throughout Chapter 3, leading to an effects analysis that is an incomprehensible hodge-podge, casting doubt on the credibility of the analysis, and thwarting any attempt to integrate effects across resources analyzed - a central role of decision-makers. Chapter 3 needs to be completely revised with a focus on using the hypothetical development scenario in Appendix B and the impacts and indicators in Appendix F as central organizing themes. As suggested in the Introduction to the draft EIS, this is a reasonable approach for a programmatic draft EIS, but to be effective, it must be implemented properly.	(see above)

40.	Withheld	Withheld	—	68965	29	Direct/Indirect Impacts	<p>5. Accounting for the limit of 2,000 acres of disturbance. Section 20001 of Public Law 115-97 includes the following language: "(3) SURFACE DEVELOPMENT.-In administering this section, the Secretary shall authorize up to 2,000 surface acres of Federal land on the Coastal Plain to be covered by production and support facilities (including airstrips and any area covered by gravel berms or piers for support of pipelines) during the term of the leases under the oil and gas program under this section." The quantitative criterion of 2,000 acres will justifiably be the object of considerable industry interest and public scrutiny. This quantitative criterion is also very amenable to monitoring. While the draft EIS may not be the place for articulating a comprehensive monitoring and compliance plan, I believe it is the place to spell-out, in as much detail as possible, how this 2,000-acre limitation on surface development will be tracked. Transparency about what rules will govern the monitoring and accounting program for this criterion is essential. This information will enable lease applicants to plan accordingly, and will provide environmental interests some assurance that this is a meaningful criterion. Early disclosure of these rules will allow them to be subjected to public comment, refined, and clarified before issuance of a Record of Decision; an approach that will build trust. In contrast, leaving disclosure of the monitoring and accounting rules for surface disturbance to an unspecified later date will foster uncertainty, distrust, and suspicion.</p>	<p>The 2,000-acre facility limit facility limit has been revised to include gravel mines. Section 1.9.1 describes those facilities that will be counted against the 2,000 acres. The BLM will use facility data in the form of ArcGIS-compatible shapefiles obtained under ROP 33 to track facility acreage to assure continued compliance with the Tax Act limit. ROP 35 requires the development of a BLM-approved abandonment and reclamation plan.</p>
41.	Withheld	Withheld	—	68965	30	Direct/Indirect Impacts	<p>I urge the BLM to include in the revised draft EIS a clear and thorough description of the rules surrounding the 2,000-acre limitation. This description in its entirety should be presented in a single location in Chapter 2, or an</p>	<p>The 2,000-acre facility limit has been revised to include gravel mines. 41. (cont.)	(see above)	(see above)	(see above)	(see above)	(see above)	(see above)	<p>appendix, and should at minimum include: *A comprehensive list of program features that will be counted toward the 2,000-acre limit (please see my specific comments below for details). *A clear protocol for field monitoring of the total acreage disturbed at any given time, including a typical annual schedule for monitoring activities, and the parties responsible for completing the monitoring activities and reporting the results. *Description of the reporting process, including public disclosure of validated monitoring results. I recommend a web-based platform, releasing monitoring results on a schedule as close to real-time as possible. *A thorough discussion of the internal controls regarding data quality that will be applied to the monitoring and reporting program. *A thorough discussion of the external controls, including audits and other forms of external oversight that will be implemented. I recommend identifying the specific entities that will be responsible for conducting audits and performing oversight functions. *A clear and complete description of the process for responding to monitoring results that indicate the program has exceeded the 2,000-acre limit. This outcome would be a violation of Public Law 115-97. Public Law 115-97 does not prescribe penalties for violations, making it incumbent on the BLM to articulate how they intend to handle this situation. This process is essential information for all parties interested in the oil and gas program. *A clear protocol for monitoring abandonment and reclamation activities. This should include clear performance standards regarding the ecological function of reclaimed acres that, when achieved, would allow these acres to be deducted from the total of disturbed acres.</p>	<p>ArcGIS-compatible shapefiles obtained under ROP 33 to track facility acreage to assure continued compliance with the Tax Act limit. ROP 35 requires the development of a BLM-approved abandonment and reclamation plan.</p>

S. Public Comments and BLM Responses (Direct/Indirect Impacts)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
42.	Withheld	Withheld	—	68965	33	Direct/Indirect Impacts	<p>8. Introduction, Section 1.9.1. The language in PL 115-97 regarding surface development is: (3) SURFACE DEVELOPMENT.-In administering this section, the Secretary shall authorize up to 2,000 surface acres of Federal land on the Coastal Plain to be covered by production and support facilities (including airstrips and any area covered by gravel berms or piers for support of pipelines) during the term of the leases [italics added] under the oil and gas program under this section. Section 1.9.1 of the draft EIS states: The BLM interprets this provision of PL 115-97 as limiting to 2,000 the total number of surface acres of all Federal land across the Coastal Plain, regardless of whether such land is leased, which may be covered by production and support facilities at any given time. Accepting the invitation in the draft EIS to comment on this interpretation, I have to ask, why does the BLM interpret “during the term of the leases” to mean “at any given time”? In my opinion, these do not mean the same thing. BLM’s interpretation appears to allow more surface development than intended by Congress. Please provide and explain the BLM’s rationale underlying their interpretation. Please also specify in detail the level of reclamation, including specific performance measures or metrics, especially regarding re-grading and revegetation, that the BLM will use to determine when a given acre no longer counts toward the total of 2,000 acres under development. Also in this section, BLM excludes gravel mines from consideration as contributing to the 2,000 acre total, offering the analogy that gravel mines are like steel mills in that they simply provide raw materials. This analogy is flawed in that the gravel mines are likely to be located on the Coastal Plain, unlike steel mills.</p>	<p>As stated in Section 1.9.1, the BLM interprets the language “during the term of the leases” in Section 20001(c)(3) of PL 115-97 as indicating Congress intended a temporal limit. Under this interpretation, the reclaimed acreage of federal land formerly containing production and support facilities would no longer count toward the 2,000-acre limit. This limit has been revised to include gravel mines.</p>

S. Public Comments and BLM Responses (Direct/Indirect Impacts)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
42. (cont.)	(see above)	(see above)	(see above)	(see above)	(see above)	(see above)	In the absence of the oil and gas development program, existing gravel mines on the coastal plain would expand at some background rate associated with ongoing activities that require gravel. Any increase in the expansion of existing gravel mines beyond this background rate that can be attributed to development of oil and gas infrastructure, and any new gravel mines that provide material for oil and gas infrastructure can and should be counted against the 2,000 acres of development associated with the oil and gas program.	(see above)
43.	Withheld	Withheld	—	68965	43	Direct/Indirect Impacts	Please be explicit about whether areas disturbed for the purposes of water withdrawal or removal of ice aggregate are included in the 2,000 acre facility limit. In my opinion, these disturbances should be included.	These areas are not covered in the 2,000-acre limit. Per the Tax Act, the limit only applies to areas covered by production and support facilities. Section 1.9.1 has been revised to identify the production and support facilities that would count towards the 2,000-acre limit, which now includes gravel mines. Rationale as to why certain facilities may not be included is contained in Section S.1.2.
44.	Withheld	Withheld	—	68965	64	Direct/Indirect Impacts	The large estimated spatial extent of sand and gravel pits and their lasting effects on Water Resources described in the next section suggest these pits may be among the most environmentally impactful aspects of this program. The analysis of effects presented here, including the estimates of the spatial extent of sand and gravel pits for each action alternative (all exceeding 300 acres), support the inclusion of sand and gravel pits in the 2,000 acre facility limit.	Section 1.9.1 has been revised to identify the production and support facilities that would count towards the 2,000-acre limit, which now includes gravel mines. Rationale as to why certain facilities may not be included is contained in Section S.1.2.

45.	Withheld	Withheld	—	68965	83	Direct/Indirect Impacts	55. Chapter 3; section 3.3.5, page 3-136. Marine Mammals. Similarly, during winter 2000-2001, two females denned successfully within 1,312 feet and 2,625 feet of remediation activities being conducted on Flaxman Island (MacGillivray et al. 2003), located just northwest of the Arctic Refuge boundary. Thank you for including at least one mention of the potential effects associated with the “abandonment and reclamation” phase of the program as described in Appendix B (pg. B-19). This phase of the program is largely ignored throughout the draft EIS, despite its potential to result in significant impacts.	The organization and approach to analysis in Chapter 3 have been standardized across all resources. Chapter 3 has been revised to include discussions of all phases of the leasing program.
46.	Peter	Stern	—	69296	10	Direct/Indirect Impacts	I-6 section 1.9.1 excludes gravel mines from the 2000 acre limitation. It also excludes elevated pipelines that don't touch the surface even though they might impede the movement of animals if they are left too low to the ground. Gravel mines must be included in any remediation requirements.	Section 1.9.1 has been revised to identify the production and support facilities that would count towards the 2,000-acre limit, which now includes gravel mines. Rationale as to why certain facilities may not be included is contained in Section S.1.2.
47.	Peter	Stern	—	69296	72	Direct/Indirect Impacts	B-21 “Road requirements are somewhat elastic in that operators could route roads through Native or State lands or even build some roadless developments if there were a possibility of the 2,000-acre disturbance cap being exceeded.” So this will allow winter and ice roads to be used to exceed the 2000 acre limitation while still impacting ground cover for many years.	Section 1.9.1 has been revised to identify the production and support facilities that would count towards the 2,000-acre limit, which now includes gravel mines. Rationale as to why certain facilities may not be included is contained in Section S.1.2.

48.	Becky	Long	—	69710	4	Direct/Indirect Impacts	The DEIS interpretation and the tax law of what is surface disturbance is wrong. Ice roads and pads, elevated pipelines and gravel mines are not counted for various reasons. The main reason is that these are not oil and gas facilities. The DEIS interpretation that the 2000 rule is at any given time as quoted on p. 3-221 is wrong and actually goes against the tax law. Appendix B-9 states that if they include the above type development in the 2000 rule then the leasing program would be impracticable. Well, too bad for that. The 2000 acre rule should apply as a total amount for all surface development for all the future leasing in the law. The only conclusion is that leasing surface development will not be limited to 2000 acres. There is no way that it could be followed. The DEIS creative definition of disturbance at any one time is a subversion of the 2000 acre rule.	Section 1.9.1 has been revised to identify the production and support facilities that would count towards the 2,000-acre limit, which now includes gravel mines. Rationale as to why certain facilities may not be included is contained in Section S.1.2. Additionally, as stated in Section 1.9.1, the BLM interprets the language “during the term of the leases” in Section 20001(c)(3) of PL 115-97 as indicating Congress intended a temporal limit. Under this interpretation, the reclaimed acreage of federal land formerly containing production and support facilities would no longer count toward the 2,000-acre limit.
49.	Withheld	Withheld	—	70203	1	Direct/Indirect Impacts	The proposal in this EIS that 2000 acres comprises a temporal occupancy by oil and gas leasing exploration is absurd. The impacts from the proposed activity in this sensitive ecosystem are permanent, not temporal. The impacts are not limited to 1.5 million acres, but extend far beyond.	Section 1.9.1 has been revised to identify the production and support facilities that would count towards the 2,000-acre limit, which now includes gravel mines. Rationale as to why certain facilities may not be included is contained in Section S.1.2. Under all alternatives, ROP 35 requires restoration to the land’s previous hydrological, vegetation, and habitat condition.
50.	Withheld	Withheld	—	70934	1	Direct/Indirect Impacts	Section 1.9.1 - Total acreage. - The exemption of gravel mines, support pads and other infrastructure from the 2000-acre limit is ludicrous. Asserting a temporal component especially without clear and objective criteria for reclamation is also not in keeping with the law or intention of the regulation. A 2000-acre limit has been established for decades and has up until now always been defined and explained as the footprint for development.	Section 1.9.1 has been revised to identify the production and support facilities that would count towards the 2,000-acre limit, which now includes gravel mines. Rationale as to why certain facilities may not be included is contained in Section S.1.2.

51.	Withheld	Withheld	—	70934	2	Direct/Indirect Impacts	In later sections of this document (eg 3.2) it is indicated that analysis of cumulative impacts are based on 2,000 acres of disturbance. This is erroneous and invalidates these analyses. In all instances the footprint for disturbance should not be measured as 2000 acres. When considering gravel extraction 4,000 is a more accurate estimate of surface disturbance and BLM should reexamine all sections of this document which use 2,000 acres as in calculating impacts.	Section 1.9.1 has been revised to identify the production and support facilities that would count towards the 2,000-acre limit, which now includes gravel mines. Rationale as to why certain facilities may not be included is contained in Section S.1.2.
52.	Withheld	Withheld	On behalf of 312 scientists	71076	2	Direct/Indirect Impacts	The DEIS does not adequately address how the area to be covered by production and support facilities will be limited to 2,000 acres as required in P.L. 115-97. This is especially important in view of the National Academy of Science/National Research Council1 finding that the impacts of Arctic development extend far beyond the physical footprint of the necessary facilities and infrastructure. The DEIS applies a very narrow interpretation of this limit: e.g., gravel mines, ice roads and elevated pipelines would not count toward the cap, even though such infrastructure is directly related to production and support of an oil and gas program. Moreover, the DEIS would allow more construction beyond 2,000 acres if previously disturbed acres are “reclaimed,” despite a dearth of scientific evidence that reclaimed acres would function in the same way as non-disturbed areas. Nor has the agency explained how it will track and enforce the 2,000-acre limitation on the ground.	Section 1.9.1 has been revised to identify the production and support facilities that would count towards the 2,000-acre limit, which now includes gravel mines. Rationale as to why certain facilities may not be included is contained in Section S.1.2. . The BLM will use facility data in the form of ArcGIS-compatible shapefiles obtained under ROP 33 to track facility acreage to assure continued compliance with the Tax Act limit. ROP 35 requires the development of a BLM-approved abandonment and reclamation plan.

53.	Withheld	Withheld	—	71099	2	Direct/Indirect Impacts	The DEIS is significantly deficient in its analysis and prefaces each modestly assessed impacts section with a statement that the project is a lease program. That is only partly true. Other municipal agencies have had to withdraw similar proposals to sell off public land to a developer because the EIS only examined the sale not the impacts of the project they were expecting to occur on the site, trying to pass the buck to the developer or segment the review. It is well established in state and federal regulations that segmentation is not permitted. Please make sure the NEPA process does not allow this as well and more importantly and timely that the arctic drilling EIS does not segment the review.	Chapter 3 has been revised to include discussions of all phases of the leasing program. All future site-specific oil and gas activities will require a separate NEPA analysis.
54.	Heather	Mirczak	—	71628	2	Direct/Indirect Impacts	I understand that any lease also includes an acreage limit on the surface development. The draft EIS stipulates a 2000 acre limit, however, as written this does not include ice roads, pads, elevated pipelines and gravel mines. This does not compute for me. As an Arctic traveler in both summer and winter, I have seen the remnants of infrastructure from all of these things. This provision seems to greatly expand the acreage that is being exposed and altered by the lease sale. I am concerned that the language also specifies "2000 acres at any given time" which does not limit the structures to a given area but allows for increased development of these structures over time. This means again greater disturbance over a wider expanse of the Refuge.	Section 1.9.1 has been revised to identify the production and support facilities that would count towards the 2,000-acre limit, which now includes gravel mines. Rationale as to why certain facilities may not be included is contained in Section S.1.2. Additionally, as stated in Section 1.9.1, the BLM interprets the language "during the term of the leases" in Section 20001(c)(3) of PL 115-97 as indicating Congress intended a temporal limit. Under this interpretation, the reclaimed acreage of federal land formerly containing production and support facilities would no longer count toward the 2,000-acre limit.

55.	Jill	Nogi	Environmental Protection Agency	71634	38	Direct/Indirect Impacts	Reclamation According to the DEIS, the BLM has interpreted the Tax Act as providing a temporal limit on surface development, such that "the reclaimed acreage of Federal land formerly containing production and support facilities would no longer count towards the 2,000-acre limit." Revegetation is challenging in arctic environments, due to harsh growing conditions as well as the potential for permafrost degradation. We recommend that the EIS include additional information regarding the reclamation standard that would be applied, and how the BLM would ensure that reclamation was successful prior to authorizing additional land disturbance.	The 2,000-acre facility limit facility limit has been revised to include gravel mines. Section 1.9.1 describes those facilities that will be counted against the 2,000 acres. The BLM will use facility data in the form of ArcGIS-compatible shapefiles obtained under ROP 33 to track facility acreage to assure continued compliance with the Tax Act limit. ROP 35 requires the development of a BLM-approved abandonment and reclamation plan.
56.	Withheld	Withheld	The Wildlife Society - Alaska Chapter	72005	3	Direct/Indirect Impacts	The DEIS must rigorously describe the 2,000-acre limitation on development of the coastal plain of the Arctic Refuge. The DEIS does not adequately address how the area to be covered by production and support facilities will be limited to 2000 acres as required in P.L. 115-97. This is especially important in view of the NRC's finding that the impacts of Arctic development extend far beyond the physical footprints of the necessary facilities and infrastructure. The DEIS provides a limited interpretation of this restriction, with a number of associated structures (e.g., gravel mines, ice roads and elevated pipelines) not counting toward the cap. Additionally, the DEIS would allow further construction outside the 2000 acres if the original developed areas are reclaimed. However, there is limited evidence of the efficacy of this approach and no clear definition of the standards by which adequate reclamation would be determined based on scientific information.	Section 1.9.1 has been revised to identify the production and support facilities that would count toward the 2,000-acre limit, which now includes gravel mines, and the rationale as to why certain facilities may not be included. The BLM will use facility data in the form of ArcGIS-compatible shapefiles obtained under ROP 33 to track facility acreage to assure continued compliance with the Tax Act limit. ROP 35 requires the development of a BLM-approved abandonment and reclamation plan.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
57.	Withheld	Withheld	Kachemak Bay Conservation Society	72060	10	Direct/Indirect Impacts	The 2017 Tax Cuts and Jobs Act that legalized drilling in the Refuge limits disturbance of land to 2,000 acres; however, the DEIS finds creative and unconvincing ways around this limitation. It does not count seismic exploration, ice roads, elevated pipelines and gravel pit mines as surface disturbance. This calculation is an obvious distortion of reality that must be amended in the final EIS. The final EIS must count the significant surface disturbances of seismic exploration, ice roads, elevated pipelines and gravel pit mines into the total land disturbed. The DEIS also only counts 2,000 acres "at any given time." This would allow for the entirety of the coastal plain to see the impacts of development over time. If congress meant 2,000 acres "at any given time" they would have said so, and the addition of this language is an attempt to override clear limitations placed by congress: it must be removed in the final EIS.	Section 1.9.1 has been revised to identify the production and support facilities that would count towards the 2,000-acre limit, which now includes gravel mines. Rationale as to why certain facilities may not be included is contained in Section S.1.2. Additionally, as stated in Section 1.9.1, the BLM interprets the language "during the term of the leases" in Section 20001(c)(3) of PL 115-97 as indicating Congress intended a temporal limit. Under this interpretation, the reclaimed acreage of federal land formerly containing production and support facilities would no longer count toward the 2,000-acre limit.
58.	Stuart	Pechek	—	72083	1	Direct/Indirect Impacts	I've reviewed the Drat EIS and commend many aspects of it's analysis. However, the oversights I see come from the impact analysis - 3.2.4 Physiography - Affected Environment. Statements surmise that the overall surface disturbance area is approximately 2000 acres, mostly from gravel pads, roads and additional gravel pits. That sounds reasonable. However, as a surveyor who's worked in Prudhoe Bay extensively as well as Kuparuk and Alpine oil fields, I can say this statement does not address the major physiography impact - the feeder oil lines which create a spider-like network in an oil fiield development.	This level of specificity would be determined at the project-level authorization. Site-specific analyses, including those associated with infrastructure in support of oil and gas development, can more realistically be provided when the BLM receives an application to permit such infrastructure. The Leasing EIS makes no decisions on such infrastructure, except to prohibit it in specified areas of particularly high value surface resources under some alternatives.
59.	Withheld	Withheld	—	72125	7	Direct/Indirect Impacts	The DEIS in Chapter 3 repeatedly describes that the, "[i]ssuance of oil and gas leases under the directives of Section 20001(c)(1) of PL 115-97 would have no direct impacts on the environment because by itself a lease	This EIS analyzes indirect impacts from oil and gas leasing at the programmatic level. While leasing does not result in any on-the-ground impacts, the BLM recognizes there is an irreversible

59. (cont.)	(see above)	(see above)	(see above)	(see above)	(see above)	(see above)	<p>does not authorize any on the ground oil and gas activities; however, a lease does grant the lessee certain rights to drill for and extract oil and gas subject to further environmental review and reasonable regulation, including applicable laws, terms, conditions, and stipulations of the lease. The impacts of such future exploration and development activities that may occur because of the issuance of leases are considered potential indirect impacts of leasing. Such post-lease activities could include seismic and drilling exploration, development, and transportation of oil and gas in and from the Coastal Plain." The above statement is misleading. The BLM does not retain substantial rights allowing it to regulate rights-of-way and easements. The DEIS should have noted that reasonable regulations may not be permitted in some cases, since Section 20001(c)(2) of PL 115-97 mandates that rights-of-way or easements across the Coastal Plain are to be issued with no mention of protecting surface resource values. Selecting any of the DEIS action alternatives would likely lead to the connected action of authorizing rights-of-way or easements. An agency is required to fully evaluate site-specific impacts once it reaches the point of making "a critical decision . . . to act on site development." An agency reaches the threshold triggering site-specific review when it proposes to make an irreversible and irretrievable commitment of resources. If BLM is going to make an irretrievable commitment of resources, it cannot defer its site-specific analysis and rely on vague programmatic statements in the draft EIS.</p>	<p>and irretrievable commitment of resources, which is why it analyzes these impacts in the EIS. The hypothetical development scenario addresses rights-of-way (ROWs) at the programmatic level, and surface disturbance from ROWs are included in the 2,000-acre facility limit facility limit(see Section 1.9.1). If a ROW or any other project-specific activity results in surface-disturbing activity, then an additional NEPA analysis is required.</p>

60.	Withheld	Withheld	—	72125	19	Direct/Indirect Impacts	the length and diameter of elevated pipelines and other structures need to be counted against the 2,000-acre limit since they "cover" an area and degrade wildlife habitat and may affect wildlife movements, which is counter to providing for natural diversity.	Section 20001(c)(3) only applies the 2,000-acre limit to land that is directly occupied by production and support facilities. This is made clear by the Tax Act's reference to areas covered by piers for support of pipelines (see Section 1.9.1). However, the EIS does analyze broader indirect impacts associated with these production and support facilities.
61.	Withheld	Withheld	—	72125	20	Direct/Indirect Impacts	A gravel mine is a facility-a "facility" is something that is "built, installed, or established to serve a particular purpose" and must be considered a facility for the purpose of calculating the acre limit. The BLM needs to explain what it believes is the basis for its authority to allow gravel mining in the Arctic Refuge.	Section 1.9.1 has been revised to identify the production and support facilities that would count towards the 2,000-acre limit, which now includes gravel mines. Rationale as to why certain facilities may not be included is contained in Section S.1.2.
62.	Withheld	Withheld	—	72125	22	Direct/Indirect Impacts	Interpreting the limitation to allow for additional lands to be developed if other lands are reclaimed means that much more than 2,000 acres of the Coastal Plain would be impacted by oil and gas activities. This is contrary to the Tax Act and cannot be permitted. Two-thousand acres is the maximum cumulative acreage that can be impacted by surface development under the Tax Act.	Section 1.9.1 has been revised to identify the production and support facilities that would count towards the 2,000-acre limit, which now includes gravel mines. Rationale as to why certain facilities may not be included is contained in Section S.1.2. Additionally, as stated in Section 1.9.1, the BLM interprets the language "during the term of the leases" in Section 20001(c)(3) of PL 115-97 as indicating Congress intended a temporal limit. Under this interpretation, the reclaimed acreage of federal land formerly containing production and support facilities would no longer count toward the 2,000-acre limit.
63.	Withheld	Withheld	—	72125	35	Direct/Indirect Impacts	Roads and Pipelines Comments (Section B.9.3): Gravel roads, gravel mines, and other infrastructure in Arctic environments will cause long-term impacts to the landscape that cannot be easily recovered or restored and will never recover to their original, wilderness and natural diversity state. Production facilities with spider-webs of road-connected drill-pads will kill	Section 1.9.1 has been revised to identify the production and support facilities that would count towards the 2,000-acre limit, which now includes gravel mines. Rationale as to why certain facilities may not be included is contained in Section S.1.2. Section 20001(c)(3) only applies the 2,000-acre limit to land that is directly occupied by

63. (cont.)	(see above)	(see above)	(see above)	(see above)	(see above)	(see above)	<p>vegetation, impact permafrost, and spread damaging dust far beyond their physical perimeters, as will other permanent roads and sand and gravel quarries. Gravel roads cause permanent hydrological and surface morphological changes to the landscape, altering permafrost freeze-and-thaw cycles and creating issues related to thermokarst. BLM improperly excluded other forms of infrastructure and activities from what it considered as part of its 2,000 acres of impacts. This includes pipelines, which could cross large areas of the Coastal Plain and have the potential to divert caribou away from key areas. BLM must consider pipelines as physical barriers for caribou that will alter their migration patterns and cause avoidance during certain points in their lifecycles. BLM is only interpreting the limitation to apply to those lands that are "directly occupied by facilities." In the DEIS, BLM concludes that only 8.4 to 10 acres would be impacted by the vertical supports for elevated pipelines, even though 210 to 250 miles of pipelines would be constructed on the Coastal Plain. Pipelines are unquestionably production and support facilities developed on the surface of the Coastal Plain. As such, all areas impacted by elevated pipelines should count toward the 2,000- acre limitation, including the full length and diameter of the pipelines themselves as well as the vertical supports. Interpreting the limitation to apply to pipelines in this way is consistent with the overarching goal that this provision be a protective measure for the Coastal Plain.</p>	<p>production and support facilities. This is made clear by the Tax Act's reference to areas covered by piers for support of pipelines; however, the EIS does analyze broader indirect impacts associated with these production and support facilities.</p>

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
64.	Withheld	Withheld	—	72125	36	Direct/Indirect Impacts	Gravel Mines Comments (Section B.9.3): Gravel mines are inconsistent with the Arctic Refuge fish and wildlife conservation and water purposes and therefore must be greatly limited in extent and location. The 2,000-acre surface disturbance cap purpose is to protect surface resources and gravel mines contribute to natural resource degradation, so for that reason alone they should be counted against the cap.	Section 1.9.1 has been revised to identify the production and support facilities that would count towards the 2,000-acre limit, which now includes gravel mines. Rationale as to why certain facilities may not be included is contained in Section S.1.2.
65.	Withheld	Withheld	—	73208	1	Direct/Indirect Impacts	PL115-97 loosely defined the 2000-ac limit to surface development, but did not limit it to only the facilities described therein, else they would have clearly stated so. However, BLM further limits the types of facilities and the temporal nature of such facilities so as to make the intent of Congress more "practicable." PL115-97 does not explicitly authorize BLM to amend the definition of this limit for any reason, nor does it explicitly exclude any types of facilities from inclusion. Therefore, the exclusion of certain types of facilities and the temporal interpretation by BLM in this Leasing EIS are unwarranted.	Section 1.9.1 has been revised to identify the production and support facilities that would count towards the 2,000-acre limit, which now includes gravel mines. Rationale as to why certain facilities may not be included is contained in Section S.1.2.
66.	Withheld	Withheld	—	73208	2	Direct/Indirect Impacts	Gravel pits will be massive scars on the land, with visual impacts from miles away. Wildlife movement across them will be impeded, especially during operations, but also well after, most likely, even after they are reclaimed. Gravel pits must be included in the 2000-ac limit.	Section 1.9.1 has been revised to identify the production and support facilities that would count towards the 2,000-acre limit, which now includes gravel mines. Rationale as to why certain facilities may not be included is contained in Section S.1.2.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
67.	Withheld	Withheld	—	73208	3	Direct/Indirect Impacts	PL115-97 identifies “production and support facilities” in this 2000-ac limit. Although it does not specifically include exploration facilities and activities, they clearly “support” production and development and are, therefore, support facilities to be included in the 2000-ac limit. Without exploration, there would be no development or production. They are essential and they have impacts. Exploration clearly would include the tractor trails left by seismic exploration, many of which remain a visible impact today from exploration in the 1960s through 1980s. And, the leases specifically allow initiation of the exploratory phase of development. Therefore, the 2000-ac limit must include all exploration phase facilities as “support facilities,” including unreclaimed tractor trails, which are equivalent to gravel roads, and ice facilities.	Section 1.9.1 has been revised to identify the production and support facilities that would count towards the 2,000-acre limit, which now includes gravel mines. Rationale as to why certain facilities may not be included is contained in Section S.1.2.
68.	Withheld	Withheld	—	73208	4	Direct/Indirect Impacts	Pipelines, although generally elevated on piers, will inhibit the movement of wildlife across the Coastal Plain, as they are foreign structures generally avoided by wildlife, and will physically inhibit movement of larger mammals. To include only the part that touches the ground is a ridiculous way to define the impact for purposes of the 2000-ac limit, as it clearly is not realistic interpretation of the resulting impacts they cause. Congress specifically included the pipeline piers, but did not explicitly exclude any part of the pipeline structures from the 2000-ac limit. All pipeline corridors, as defined by the width between the piers, including any associated service roads, and their entire length, must be included in the 2000-ac limit calculation.	Section 1.9.1 has been revised to identify the production and support facilities that would count towards the 2,000-acre limit, which now includes gravel mines. Rationale as to why certain facilities may not be included is contained in Section S.1.2.

S. Public Comments and BLM Responses (Direct/Indirect Impacts)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
69.	Withheld	Withheld	—	73208	5	Direct/Indirect Impacts	BLM excludes any reclaimed land as exempt from the 2000-ac limit, which appears reasonable. But when is the land truly “reclaimed?” It is reclaimed when it is returned to its original natural state, and not before. Therefore, any land that is under reclamation, post-operational or pending reclamation must also be included in the 2000-ac limit because such land will have impact on wildlife movement and visually, among other impacts.	Until such time as the areas are reclaimed as required by ROP 35, they would still be included in the 2,000-acre limit. Under all alternatives, ROP 35 requires restoration to the land’s previous hydrological, vegetation, and habitat condition.
70.	Withheld	Withheld	—	73208	6	Direct/Indirect Impacts	BLM excludes “facilities constructed of ice or snow” which includes ice roads and pads because they have a “fleeting existence, and thus this aspect of BLM’s interpretation is consistent with the temporal limit intended by Congress.” The only temporal limit Congress imposed was “during the term of the leases” so any ice or snow facilities employed during the term of the leases must be included in the 2000-ac footprint. Further, seismic exploration activities are required to be conducted in winter when the snow protects the tundra, and such activities, including worker camps and supply facilities clearly will inhibit the movement of musk oxen, among other species active in winter. Ice roads and pads will have the same impacts. Since Congress did not exclude snow and ice facilities, which clearly “support” the oil and gas program, they must be included in the 2000-ac footprint.	Section 1.9.1 has been revised to identify the production and support facilities that would count towards the 2,000-acre limit, which now includes gravel mines. Rationale as to why certain facilities may not be included is contained in Section S.1.2.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
71.	Katherine	Trisolini	Loyola Law School	74278	3	Direct/Indirect Impacts	The EIS makes that outrageous assumption that Congress' direction to develop an oil and gas leasing program that disturbs a maximum of 2000 surface acres somehow also somehow incorporates authorization to disturb another 300 or more acres with gravel mining. Because the Bureau refuses to include these activities within the 2000 surface acre limit and describes the 300 acres as an "estimate," the DEIS appears to presume that Congress has authorized an unlimited number of acres to be disturbed by gravel mining within this pristine area. (DEIS 3-26). Nothing in the Act provides for this additional surface disturbance. As acknowledged by the DEIS, gravel pits remaining after extraction would typically not be completely backfilled, thus leading to permanent changes on physiography.	Section 1.9.1 has been revised to identify the production and support facilities that would count towards the 2,000-acre limit, which now includes gravel mines. Rationale as to why certain facilities may not be included is contained in Section S.1.2.
72.	Katherine	Trisolini	Loyola Law School	74278	5	Direct/Indirect Impacts	The Bureau's assumptions regarding gravel mining contradict Congress' limitation on surface disturbance within the pristine area of ANWR. The DEIS attempts to characterize the gravel operations as somehow not part of the production and support facilities that "count" towards the 2000 acre maximum surface coverage. However, this effort seems particularly nonsensical in light of Congress' explicit inclusion of airstrips and pipeline support structures.	Section 1.9.1 has been revised to identify the production and support facilities that would count towards the 2,000-acre limit, which now includes gravel mines. Rationale as to why certain facilities may not be included is contained in Section S.1.2.

74.	Richard	Edwards	—	74281	2	Direct/Indirect Impacts	<p>the document is almost wholly lacking in any useful quantification of the resource impacts of that Hypothetical Development Scenario. The document most often provides only qualitative assessment of resource impacts---with little or no attempt to actually quantify potential impacts in any meaningful way useful to an informed decision --- especially over time. The "appearance of impact quantification" is often provided by inclusion of data tables defining the existing condition---with no actual use of those data in any substantial quantitative analysis of impacts (e.g., Water Resources appendix) or reference to satellite documents to provide assumed weight--and expediency---to the analysis. Mostly qualitative assessments are followed by stock conclusions that "improved technology" and designated best management practices will minimize potential adverse impacts. For example, at page 3-57 we read: "Future mining pads, airstrips, and roads would be designed to account for thermal criteria (minimum thickness to prevent permafrost degradation) and hydrologic criteria to minimize potential impacts on the surrounding area, as discussed in ROPs 23 and 24." Yet, we read in Section 3.7 that "Loss or change in vegetation and wetlands where gravel is placed, regardless of whether it is removed at abandonment" is an irreversible and irretrievable commitment of resources.</p>	<p>The text has been revised in Section 3.7 to reflect accurate "irreversible and irretrievable commitment of resources," acknowledging there is an expectation that some areas would be reclaimed.</p>

75.	Richard	Edwards	—	74281	6	Direct/Indirect Impacts	The BLM has conveniently excluded gravel mines as not being subject to the 2,000-acre occupation limit---equating them to off-site steel mills. This equation defies even the most basic logic. Gravel/road mix is the primary on-site resource that would enable the proposed level of development to occur in the first place. Without site stabilization by sand/gravel materials---assuming one desires to avoid truly massive impacts to the active soil layer and native vegetation---all site access and activity would be limited to ice roads and pads.	Section 1.9.1 has been revised to identify the production and support facilities that would count towards the 2,000-acre limit, which now includes gravel mines. Rationale as to why certain facilities may not be included is contained in Section S.1.2.
76.	Richard	Edwards	—	74281	7	Direct/Indirect Impacts	There are, of course, no gravel mines in the No Action alternative. Each of the action alternatives would trigger the development of multiple mine sites for both the construction and maintenance of other production and support facilities---the gravel mines are, in fact, on-site support facilities. The sites would be used for gravel storage and as secondary staging areas---where surface water conditons allow. Likening them to off-site ore deposits and steel mills defies logic. BLM's interpretation fails to acknowledge this basic fact in the process of semantics play over the 2,000- acre occupation definition.	Section 1.9.1 has been revised to identify the production and support facilities that would count towards the 2,000-acre limit, which now includes gravel mines. Rationale as to why certain facilities may not be included is contained in Section S.1.2.

77.	Richard	Edwards	—	74281	52	Direct/Indirect Impacts	The Draft EIS fails to identify and address the impacts of oil and gas exploration and development on the ability of the U. S. Fish and Wildlife Service to manage the Refuge in concert with its intended purposes. ANICLA provided four purposes that guide management of the Refuge: to conserve animals and plants in their natural diversity, ensure a place for hunting and gathering activities, protect water quality and quantity, and fulfill international wildlife treaty obligations. In short, USFWS is mandated to provide for the long-term protection of this globally significant landscape. How will the ability of the USFWS to successfully manage the Coastal Plain for these purposes be impacted in both the short and long-term by the proposed activities? The Draft EIS must be revised to adequately address the short and long-term impacts of the proposed activities on USFWS's land management role.is issue.	The USFWS will revise its Arctic National Wildlife Refuge CCP to address the five purposes of the Arctic Refuge and its management strategies.

78.	Lisa	Baraff	Northern Alaska Environmental Center	74306	15	Direct/Indirect Impacts	Section 20001 of the Tax Cuts and Jobs Act establishing the oil and gas program on the Coastal Plain included the following: "In administering this section, the Secretary shall authorize up to 2,000 surface acres of Federal land on the Coastal Plain to be covered by production and support facilities (including airstrips and any area covered by gravel berms or piers for support of pipelines) during the term of the leases under the oil and gas program under this section." BLM's interpretation of this is faulty, excludes damaging development- related activities, and would allow for acreage in excess of the "up to 2,000 surface acres" authorized in the Tax Act. The DEIS excludes ice roads and pads, elevated pipelines, and gravel mines from its definition of surface disturbance and, therefore, the 2000 acre limit of surface acres outlined in the PL 115-97. BLM states that "inclusion of such facilities would make Congress's clear purpose -establishment of an oil and gas program on the Coastal Plain - impracticable" (Vol. 2, Appendix B-9) suggesting that they conducted their analysis in order to draw the desired conclusion.	Section 1.9.1 has been revised to identify the production and support facilities that would count toward the 2,000-acre limit, which now includes gravel mines, and the rationale as to why certain facilities may not be included.

S. Public Comments and BLM Responses (Direct/Indirect Impacts)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
79.	Lisa	Baraff	Northern Alaska Environmental Center	74306	16	Direct/Indirect Impacts	BLM's rationale for excluding gravel mines is that "they supply raw materials for construction of oil and gas facilities but are not themselves oil and gas facilities any more than are mills that supply steel for construction of pipelines and other facilities." This is a false comparison. It might make sense if the gravel were imported into the region as is the steel that is created elsewhere. Gravel mines will be used to supply the gravel that is directly used to build the roads and pads for any oil and gas developments, and are therefore integrally related support facilities, and they will be located within the leasing area. The entire purpose of these gravel mines would be to supply gravel for any oil and gas infrastructure; they would not be developed if there was no oil and gas program. BLM needs to fully account for the total number of acres that could be directly and indirectly impacted from gravel mining used to support the oil and gas program as part of the 2,000 acres.	Section 1.9.1 has been revised to identify the production and support facilities that would count towards the 2,000-acre limit, which now includes gravel mines. Rationale as to why certain facilities may not be included is contained in Section S.1.2.
80.	Lisa	Baraff	Northern Alaska Environmental Center	74306	17	Direct/Indirect Impacts	BLM is also only counting 2000 acres "at any given time" (Vol. 1, p. 3-221). This means that any land that is "reclaimed" can be deducted from the 2000 acre cap and credited toward more development. This rolling cap interpretation would allow for an expansion of impacts across the Coastal Plain over time. This is based on a faulty assumption that in 10-50 (or even 85 or more years) that an area can be reclaimed.	As stated in Section 1.9.1, the BLM interprets the language "during the term of the leases" in Section 20001(c)(3) of PL 115-97 as indicating Congress intended a temporal limit. Under this interpretation, the reclaimed acreage of federal land formerly containing production and support facilities would no longer count toward the 2,000-acre limit, which has been revised to include gravel mines.

S. Public Comments and BLM Responses (Direct/Indirect Impacts)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
81.	Lisa	Baraff	Northern Alaska Environmental Center	74306	19	Direct/Indirect Impacts	The DEIS fails to consider what 2,000 acres of development could look like geographically and spatially, and the impacts that could occur depending on the location of activities and development. BLM also failed to explain what method it will use to track and regulate surface development to actually keep any development below this 2,000 cap and what happens when the cap is reached. Does development on leases cease and how will that be ensured?	Section 1.9.1 describes those facilities that will be counted against the 2,000 acres. The BLM will use facility data in the form of ArcGIS-compatible shapefiles obtained under ROP 33 to track facility acreage to assure continued compliance with the Tax Act limit. ROP 35 requires the development of a BLM-approved abandonment and reclamation plan. At the leasing stage, it is unknown as to where leases will be issued, where exploration will occur, and, if oil and gas resources are discovered in economic quantities, where development would occur. Accordingly, a spatial depiction could mislead the public into assuming the developments would occur in the depicted areas.
82.	Jason	Paulsen	—	74312	6	Direct/Indirect Impacts	If a warming climate is likely to result in increased wildfire activity in the Arctic, then this DEIS does not adequately quantify the risks that these fire events could pose with respect to oil extraction infrastructure including new pipelines necessary to transport future oil.	Additional planning for wildland fire events would be addressed at a site-specific level.
83.	Jason	Paulsen	—	74312	7	Direct/Indirect Impacts	If the 2,000 acre size limitation does not include features of the built environment including pipelines, then the analysis fails to properly examine the significant negative impacts that development will have upon the experience of a recreational user in the Refuge and Wilderness Areas.	The 2,000-acre facility limit facility limit and associated EIS analysis includes impacts on resources from pipelines and other oil and gas facilities.
84.	Philip	Wight	—	74333	4	Direct/Indirect Impacts	Finally, the DEIS neglects to mention the environmental impacts of the field after oil development is completed. Who will pay for cleanup? How will drilling muds and toxins be removed? What will be the impact of these developments on the long term ecology of the region?	Under all alternatives, ROP 35 requires operators to restore the land's previous hydrological, vegetation, and habitat condition through implementation of an approved reclamation plan.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
85.	Rena	Smith	Counsel for Environmental Protection	74336	6	Direct/Indirect Impacts	BLM fails to provide a reasonable basis for its interpretation that Congress intended the 2,000-acre development limit to apply to surface development at any given moment in time, and not the cumulative total of facilities over the life of the Leasing Program. In effect, BLM's interpretation renders Congress's 2,000-acre limitation meaningless because the cumulative effects of BLM's approach will lead to far more than 2,000 acres of surface disturbance over time. As the U.S. Fish and Wildlife Service has recognized, human disturbances cause long-term damage to the Arctic tundra. 60 Scientists studying the long-term effects of winter seismic trails in the Arctic Refuge concluded that "vehicle traffic over snow-covered tundra can cause long-term changes to plant communities and permafrost stability."61 Notably, this study contradicted predictions that impacts from exploration "would be mainly aesthetic" and would not create long-lasting damage.62	As stated in Section 1.9.1, the BLM interprets the language "during the term of the leases" in Section 20001(c)(3) of PL 115-97 as indicating Congress intended a temporal limit. Under this interpretation, the reclaimed acreage of federal land formerly containing production and support facilities would no longer count toward the 2,000-acre limit, which has been revised to include gravel mines.
86.	Rena	Smith	Counsel for Environmental Protection	74336	7	Direct/Indirect Impacts	BLM also fails to provide a reasonable basis for interpreting "surface development" to exclude: (1) any surface disturbance "indirectly related to or resulting from" the facilities; (2) ice roads because of their "fleeting existence;" and (3) gravel mines that supply raw materials for construction of oil and gas facilities but are not themselves oil and gas facilities.63 Each of these structures and disturbances are the direct or indirect result of surface development required by or relating to the oil and gas program, and thus, BLM unreasonably and without adequate explanation excludes them from the 2,000-acre surface development limit.	Section 1.9.1 has been revised to identify the production and support facilities that would count towards the 2,000-acre limit, which now includes gravel mines. Rationale as to why certain facilities may not be included is contained in Section S.1.2.

S. Public Comments and BLM Responses (Direct/Indirect Impacts)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
87.	Renaë	Smith	Counsel for Environmental Protection	74336	9	Direct/Indirect Impacts	And BLM's explanation that gravel mines do not constitute surface development because they "supply raw materials for construction of oil and gas facilities" and are thus akin to "mills that supply steel for construction of pipelines and other facilities" ⁶⁵ is utterly illogical when, unlike a steel mill, that likely already exists, the gravel mines will be developed within the Coastal Plain and thus contribute to the overall environmental damage resulting from the proposed action. Indeed, the DEIS acknowledges that gravel mines could cause longer term adverse effects on terrestrial mammals such as habitat loss; habitat alteration from dust, water displacement and hydrological alteration; and displacement from gravel mines due to noise and activity. ⁶⁶ BLM cannot logically exclude such long-term disruption and damage from its surface development acreage calculations.	Section 1.9.1 has been revised to identify the production and support facilities that would count towards the 2,000-acre limit, which now includes gravel mines. Rationale as to why certain facilities may not be included is contained in Section S.1.2.
88.	Renaë	Smith	Counsel for Environmental Protection	74336	12	Direct/Indirect Impacts	The Congressional Budget Office (CBO) estimate that the Leasing Program will generate total revenues of \$2.2 billion, with \$1.1 billion for federal deposit, is based largely on an U.S. Energy Information Administration (U.S. EIA) analysis of how Coastal Plain oil production would impact the energy outlook projections. ⁷³ But the U.S. EIA acknowledges that its projections are "highly uncertain because of several factors that affect the timing and cost of development, little direct knowledge of the resource size and quality that exists in ANWR, and inherent uncertainty about market dynamics." ⁷⁴ BLM fails to analyze or account for these uncertainties or how they affect the Leasing Program's revenue generation potential.	The Tax Act does not direct the Secretary to generate any particular amount of revenue from oil and gas leasing in the Coastal Plain.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
89.	Renae	Smith	Counsel for Environmental Protection	74336	27	Direct/Indirect Impacts	BLM also ignores the possibility that Coastal Plain development and production could drive demand that would not otherwise exist further contributing to greenhouse gas emissions and associated climate change.160	The BLM's greenhouse gas analysis takes into account potential changes in demand (see Section 3.2.1).
90.	Eric	Walsh	Government of Canada	74346	9	Direct/Indirect Impacts	The EIS provides almost no analysis of the transboundary effects that may result from the oil and gas development induced by the lease sales on Canadians and the resources we co-manage with the United States under formal agreements. Because of this omission, Canada finds that the dEIS is fundamentally flawed and requires a Supplemental EIS. The legal requirement to conduct a thorough analysis of transboundary effects flows from the application of the 1997 Council of Environmental Quality (CEQ) guidance ¹² and was described fully in the scoping letter sent in by the Inuvialuit ¹³ and other scoping submissions, and the analysis of that requirement is not reproduced here. In addition, the Inuvialuit scoping letter described several other international agreements that draw attention to the need to carefully consider the impacts of potential development to subsistence users in Canada. Canada articulated our concerns over transboundary impacts in our scoping letter ¹⁴ . Canada notes that although the CEQ document is cited repeatedly in the dEIS, the provisions concerning transboundary analyses are not referenced or assessed in the dEIS.	The EIS has been revised to more fully analyze transboundary impacts, where applicable.

91.	Mart	Gallagher	—	75131	1	Direct/Indirect Impacts	The final Tax Act included a 2,000 acre limitation, but BLM excluded infrastructure like pipelines and gravel mines that would create a spider web of impacts across the Coastal Plain. This EIS also ignores the impacts of potential seismic exploration. This limited interpretation of 2,000-acre restriction would allow for more development and greater impacts than Congress voted on in 2017. The BLM needs to include all of the oil and gas development-related infrastructure in calculating the 2,000-acre surface disturbance. All of the action alternatives offer considerably more acreage than is required by the Tax Act. The DEIS gives no reason why it is offering 66 to 100 percent of the 1.56 million-acre Coastal Plain for leasing purposes in the action alternatives, when Congressional direction only stipulated “at least” 400,000 acres be offered—just 25 percent of the total program area. Can you explain this to me?	The 2,000-acre facility limit facility limit has been revised to include gravel mines (see Section 1.9.1). Alternative D2 has been revised to offer 800,000 acres of land available for lease. Appendix B explains the different types of seismic exploration that are analyzed in the EIS. Seismic exploration can be done across the full area of the Coastal Plain, even if an area is not available for lease. Site-specific NEPA analyses would be done for any proposed seismic explorations.
92.	Withheld	Withheld	—	75145	12	Direct/Indirect Impacts	The Tax Act that allowed oil and gas leasing requires that only 2,000 acres of the Coastal Plain be impacted by oil and gas development and production. However, BLM interpreted this restriction too narrowly. BLM did not count acreage affected by pipelines, gravel mines, ice roads, or other industry activity (such as seismic exploration) that the agency recognizes will have significant impacts. Areas that supposedly would be “reclaimed” also are not considered in the 2,000-acre limit. Thus, the cumulative footprint of development would be much greater than the 2,000 acre restriction with far more actual development and greater impacts]. ?The narrow definition of the 2,000 acre limit would permit greater impacts on the Arctic National Wildlife Refuge than allowed in the 2017 Tax Act.	Section 1.9.1 has been revised to identify the production and support facilities that would count towards the 2,000-acre limit, which now includes gravel mines. Rationale as to why certain facilities may not be included is contained in Section S.1.2.

S. Public Comments and BLM Responses (Direct/Indirect Impacts)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
93.	Jeannie	Ambrose	—	75238	4	Direct/Indirect Impacts	The 2,000 acres of surface infrastructure permitted at any given time do not include surface disturbances from the construction of temporary winter ice roads, ice pad, and (associated) gravel mines.	Section 1.9.1 has been revised to identify the production and support facilities that would count towards the 2,000-acre limit, which now includes gravel mines. Rationale as to why certain facilities may not be included is contained in Section S.1.2.
94.	Withheld	Withheld	—	75601	4	Direct/Indirect Impacts	The DEIS interprets that ice roads and pads, elevated pipelines, and gravel mines do NOT count as surface disturbance and, therefore, are not considered in the 2,000 acre limit of surface acres outlined in PL 115-97 (Vol. 2, Appendix B-9). As ice roads, pads, pipelines, and gravel mines are clearly examples of surface disturbance, and because these types of facilities are necessary for oil and gas development, they should count toward the 2,000 acre limit.	Section 1.9.1 has been revised to identify the production and support facilities that would count towards the 2,000-acre limit, which now includes gravel mines. Rationale as to why certain facilities may not be included is contained in Section S.1.2.
95.	Chandra	Turner	Inuvialuit Game Council	75904	23	Direct/Indirect Impacts	It is our contention, principally for the reasons given in Part 2 of this submission, that the DEIS does not allow us to assess the effect of post-leasing activities on the rights of Canadian Inuvialuit communities as Indigenous peoples under international law and as minorities under international law. While the sections of the DEIS dealing with Subsistence Use and Resources (3.3.3), Sociocultural Systems (3.4.4) and Environmental Justice (3.5.5) touch on these issues the DEIS completely fails (as we have already noted in Part 2) to assess how these post-leasing activities will affect communities beyond the four study communities. As a result, we are not in a position to assess whether these activities will, inter alia, deprive the Inuvialuit of their means of subsistence, or deny them access to the material elements necessary for them to continue to practice their culture and to transmit that culture to subsequent generations.	The EIS has been revised to more fully analyze transboundary impacts, where applicable. Site-specific analyses of subsistence uses and resources, sociocultural systems, and environmental justice, including impacts associated with infrastructure in support of oil and gas development, can more realistically be provided when the BLM receives an application to permit such infrastructure. This EIS makes no decisions on such infrastructure, except to prohibit development in specified areas of particularly high value surface resources under some alternatives.

S. Public Comments and BLM Responses (Direct/Indirect Impacts)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
96.	Chandra	Turner	Inuvialuit Game Council	75904	50	Direct/Indirect Impacts	the DEIS applies a different standard to the study and consideration of the impact of post-leasing activities on Canadian Indigenous communities than it applies to the impact of these activities on Alaskan Indigenous communities. As a result, it is impossible to draw informed conclusions as to the impact of these activities on Canadian Indigenous communities and specifically Inuvialuit communities that depend upon the Porcupine Caribou Herd (PCH) as well as other shared resources.	The EIS has been revised to more fully analyze transboundary impacts, where applicable. Site-specific analyses of subsistence uses and resources, sociocultural systems, and environmental justice, including impacts associated with infrastructure in support of oil and gas development, can more realistically be provided when the BLM receives an application to permit such infrastructure. The Leasing EIS makes no decisions on such infrastructure, except to prohibit it in specified areas of particularly high value surface resources under some alternatives.

97.	Withheld	Withheld	—	77891	7	Direct/Indirect Impacts	<p>he Tax Act that allowed oil and gas leasing requires that only 2,000 acres of the Coastal Plain be impacted by oil and gas development and production. This restriction has been interpreted too narrowly, and BLM did not count acreage affected by pipelines, gravel mines, ice roads, or other industry activity (such as seismic exploration) that the agency recognizes will have significant impacts. Areas that supposedly would be “reclaimed” also are not considered in the 2,000-acre limit. Thus, the cumulative footprint of development would be much greater than the 2,000 acre restriction with far more actual development and greater impacts. The negative repercussions of allowing oil and gas into the ANWR are far reaching and irreversibly destructive. The DEIS also failed to consider proposed seismic surveys, failed to identify the economic value of the Arctic Refuge and the invaluable ecosystem services it provides, failed to offer effective mitigation and climate impacts, and lacks scientific integrity. Although the potential harm these actions would cause is acknowledged in some instances, the DEIS fails to adequately note and address too many aspects. BLM recognized that the ecological value of this refuge would be harmed by oil and gas leasing, but it did not conduct an economic analysis to quantify or identify these values or impacts. The DEIS failed to include an economic projection of revenue from lease sales and failed to assess the immense value of wilderness and Refuge lands to air and water quality, wildlife, scientific inquiry, human well-being, and America’s natural and cultural heritage.</p>	<p>The 2,000-acre facility limit has been revised to include gravel mines (see Section 1.9.1). Appendix B explains the different types of seismic exploration that are analyzed in the EIS. Seismic exploration can be done across the full area of the Coastal Plain, even if an area is not available for lease. Site-specific NEPA analyses would be done for any proposed seismic explorations. Additionally, the Tax Act does not direct the Secretary to generate any particular amount of revenue from oil and gas leasing in the Coastal Plain.</p>

100.	Cherise	Gaffney	Alaska Oil and Gas Association, and American Petroleum Institute	79893	3	Direct/Indirect Impacts	<p>Congress intended the 2,000 surface acre limit to apply only to leased areas. As noted above, the Tax Act requires BLM to authorize "up to 2,000 surface acres of Federal land on the Coastal Plain to be covered by production and support facilities"³⁶ In describing how it will apply this limitation, BLM interprets the 2,000 surface acre limit to include production and support facilities on both leased lands and ROWs and easements located on nonleased lands.³⁷ BLM provides little explanation for this interpretation, stating only that the Tax Act provides for the issuance of ROWs and easements, pursuant to which production and support facilities may be constructed.³⁸ These are, however, distinct and separate statutory provisions addressing independent mandatory requirements for execution of the oil and gas program. First, with respect to ROWs and easements, the language of the Tax Act clearly directs that "[t]he Secretary shall issue any rights-of-way or easements across the Coastal Plain for the exploration, development, production, or transportation necessary to carry out this section."³⁹ The legislation at subsection (c)(3) separately addresses surface occupancy for the separate purposes of "production and support facilities"-which are not within ROWs or easements. This plain statutory language is confirmed by the Joint Explanatory Statement of the Committee of Conference,⁴⁰ which makes clear that Congress did not intend for facilities on ROWs or easements to count toward the 2,000-acre limitation: 36 Id. § 20001(c)(3). 37 DEIS at 1-6. 38 Id. 39 Pub. L. No. 115-97, § 20001(c)(2) (emphases added). 40 A joint explanatory statement is the most reliable piece of legislative history in ascertaining congressional intent. See Richard J. McKinney & Ellen A.</p>	The BLM's interpretation of the Tax Act includes surface disturbance related to ROWs in the 2,000-acre limit definition (see Section 1.9.1).

101. (cont.)	(see above)	(see above)	(see above)	(see above)	(see above)	(see above)	development (ice roads, pipelines, gravel mines, etc.) All oil and gas development-related infrastructure should be included in the 2,000-acre calculation.	and may require site-specific environmental review. Requests should contain, at a minimum, a plan that includes related on-site or off-site mitigation efforts to adequately protect affected resources; data collection and monitoring efforts; and timeframes for initiation and completion of construction, drilling, and completion operations. The operator's request may be included in an Application for Permit to Drill, Notice of Staking, Sundry Notice, or letter. The BLM may also proactively initiate the process. During the review process, BLM coordination with other local, state, or federal agencies (e.g., ADFG, NSB, and local governments) should be undertaken, as appropriate, and documented. The BLM will also consult with the federal surface management agency (e.g., USFWS). Approval or disapproval is made by the Authorized Officer, and the decision is documented. If the waiver, exception, or modification is approved, any necessary mitigation is also documented. The applicant is then provided with a written notification of the decision. See Instruction Memorandum 2008-032 and 43 CFR 3101.1-4 for additional details. Section 1.9.1 has been revised to identify the production and support facilities that would count towards the 2,000-acre limit, which now includes gravel mines. Rationale as to why certain facilities may not be included is contained in Section S.1.2.

104.	Withheld	Withheld	World Wildlife Fund	81184	7	Direct/Indirect Impacts	<p>The draft EIS fails to analyze the impacts of habitat fragmentation from industrial activities on the Southern Beaufort Sea polar bear subpopulation. In Appendix B, the draft EIS describes the expansive industrialization of the Coastal Plain as a Reasonably Foreseeable Development scenario. This scenario assumes central processing facilities (CPF), each of which would include oil pipeline connections to the Trans-Alaska Pipeline, water and electricity pipelines totalling hundreds of miles, barge landings, staging pads, seawater treatment plants located along the coastline, a generator, airstrip, storage tanks, a communications center, waste treatment units, and maintenance shop, as well as living quarters and offices. Hundreds of miles of gravel roads, and undisclosed miles of ice roads, would be constructed, and gravel mines would unearth hundreds of additional acres. The BLM's draft EIS fails to take a hard look at the enormous imposition of this industrial infrastructure and these associated activities on critical habitat for the Southern Beaufort Sea polar bears, and provides no evidence to support its conclusion that the impacts will be minimal. The BLM must revise the draft EIS to assess the impacts of habitat fragmentation from industrial expansion on the movements, behaviors, health, and distribution of Southern Beaufort Sea polar bears, including impacts to Southern Beaufort Sea polar bears from potential increases in human-bear conflict resulting from the increased likelihood of human-bear interaction under such scenarios.</p>	<p>Section 3.3.5 pertaining to polar bears describes in detail the population status of the SBS stock and the current and likely direct, indirect, and cumulative impacts on their habitats, behavior, and demography. Post-leasing activities in the program area will require new ITRs and an associated biological assessment and biological opinion to minimize impacts on polar bears. When promulgated, future ITRs will specify mitigation measures to eliminate or reduce impacts on polar bears, as described in Section 3.3.5, Direct and Indirect Impacts, and in Appendix J.</p>

105.	Withheld	Withheld	—	81307	3	Direct/Indirect Impacts	From the Tax Act: Title II Section 200001 (c) (3) SURFACE DEVELOPMENT.—In administering this section, the Secretary shall authorize up to 2,000 surface acres of Federal land on the Coastal Plain to be covered by production and support facilities (including airstrips and any area covered by gravel berms or piers for support of pipelines) during the term of the leases under the oil and gas program under this section. This clearly authorizes “covering” up to 2000 acres, period. No more. The “at any given time” interpretation that BLM suggests is contrary to all that has gone before, is contrary to congressional intent, is contrary to the plain language reading of (c) (3) above, and would render the 2000 acre restriction meaningless. BLM apparently intends the “at any given time” interpretation to allow “covering” virtually all of the federal land within the Coastal Plain, with repeating a cycle of “covering,” “reclaiming,” and “covering” over and over.. There are at least two major problems with this interpretation. First, the BLM’s interpretation would render the 2000 acre restriction meaningless. If BLM’s interpretation was put into effect, the entire acreage of Federal land on the Coastal Plain could be “covered.” If this were the case, why have the restriction at all?	Section 1.9.1 describes those facilities that will be counted against the 2,000 acres. The BLM will use facility data in the form of ArcGIS-compatible shapefiles obtained under ROP 33 to track facility acreage to assure continued compliance with the Tax Act limit. ROP 35 requires the development of a BLM-approved abandonment and reclamation plan.
106.	Withheld	Withheld	—	81307	4	Direct/Indirect Impacts	In addition, the DEIS does not adequately address the question of accounting for or keeping track of acreage that is to be counted against the 2000 acre cap as such acreage is “covered.” This is necessary to ensure that the 2000 limit is not exceeded. The DEIS also does not discuss or suggest a system to monitor the amount of “covered” acreage as it grows to the 2000 acre limit. And the DEIS does not discuss or suggest any enforcement mechanisms.	Section 1.9.1 describes those facilities that will be counted against the 2,000 acres. The BLM will use facility data in the form of ArcGIS-compatible shapefiles obtained under ROP 33 to track facility acreage to assure continued compliance with the Tax Act limit. ROP 35 requires the development of a BLM-approved abandonment and reclamation plan.

107.	Roberta	Joseph	Tr'ondek Hwech'in First Nation	81742	9	Direct/Indirect Impacts	The second key assumption by BLM is that the development footprint in ANWR will not exceed 2000 acres. However, Sec 20001 of PL 115-97 specifies that 2000 acres of surface development are permitted 'at any given time'. This caveat suggests that there will likely be a larger footprint if old sites are 'reclaimed'. Reclamation standards, however, were not specified. Given the low productivity of the Arctic landscape, it is unlikely that reclamation will be effective enough within the lifetime of the oil field (10 - 50 years, pg. B-18). Therefore, we expect that far more than 2000 acres will be disturbed over the lifetime of the oil field. Also, BLM did not include gravel pits within their interpretation of "production and support facilities". Gravel pits will be essential to build all the roads, airstrips and pads that will be necessary within the proposed oil field. The draft EIS estimates nearly 13 million yd3 of gravel could be required for construction and that 320 acres of surface disturbance could result from gravel mines.	The 2,000-acre facility limit has been revised to include gravel mines. As stated in Section 1.9.1, the BLM interprets the language "during the term of the leases" in Section 20001(c)(3) of PL 115-97 as indicating Congress intended a temporal limit. Under this interpretation, the reclaimed acreage of federal land formerly containing production and support facilities would no longer count toward the 2,000-acre limit, which has been revised to include gravel mines.

108.	Withheld	Withheld	Native Village of Venetie Tribal Government	81748	109	Direct/Indirect Impacts	The Tax Cuts and Jobs Act of 2017 ("Tax Act") provides: In administering this section, the Secretary shall authorize up to 2,000 surface acres of Federal land on the Coastal Plain to be covered by production and support facilities (including airstrips and any area covered by gravel berms or piers for support of pipelines) during the term of the leases under the oil and gas program under this section.75 75 Pub. L. No. 115-97, 131 Stat. 2054. BLM's narrow interpretation of the surface facility limitation fails to consider serious impacts associated with potential development. BLM excludes, for example, significant surface-disturbing activities such as gravel mines. BLM also imposes a temporal limit that undermines the purpose of the surface facility limitation. Because BLM interprets the 2,000-acre limitation as limiting the number of acres covered by production or support facilities "at any given time," reclaimed acres that previously contained production and support facilities no longer count towards the 2,000-acre limit. (DEIS, at B-9). This flawed interpretation is contrary to the Tax Act.	Section 1.9.1 has been revised to identify the production and support facilities that would count towards the 2,000-acre limit, which now includes gravel mines. Rationale as to why certain facilities may not be included is contained in Section S.1.2. Additionally, as stated in Section 1.9.1, the BLM interprets the language "during the term of the leases" in Section 20001(c)(3) of PL 115-97 as indicating Congress intended a temporal limit. Under this interpretation, the reclaimed acreage of federal land formerly containing production and support facilities would no longer count toward the 2,000-acre limit.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
109.	Withheld	Withheld	Native Village of Venetie Tribal Government	81748	110	Direct/Indirect Impacts	Acres Included. The DEIS interprets the 2,000-acre limitation to "refer to acres of land directly occupied by facilities that are primarily used for development, production, and transportation of oil and gas." (DEIS, at B-9). This includes surface acres that are covered by gravel upon which these facilities are built or surface acres that are directly touched by these facilities without gravel between them and the tundra. The DEIS specifically mentions: gravel pads for wells and production/processing facilities; gravel pads from pumps or compressor stations; gravel airstrips and roads; gravel berms; and piers anchored in the tundra for the support of pipelines. (DEIS, at B-9). BLM fails to clarify whether the acres are "gravel surface acres" as measured at the top of gravel roads and pads or "tundra covered acres" as measured at the toe of the slope of gravel fill areas.	The 2,000-acre facility limit has been revised to include gravel mines (see Section 1.9.1). This includes all surface acres of disturbance, which includes toe-to-toe of roads.

110.	Withheld	Withheld	Native Village of Venetie Tribal Government	81748	111	Direct/Indirect Impacts	Acres Excluded. The DEIS specifies three exclusions to the 2,000-acre limitations. First, the DEIS excludes ice or snow roads and pads because they have a fleeting existence. (DEIS, at B-9). Second, BLM excludes pipeline infrastructure that does not touch the land surface because the Tax Act only mentions pipeline support "piers" and is silent on the elevated pipeline itself between such supports. (DEIS, at B-9). The BLM fails to recognize that elevated pipelines over the tundra can cause surface disturbances, which is what the surface development cap is meant to limit. Surface disturbances are especially significant when multiple pipelines are positioned together in an elevated rack. This pipeline configuration significantly impacts the tundra below due to changes in snow accumulation depths, surface drainage characteristics, wind velocities, and sunlight penetration with resulting changes in habitat and wildlife access. (See Figure 11).Figure 11. Extensive pipe racks which in aggregate create surface disturbance. This type of design significantly impacts the tundra below the pipes due to changes in snow accumulation depths, surface drainage characteristic, wind velocities, and sunlight penetration with resulting changes in habitat and wildlife access.	Section 20001(c)(3) only applies the 2,000-acre limit to land that is directly occupied by production and support facilities. This is made clear by the Tax Act's reference to areas covered by piers for support of pipelines; however, the EIS does analyze broader indirect impacts associated with these production and support facilities. Section 1.9.1 has been revised to identify the production and support facilities that would count towards the 2,000-acre limit, which now includes gravel mines. Rationale as to why certain facilities may not be included is contained in Section S.1.2.
111.	Withheld	Withheld	Native Village of Venetie Tribal Government	81748	113	Direct/Indirect Impacts	Third, the DEIS excludes gravel mines because, like mills that supply steel for pipelines, they are not themselves oil and gas facilities. (DEIS, at B-9). The BLM, however, fails to recognize that gravel mines cause significant direct and indirect surface disturbance which is what the surface development cap is meant to limit. (See Figure 12). And the BLM fails to consistently apply its rationale for excluding gravel mines. For example, airstrips are not themselves oil and gas facilities yet they are included in the cap.	Section 1.9.1 has been revised to identify the production and support facilities that would count towards the 2,000-acre limit, which now includes gravel mines. Rationale as to why certain facilities may not be included is contained in Section S.1.2.

112.	Withheld	Withheld	Native Village of Venetie Tribal Government	81748	114	Direct/Indirect Impacts	Gravel mining has very serious impacts that BLM fails to consider in the DEIS. Gravel extraction is generally done in large, open pit mines typically located away from major streams and lakes. It is not clear how such mines could be located in a way that protects the sensitive wildlife and biological resources of the Coastal Plain. Open pit mines require extensive overburden removal. For example, over 50 feet of vegetation and soil needed to be excavated to reach suitable gravel in the mines created for Kuparuk. ⁷⁶ The resulting overburden stockpile disturbs tundra, and the gravel pit itself causes permanent changes to the area's thermal regime due to "thaw bulbs" forming in the permafrost around the unfrozen water during flooding. ⁷⁷ Indirect effects such as these have led some researchers to estimate that a one acre (0.4 ha) gravel pit may impact as much as twenty-five acres surrounding the site. ⁷⁸	This level of specificity would be determined at the project-level authorization. Site-specific analyses, including those associated with infrastructure in support of oil and gas development, can more realistically be provided when the BLM receives an application to permit such infrastructure. The Leasing EIS makes no decisions on such infrastructure, except to prohibit it in specified areas of particularly high value surface resources under some alternatives.
113.	Withheld	Withheld	Native Village of Venetie Tribal Government	81748	116	Direct/Indirect Impacts	Despite recognizing the impacts to areas surrounding gravel mines, the BLM makes no attempt to quantify that disturbance. The BLM only acknowledges the direct footprint of mining itself as being approximately 308-315 acres. (DEIS, at 3-50). The BLM does not consider the impacts to the sensitive ecosystems surrounding these mines. Additionally, the DEIS states that multiple material sources are expected to be used. Yet the DEIS does not analyze impacts from multiple gravel mines, which would have a much greater impact on the Coastal Plain than a single mine. There are also likely to be other significant impacts to the surrounding area, such as noise impacts, that have not been fully accounted for in the DEIS.	This level of specificity would be determined at the project-level authorization. Site-specific analyses, including those associated with infrastructure in support of oil and gas development, can more realistically be provided when the BLM receives an application to permit such infrastructure. The Leasing EIS makes no decisions on such infrastructure, except to prohibit it in specified areas of particularly high value surface resources under some alternatives.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
114.	Withheld	Withheld	Native Village of Venetie Tribal Government	81748	117	Direct/Indirect Impacts	Acres Overlooked. The DEIS also completely fails to account for the following surface development footprints: 1. Non-pipeline facilities such as buildings constructed on piers elevated over the tundra and without a gravel pad beneath. This type of design significantly impacts the tundra below the facilities due to changes in snow accumulation depths, surface drainage characteristics, wind velocities, and sunlight penetration with resulting changes in habitat and wildlife access. (See Figure 13). 2. Other structures directly in contact with the land surface, including: snow fences, power lines, telecom towers, bridge abutments, and pilings. 3. Other gravel fill footprints not specifically mentioned as included or excluded, including: construction equipment storage and materials laydown pads, ancillary gravel mining areas for gravel sorting, gravel pile storage, overburden storage, and drilling waste grind and inject well and associated facilities. 4. Expanding gravel road and pad surface areas due to maintenance practices. (See Figure 14).	The BLM's hypothetical development scenario (Appendix B) does not foresee the use of pile-supported facilities besides pipelines. The definition in Section 1.9.1 interprets the types of production and support facilities that will count toward the 2,000-acre limit as "any type of gravel or other fill which touches the land's surface." Any examples given are not intended to be exclusive.
115.	Withheld	Withheld	Native Village of Venetie Tribal Government	81748	130	Direct/Indirect Impacts	As shown, acres required for well pads will be reduced 66% across the scenarios due to technological advancements, but total surface acres are reduced only 30% over the forward-looking time frame (or only 25% if a 300-acre gravel mine is included in each scenario). By focusing on one aspect of development, well pads, and excluding infrastructure requirements for full development, the DEIS fails to realistically portray the impact of technological advancements on required surface acres.	Alternative D2 has been revised to offer 800,000 acres of land for leasing. Section 1.9.1 has been revised to identify the production and support facilities that would count towards the 2,000-acre limit, which now includes gravel mines. Rationale as to why certain facilities may not be included is contained in Section S.1.2.

116.	Withheld	Withheld	—	82848	1	Direct/Indirect Impacts	<p>I am extremely concerned that the 2,000 acres surface impact limit described in the EIS does not include the footprint of gravel mines used for development of the region. The creation of gravel mines has the effect of completely denuding the landscape of vegetation, effectively removing habitat for all animals that were using it. While the EIS describes a process of site restoration, restoration of gravel mines does not actually create a site that returns to its original state, with original geophysical structure and vegetation. As gravel mines constitute an irreversible change to the landscape, I believe that it is most appropriate to consider any gravel mines to contribute to the 2,000 acres surface impact limit. I am extremely concerned that the EIS seems to not include gravel pits (as well as other infrastructure such as ice roads and elevated oil pipelines) within the acreage limit, especially because this conclusion seems to be based not on best management principles, but on the pressure for oil development created PL 115-97. From the draft EIS these infrastructure elements are excluded because "inclusion of such facilities would make Congress's clear purpose – establishment of an oil and gas program on the Coastal Plain – impracticable." This is a clear example of how this EIS is written to support a particular end goal- development of the oil fields- rather than being what it should be- a balanced analysis of options for the Refuge.</p>	<p>Section 1.9.1 has been revised to identify the production and support facilities that would count towards the 2,000-acre limit, which now includes gravel mines. Rationale as to why certain facilities may not be included is contained in Section S.1.2.</p>

117.	Ruth	Wood	—	83199	4	Direct/Indirect Impacts	<p>BLM chooses to interpret this provision such that more development, not less, is allowed. Snow and ice roads are exempt, but when the snow and ice melt, the impact of the road is still there. Comment #1 on Draft Coastal Plain Oil and Gas Leasing Program EIS Page 3 of 3 From Ruth D. Wood, Talkeetna, Alaska 99676 March 8, 2019 They should not be exempt. Elevated pipe lines are exempt because they do not touch the surface. That makes no sense whatsoever. It isn't only the impact on the ground that is important, it is the impact on fish and wildlife, and elevated pipe lines in the calving grounds will have a serious negative impact on calf survival. Furthermore, elevated pipe lines have the potential of interfering with both subsistence and recreational use of the Refuge. Therefore, elevated pipe lines should not be exempted from the 2000 footprint, and the cumulative effect of these pipe lines on subsistence and recreational users needs to be addressed. BLM is making some assumptions that once something is no longer in use or the lease expires, it no longer counts as part of the 2000 footprint. The legislation didn't say that, but BLM assumes it. As long as the structure is there or for as long as any evidence of its having been there exists, it must count. A pipe line that's not being used, but has not been removed and the area restored to its pre-drilling state, most definitely should be included in the 2000 footprint. Moreover, it is not clear that there would be any enforcement of a 2,000-acre limit or consequence for exceeding the total.</p>	<p>Section 1.9.1 has been revised to describe the production and support facilities that are included in the 2,000-acre facility limit, which now includes gravel mines. As noted under ROP 40i, the BLM has authority under 43 CFR 3163 to issue assessments and penalties for non-compliance with oil and gas operational requirements.</p>

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
118.	Withheld	Withheld	Arctic Slope Regional Corporation	83317	28	Direct/Indirect Impacts	BLM should remain mindful of the benefits of gravel mine sites within an active floodplain and revise ROP 24 accordingly. ASRC oversees the Colville River Mine site and has decades-long experience working with operators, the NSB, USACE, Native community, and State of Alaska in gravel mine resources. This includes the long-term observations of post-mined sites, which become habitat creation sites after reclamation, including valuable habitat for special species like Eiders as well as subsistence habitat. Gravel has also been excavated twice from private land within the Coastal Plain. Gravel sourced from the Kaktovik sites were used in the relocation of Kaktovik and the sites have since been rehabilitated; this should be included in the EIS.	The BLM recognizes it is not possible to have an oil and gas program without access to gravel, and it is often less impactful to obtain gravel from streambeds. For example, areas overlain with tundra may be more difficult to reclaim. All future projects would be analyzed through NEPA for site-specific impacts.
119.	Henrik	Kulmala	—	83333	2	Direct/Indirect Impacts	easements between buildings, ice roads, runways, and required spaces between structures should all count toward the acreage being used. It is not the size of the supports or the structure alone which takes up the space and denies animals access, but also the walkways, paths, and ice roads. Related structures need to be counted as a unit, not as individual structures for the purpose of assessing their footprint. Ice roads must count against the total, as otherwise they are likely to propagate as being uncounted.	Section 1.9.1 has been revised to describe the production and support facilities that are included in the 2,000-acre limit, which now includes gravel mines. Section 20001(c)(3) of the Tax Act only applies the 2,000-acre limit to land that is directly occupied by production and support facilities. This is made clear by the Tax Act's reference to areas covered by piers for support of pipelines; however, the EIS does analyze broader indirect impacts associated with these production and support facilities.

S. Public Comments and BLM Responses (Direct/Indirect Impacts)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
120.	Henrik	Kulmala	—	83333	3	Direct/Indirect Impacts	The nature of longterm facilities, such as those used to store oil or gas prior to shipment, needs to be approved and plans prepared for their removal and the restoration of the area once drilling activity is finished. There can be no long period of inactivity or hibernation used as a pretext to abandon facilities. All structures, facilities, erections, and roads must be removed to place the land into as close to pre-encroachment condition as possible, or the lands still counts as being part of the 2000 acres and no further site may be used unless authorized by public law.3	Under all alternatives, ROP 35 requires restoration to the land's previous hydrological, vegetation, and habitat condition.
121.	Withheld	Withheld	The Wildlife Society - Alaska Chapter	83694	3	Direct/Indirect Impacts	Based on limited knowledge and understanding of the cumulative effects of oil and gas exploration and development on Alaska's North Slope, and the difficulty of accurately predicting the timing or extent of potential development scenarios, it is challenging to quantitatively predict the long-term, cumulative effects on the wildlife and ecosystem processes of the Arctic Refuge's 1002 Area. Thus, it is unlikely that a mitigation plan could be developed with any degree of certainty.	Monitoring plans will be tailored to the specific location of development and resources or activity being monitored.
122.	Robin	Stebbins	—	83751	2	Direct/Indirect Impacts	PL 115-97 constrains surface development for production and support facilities to 2,000 acres. The BLM illogically interprets gravel mines as supplying raw materials, but doesn't apply the same logic to desalination plants.	Section 1.9.1 has been revised to describe the production and support facilities that are included in the 2,000-acre limit, which now includes gravel mines.
123.	Robin	Stebbins	—	83751	10	Direct/Indirect Impacts	If gas leasing comes later, as hypothesized, then the entire lifetime of the development is extended, and the plan for progressive closing of facilities falls apart. The first developments are extended to support gas production, and hence not recovered. Will the later developments be delayed to preserve the 2,000 acre limit?	Section 1.9.1 describes those facilities that will be counted against the 2,000 acres. The BLM will use facility data in the form of ArcGIS-compatible shapefiles obtained under ROP 33 to track facility acreage to assure continued compliance with the Tax Act limit. ROP 35 requires the development of a BLM-approved abandonment and reclamation plan.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
124.	Withheld	Withheld	—	84578	4	Direct/Indirect Impacts	The Tax Law stipulates a 2000-acre surface development limit on the Coastal Plain. The DEIS interprets that ice roads and pads, elevated pipelines, and gravel mines do NOT count as surface disturbance and, therefore, are not considered in the 2,000-acre limit. BLM states that “inclusion of such facilities would make Congress’s clear purpose—establishment of an oil and gas program on the Coastal Plain—impracticable.” Further, they count gravel mines as infrastructure that “supply raw materials for construction of oil and gas facilities but are not themselves oil and gas facilities.” BLM is also only counting 2000 acres “at any given time” which means that any land that is “reclaimed” can be deducted from the 2000-acre cap and credited toward more development. This approach would allow for the entirety of the coastal plain to see the impacts of development over time.	Section 1.9.1 has been revised to describe the production and support facilities that are included in the 2,000-acre limit, which now includes gravel mines. As stated in Section 1.9.1, the BLM interprets the language “during the term of the leases” in Section 20001(c)(3) of PL 115-97 as indicating Congress intended a temporal limit. Under this interpretation, the reclaimed acreage of federal land formerly containing production and support facilities would no longer count toward the 2,000-acre limit.
125.	Withheld	Withheld	WWF-Canada	85059	21	Direct/Indirect Impacts	Increased vessel-traffic due to increased shipping associated with the proposed oil and gas development of the Coastal Plain will have adverse impacts across this ecologically sensitive Arctic marine ecosystem that serves as key habitat for many transboundary marine mammals, fish, and birds. Despite the tremendous global importance of the Arctic seas as habitat for wildlife, BLM’s draft EIS narrows the scope of impacts inappropriately and fails to adequately describe shipping activities associated with the proposed Coastal Plain oil and gas lease sales, including various alternatives, near the project area and along the marine barge route.	Where marine vessel traffic would go is beyond the scope of this analysis. Direct and indirect impacts from marine vessel traffic cannot be analyzed on a site-specific basis within this EIS, but they are analyzed for the program area generally based off the hypothetical development scenario (Appendix B).

S. Public Comments and BLM Responses (Direct/Indirect Impacts)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
126.	Withheld	Withheld	WWF-Canada	85059	22	Direct/Indirect Impacts	The BLM's draft EIS improperly limits its shipping discussion to the program area, which is much smaller than the area that will experience effects from the proposed development. While the program area encompasses the federal lands and waters of the Coastal Plain within the Arctic Refuge and includes approximately 125 miles of coastline from the Staines River to the Beaufort Lagoon, shipping activities connected with the proposed action will take place, and their impacts will be felt, along the entire 1,600-nautical mile (nm) marine barge route from Dutch Harbor to Kaktovik, Alaska.	The marine vessel route to Dutch Harbor is included as part of the hypothetical development scenario (Appendix B), and is analyzed in the EIS.
127.	Withheld	Withheld	WWF-Canada	85059	23	Direct/Indirect Impacts	Moreover, the draft EIS includes virtually no description of the nature and extent of shipping activity. There is no clear discussion of what kinds of vessels will be used, how many vessel transits are expected, what cargo and materials they will carry, or how fast they are expected to travel. The limited information provided is scattered throughout the draft EIS, and it is misleading in suggesting that shipping traffic will be limited to two barge convoys per year. Indeed, in the absence of any road, or proposal for a road, connecting Kaktovik and Deadhorse, it is clear that the vast majority of project supplies and materials, including bulk fuel and hazardous materials, will need to be shipped to the site.	This level of specificity would be determined at the project-level authorization. Site-specific analyses, including those associated with infrastructure in support of oil and gas development, can more realistically be provided when the BLM receives an application to permit such infrastructure. The Leasing EIS makes no decisions on such infrastructure, except to prohibit it in specified areas of particularly high value surface resources under some alternatives.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
128.	George	Matz	—	86074	1	Direct/Indirect Impacts	I think a fatal flaw in the Coastal Plain Oil and Gas Programming EIS is that it while it acknowledges the need to “minimize adverse impacts” from oil and gas development on the Coastal Plain, it provides no standard as to what “minimize” actually means. Without a standard that is consistently applied, we have no idea as to whether “minimize” means no net loss of resources (other than oil and gas) that might potentially be impacted by development, or something more discretionary that might not be anything more than window dressing that in effect minimizes cost to the resource developer. Furthermore, without clearly specified mitigation standards we have no idea as to who BLM intends to serve first; the resource developer or protection of resources other than oil and gas and respective resource users.	To “minimize” an impact is defined in the glossary under the term “mitigation.”
129.	Elizabeth	Ballard	—	90951	19	Direct/Indirect Impacts	The mitigation measures to address impacts to shorebirds in river deltas are inadequate and arbitrary. ³³ The DEIS fails to analyze impacts to shorebirds in river deltas and the mitigation measure will not address these impacts.	Text has been added; see Section 3.3.4 for discussion of impacts on shorebirds, including in river deltas.
130.	Withheld	Withheld	Friends of Alaska National Wildlife Refuges	90981	2	Direct/Indirect Impacts	did not include the acreage that would be affected by pipelines, gravel mines, ice roads, and other industrial activity, such as seismic exploration, that the agency recognized will have significant impacts. Areas that supposedly would be “reclaimed” also were excluded from the 2,000- acre limit. Thus, the total footprint of development and the resultant impacts on the Coastal Plain would be far greater than the 2,000 acres allowed under the Tax Act.	Section 1.9.1 has been revised to identify the production and support facilities that would count towards the 2,000-acre limit, which now includes gravel mines. Rationale as to why certain facilities may not be included is contained in Section S.1.2. . The BLM will use facility data in the form of ArcGIS-compatible shapefiles obtained under ROP 33 to track facility acreage to assure continued compliance with the Tax Act limit. ROP 35 requires the development of a BLM-approved abandonment and reclamation plan.

S. Public Comments and BLM Responses (Direct/Indirect Impacts)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
131.	Withheld	Withheld	—	92034	4	Direct/Indirect Impacts	The DEIS is deficient both legally and substantively. It failed to include: the required analyses, the necessary mitigation measures and alternatives necessary to protect the resources mandated by the established purposes of the Arctic National Wildlife Refuge. BLM must thoroughly and objectively analyze the 680,000 public comments submitted during the scoping process (which ended in June, 2018), carefully consider the concerns expressed by the Gwich'in Nation that will be adversely impacted by the proposed drilling, and conduct the necessary analyses to understand the impacts of oil and gas leasing in order to comply with federal and international legal obligations.	All action alternatives are designed to meet the purpose and need, and to account for all purposes of the Arctic National Wildlife Refuge. Additional text has been added to the Final EIS. All comments received during scoping were reviewed and considered during the development of the Draft EIS; the Scoping Report is available online on the project website.
132.	Withheld	Withheld	—	92034	11	Direct/Indirect Impacts	The Tax Act that allowed oil and gas leasing requires that only 2,000 acres of the Coastal Plain be impacted by oil and gas development and production. However, BLM interpreted this restriction too narrowly. BLM did not count acreage affected by pipelines, gravel mines, ice roads, or other industry activity (such as seismic exploration) that the agency recognizes will have significant impacts. Areas that supposedly would be "reclaimed" also are not considered in the 2,000-acre limit. Thus, the cumulative footprint of development would be much greater than the 2,000 acre restriction with far more actual development and greater impacts]. The narrow definition of the 2,000 acre limit would permit greater impacts on the Arctic National Wildlife Refuge than allowed in the 2017 Tax Act.	Section 1.9.1 has been revised to identify the production and support facilities that would count towards the 2,000-acre limit, which now includes gravel mines. Rationale as to why certain facilities may not be included is contained in Section S.1.2.

133.	Withheld	Withheld	—	92095	4	Direct/Indirect Impacts	The Tax Act that allowed oil and gas leasing requires that only 2,000 acres of the Coastal Plain be impacted by oil and gas development and production. However, BLM interpreted this restriction too narrowly. BLM did not count acreage affected by pipelines, gravel mines, ice roads, or other industry activity (such as seismic exploration) that the agency recognizes will have significant impacts. Areas that supposedly would be “reclaimed” also are not considered in the 2,000-acre limit. Thus, the cumulative footprint of development would be much greater than the 2,000 acre restriction with far more actual development and greater impacts. The narrow definition of the 2,000 acre limit would permit greater impacts on the Arctic National Wildlife Refuge than allowed in the 2017 Tax Act.	Section 1.9.1 has been revised to identify the production and support facilities that would count towards the 2,000-acre limit, which now includes gravel mines. Rationale as to why certain facilities may not be included is contained in Section S.1.2.
134.	Ruth	Wood	—	92475	9	Direct/Indirect Impacts	elevated pipe lines should not be exempted from the 2000 footprint, and the cumulative effect of these pipe lines on subsistence and recreational users needs to be addressed	Section 20001(c)(3) only applies the 2,000-acre limit to land that is directly occupied by production and support facilities. This is made clear by the Tax Act's reference to areas covered by piers for support of pipelines; however, the EIS does analyze broader indirect impacts associated with these production and support facilities.

S. Public Comments and BLM Responses (Direct/Indirect Impacts)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
135.	Ruth	Wood	—	92475	10	Direct/Indirect Impacts	BLM is making some assumptions that once something is no longer in use or the lease expires, it no longer counts as part of the 2000 footprint. The legislation didn't say that, but BLM assumes it. As long as the structure is there or for as long as any evidence of its having been there exists, it must count. A pipe line that's not being used, but has not been removed and the area restored to its pre-drilling state, most definitely should be included in the 2000 footprint. Moreover, it is not clear that there would be any enforcement of a 2,000-acre limit or consequence for exceeding the total.	As stated in Section 1.9.1, the BLM interprets the language "during the term of the leases" in Section 20001(c)(3) of PL 115-97 as indicating Congress intended a temporal limit. Under this interpretation, the reclaimed acreage of federal land formerly containing production and support facilities would no longer count toward the 2,000-acre limit, which has been revised to include gravel mines. Additionally, as noted under ROP 40i, the BLM has authority under 43 CFR 3163 to issue assessments and penalties for non-compliance with oil and gas operational requirements.
136.	Withheld	Withheld	Government of the Northwest Territories	92862	20	Direct/Indirect Impacts	The GNWT recommends federal land formerly containing production and support facilities should continue to count towards the 2,000 acre limit of surface disturbance until the end objective of requirement/standard of ROP 35 is met. That is, federal land that was used for oil and gas infrastructure will continue to count towards the 2,000 acre limit of surface disturbance until restoration of the ecosystem function (or the more stringent requirement under Alternative D that also includes the meeting the minimal standards to restore general wilderness characteristics).	Section 1.9.1 has been revised to identify the production and support facilities that would count towards the 2,000-acre limit, which now includes gravel mines. Rationale as to why certain facilities may not be included is contained in Section S.1.2. Under all alternatives, ROP 35 requires restoration to the land's previous hydrological, vegetation, and habitat condition.
137.	Withheld	Withheld	Government of the Northwest Territories	92862	22	Direct/Indirect Impacts	The GNWT recommends the BLM include the entire building footprint in the calculation of the acres of surface disturbance that will count towards the 2,000 acres surface facility limit, regardless of whether the building is built on raised pilings.	Section 20001(c)(3) only applies the 2,000-acre limit to land that is directly occupied by production and support facilities. This is made clear by the Tax Act's reference to areas covered by piers for support of pipelines; however, the EIS does analyze broader indirect impacts associated with these production and support facilities.

S. Public Comments and BLM Responses (Direct/Indirect Impacts)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
138.	Withheld	Withheld	Government of the Northwest Territories	92862	23	Direct/Indirect Impacts	The GNWT recommends the BLM provide for review a comprehensive list of activities that will count towards the calculation of a 2,000 acre surface facility limit.	Section 1.9.1 has been revised to describe the production and support facilities that are included in the 2,000-acre limit, which now includes gravel mines.
139.	Withheld	Withheld	Government of the Northwest Territories	92862	26	Direct/Indirect Impacts	Whether or not BLM's interpretation of the 2,000 acre surface occupancy limit in the Tax Act is accurate, the EIS fails to account for two key points within the development program in basing all of its alternatives on this expansive interpretation. First, unlike the 800,000 acre program limit, this is a maximum, and not a minimum; this allows an array of options to be considered to mitigate this program's significant impact on the environment of the area.	Given that Congress explicitly established this protective facility acreage limit, any interpretation by the BLM to reduce the limit for a given alternative would be inconsistent with the Tax Act.
140.	Withheld	Withheld	Government of the Northwest Territories	92862	27	Direct/Indirect Impacts	Second, it fails to account for the long-term recovery of reclaimed land. The program is occurring in an area still recognized for its ecological and cultural importance. The relevant provisions of the Tax Act and the leasing program must also be interpreted in light of NEPA's mandate to mitigate significant impacts; an expansion of interpretation of the 2,000 acre surface occupancy limit would greatly expand the impact of the program. This is particularly true because surface occupancy is the key aspect of the drilling program that causes/drives the program's environmental impacts, especially those on the protected species the land was originally set aside to protect. As a result, it is the aspect of the program that most warrants mitigation and/or design aspects that lessen its impact.	Section 1.9.1 has been revised to identify the production and support facilities that would count towards the 2,000-acre limit, which now includes gravel mines. Rationale as to why certain facilities may not be included is contained in Section S.1.2. . The BLM will use facility data in the form of ArcGIS-compatible shapefiles obtained under ROP 33 to track facility acreage to assure continued compliance with the Tax Act limit. ROP 35 requires the development of a BLM-approved abandonment and reclamation plan.
141.	Withheld	Withheld	Government of the Northwest Territories	92862	28	Direct/Indirect Impacts	The GNWT recommends gravel mines be included in a compressive list of activities that will count towards the calculation of a 2,000 acre surface facility limit.	Section 1.9.1 has been revised to describe the production and support facilities that are included in the 2,000-acre limit, which now includes gravel mines.

S. Public Comments and BLM Responses (Direct/Indirect Impacts)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
142.	Withheld	Withheld	Government of the Northwest Territories	92862	29	Direct/Indirect Impacts	While the draft EIS acknowledges potential impacts of pipelines on wildlife and provides some mitigations in the lease stipulations (e.g. elevated pipelines separated from roads by 500 feet), the actual pipeline is not included in the calculation of the project footprint. Only including the vertical support member (VSM) in the footprint of the development renders it difficult to determine the overall impact of the pipelines to wildlife of the area. Recommendation The GNWT recommends permanent pipelines be included in the calculation of surface disturbance footprint (i.e. count towards the allowable disturbance area). The GNWT also recommends the BLM explain how impacts can be mitigated if an unlimited amount of pipelines can be installed.	Section 20001(c)(3) only applies the 2,000-acre limit to land that is directly occupied by production and support facilities. This is made clear by the Tax Act's reference to areas covered by piers for support of pipelines (see Section 1.9.1). However, the EIS does analyze broader indirect impacts associated with these production and support facilities. Any proposed pipeline would require a separate NEPA analysis to analyze impacts of the site-specific proposal and appropriate mitigation measures.
143.	Withheld	Withheld	Government of the Northwest Territories	92862	30	Direct/Indirect Impacts	The draft EIS does not describe how the 2,000 acre surface facility limit will be enforced, who will enforce it and under what legislation. The certainty that this mitigation of limited surface disturbance will be effective or even established is decreased without details on how it will be enforced. Recommendation The GNWT recommends the BLM provide detailed information on the enforcement of the 2,000 acre surface facility limit.	Section 1.9.1 describes those facilities that will be counted against the 2,000 acres. The BLM will use facility data in the form of ArcGIS-compatible shapefiles obtained under ROP 33 to track facility acreage to assure continued compliance with the Tax Act limit. ROP 35 requires the development of a BLM-approved abandonment and reclamation plan.

S. Public Comments and BLM Responses (Direct/Indirect Impacts)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
144.	Barbara	Nabors	—	93673	2	Direct/Indirect Impacts	The EIS must be revised to honor the 2,000 acre limitation for production and support areas as required in PL 115-97. The EIS must include all infrastructure related to oil and gas production, such as gravel mines and ice roads, towards this cap. Also, the EIS must not allow construction beyond 2,000 acres if the areas are reclaimed, since there is no scientific basis that the reclaimed areas would function similarly to the non-disturbed areas. Also, the BLM must provide specific processes for tracking and enforcing this limit.	Section 1.9.1 has been revised to describe the production and support facilities that are included in the 2,000-acre limit, which now includes gravel mines. Under all alternatives, ROP 35 requires restoration to the land's previous hydrological, vegetation, and habitat condition. The BLM will use facility data in the form of ArcGIS-compatible shapefiles obtained under ROP 33 to track facility acreage to assure continued compliance with the Tax Act limit. ROP 35 requires the development of a BLM-approved abandonment and reclamation plan.
145.	Malkolm	Boothroyd	CPAWS Yukon Chapter	94061	21	Direct/Indirect Impacts	It is inappropriate for the BLM to allow for roll-over on the 2,000 acre limit. In an arbitrary interpretation, the BLM excludes gravel quarries from the 2,000 acre limit, arguing that quarries do not constitute a "support facility" for oil and gas infrastructure. The BLM insists that since gravel quarries only provide raw materials, they are no more a support facility than a mill that provides steel. ⁵³ The BLM undermines this interpretation by later including a seawater treatment facility within the 2,000 acre definition. Like gravel quarries and steel mills, a seawater treatment facility would provide raw materials to support oil and gas activities. Quarries would provide essential materials for oil and gas activities and would not exist in the Arctic Refuge without the existence of a leasing program. The exclusion of quarries from the 2,000 acre facility limit also mislead the public to the extent of damage under the leasing program. According to the DEIS gravel mining could encompass approximately 300 acres of tundra. The BLM must define quarries as a support facility and include them within the 2000 acre limit.	Section 1.9.1 has been revised to describe the production and support facilities that are included in the 2,000-acre limit, which now includes gravel mines.

S. Public Comments and BLM Responses (Direct/Indirect Impacts)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
146.	Malkolm	Boothroyd	CPAWS Yukon Chapter	94061	21	Direct/Indirect Impacts	the BLM interprets the 2,000 acre limit as a rolling limit, allowing for 'reclaimed' sites to be removed from the ledger and new sites added. Unfortunately, fragile Arctic ecosystems can take generations to recover. For instance, scars from 1980s era seismic testing are still visible on the coastal plain. The DEIS fails to provide comprehensive analysis on how reclamation would occur, how long reclamation would take, and what metrics would be used to evaluate the successfulness of reclamation.	Operators would be required to submit a reclamation plan that satisfies the objective. At the earliest feasible time, the operator shall reclaim the area disturbed, to the extent necessary, by taking reasonable measures to prevent or control on-site and off-site damage of the federal lands. Under all alternatives, ROP 35 requires restoration to the land's previous hydrological, vegetation, and habitat condition.
147.	Amy	Law	Government of Yukon	94076	31	Direct/Indirect Impacts	Further, the United States Public Law 115-97 has a limit of up to 2,000 surface acres to be covered by production and support facilities. The draft EIS provides no indication that the 2,000 surface acre limit will be enforced, despite stating this limit as a key mitigation.	Section 1.9.1 describes those facilities that will be counted against the 2,000 acres. The BLM will use facility data in the form of ArcGIS-compatible shapefiles obtained under ROP 33 to track facility acreage to assure continued compliance with the Tax Act limit. ROP 35 requires the development of a BLM-approved abandonment and reclamation plan.
148.	Amy	Gulick	—	94077	6	Direct/Indirect Impacts	6) The Tax Cuts and Jobs Act of 2017 stipulated a 2,000-acre surface development limit on the Coastal Plain, and yet infrastructure including ice roads and pads, elevated pipelines, and gravel mines to not count as surface disturbance and, therefore, are not considered in the 2,000-acre limit of surface acres. This is disingenuous, and does not take into account the full impacts of all oil and gas activities and infrastructure.	Section 1.9.1 has been revised to describe the production and support facilities that are included in the 2,000-acre limit, which now includes gravel mines.

S. Public Comments and BLM Responses (Direct/Indirect Impacts)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
149.	Bernadette	Demientieff	Gwich'in Steering Committee	94080	23	Direct/Indirect Impacts	BLM improperly excluded other forms of infrastructure and activities from what it considered as part of its 2,000 acres of impacts. BLM's interpretation of this provision includes pipeline supports, but not the actual pipelines themselves, which could cross large areas of the Coastal Plain and have the potential to divert caribou away from key areas and cause other changes to the lands and waters of the Coastal Plain. But BLM does not include other infrastructure and activities like gravel mining under this provision. Gravel mining has severe sound and other environmental impacts that could deter caribou and other species from important habitat areas.	Section 1.9.1 has been revised to describe the production and support facilities that are included in the 2,000-acre limit, which now includes gravel mines.
150.	—	—	Alaska Department of Natural Resources	94102	72	Direct/Indirect Impacts	48 Chapter 3, Page 3-232 Revise analysis- incongruous representation of the benefits vs. impacts Paragraph five on this page notes that "For the purposes of this analysis, the projections are based on the hypothetical development scenarios on potential economic impacts area carried through 2050 only." This 31-year time frame appears to conflict with the 50-year and 70-year time frames discussed elsewhere in the EIS documents. One time-frame should be used from for comparison across all the different disciplines, and we recommend the 50-or 70-year time frame	The timeframe utilized for impact analysis has been revised to 85 years, unless otherwise specified in individual resource sections.

S. Public Comments and BLM Responses (Direct/Indirect Impacts)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
151.	Kennon	Meyer	—	94105	4	Direct/Indirect Impacts	the BLM adopts a “rolling” disturbance approach so that an unlimited number of acres could be disturbed over the life of the project, provided only 2000 acres are disturbed at any one time. ¹⁶ This approach violates the entire purpose of the limit, which is to protect the Coastal Plain’s resources from overdevelopment. The impact, for example, of roads on caribou may last well beyond the point of reclamation as animals learn to avoid areas that are historically occupied by vehicles. Similarly, polar bear dens that are abandoned because of human activity near well sites will not necessarily be reoccupied once sites are abandoned. In short, characterizing these surface disturbances as having “temporary” impact is misleading because the cumulative ongoing impacts could be long lasting. Under such circumstances, the “rolling” approach renders the limit meaningless.	As stated in Section 1.9.1, the BLM interprets the language “during the term of the leases” in Section 20001(c)(3) of PL 115-97 as indicating Congress intended a temporal limit. Under this interpretation, the reclaimed acreage of federal land formerly containing production and support facilities would no longer count toward the 2,000-acre limit, which has been revised to include gravel mines. Under all alternatives, ROP 35 requires restoration to the land’s previous hydrological, vegetation, and habitat condition.
152.	Kennon	Meyer	—	94105	6	Direct/Indirect Impacts	More importantly, this fundamental misinterpretation infects the entire DEIS analysis because, “The BLM employs this interpretation of Section 20001(c)(3) of PL 115-97 as an assumption in each of the action alternatives analyzed in the EIS.” ²³ By excluding such ice roads, pipelines, and gravel mines from the surface facility limit, the BLM is implicitly authorizing an unlimited amount of such facilities. This, in turn, means that the BLM has woefully understated the adverse impacts associated with the leasing program actually contemplated by Title II.	Section 1.9.1 has been revised to describe the production and support facilities that are included in the 2,000-acre limit, which now includes gravel mines.

S. Public Comments and BLM Responses (Direct/Indirect Impacts)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
153.	Andrew	Odgen	—	94112	2	Direct/Indirect Impacts	The Tax Cuts and Jobs Act of 2017 stipulated a 2000 acre surface development limit on the Coastal Plain. The DEIS interprets that ice roads and pads, elevated pipelines, and gravel mines do NOT count as surface disturbance and, therefore, are not considered in the 2,000 acre limit of surface acres outlined in the PL 115-97 (Vol. 2, Appendix B-9). BLM states that “inclusion of such facilities would make Congress's clear purpose - establishment of an oil and gas program on the Coastal Plain - impracticable” suggesting that they conducted their analysis in order to draw the desired conclusion (Vol. 2, Appendix B- 9).Further, they rationalize excluding gravel mines as being infrastructure that “they supply raw materials for construction of oil and gas facilities but are not themselves oil and gas facilities (Vol. 2, Appendix B-9).” BLM is also only counting 2000 acres “at any given time” (Vol 1, p. 3-221). This means that any land that is “reclaimed” can be deducted from the 2000 acre cap and credited toward more development. This rolling cap interpretation would allow for the entirety of the coastal plain to see the impacts of development over time	Section 1.9.1 has been revised to describe the production and support facilities that are included in the 2,000-acre limit, which now includes gravel mines.
154.	William	Edwards	—	94530	2	Direct/Indirect Impacts	The DEIS completely fails to examine what this landscape looks like not only during active production, but after reclamation. There are still visible scars in the tundra from decades-old exploration activities. What will this coastal plain look like in one hundred years? I sure can't tell by reading this DEIS. This needs to go back to the drawing board to answer questions like this.	Under all alternatives, ROP 35 requires restoration to the land's previous hydrological, vegetation, and habitat condition.

S. Public Comments and BLM Responses (Direct/Indirect Impacts)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
155.	Withheld	Withheld	—	94632	3	Direct/Indirect Impacts	I find it absurd that the draft EIS does not consider the area covered ice roads and pads, elevated pipelines, and gravel mines as counting toward part of the maximum of 2000 acres of surface disturbance allowed under the Tax Act of 2017. If your neighbor or your local utility put a gravel mine and four parallel 16 inch diameter elevated pipelines across your property and claimed that it was allowable because their definition of "surface disturbance" didn't include these things, would you accept their "surface disturbance" definition? That would be preposterous, and so is the BLM's overly creative interpretation of this legislation. If our lawmakers set a maximum of 2000 acres of surface disturbance, they may have actually meant for the level of development to be minimal. The legislation may not have passed, had the surface facility limit been set higher in such a long-fought-for protected area. If they have no comprehension of just how much disturbance is required to enable resource extraction on a scale the BLM expects, then they need to be properly informed and allowed to reconsider the issue before allowing this process to move forward. I think the BLM has massively overstepped their bounds in ignoring the specific limits to surface disturbance set by law, by tailoring their own peculiar definition of "surface disturbance" to get the resulting true level of development (and greater real disturbance) they deem appropriate.	Section 1.9.1 has been revised to describe the production and support facilities that are included in the 2,000-acre limit, which now includes gravel mines.

S. Public Comments and BLM Responses (Direct/Indirect Impacts)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
156.	Withheld	Withheld	—	94632	4	Direct/Indirect Impacts	I also think the BLM's policy of allowing "reclaimed" land to be removed from this 2000 acre limit is also inexcusable, because it suggests that "reclaimed" land has not had it's surface disturbed, which is patently false. Reclamation never restores the land to an undisturbed wilderness state, at least not on a meaningful human timescale, particularly in such a cold and sensitive biome which revegetates so slowly. Perhaps after several centuries of regrowth the land could again be considered undisturbed, but certainly not within the timescales of the proposed leases. These overly creative interpretations essentially allow the leaseholders to develop far more of the surface than the limit set by law, and eventually to potentially develop and "reclaim" the entire coastal plain which is an obvious violation of the spirit and intent of the law.	As stated in Section 1.9.1, the BLM interprets the language "during the term of the leases" in Section 20001(c)(3) of PL 115-97 as indicating Congress intended a temporal limit. Under this interpretation, the reclaimed acreage of federal land formerly containing production and support facilities would no longer count toward the 2,000-acre limit, which has been revised to include gravel mines. Under all alternatives, ROP 35 requires restoration to the land's previous hydrological, vegetation, and habitat condition.

S. Public Comments and BLM Responses (Direct/Indirect Impacts)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
157.	Withheld	Withheld	—	95024	1	Direct/Indirect Impacts	The development portrayed in the DEIS with its barge landing, seawater treatment plant, and one CPF pad/airstrip and satellite wells is egregiously misleading (Vol. 2, B-15). How is the barge landing connected to the CPF? From Figures B-1 and B-2 in Vol. 2, the barge landing is completely unconnected to the CPF. And that little stub of a line that leaves the drawing in those same figures—where does the export pipeline to TAPS go? How long will that pipeline be and its required gravel roads? The DEIS notes that gravel roads are the biggest source of disturbance as a result of oil and gas development. Pipelines need gravel roads for year-round maintenance in case of an oil leak; ice roads cannot serve them. None of that additional development has been included in the acreage estimates or has its additional impact been assessed on wildlife and its habitat. It is highly unlikely that the 2,000-acre footprint can be observed. If indeed, the U.S. and the State of Alaska end up gutting the Coastal Plain to supply oil and gas to China and other countries, then the entire cost and potential damage to the area, from input to final output need to be included in any future Environmental Impact Statements.	At the leasing stage, it is unknown as to where leases will be issued, where exploration will occur, and, if oil and gas resources are discovered in economic quantities, where development would occur. Accordingly, a spatial depiction could mislead the public into assuming the developments would occur in the depicted areas. Section 1.9.1 has been revised to describe the production and support facilities that are included in the 2,000-acre limit, which now includes gravel mines.
158.	Harry K.	Brower Jr.	North Slope Borough	95612	54	Direct/Indirect Impacts	We recommend that BLM provide additional explanation regarding the selection and application of the 50-year timeframe, and address some of the apparent inconsistencies associated with the underlying assumptions, to ensure that the potential environmental effects associated with leasing in the Coastal Plain are appropriately identified and evaluated.	The analysis in Chapter 3 has been revised to utilize an 85-year timeframe. Assumptions associated with the timing of the various phases of development are discussed in Appendix B.

S. Public Comments and BLM Responses (Direct/Indirect Impacts)

159.	Greta	Burkart	—	96243	31	Direct/Indirect Impacts	<p>The purpose of tiering is to “tier off their environmental impact statements to eliminate repetitive discussions of the same issues and to focus on the actual issues ripe for decision at each level of environmental review” (CEQ, 40 CFR 1500-1508 Subsection 1502.20). Tiering is not appropriate when tiered discussions are not relevant and a new analysis is warranted. In many cases tiering is inappropriate due to the differences between the Arctic refuge 1002 Area and the NPRA. In other cases tiering is not appropriate because the analyses or in the tiered-to documents are flawed and have not been peer-reviewed by subject matter experts. In many cases of tiering, it is not at all clear what part of which document is even be tiered to. The analysis of effects simply tiers to NPRA EIS and does not consider or even present the best available datasets that could be useful for analysis of the impacts in the Arctic Refuge 1002 Area. These datasets include Trawicki et al. 1991 and 1994, which provide the most comprehensive water quantity dataset and include water quantity for almost the entire surface area of lakes and covers the vast majority of major river miles. The only potential changes to groundwater considered in the analysis is the impact expected to occur to shallow suprapermafrost groundwater related to gravel mining. Gravel mining is not the only activity expected to impact groundwater and shallow suprapermafrost groundwater is not the only type of groundwater that may be impacted. Every aspect of infrastructure associated with oil and gas activities is expected to influence shallow suprapermafrost groundwater in the vicinity of infrastructure. Oil exploration, drilling, and injection of hazardous wastes into the ground has great potential for contamination of the</p>	<p>The terrain and topography of the Arctic Refuge Coastal Plain are steeper and more varied than where oil and gas activities have been conducted in the NPR-A. The types of oil and gas activities of the NPR-A are likely similar to the types of activities that would occur in the Arctic Refuge Coastal Plain if oil and gas were developed. The impacts of activities in the two regions would also be different due to differences in water availability, terrain, and physical features. Any future actions or activities are required to receive the appropriate authorizations for water withdrawals. A determination of specific water withdrawals and impacts on water quantity cannot be made until site-specific development activities are proposed.</p>

159. (cont.)	(see above)	(see above)	(see above)	(see above)	(see above)	(see above)	deep groundwater flowpaths that support the springs that are so important to the unique aquatic and terrestrial communities in the Refuge's 1002 Area and the associated subsistence activities. These springs are not prevalent in the NPRA and there are no supporting data to indicate groundwater in the NPRA has not been contaminated; thus, tiering off to an NPRA EIS for this analysis is not appropriate.	(see above)
160.	Greta	Burkart	—	96243	87	Direct/Indirect Impacts	Since the development scenarios for the alternatives did not address a range of development/infrastructure needs at the level necessary to assess impacts on fish and aquatic species (e.g. water withdrawal needs, ice road length, gravel mine locations and type), it is not possible to conduct an analysis that considers these factors when assessing impacts and comparing alternatives. More information is necessary to complete an adequate analysis. This information should include water needs, ice road lengths, etc. When there are a range of possibilities for a given scenario, the range should be given. This type of analysis needs to happen so that document authors can adequately assess impacts for water resources, vegetation, etc. Until this information is available, an adequate analysis cannot be done.	This level of specificity would be determined at the project-level authorization. Site-specific analyses, including those associated with infrastructure in support of oil and gas development, can more realistically be provided when the BLM receives an application to permit such infrastructure. The Leasing EIS makes no decisions on such infrastructure, except to prohibit it in specified areas of particularly high value surface resources under some alternatives.
161.	Greta	Burkart	—	96243	97	Direct/Indirect Impacts	t: It is misleading to call the 2,000-acre cap a surface disturbance cap if the BLM interpretation is that the cap does not include all types of surface disturbance related oil development. Use more appropriate terminology that is not misleading.	Text of Appendix B has been revised to be consistent with Section 1.9.1 in reference to the 2,000-acre limit.
162.	Greta	Burkart	—	96243	98	Direct/Indirect Impacts	Be explicit about what offshore actions are planned so that these can be considered in the range of effects. Otherwise, these analyses are grossly incomplete.	The analysis is based off the hypothetical unconstrained scenarios contained in Appendix B.

163.	Brook	Brisson	Trustees for Alaska	96981	11	Direct/Indirect Impacts	<p>First, BLM is interpreting the limitation to be a rolling limit, as opposed to a cumulative cap on impacted acreage.⁵⁵ In the proceedings leading up to bill passage, this provision was described as providing a cap on all surface development on the Coastal Plain.⁵⁶ At no point in the legislative history is there any indication Congress intended for this number to be a rolling total or that Congress wanted BLM to rely on wholly unproven reclamation techniques to further expand the footprint of development beyond 2,000 acres. Interpreting the limitation to allow for additional lands to be developed if other lands are reclaimed means that much more than 2,000 acres of the Coastal Plain would be impacted by oil and gas activities. This is contrary to the Tax Act and cannot be permitted. Two-thousand acres is the maximum cumulative acreage that can be impacted by surface development under the Tax Act.</p>	<p>As stated in Section 1.9.1, the BLM interprets the language “during the term of the leases” in Section 20001(c)(3) of PL 115-97 as indicating Congress intended a temporal limit. Under this interpretation, the reclaimed acreage of federal land formerly containing production and support facilities would no longer count toward the 2,000-acre limit, which has been revised to include gravel mines. Under all alternatives, ROP 35 requires restoration to the land’s previous hydrological, vegetation, and habitat condition.</p>

164.	Brook	Brisson	Trustees for Alaska	96981	12	Direct/Indirect Impacts	In the draft EIS, BLM concludes that only 8.4 to 10 acres would be impacted by the vertical supports for elevated pipelines, even though 210 to 250 miles of pipelines would be constructed on the Coastal Plain. ⁵⁹ BLM's basis for this interpretation is that the language of the Tax Act identifies "piers for support of pipelines." ⁶⁰ BLM's interpretation fails to account for the fact that the list included in the Tax Act is an inclusive list, not an exclusive list. Pipelines are unquestionably production and support facilities developed on the surface of the Coastal Plain. As such, all areas impacted by elevated pipelines should count toward this limitation, including the full length of the pipelines themselves as well as the vertical supports. Interpreting the limitation to apply to pipelines in this way is consistent with the overarching goal that this provision be a protective measure for the Coastal Plain. By interpreting the limitation to ignore the miles of actual pipelines, BLM is able to ignore considerable acreage directly impacted by pipelines. BLM's attempt to exclude elevated pipelines themselves from the 2,000-acre limitation cannot carry forward in the final EIS. ⁶¹ [It is also unclear how BLM is accounting for the assumed connections to the Trans-Alaska Pipeline System in its overall surface disturbance calculations. See DEIS vol. 2 at B-8, B17.]	Section 20001(c)(3) only applies the 2,000-acre limit to land that is directly occupied by production and support facilities. This is made clear by the Tax Act's reference to areas covered by piers for support of pipelines; however, the EIS does analyze broader indirect impacts associated with these production and support facilities. The 2,000-acre limit includes all surface development and fill within the Coastal Plain (see Section 1.9.1).

S. Public Comments and BLM Responses (Direct/Indirect Impacts)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
165.	Brook	Brisson	Trustees for Alaska	96981	13	Direct/Indirect Impacts	BLM asserts that it is not including gravel mines under the category of things subject to the 2,000-acre limitation because gravel mines supply raw materials to build oil and gas facilities, but are not, according to BLM, facilities themselves. ⁶⁴ This is inconsistent with BLM's own interpretation of the term "facility." According to BLM, a "facility" is something that is "built, installed, or established to serve a particular purpose." ⁶⁵ It is also inconsistent with the National Research Council's accounting of gravel infrastructure on the North Slope, which included gravel mines in the total impacted area. ⁶⁶ Gravel mines are built and established to serve the particular purpose of supplying gravel for oil and gas roads and pads. Their only purpose under the oil and gas program is to support oil and gas development. ⁶⁷ If not for the oil and gas program, these gravel mines would not be built. BLM recognizes as much in the draft EIS. ⁶⁸ BLM also acknowledges that gravel mines are part of the program by subjecting them to project requirements under ROP 24. If they are part of the program, they must be subject to the 2,000-acre limitation...BLM's attempt to exclude them from the category of things that is subject to the 2,000-acre limitation cannot carry forward in the final EIS.	Section 1.9.1 has been revised to describe the production and support facilities that are included in the 2,000-acre limit, which now includes gravel mines.
166.	Brook	Brisson	Trustees for Alaska	96981	14	Direct/Indirect Impacts	BLM also does not specify in its 2,000-acre limitation how it will address several other types of infrastructure including buildings without gravel pads that are elevated over the tundra, gravel roads that expand in width following use (a common occurrence on the North Slope), power lines, and snow fences.	Section 1.9.1 has been revised to describe the production and support facilities that are included in the 2,000-acre limit, which now includes gravel mines.

S. Public Comments and BLM Responses (Direct/Indirect Impacts)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
167.	Brook	Brisson	Trustees for Alaska	96981	15	Direct/Indirect Impacts	In addition to improperly interpreting the limitation, BLM fails to address important components of the 2,000-acre limitation. First, how the surface disturbance is permitted to occur will have vastly different impacts on habitat and, as a result, subsistence uses. As the U.S. Court of Appeals for the Tenth Circuit recognized, having a simple limitation on the amount of surface disturbance but no direction on how that disturbance will occur can result in a significant variation in the effects of that disturbance on plants and wildlife. In <i>New Mexico ex rel. Richardson v. BLM</i> , the BLM changed from an alternative that limited surface disturbance associated with oil and gas development to a specific location (along existing roads) to a cap of one percent of lease acreage.... BLM's draft EIS fails to consider what 2,000 acres of development could look like geographically and spatially, and the impacts that could occur depending on the location of activities and development.	At the leasing stage, it is unknown as to where leases will be issued, where exploration will occur, and, if oil and gas resources are discovered in economic quantities, where development would occur. Accordingly, a spatial depiction could mislead the public into assuming the developments would occur in the depicted areas.
168.	Brook	Brisson	Trustees for Alaska	96981	16	Direct/Indirect Impacts	The agency also failed to explain what mechanism it is adopting to ensure that the agency has the ability to regulate surface development to actually keep any development below this acreage cap, as well as the enforcement authority available to the agency to ensure compliance if development begins. Importantly, BLM has not elaborated how it intends to track surface disturbance to ensure that limits are not being neared, then reached and exceeded by multiple projects at the same time. BLM needs to demonstrate reliable technology, reporting, verification and monitoring techniques that it intends to use.	Section 1.9.1 describes those facilities that will be counted against the 2,000 acres. The BLM will use facility data in the form of ArcGIS-compatible shapefiles obtained under ROP 33 to track facility acreage to assure continued compliance with the Tax Act limit. ROP 35 requires the development of a BLM-approved abandonment and reclamation plan.

S. Public Comments and BLM Responses (Direct/Indirect Impacts)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
169.	Brook	Brisson	Trustees for Alaska	96981	18	Direct/Indirect Impacts	BLM has not elaborated upon how it intends to enforce the surface facility limitation once it grants leases to operators. It is not clear if the agency intends to place any limits on individual leases or to simply track the acreage and then send notices to companies to halt activities if acreage limits are reached. Nor is it clear how individual companies will be required to track surface-disturbing activities and report them.	Section 1.9.1 describes those facilities that will be counted against the 2,000 acres. The BLM will use facility data in the form of ArcGIS-compatible shapefiles obtained under ROP 33 to track facility acreage to assure continued compliance with the Tax Act limit. ROP 35 requires the development of a BLM-approved abandonment and reclamation plan.
170.	Brook	Brisson	Trustees for Alaska	96981	22	Direct/Indirect Impacts	Finally, BLM failed to explain how it interprets this limitation to apply to the private lands on the Coastal Plain (i.e., the KIC/ASRC lands and Native Allotments). BLM explains how it will apply the limitation on Federal land. But the limitation is also a legal requirement to conserve the Arctic Refuge Coastal Plain. As such, BLM must explain how it could apply to all private lands in the Refuge under section 22(g) of the Alaska Native Claims Settlement Act as well as how it could apply to ASRC/KIC lands under the terms of that Land Exchange Agreement.	See Section 1.4 for clarity of private lands. The BLM only has the ability to implement the oil and gas leasing program on federal lands within the Coastal Plain of the Arctic National Wildlife Refuge.
171.	Brook	Brisson	Trustees for Alaska	96981	61	Direct/Indirect Impacts	The draft EIS does not include impact criteria and overall rankings that show the level of impact by alternative for impacts to all resources. BLM provides no explanation for the arbitrary absence of impact criteria or analysis of the level of impacts by alternative. Through its NPR-A planning and leasing efforts, BLM has developed specific impact criteria for nearly every resource present on the Coastal Plain. These criteria were well-vetted and subject to public comment in the GMT1 Final SEIS and GMT2 Draft SEIS.174 There is seemingly no reason that BLM should refuse to use impact criteria in the Draft EIS for the Coastal Plain.	The organization and approach to analysis in Chapter 3 have been standardized across all resources. See Appendix F for definitions of context, intensity, and duration, and descriptions of impact criteria by resource.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
172.	Brook	Brisson	Trustees for Alaska	96981	73	Direct/Indirect Impacts	The draft EIS fails to provide sufficient detail about the stipulations and ROPs being contemplated, or to analyze their effectiveness. This is because the approach to analyzing the mitigation measures is fundamentally flawed: it considers the amount and purported benefit of the measures, instead of analyzing the adverse effects that are still likely to occur. This means that the EIS fails to disclose the effects that will occur despite mitigation. ...For example, Appendix E contains this statement: "The mitigation measures proposed under Alternative B (Lease Stipulations 3, 4, 7, and 9, and ROPs 23 and 42) would be adequate to maintain caribou passage to coastal areas."218 But there is no meaningful analysis of how these stipulations and ROPs would be effective. ... In some instances, the impacts analysis mentions a potential mitigation measure without even referring back to a specific stipulation or ROP, leaving the reader guessing if and how such a measure might be implemented.220 The draft EIS utterly fails to analyze the effectiveness of its proposed mitigation measures.	The analyses in Chapter 3 and discussions in Appendix E have been revised based on public comments received.
173.	Brook	Brisson	Trustees for Alaska	96981	90	Direct/Indirect Impacts	BLM repeatedly refers to other documents as a way to truncate and obscure analysis in the draft EIS, contrary to NEPA. For example, BLM refers to the NPRA's Greater Mooses Tooth 2 development's analysis as "fully describing" how climate change is impacting soils and permafrost.762 The text of the draft EIS, however, contains only wholly uninformative, bland statements like "climate change described under Affected Environment above [i.e. the reference to the NPRA document], could influence the rate or degree of the potential cumulative impacts."763 It contains none of the information in the NPRA document about changes to surface topography, increased water accumulation, changed	Section numbers have been provided when discussions in other major studies and reports are incorporated by reference.

173. (cont.)	(see above)	(see above)	(see above)	(see above)	(see above)	(see above)	drainage patterns (including sudden drainage events), and increased potential for soil erosion and sedimentation. In the Refuge's Coastal Plain, many of these phenomena have already been greatly accelerated by climate change in the past 30 years. ⁷⁶⁴ BLM also repeatedly cites, without informatively explaining or summarizing, the environmental analysis for the Nanushuk project, which is on state lands immediately adjacent to the Reserve; BLM relies on the Nanushuk decision to support its statements about changes to snow conditions that can occur from infrastructure, reclamation impacts, the potential for accelerated permafrost thaw, and for the proposition that placement of fill will cover soils and kill existing vegetation, which in turn alters the thermal active layer. ⁷⁶⁵ BLM's incorporation of these unrelated decision documents by reference is deficient on multiple grounds. First, BLM failed to provide adequate citations or explanations about the content and nature of those documents, contrary to binding NEPA regulations and guidance that require summaries of referenced material. ⁷⁶⁶ It is impossible for the public to determine precisely which sections BLM is referring to and to understand how the analyses in those documents may or may not apply to the Coastal Plain.	(see above)
174.	Brook	Brisson	Trustees for Alaska	96981	121	Direct/Indirect Impacts	BLM's analysis of how the impacts will differ between alternatives focuses heavily on the no surface occupancy provisions to differentiate between the impacts under each alternative. ⁸³⁰ However, there are serious questions about whether the NSO and other timing provisions are likely to be effective. These provisions will only be effective to the extent that BLM actually adopts and holds to those safeguards. As written, the draft EIS allows for	Additional text has been added to Table 2-2 clarifying the process. Operators are required to submit a written request for an exception, waiver, or modification and information demonstrating that (1) the factors leading to the inclusion of the stipulation in the lease have changed sufficiently to make the protection provided by the lease stipulation no longer needed or (2) the proposed operation would not

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
175.	Brook	Brisson	Trustees for Alaska	96981	125	Direct/Indirect Impacts	BLM also needs to fully evaluate any gravel mines used to support oil and gas infrastructure on the Coastal Plain as a connected action in the EIS. "Connected actions" are defined as actions that: automatically trigger other actions which may require environmental impact statements; cannot or will not proceed unless other actions are taken previously or simultaneously; or are interdependent parts of a larger action and depend on the larger action for their justification. ⁸³⁸ The entire purpose of these gravel mines would be to supply gravel for any oil and gas infrastructure; they would not be developed but for the need to use them as part of the oil and gas program. Thus, BLM must fully analyze the direct, indirect and cumulative impacts of gravel mining for each action alternative. BLM must conduct this analysis, regardless of whether the gravel mines are ultimately projected to be within or outside the boundaries of the Refuge.	Section 1.9.1 has been revised to describe the production and support facilities that are included in the 2,000-acre limit, which now includes gravel mines.
176.	Withheld	Withheld	—	97253	4	Direct/Indirect Impacts	all of the action alternatives should be revised to allow for no more than 2,000 acres of surface disturbance, including all roads, landing strips, gravel pits, etc... All of this infrastructure is surface disturbing and has potentially detrimental effects on wildlife, access for subsistence, water quality, recreational use and access, and other characteristics of the Refuge. It should be considered in the total acres of surface disturbance.	Section 1.9.1 has been revised to describe the production and support facilities that are included in the 2,000-acre limit, which now includes gravel mines.

177.	Withheld	Withheld	—	97404	1	Direct/Indirect Impacts	1. PL 115-97 authorizes up to 2000 surface acres to be covered by production and support facilities. Your addition of language to this bill, namely 2000 acres “at any one time”, changes the intent of the law and is outside of the purview of your agency. 2. Several specialist’s reports neglect to consider this “at any one time” language and have assumed that, in total, 2000 acres would ever be disturbed. These documents need to reconsider the full events of your proposed action. 3. Removing lands affected by gravel mines from the 2000-ac limit is arbitrary and without basis. It is also inconsistent with your 2012 BLM NPR-A IAP/EIS where gravel mines were defined as “permanent oil and gas facilities”.	As stated in Section 1.9.1, the BLM interprets the language “during the term of the leases” in Section 20001(c)(3) of PL 115-97 as indicating Congress intended a temporal limit. Under this interpretation, the reclaimed acreage of federal land formerly containing production and support facilities would no longer count toward the 2,000-acre limit, which has been revised to include gravel mines. Resource discussions for all action alternatives analyze up to 2,000 acres of development from oil and gas facilities. Section 1.9.1 has been revised to describe the production and support facilities that are included in the 2,000-acre limit, which now includes gravel mines.
178.	Withheld	Withheld	—	97577	1	Direct/Indirect Impacts	While in the earlier sections of Chapter 3, adverse environmental/subsistence/economic impacts for each of the options as they pertain the identified categories are covered in some detail, there is, understandably, a lack of specific strategies or tactics stated that would accomplish the goals of mitigating these impacts. However, in light of the broad disagreement concerning potential harm arising from the action options, far more attention should be given to adverse impacts that have been identified as unavoidable. Section 3.5 consists of 2 paragraphs and 8 bullet points, and fails to adequately give weight to the concerns that arise from the information contained within it. Although this section makes references to concerns raised elsewhere in Chapter 3, it should provide more specific and informative coverage to the points it discusses;	The analyses in Chapter 3 and discussions in Appendix E have been revised based on public comments received.

179.	Susan	Smith	—	97752	3	Direct/Indirect Impacts	<p>I believe the Tax Act of 2017, which included a provision for oil gas leasing in ANWR, mandates a lease offering of 400000 acres, and stipulates 2000 acres may be devoted to infrastructure. 2000 acres does not seem like much compared to the entire Coastal Plain, but it appears that the term infrastructure does not include roads, gravel pits, etc, which will certainly have as much impact as a drill pad itself. Infrastructure needs to be redefined to include all man-made transformation of the area. Also, it looks like the 2000 acres means 2000 acres at one time, and when one area is finished, the leaseholder can move on to another 2000 acre parcel. This is ludicrous, as it opens the entire area to destruction. This does not sound like what Congress intended. This 2000 acre provision needs to be more carefully considered and defined to truly minimize the impact of development on the wilderness uses originally intended in establishing ANWR</p>	<p>Alternative D2 has been revised to offer 800,000 acres of land for leasing. Section 1.9.1 has been revised to identify the production and support facilities that would count towards the 2,000-acre limit, which now includes gravel mines. Rationale as to why certain facilities may not be included is contained in Section S.1.2.</p>

180.	Jenna	Jonas	—	97882	6	Direct/Indirect Impacts	This is not how it should work. The DEIS does not provide a balanced range of alternatives, it provides a only very development-focused options and no conservation-focused ones. BLM is also only counting 2000 acres “at any given time” (Voll, p. 3-221). This means that any land that is “reclaimed” can be deducted from the 2000 acre cap and credited toward more development. This rolling cap interpretation would allow for the entirety of the coastal plain to see the impacts of development over time. is also only counting 2000 acres “at any given time” (Vol1, p. 3-221). This means that any land that is “reclaimed” can be deducted from the 2000 acre cap and credited toward more development. This rolling cap interpretation would allow for the entirety of the coastal plain to see the impacts of development over time. In addition, the alternatives presented far exceed the amount of acreage mandated by the Tax act.	As stated in Section 1.9.1, the BLM interprets the language “during the term of the leases” in Section 20001(c)(3) of PL 115-97 as indicating Congress intended a temporal limit. Under this interpretation, the reclaimed acreage of federal land formerly containing production and support facilities would no longer count toward the 2,000-acre limit, which has been revised to include gravel mines.
181.	Helen	Nienhueser	—	97946	2	Direct/Indirect Impacts	Another area dealt with inadequately is the 2000 acre surface development limitation. Elevated pipelines and gravel mines certainly are surface development. look at what is there now, imagine an elevated pipeline or a gravel pit and tell me with a straight face that this is not surface development! And do you seriously think reclaimed land is the same as what is there now? (Time scale matters on this issue. How long will it be before the footprint of man is erased? Certainly more than one lifetime ...)	Section 1.9.1 has been revised to identify the production and support facilities that would count towards the 2,000-acre limit, which now includes gravel mines. Rationale as to why certain facilities may not be included is contained in Section S.1.2. Under all alternatives, ROP 35 requires restoration to the land’s previous hydrological, vegetation, and habitat condition.
182.	Christy	Stebbins	—	97980	1	Direct/Indirect Impacts	The BLM needs to include all of the oil and gas development-related infrastructure in calculating the 2,000-acre surface disturbance.	Section 1.9.1 has been revised to identify the production and support facilities that would count towards the 2,000-acre limit, which now includes gravel mines. Rationale as to why certain facilities may not be included is contained in Section S.1.2.

S. Public Comments and BLM Responses (Direct/Indirect Impacts)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
183.	Katherine	Trisolini	—	98002	9	Direct/Indirect Impacts	Finally, the exclusion of ice roads and structures on the basis that these are temporary and without permanent environmental impact is not supported by any evidence. In fact, explanation of impacts from ice pad and ice road construction elsewhere in the document seems to contradict this claim.	Section 1.9.1 has been revised to identify the production and support facilities that would count towards the 2,000-acre limit, which now includes gravel mines. Rationale as to why certain facilities may not be included is contained in Section S.1.2.
184.	Jamie	Williams	The Wilderness Society	98058	3	Direct/Indirect Impacts	The omission of maps, diagrams, or visuals of realistic development scenarios obscures the import of BLM's faulty interpretation of the Tax Act's 2,000-acre surface facility limitation, including the agency's decision not to include significant infrastructure such as gravel mines in the acreage limitation. ⁶ The DEIS also fails to provide clear guidelines for implementing and enforcing the limitation or to consider different geographic and spatial disturbance configurations for the infrastructure. Collectively, these failures have misled some to believe that that only a small portion of the Coastal Plain would contain oilfield infrastructure.	At the leasing stage, it is unknown as to where leases will be issued, where exploration will occur, and, if oil and gas resources are discovered in economic quantities, where development would occur. Accordingly, a spatial depiction could mislead the public into assuming the developments would occur in the depicted areas. Section 1.9.1 describes those facilities that will be counted against the 2,000 acres. The BLM will use facility data in the form of ArcGIS-compatible shapefiles obtained under ROP 33 to track facility acreage to assure continued compliance with the Tax Act limit. ROP 35 requires the development of a BLM-approved abandonment and reclamation plan.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
185.	Susan	Culliney	—	98092	3	Direct/Indirect Impacts	the EIS does not limit development to 2,000 acres on the coastal plain as required by the 2017 Tax Act. The EIS would count gravel roads, pipeline supports, and drill pads towards the 2,000 acres, but would not count gravel mines or ice roads, two types of infrastructure that are impactful. The EIS would count the development acreage "at any given time," meaning that as impacted acres are supposedly reclaimed, those acres would no longer count toward the 2,000 limit. More acres could be developed, and the cumulative impact of acreage would be far greater than 2,000 acres. Nor does the EIS clearly explain how the agency will track the acreage through time and how it will hold companies accountable.	As stated in Section 1.9.1, the BLM interprets the language "during the term of the leases" in Section 20001(c)(3) of PL 115-97 as indicating Congress intended a temporal limit. Under this interpretation, the reclaimed acreage of federal land formerly containing production and support facilities would no longer count toward the 2,000-acre limit, which has been revised to include gravel mines. The BLM will use facility data in the form of ArcGIS-compatible shapefiles obtained under ROP 33 to track facility acreage to assure continued compliance with the Tax Act limit. ROP 35 requires the development of a BLM-approved abandonment and reclamation plan.
186.	Susan	Culliney	—	98092	5	Direct/Indirect Impacts	The EIS does not limit development to 2,000 acres, does not explain how a limit would work, and also simply reveals that the very notion of limiting the impacts of development on the coastal plain 2,000 acres is false.	Section 1.9.1 has been revised to identify the production and support facilities that would count towards the 2,000-acre limit, which now includes gravel mines. Rationale as to why certain facilities may not be included is contained in Section S.1.2.
187.	John	Schoen	—	98097	4	Direct/Indirect Impacts	The DEIS does not adequately address how the area to be covered by production and support facilities will be limited to 2,000 acres, as required by law. This is especially important in view of the National Research Council's 2003 finding that the impacts on Arctic development extend far beyond the physical footprints of the necessary facilities and infrastructure.	Section 1.9.1 has been revised to identify the production and support facilities that would count towards the 2,000-acre limit, which now includes gravel mines. Rationale as to why certain facilities may not be included is contained in Section S.1.2.
188.	John	Schoen	—	98097	8	Direct/Indirect Impacts	the DEIS is seriously flawed without describing and committing to a comprehensive monitoring plan for the coastal plain	Monitoring plans will be tailored to the specific location of development and resources or activity being monitored; it is not practicable to develop a template that would cover all resources, activities, and requirements for this EIS.

S. Public Comments and BLM Responses (Direct/Indirect Impacts)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
189.	Pamela	Miller	—	98116	2	Direct/Indirect Impacts	And furthermore, the 2,000 acres does not apply to private lands or state lands, but those impacts? Have not been included even in the cumulative impact analysis. So there has been no addressing potential impacts from the Kaktovik Inupiat Corporation lands that are within the program area or outside the program area but within the external boundaries of the refuge.	See Section 1.4 for clarity of private lands. The BLM only has the ability to implement the oil and gas leasing program on federal lands within the Coastal Plain of the Refuge.
190.	Pamela	Miller	—	98116	2	Direct/Indirect Impacts	Furthermore, in the 2,000 acres it does not include gravel mines. It does not include the water, how water will be obtained	Section 1.9.1 has been revised to identify the production and support facilities that would count towards the 2,000-acre limit, which now includes gravel mines. Rationale as to why certain facilities may not be included is contained in Section S.1.2.
191.	Pamela	Miller	—	98116	2	Direct/Indirect Impacts	One of the real challenges with this Environmental Impact Statement is the hypothetical development scenarios, as well as what's in or out of the 2,000 acres. So there is not described how the government will keep track of the accounting from now until 130 years from now of the infrastructure, the permanent infrastructure, what's included within the 2,000 acres.	Section 1.9.1 has been revised to identify the production and support facilities that would count towards the 2,000-acre limit, which now includes gravel mines. Rationale as to why certain facilities may not be included is contained in Section S.1.2. . The BLM will use facility data in the form of ArcGIS-compatible shapefiles obtained under ROP 33 to track facility acreage to assure continued compliance with the Tax Act limit. ROP 35 requires the development of a BLM-approved abandonment and reclamation plan.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
192.	Pamela	Miller	—	98116	8	Direct/Indirect Impacts	these river systems of the coastal plain are extraordinarily different than coming straight out of the glaciers of the Brooks Range. Some of the water comes from springs that are fed by water on the south side of the Brooks Range, which is very interesting to think about. Where is that water coming from? If you disturb those spring systems that are feeding the fresh waters of the Canning, the Hulahula, the Aichilik and potentially other rivers, as well as -- anyway, it will affect the long-term natural diversity of fish and wildlife and their habitats, the populations in the river systems. That's not been adequately addressed in the EIS and is not captured by this 2,000-acre assumption of what facilities will be needed and activities that cause disturbance in the refuge.	ROP 9 provides protections at the leasing stage for water quantity and quality. Any future actions or activities are required to receive the appropriate authorizations for water withdrawals. A determination of specific water withdrawals and impacts on water quantity cannot be made until site-specific development activities are proposed.
193.	Valanne	Glooschenko	—	98147	4	Direct/Indirect Impacts	Thirdly, the problem is the EIS contains proposed infrastructure requirements that also allows the company to obtain waivers, exceptions, and nullification of any of the requirements. It's impossible to comment on the impacts of development if the public does not know what requirements actually will be imposed. This is an extremely serious deficit.	Operators are required to submit a written request for an exception, waiver, or modification and information demonstrating that (1) the factors leading to the inclusion of the stipulation in the lease have changed sufficiently to make the protection provided by the lease stipulation no longer needed or (2) the proposed operation would not cause unacceptable impacts. The criteria for approval of exceptions, waivers, and modifications should be supported by NEPA analysis, and may require site-specific environmental review. Requests should contain, at a minimum, a plan that includes related on-site or off-site mitigation efforts to adequately protect affected resources; data collection and monitoring efforts; and timeframes for initiation and completion of construction, drilling, and completion operations. The operator's request may be included in an Application for Permit to Drill, Notice of Staking, Sundry Notice,

193. (cont.)	(see above)	(see above)	(see above)	(see above)	(see above)	(see above)	(see above)	or letter. The BLM may also proactively initiate the process. During the review process, BLM coordination with other local, state, or federal agencies (e.g., ADFG, NSB, and local governments) should be undertaken, as appropriate, and documented. The BLM will also consult with the federal surface management agency (e.g., USFWS). Approval or disapproval is made by the Authorized Officer, and the decision is documented. If the waiver, exception, or modification is approved, any necessary mitigation is also documented. The applicant is then provided with a written notification of the decision. See Instruction Memorandum 2008-032 and 43 CFR 3101.1-4 for additional details.
194.	Valanne	Glooschenko	—	98147	5	Direct/Indirect Impacts	The fourth deficit of the Draft EIS is the tax law Congress passed authorizing development in the refuge limits, quotes, "surface disturbance," quotes, to 2,000 acres. BLM has chosen to interpret the 2,000-acre limitation to exclude ice roads and excludes hundreds of miles of elevated pipelines. It excludes gravel finds. All the other types of infrastructure. However, BLM needs to include all oil and gas development related infrastructure in the 2,000-acre calculation. Otherwise, the BLM is proposing a false set of data upon which it wants the public to comment. It's proposing a false set of information, minus all the critical infrastructure elements that are simply not even on the table. Shame on you, BLM.	Section 1.9.1 has been revised to identify the production and support facilities that would count towards the 2,000-acre limit, which now includes gravel mines. Rationale as to why certain facilities may not be included is contained in Section S.1.2.

S. Public Comments and BLM Responses (Direct/Indirect Impacts)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
195.	Bella	Moucher	—	98186	1	Direct/Indirect Impacts	The BLM almost completely ignores the transboundary impacts that oil and gas drilling in the Arctic Refuge would have on Canada. The BLM must comprehensively address the direct, indirect, cumulative and transboundary impacts of drilling in the Arctic Refuge.	The EIS has been revised to more fully analyze transboundary impacts, where applicable.
196.	Brook	Brisson	Trustees for Alaska	98269	41	Direct/Indirect Impacts	The DEIS gives shockingly little attention to transboundary impacts. While the DEIS mentions the International Porcupine Caribou Agreement and devotes some attention to the indirect effects of oil and gas leasing on caribou and other migratory and transboundary species in Alaska, it almost entirely ignores such impacts in Canada. The potential transboundary effects of oil and gas leasing associated with the Porcupine Caribou Herd (PCH) is of paramount concern, given that 85 percent of the PCH harvest occurs in Canada. ⁴³³	The EIS has been revised to more fully analyze transboundary impacts, where applicable. The EIS gives due consideration to the IPCA, and the DOI has conducted consultation with the IPCB and with Canadian officials.
197.	Brook	Brisson	Trustees for Alaska	98269	42	Direct/Indirect Impacts	More egregious is the complete lack of information about transboundary impacts on Canadian communities in the Sociocultural Systems and Environmental Justice sections of the DEIS. ⁴³⁵ The DEIS largely focuses on impacts to four Alaskan communities - Kaktovik, Nuiqsut, Arctic Village, and Venetie - and never mentions any affected Canadian communities such as Old Crow, Aklavik, or Fort McPherson. ... ⁴³⁶ Caribou do not perceive borders and BLM must acknowledge the calving grounds of the PCH are sacred to all Gwich'in people, whether Canadian or Alaskan.	The EIS has been revised to more fully analyze transboundary impacts, where applicable.

S. Public Comments and BLM Responses (Direct/Indirect Impacts)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
198.	Brook	Brisson	Trustees for Alaska	98269	45	Direct/Indirect Impacts	BLM has also failed to consider the transboundary impacts of Coastal Plain oil and gas development on migratory birds that migrate between the coastal plain and other countries. For example, shorebirds such as Dunlin that use the East Asian-Australasian Flyway are experiencing increased coastal development along migratory and wintering areas. ⁴³⁷ Development in the project area could exacerbate the pressures faced by Dunlin and other transboundary migratory birds.	The EIS has been revised to more fully analyze transboundary impacts, where applicable.
199.	Brook	Brisson	Trustees for Alaska	98269	83	Direct/Indirect Impacts	As a threshold matter, BLM's view that it can allow more than 2,000 acres of direct development impacts is flatly inconsistent with the language of the Tax Act. That law permits the Secretary to authorize that "up to 2,000 surface acres of Federal land on the Coastal Plain . . . be covered by production and support facilities . . . during the term of the leases." ⁴⁸⁹ The metric the Tax Act uses does not mean "at one time." Rather, it provides a single limit for all acreage covered by facilities throughout the life of the leasing program.	As stated in Section 1.9.1, the BLM interprets the language "during the term of the leases" in Section 20001(c)(3) of PL 115-97 as indicating Congress intended a temporal limit. Under this interpretation, the reclaimed acreage of federal land formerly containing production and support facilities would no longer count toward the 2,000-acre limit, which has been revised to include gravel mines.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
200.	Brook	Brisson	Trustees for Alaska	98269	86	Direct/Indirect Impacts	<p>BLM's analysis fails to adequately account for the long-term changes that are likely to occur from infrastructure and the challenges related to reclamation that relate to that. It is unrealistic to expect that reclamation will return land to its previous condition and ecosystem function. The ground under a gravel pad or road is compressed over time, lowering the surface elevation. When gravel is removed to meet land lease agreements and USACE regulations, sometimes gravel is left behind to avoid creating a square lake. The only way to maintain an elevation similar to that of the surrounding tundra grade is to leave a certain amount of gravel at the site. Because of the drastic change in soil conditions, and often in hydrology, natural colonization by species similar to those in the surrounding relatively undisturbed tundra is less likely. If grass seed is sown, even species that are expected to decline over time, the resulting plant community does not aesthetically or functionally resemble the surrounding plant community. If a site subsides after gravel is removed and the site becomes covered in more water than was present prior to development, there is little that can be done to reverse this condition. The Coastal Plain tends to have high volumes of ground ice, making it more likely that a site will subside once gravel is removed. BLM needs to account for these long-term impacts and changes in its impact analysis and consideration of reclamation.</p>	<p>Until such time as the areas are reclaimed as required by ROP 35, they would still be included in the 2,000-acre limit. Under all alternatives, ROP 35 requires restoration to the land's previous hydrological, vegetation, and habitat condition.</p>

S. Public Comments and BLM Responses (Direct/Indirect Impacts)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
201.	Brook	Brisson	Trustees for Alaska	98269	89	Direct/Indirect Impacts	Restoration implies that a site will return to its pre-program conditions. Based on over 30 years of tundra rehabilitation activities, it is unrealistic to expect a site on the North Slope to return to pre-program conditions in a human-significant time frame. In addition, road dust, especially within 100 feet of a road, can settle onto surrounding permafrost, altering albedo, evapotranspiration, and vegetation communities. In areas heavily covered in dust, permafrost ice wedges can melt, resulting in degraded polygons (those in which the ice wedges have melted leaving the centers of the polygons higher than the surrounding grade). This is an irreversible long-term impact. BLM should acknowledge all of these long term impacts as part of its analysis and consideration of impacts.	Until such time as the areas are reclaimed as required by ROP 35, they would still be included in the 2,000-acre limit. Under all alternatives, ROP 35 requires restoration to the land's previous hydrological, vegetation, and habitat condition.
202.	Brook	Brisson	Trustees for Alaska	98270	46	Direct/Indirect Impacts	BLM also does not adequately account for the fact that the mitigation measures are potentially subject to waivers, exceptions, and modifications. The effectiveness of any mitigation measures is in part directly tied to whether or not they are enforceable or could be waived. BLM needs to account for the potential waiver of these provisions as part of its analysis, as that could negate any of the purported protections and benefits of such provisions.	Operators are required to submit a written request for an exception, waiver, or modification and information demonstrating that (1) the factors leading to the inclusion of the stipulation in the lease have changed sufficiently to make the protection provided by the lease stipulation no longer needed or (2) the proposed operation would not cause unacceptable impacts. The criteria for approval of exceptions, waivers, and modifications should be supported by NEPA analysis, and may require site-specific environmental review. Requests should contain, at a minimum, a plan that includes related on-site or off-site mitigation efforts to adequately protect affected resources; data collection and monitoring efforts; and timeframes for initiation and completion of construction, drilling, and completion operations. The operator's request may be included in an Application for Permit to Drill,

203.	Brook	Brisson	Trustees for Alaska	98270	107	Direct/Indirect Impacts	Nor does the DEIS include any information about how it will monitor and respond to changes in recreation and visitor experiences to ensure that Refuge purposes are met, as we requested in our scoping comments.	Monitoring plans will be tailored to the specific location of development and the resources or activity being monitored.
204.	Brook	Brisson	Trustees for Alaska	98270	147	Direct/Indirect Impacts	The geographic scope of the various "affected environment" discussions in the DEIS is too narrow.1885 These discussions focus heavily on the "program area," which is much smaller than the area that will experience effects from the proposed action.1886 While the program area encompasses the "[f]ederal lands and waters ... of the Coastal Plain within the ... Arctic Refuge"1887 and includes approximately 125 miles of coastline from the Staines River to the Beaufort Lagoon,1888 shipping activities connected with the proposed action will take place, and their impacts will be felt, along the entire 1,600-nautical mile (nm) marine barge route from Dutch Harbor to Kaktovik, Alaska.1889	Marine vessel traffic is beyond the scope of this analysis. Direct and indirect impacts cannot be analyzed on a site-specific basis within this EIS, but they are analyzed for the program area generally based off the hypothetical unconstrained scenarios in Appendix B. The BLM does not have authority to regulate marine traffic outside the Coastal Plain.

S. Public Comments and BLM Responses (Direct/Indirect Impacts)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
205.	Brook	Brisson	Trustees for Alaska	98270	148	Direct/Indirect Impacts	<p>Due to the narrow scope of the affected environment discussions, there is very little baseline information in the DEIS regarding the important marine areas along the marine shipping corridor to the west and south of the program area that could be adversely affected by shipping activities associated with the proposed action. Some important marine areas left out of the DEIS are in the Beaufort Sea and Chukchi Sea regions, including the Chukchi Corridor, Hanna Shoal, Herald Shoal, Barrow Canyon East, Smith Bay, Harrison Bay-Colville Delta, Beaufort Shelf Break, and Oliktok Point to Demarcation Bay, which are described in the attached reports.¹⁸⁹⁰ Other important marine areas not addressed in the DEIS are in the Bering Sea region, such as the Bering Strait and the waters surrounding King Island, St. Lawrence Island, and Nunivak Island, as described in the attached report prepared by the U.S. Coast Guard.¹⁸⁹¹ Including baseline descriptions of these important marine areas in a revised DEIS will facilitate appropriate discussions regarding the direct, indirect, and cumulative impacts arising from the shipping activities associated with proposed Coastal Plain oil and gas operations. ¹⁸⁹⁰ See, e.g., Pew Charitable Trusts, et al, A Synthesis of Important Areas in the U.S. Chukchi and Beaufort Seas: Best Available Data to Inform Management Decisions (April 2016), available at https://www.pewtrusts.org//media/assets/2016/05/synthesis_of_important_areas_us_chukchi_beaufort_seas.pdf; Natural Resources Defense Council, et al, Environmental Risks with Proposed Offshore Oil and Gas Development off Alaska's North Slope (Aug. 2012), available at https://www.nrdc.org/sites/default/files/drilling-off-north-slope-IP.pdf. ¹⁸⁹¹ See,</p>	<p>Marine vessel traffic is beyond the scope of this analysis. Direct and indirect impacts cannot be analyzed on a site-specific basis within this EIS, but they are analyzed for the program area generally based off the hypothetical unconstrained scenarios in Appendix B. 206.	Brook	Brisson	Trustees for Alaska	98270	151	Direct/Indirect Impacts	Shipping-related oil and hazardous substance spills and resulting impacts are not discussed in any substantive way in the DEIS. While the potential for oil and hazardous substance spills is evaluated in the solid/hazardous waste section of the DEIS, this section focuses on terrestrial and freshwater impacts resulting from spills associated with onshore operations.1899 There are also a few sentences referring to the potential for marine impacts from oil spills in the water resources section, but this language refers to spills from onshore barge docking sites, not from shipping.1900 The apparent rationale for the general exclusion of shipping-related spills from the DEIS analysis is buried in the marine mammal section. The narrative strongly downplays the potential likelihood, extent, and harm of any oil or hazardous substance spill by suggesting that (1) there is a "low risk" of spilled fuel if a vessel carrying fuel were to run aground during barging, (2) a large oil spill in the Arctic marine environment is unlikely because "[t]o date," such as a spill has "not occurred," (3) spill risks will be reduced through "safeguards" specified in the required oil spill prevention and contingency plans, (4) the quantities of oil or hazardous substances likely to be released would be "relatively small," and (5) potential spills during refueling at sea would be only "small, accidental" spills.1901 This rationale is deeply flawed. While bulk fuel has historically been delivered to the North Slope by	BLM requirements should not duplicate State of Alaska requirements, especially when ADEC requirements are more detailed, and in some cases more stringent, than federal requirements. At the time of a site-specific proposal, the operator will be required to submit a spill response plan.

S. Public Comments and BLM Responses (Direct/Indirect Impacts)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
206. (cont.)	(see above)	(see above)	(see above)	(see above)	(see above)	(see above)	tanker truck along the haul road, bulk fuel deliveries by barge have commenced and are likely to become the preferred option in the future. The first large-scale fuel delivery by barge took place in September 2018, and it carried 2 million gallons of fuel from Valdez to Deadhorse.1902 A collision, grounding, or other accident resulting in the discharge of even half the cargo of a fuel barge of this size (i.e., 1 million gallons) would be 10 times greater than BLM's own threshold for a "very large" spill,1903 and it would constitute a major spill by any other estimation as well. Moreover, as the ice-free, open water season lengthens due to warming temperatures in the Arctic, transporting fuel by barge is likely to be viewed as a more convenient and/or cost-effective method of transporting fuel compared to the much smaller and more frequent 10,000-gallon increments that can be transported via tanker truck.1904 Barge deliveries may even be the only feasible way of transporting fuel in support of Coastal Plain oil and gas operations because of the lack of a road between Deadhorse and Kaktovik.1905	(see above)
207.	Brook	Brisson	Trustees for Alaska	98270	154	Direct/Indirect Impacts	Accordingly, the spill analysis in section 3.2.11 of the DEIS must be expanded to encompass large-scale spills into the marine environment from bulk fuel barges, both near the program area and along the marine barge route from Dutch Harbor to Kaktovik.	Marine vessel traffic is generally beyond the scope of this analysis. Direct and indirect impacts cannot be analyzed on a site-specific basis within this EIS, but they are analyzed for the program area generally based off the hypothetical unconstrained scenarios in Appendix B. The BLM does not have authority to regulate marine traffic outside the Coastal Plain.

S. Public Comments and BLM Responses (Direct/Indirect Impacts)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
208.	Brook	Brisson	Trustees for Alaska	98270	155	Direct/Indirect Impacts	<p>Additionally, as the DEIS acknowledges, toxic chemicals and other hazardous materials are used in oil and gas operations and have been known to kill polar bears through accidental ingestion.1909 In fact, on the North Slope of Alaska, substantial quantities of acidic, explosive, poisonous, flammable, and corrosive materials are transported into the area each year, including several substances designated “extremely hazardous,” such as sulfuric acid, hydrochloric acid, hydrogen peroxide, and chlorine.1910 The same types of chemicals can be expected to be used at new oil and gas facilities on the Coastal Plain. While trucks have been used to transport chemicals to the North Slope historically,1911 marine transportation is likely to be used for Coastal Plain operations given the lack of a road between Kaktovik and Deadhorse.1912 The spill analysis in section 3.2.11 of the DEIS must therefore be expanded to encompass toxic chemical spills into the marine environment from shipping activities both near the program area and along the marine barge route from Dutch Harbor to Kaktovik.</p>	<p>Marine vessel traffic is generally beyond the scope of this analysis. Direct and indirect impacts cannot be analyzed on a site-specific basis within this EIS, but they are analyzed for the program area generally based off the hypothetical unconstrained scenarios in Appendix B. The BLM does not have authority to regulate marine traffic outside the Coastal Plain.</p>
209.	Brook	Brisson	Trustees for Alaska	98270	156	Direct/Indirect Impacts	<p>Finally, the DEIS must consider the marine impacts of potential oil spills on keystone Arctic species, such as the Arctic cod. Arctic cod (<i>Boreogadus saida</i>) are an energy-rich Arctic keystone forage fish that serve as primary prey species for marine mammals, seabirds, and fish. A recent study by scientists at Oregon State University and NOAA found that exposure of Arctic cod eggs to low dosages of Alaskan North Slope crude oil resulted in sublethal cardiac abnormalities and deficits in energetics that lasted into the juvenile stage.1913</p>	<p>Arctic cod EFH is discussed in Appendix P. Future site-specific NEPA analyses for proposed projects would be required. A more quantified analysis for specific species is more appropriate during a site-specific analysis. Additionally, at the time of a site-specific proposal, the operator will be required to submit a spill response plan.</p>

S. Public Comments and BLM Responses (Direct/Indirect Impacts)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
210.	Brook	Brisson	Trustees for Alaska	98270	158	Direct/Indirect Impacts	<p>Reduced survival and fat content are irreversible impacts that make Arctic cod, and in turn, the maritime Arctic ecosystem that depends on them, highly vulnerable to an oil spill. Furthermore, Arctic cod eggs are buoyant, 1914 as is oil, making them additionally sensitive to potential oil spills. If the Coastal Plain were to be developed, and Arctic cod embryos came into contact with oil from a future spill, the eggs would be in contact with the oil for an extended period of time. Thus the eggs are highly vulnerable to exposure. The spill analysis in section 3.2.11 of the DEIS must also therefore be expanded to encompass the impacts of oil spills on the survival of keystone species at critical life stages and the marine ecosystems whose life they support.</p>	<p>Arctic cod EFH is discussed in Appendix P. Future site-specific NEPA analyses for proposed projects would be required. A more quantified analysis for specific species is more appropriate during a site-specific analysis. Additionally, at the time of a site-specific proposal, the operator will be required to submit a spill response plan.</p>
211.	Brook	Brisson	Trustees for Alaska	98270	159	Direct/Indirect Impacts	<p>Geographic Scope. The discussions in the DEIS regarding the impacts of noise in general and on fish, birds, marine mammals, and subsistence focus heavily on noise-generating activities within or near the program area, especially in the vicinity of Kaktovik. 1923 As a result, they largely fail to address shipping noise along the marine barge route and its resulting impacts on wildlife, habitat, and subsistence activities in the many important marine areas along that route. The DEIS should be revised to address noise impacts from shipping along the marine barge route.</p>	<p>The hypothetical development scenario (Appendix B) is applicable to the program area, and speculation beyond where marine vessel traffic would go is beyond the scope of this analysis. Direct and indirect impacts cannot be analyzed on a site-specific basis within this EIS, but they are analyzed for the program area generally based off the hypothetical development scenario. The BLM does not have authority to regulate marine traffic outside the Coastal Plain.</p>

S. Public Comments and BLM Responses (Direct/Indirect Impacts)

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
212.	Brook	Brisson	Trustees for Alaska	98270	162	Direct/Indirect Impacts	Yet there is no discussion in the DEIS of potential impacts of noise resulting from icebreaking. Furthermore, there is no recognition of icebreaking noise as causing sea ice habitat loss or alteration. Icebreaking noise and disturbance are not addressed anywhere in the DEIS, and this represents a major substantive gap. The DEIS should be revised to include a substantial discussion of icebreaking noise impacts near the program area and along the marine shipping route, and an analysis of the impact of icebreaking on sea ice habitat loss and alteration should be added in section 3.3.5 of the DEIS.1930	The level of specificity for this would be determined at the project-level authorizations. The hypothetical development scenario does not consider barging when icebreaking would be required. Site-specific analyses, including those associated with infrastructure in support of oil and gas development, can more realistically be provided when the BLM receives an application to permit such infrastructure.
213.	Brook	Brisson	Trustees for Alaska	98270	167	Direct/Indirect Impacts	The discussion of [shipping and icebreaking] noise impacts in the subsistence section of the DEIS similarly assumes that the ROPs will be highly effective in mitigating impacts,1938 and thus the DEIS understates the potential adverse effects. Where subsistence activities involving marine mammals are expected to be disturbed, the discussion focuses on whales and mentions other marine mammals only in passing.1939 This is inadequate. For example, BLM predicts the effects of noise disturbance on seals will be temporary (less than 5 years), with no lasting demographic effects.1940 Presumably, however, displacement of the majority of seals from the project area in response to noise would have a notable impact on subsistence activities. The discussion should be revised to provide a more accurate analysis of shipping and icebreaking noise impacts on subsistence near the program area and along the marine shipping route.	The text has been updated as appropriate to discuss impacts related to the marine barge route. An additional NEPA analysis would be completed at the project-level authorization.

214.	Brook	Brisson	Trustees for Alaska	98271	185	Direct/Indirect Impacts	<p>The DEIS repeatedly affirms the idea that “the areas of NSO would have no additional impact relative to Alternative A.”¹³¹⁷ Such a statement neither aligns with scientific understanding, nor with other statements in the DEIS. The DEIS clearly states that “[t]here would be no direct or indirect impacts on terrestrial mammals from post-lease oil and gas activities under Alternative A.”¹³¹⁸ No impacts is then the standard against which NSO areas should be compared. A first issue with the assertion of no impacts in NSO areas is that it assumes effects of development will end at the boundary of NSO areas. The idea of “edge effects” - that conditions around the edge of a habitat patch will often be different than those in the interior of the patch - has long been recognized in landscape ecology.¹³¹⁹ In the context of the Coastal Plain the concern is that effects occurring in the non-NSO areas will “spill over” into the NSO areas. This phenomenon is affirmed in the DEIS in the Recreation section where it states that under Alternative D, “some impacts associated with an anticipated 21 well pads and associated infrastructure would occur inside of the NSO areas. These would include changes to the recreation setting from artificial lighting and alteration of the recreation setting and visitor experiences from the visual presence of infrastructure and vehicles.”¹³²⁰ The analysis of viewshed effects of Coastal Plain development submitted by Stuart Smith confirms that the visual effects of development would extend far across the Coastal Plain.¹³²¹ Many of these impacts could also affect caribou, which are highly visual creatures and rely heavily on sight for predator avoidance.</p>	<p>The text has been revised throughout Chapter 3 to clarify impacts that could occur in NSO areas.</p>

215.	Brook	Brisson	Trustees for Alaska	98271	187	Direct/Indirect Impacts	Another reason impacts in NSO areas are expected to exceed those under Alternative A is because seismic activity will be allowed across the entire program area.1326 The DEIS clearly notes potential impacts from seismic exploration and, as is noted above, there is reason to conclude impacts may be greater than indicated in the DEIS. Nevertheless, there clearly will be impacts of some sort in the NSO and no leasing areas if seismic activity is allowed there that will differ from the current conditions, which would be maintained under Alternative A.	The text has been revised throughout Chapter 3 to note that seismic activity could occur across the entire program area, including in areas identified as NSO or no leasing areas.
216.	Brook	Brisson	Trustees for Alaska	98271	188	Direct/Indirect Impacts	Finally, NSO stipulations are subject to waivers, exceptions, and modifications across all action alternatives. Indeed, the DEIS expressly acknowledges how particular stipulations may be waived. For example, under Lease Stipulation 2 in Alternative D surface occupancy is prohibited within 0.5 miles of certain waterbodies, except that “[o]n a case-by-case basis, essential pipelines, road crossings, and other permanent facilities may be considered through the permitting process in these areas where the lessee/operator/contractor can demonstrate on a site-specific basis that impacts would be minimal.”1327 Similar possibilities for NSO waivers are mentioned in Lease Stipulations 1, 4, 5, and 9.1328 In these instances it is clear that impacts would be different than under Alternative A and must be analyzed. BLM may not claim that no impacts will occur in NSO areas.	Text has been added to Table 2-2 further explaining the applicable waivers, exceptions, or modifications.

217.	Donald	Walker	—	68	50	Direct/Indirect Impacts	A study of impacts to upland tundra from current exploration on the MacKenzie River Delta, Canada, reported that initial impacts are similar to or somewhat greater than those reported from 2D surveys in the same area 30 years previously. ^{70,71} A recent BLM Environmental Assessment for seismic surveys in northern Alaska stated that “seismic exploration may vary from having no observable effects in some situations to damaging vegetation to the extent that it may take years or even decades to heal. These impacts occur despite existing stipulations on operations, and cannot be further mitigated, given the types of equipment currently used.” ⁷²	The EIS has been updated to include more recent data and studies related to seismic exploration activities.

1.	David	Fuller	—	18480	2	Economy	During the public scoping period I submitted a letter requesting, among other things, that the BLM use nonmarket economic analysis methods specifically to determine impacts to the Existence Value of the millions of acres of unspoiled lands that may be affected, directly and indirectly, by the proposed leases. I was disappointed to read the DEIS and see this statement on page 3-231: “As noted in Affected Environment, quantifying nonmarket values associated with the Arctic Refuge is not part of this analysis.” Please note that this is not actually “noted”, or even mentioned, in the Affected Environment section of the document. In fact, no explanation or rationale is provided as to why the BLM has chosen not to analyze nonmarket values. As you may be aware, BLM Instruction Memorandum 2013-131 provides policy and guidance for the analysis of nonmarket environmental values. A few applicable excerpts from Attachment 1	The EIS has been revised to provide a qualitative description of nonuse/passive use/existence values (nonmarket values) and other ecosystem service values associated with the Coastal Plain (see Section 3.4.10, Economy, Affected Environment). However, a primary study to quantify the nonuse values of the Coastal Plain is outside the scope of this EIS; instead, other relevant studies from the literature on nonuse values are summarized in the EIS. The Economy section is focused on evaluating potential impacts on the local, regional, and statewide economy with respect to jobs, income, and revenues. The evaluation of potential impacts on the physical environment, biological resources, and other social systems, such as cultural resources, subsistence, recreation, visual resources, and public health,

1. (cont.)	(see above)	(see above)	(see above)	(see above)	(see above)	(see above)	<p>of IM 2013-131: "At least a qualitative description of the most relevant nonmarket values should be included for the affected environment and the impacts of alternatives in NEPA analyses involving environmental impact statements (EIS), for both resource management plans (RMP) and project- level decisions." "The use of quantitative valuation methods should contribute to the analysis of one or more issues to be addressed in the environmental analysis supporting planning or other decision-making. A quantitative analysis of nonmarket values in EIS-level NEPA analyses is strongly encouraged where one or more of the criteria provided below apply." The first criterion listed: "A proposed action is likely to have a significant direct or indirect effect (as defined at 40 CFR 1508.8 and 1508.27), and the quality or magnitude of the effect can be clarified through the analysis of nonmarket values. For example, a proposed wind energy installation may affect the viewshed of a nearby community in ways that alter scenic values." "Passive uses concern values attributed to a place, landscape, or ecological condition without direct use or experience. Many Americans will attribute value to the existence of the Arctic National Wildlife Refuge (ANWR) as a wilderness without having been there." "The added time and expense required for original nonmarket studies should not preclude their use by the BLM: many biophysical studies prepared for environmental analyses supporting RMPs or individual project approvals require as great or greater budgets and timeframes." Clearly, the BLM has not followed its own policy and guidance and has chosen instead to ignore impacts to nonmarket environmental values, even when the Existence Value associated with the</p>	are provided in other sections of the EIS.

1. (cont.)	(see above)	(see above)	(see above)	(see above)	(see above)	(see above)	Arctic National Wildlife Refuge (ANWR) is used as an example in BLM's own policy memo. In addition, the BLM chose to ignore the substantive comments and peer-reviewed citations that I provided during the public comment period.	(see above)
2.	David	Fuller	—	18480	3	Economy	A thorough nonmarket economic analysis should not be precluded by the arbitrary time limits set in Secretarial Order 3355. The NEPA process for the Coastal Plains leasing should be exempt from Secretarial Order 3355 given the decades of controversy noted above. Note that 40 CFR 1500.8 allows agencies to set time limits but states that the limits must be consistent with the purposes of NEPA and that agencies should consider, among other factors, the degree to which the action is controversial. Not many NEPA analyses are as controversial as this one. As stated in IM 2013-131 "added time and expense required for original nonmarket studies should not preclude their use by BLM".	The EIS has been revised to provide a qualitative description of nonuse/passive use/existence values (nonmarket values) and other ecosystem service values associated with the Coastal Plain (see Section 3.4.10, Economy, Affected Environment). However, a primary study to quantify the nonuse values of the Coastal Plain is outside the scope of this EIS; instead, other relevant studies from the literature on nonuse values are summarized in the EIS. The Economy section is focused on evaluating potential impacts on the local, regional, and statewide economy with respect to jobs, income, and revenues. The evaluation of potential impacts on the physical environment, biological resources, and other social systems, such as cultural resources, subsistence, recreation, visual resources, and public health, are provided in other sections of the EIS.

5.	gregory	jackson	—	57077	4	Economy	I urge you to delay permitting to allow further study that takes into account the true economic costs of development and potential clean-up costs.	Operators are required to explore and develop the oil and gas resources of leased areas per 43 CFR 3130. This Leasing EIS will not result in the authorization of any on-the-ground activities. Accordingly, the environmental baseline will be preserved throughout the lease sale process. Any on-the-ground activities will require an additional NEPA analysis. At that time, the BLM will determine which baseline studies may be necessary.
6.	Withheld	Withheld	W&M Student Environmental Action Coalition	57137	1	Economy	There is very little financial incentive to open up the Coastal Plains to drilling as experts estimate it could be up to 10x more expensive than drilling in the contiguous United States due to cold and harsh environmental conditions (Alaskaconservation.org). In addition, a majority of our public lands are open to leasing (90% of land managed by BLM) and of the 25.7 million acres leased, only 12.7 million acres are currently being used for energy production (Alaskaconservation.org).	Drilling in the Alaska North Slope is known to be more expensive than drilling in most of the contiguous United States; however, there are currently a number of exploration, drilling, and production activities in the Alaska North Slope that are underway despite the higher cost of drilling in this region. This suggests that these projects in the Alaska North Slope have passed the oil industry's threshold for economic viability. It is not the objective of this EIS to determine the financial/economic viability of development in the Coastal Plain area; however, costs associated with the hypothetical development scenario used for the analysis of the economic impacts were estimated.

7.	Matthew	Moran	—	57160	1	Economy	<p>We would like to address the ecosystem services that could be reduced or lost if the 1002 Area is developed for oil and gas. Ecosystem services are the benefits that natural ecosystems provide to humanity. These services are often categorized as provisioning (e.g. food), regulating (e.g. climate), supporting (e.g. nutrient cycling), and cultural (e.g. aesthetic and spiritual value). Rigorous assessment of these aspects of the value of the 1002 area were not included in the draft EIS report published late in 2018. While the EIS document discusses the various environmental, social, conservation, and aesthetic values of the area, there is little quantification of these values. For example, in Vol. 1, p. 3-239, the document states, The nonuse and passive use values of the Coastal Plain and its other ecosystem service values (although not quantified in this analysis) would be diminished from their current value by oil and gas leasing development. Stating that ecosystem services values would be diminished, without having an idea of their original value or how much they would be diminished, does not tell a sufficient story. A thorough EIS should quantify these impacts, and there are established methods for doing so. A review of the land-use and ecosystem services literature would provide a variety of approaches for this sort of analysis.</p>	<p>The EIS has been revised to provide a qualitative description of nonuse/passive use/existence values (nonmarket values) and other ecosystem service values associated with the Coastal Plain (see Section 3.4.10, Economy, Affected Environment). However, a primary study to quantify the nonuse values of the Coastal Plain is outside the scope of this EIS; instead, other relevant studies from the literature on nonuse values are summarized in the EIS.</p> <p>The Economy section is focused on evaluating potential impacts on the local, regional, and statewide economy with respect to jobs, income, and revenues. 8.	Matthew	Moran	—	57160	2	Economy	In our recent study (Turner et al., in review), we performed a comprehensive valuation of the ecosystem services provided by the Arctic National Wildlife Refuge, with a more focused estimation of key services provided by the 1002 Area. For a description of the ecosystem services we estimated, see de Groot et al. (2002). Our results indicate that the Refuge as a whole provides about \$2,060 per hectare in annual ecosystem services and the Coastal Plain portion of the refuge provides \$2,070 per hectare annually. According to our survey of American attitudes, the aesthetic value alone of the Arctic National Wildlife Refuge is \$944 per hectare annually, but that if better informed about the Refuge, the US population would value it at \$1,687 per hectare per year, a value greater than the oil and gas economic impact (Kotchen and Burger, 2007).	The EIS has been revised to provide a qualitative description of nonuse/passive use/existence values (nonmarket values) and other ecosystem service values associated with the Coastal Plain (see Section 3.4.10, Economy, Affected Environment). However, a primary study to quantify the nonuse values of the Coastal Plain is outside the scope of this EIS; instead, other relevant studies from the literature on nonuse values are summarized in the EIS. The Economy section is focused on evaluating potential impacts on the local, regional, and statewide economy with respect to jobs, income, and revenues. The evaluation of potential impacts on the physical environment, biological resources, and other social systems, such as cultural resources, subsistence, recreation, visual resources, and public health, are provided in other sections of the EIS.
9.	Withheld	Withheld	—	59376	15	Economy	Over how many years will this project provide job? - no esti-mate in Draft EIS, p 3-234? The EIS explains uses a 50-year cradle-to-crave timeline, but it is not clear how many years of work that will provide the number of jobs estimated in the EIS.	The job estimates provided on page 3-234 cover the exploration, development, and production phases, with the first lease sale scheduled in 2021 and production activities through 2050 (a 30-year timeframe).
10.	Withheld	Withheld	—	59376	16	Economy	Will Alaska Natives get job preference or be training to be able to qualify for a job since they are the ones being displaced/adversely affected from the project?	This level of specificity would be determined at the project-level authorization. There are no existing lease stipulations or state regulations that address local hire preferences.

11.	Martha	Raynolds	—	67039	14	Economy	Economy This section says it will discuss Arctic Village and Venetie, but then doesn't.	The Affected Environment section includes the communities of Arctic Village and Venetie; the existing population, employment, and total wages are presented in Tables O-1 and O-2 in Appendix O. Baseline socioeconomic conditions in these communities were described in the Economy section. The potential impacts on these two communities are described in the Subsistence Section of the Draft EIS.
12.	Ronald	Yarnell	—	67164	6	Economy	What loss of income & job opportunities will be foregone to wilderness guides, bed & breakfast, hunting guides, air taxi operators, hotels in Alaska communities, etc. A full economic analysis needs to be done to determine the economic effects of oil & gas leasing & development upon these businesses. Additionally a full economic analysis need to be done to determine the total economic impact full development will have on all users.	This issue is addressed in the Recreation Section of the EIS (Section 3.4.6). Section 3.4.6 notes that there are a number of businesses (i.e., air travel operators and chartered polar bear viewing excursion operators) that could be affected by post-leasing activities. New oil and gas development following lease sales would potentially diminish the quality of the recreation setting and visitor experiences, displace visitors and subsistence users, and increase conflicts between users. The loss of income and job opportunities to wilderness guides and other businesses that depend on the recreational experience cannot be quantified without specific information on the magnitude of the reduction in recreational uses in the area. Section 3.4.6 provides a qualitative description of potential impacts on recreational resources.

13.	Withheld	Withheld	—	69211	8	Economy	How will bonds be developed and what will they be and who will pay them for future clean up and restoration and damages?	Operators would be required to submit a reclamation plan that satisfies the objective of the ROP. Bonding would be determined and required with the specific oil and gas authorization (43 CFR 3134); the BLM would also apply these NPR-A regulations to the Coastal Plain. A reclamation plan would be developed in coordination with applicable federal, state, and local agencies (footnote 1, Table 2-2).
14.	Withheld	Withheld	—	69211	13	Economy	What resources, texts, sources, etc. will be used to allocate a quantitative value to a natural resource to determine the fines and loss such as the monetary value of a walrus, seal, whale, golden eagle, short eared owl, fish, plants, caribou and other natural resources?	The EIS has been revised to provide a qualitative description of nonuse/passive use/existence values (nonmarket values) and other ecosystem service values associated with the Coastal Plain (see Section 3.4.10, Economy, Affected Environment). However, a primary study to quantify the nonuse values of the Coastal Plain is outside the scope of this EIS; instead, other relevant studies from the literature on nonuse values are summarized in the EIS. The Economy section focuses on evaluating potential impacts on the local, regional, and statewide economy with respect to jobs, income, and revenues. The evaluation of potential impacts on the physical environment, biological resources, and other social systems, such as cultural resources, subsistence, recreation, visual resources, and public health, are provided in other sections of the EIS.
15.	Peter	Stern	—	69296	83	Economy	Page O-1 Table O-2. The number of people employed needs a big asterisk because much of the employment is seasonal, lasting only a few months. This table makes it seem like there is year around employment.	The discussion of jobs on page 3-234 indicates that jobs during the exploration and development phases are seasonal and temporary. A note was added to the table showing potential employment effects to further emphasize this point.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
16.	Curt	Leigh	—	69329	14	Economy	The economic evaluation in the EIS is also deficient. It considers a very limited range of non oil development economic topics. Even though the EIS identifies a recent increase in tourism (EIS p. 3-148), it fails to project lost tourism jobs or economic activity related to tourism through the fifty year project life. Existence values, future recreational values and other passive use values were specifically excluded from any economic evaluation (EIS p. 3-239). The values of undisturbed arctic habitats, which cannot be recreated even with a substantial budget, are not considered.	The EIS has been revised to provide a qualitative description of nonuse/passive use/existence values (nonmarket values) and other ecosystem service values associated with the Coastal Plain (see Section 3.4.10, Economy, Affected Environment). However, a primary study to quantify the nonuse values of the Coastal Plain is outside the scope of this EIS; instead, other relevant studies from the literature on nonuse values are summarized in the EIS. The Economy section focuses on evaluating potential impacts on the local, regional, and statewide economy with respect to jobs, income, and revenues. The evaluation of potential impacts on the physical environment, biological resources, and other social systems, such as cultural resources, subsistence, recreation, visual resources, and public health, are provided in other sections of the EIS.
17.	Linda	Serret	—	69357	8	Economy	Over how many years will this project provide job?- no estimate in Draft EIS, p 3-234?	The job estimates provided on page 3-234 cover the exploration (including pre-leasing seismic), development, production, and reclamation and abandonment phases, with the first lease sale scheduled in 2021 and production activities through 2050. Reclamation and abandonment activities could occur beyond 2050.
18.	Linda	Serret	—	69357	9	Economy	Will Alaska Natives get job preference or be training to be able to qualify for a job since they are the ones being displaced/adversely affected from the project?	The BLM does not make assumptions in the analysis regarding preferences for Alaska Native hire or training programs that benefit Alaska Natives. There are no existing lease stipulations or state regulations that address local hire preferences.

19.	Withheld	Withheld	—	70934	44	Economy	A complete analysis of the economic impacts of tourism in the refuge needs to be conducted and impacts to this sector of the economy need to be considered.	There could be impacts on local, regional, and statewide tourism depending on how the development in the Coastal Plain would affect future visitors. The potential impacts on the recreational resources in the area are presented in Section 3.4.6 of the Draft EIS.
20.	Withheld	Withheld	—	70934	52	Economy	Page 3-233 second paragraph mentions the multiplier effect of in-state purchases but there is no effort to ensure or guarantee any local hire, any in-state service or purchase requirements or any other assurances that money will stay within Alaska. Negotiations which guarantee Alaskans get a fair share should conclude prior to any leasing.	The multiplier effects provided are estimates of the "potential" effects of in-state spending based on existing statewide economic conditions and capacity. There is no explicit assumption of local hire or local purchase requirements considered in the analysis. This will be the prerogative of the future leaseholders.
21.	Tristan	Glowa	—	73594	1	Economy	Section 3.4.10 on economic impacts of this dEIS does not at all consider the adverse economic impacts of path dependence as a result of new oil and gas leasing. There ought to be analyses of the potentially adverse economic impacts – would leasing deepen economic dependence on the oil and gas industry and lead to the phenomenon of path dependence with larger adverse socio-economic impacts. Where is the discussion of worsening potential "Dutch Disease" or "Resource Curse" symptoms for Alaska politics as a result of a new infusion of oil and gas leases? These are established literature in academic studies of the political economy of resource-dependent regions. Particularly as the global energy transition moves to low-carbon fuels, in what ways does this leasing deepen path dependence and lock-in to fossil fuel based development and therefore create adverse socio-economic impacts? There is a risk that this leasing program will in fact hinder Alaska's long-term economic resilience that is not considered in this dEIS.	The EIS states that future oil and gas development in the Coastal Plain region would create additional economic activity in Alaska; however, the State of Alaska determines its own long-term economic strategy.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
22.	Tristan	Glowa	—	73594	2	Economy	The references to state tax revenue are also deficient. Again, new tax revenue for the state government from oil and gas development is portrayed as exclusively positive, without consideration of the challenges for long-term fiscal sustainability. Alaska's dependence on oil and gas tax revenue has led to volatile boom and bust cycles for state government based on the price of oil and other factors. By providing relief from pressure to diversify state revenue sources, this oil and gas leasing could directly stand in the way of sustainable fiscal policy in Alaska. Such an outcome is not considered, but absolutely should	Alaska's fiscal policy is determined by the Alaska legislature. The State's dependence on oil and gas tax revenues and whether it is beneficial or detrimental to the state's long-term sustainability is a value judgment that is up to the State of Alaska and its residents/stakeholders. The EIS presents these estimates as projections of potential revenues given the current fiscal structure in Alaska.
23.	Allen E.	Smith	—	74324	12	Economy	the DEIS fails to evaluate the economic value of the Arctic Refuge coastal plain for the unique values of its wildlife, wilderness, biological services, air and water quality, scientific research, and natural and cultural heritage.	The EIS has been revised to provide a qualitative description of nonuse/passive use/existence values (nonmarket values) and other ecosystem service values associated with the Coastal Plain (see Section 3.4.10, Economy, Affected Environment). However, a primary study to quantify the nonuse values of the Coastal Plain is outside the scope of this EIS; instead, other relevant studies from the literature on nonuse values are summarized in the EIS. The Economy section focuses on evaluating potential impacts on the local, regional, and statewide economy with respect to jobs, income, and revenues. The evaluation of potential impacts on the physical environment, biological resources, and other social systems, such as cultural resources, subsistence, recreation, visual resources, and public health, are provided in other sections of the EIS.

24.	Matthew	Rexford	Kaktovik Iñupiat Corporation	74331	5	Economy	<p>3. Incorporate local economic impacts and potential for local capacity building in discussion of impacts An important aspect that is overlooked in the DEIS is the positive local economic impacts from leasing and development in the Program Area. Although the DEIS correctly describes the benefits the North Slope Borough and State of Alaska stand to gain, the benefits to private land owners, like KIC or Native Allotment holders, are not well described in the DEIS. KIC understands that because KIC's lands are not under BLM's leasing authority, BLM has shied away from their inclusion. While it is appropriate for BLM not to include Native-owned lands in their stipulations, requirements, and restrictions, the indirect benefits and impacts of BLM's proposed leasing program should be included in BLM's analysis. Private, Native-owned land owners may experience a multitude of direct and indirect positive impacts from leasing and development in the Program Area which should be considered by BLM. BLM must analyze the following: *</p> <ul style="list-style-type: none"> Indirect benefit of leasing and development in the Program Area which could facilitate development on KIC lands; * Opportunity for Native Allotment holders to benefit from development, access, and/or use of their inholdings; * Capacity building of KIC and other Native-owned buildings for support services of industry programs; and, * Local economic generation as a result of industry's presence in and around Kaktovik. KIC in particular stands to benefit significantly from activity on our land, through support service businesses, contracting, and jobs for our shareholders. We have benefited from resource development across the North Slope as it provides for many of the essential services in Kaktovik. 	<p>The EIS already has some discussion regarding potential employment opportunities for residents of Kaktovik; under Section 3.4.10 Economy, Local Public Infrastructure and Local Businesses, the EIS states that "local businesses, including KIC and its subsidiaries, could receive greater revenues during the exploration, development, and production of petroleum resources in the program area."</p> <p>The EIS was also revised to provide additional discussion on potential benefits to Kaktovik and KIC in the environmental consequences section under economic sectors.</p>

24. (cont.)	(see above)	(see above)	(see above)	(see above)	(see above)	(see above)	Resource development in the Program Area will also add to these benefits. While commonplace in most of America, amenities like sanitary sewage, running water, electricity, our diesel-powered power plant, K-12 education, and emergency services have only been in place for one generation in our community. This translates into transformative public health impacts, education for our children, workforce development training, good paying jobs in Kaktovik, search and rescue for subsistence users, and more. As we have experienced, the indirect benefits from resource development ripple across the North Slope and often have a greater degree of impact at the local level. Through our local capacity building, leasing could stimulate various contracting opportunities for KIC and jobs for our shareholders like support services, subsistence advisers, environmental analysis, scientific research and more. Discoveries near Kaktovik could transition our diesel-powered plant into more economical and environmentally friendly natural gas. This should all be included in the DEIS.	(see above)

27.	Ronald	Yarnell	—	98124	2	Economy	<p>Not one thing is mentioned about the loss of dollars. If this oil development occurs on this area, I won't be taking trips across there. I won't be leading people to see this wonderful area. Who is going to float through Prudhoe Bay? It's not much fun. I've done it. It's not much fun. So even with the seismic exploration activity that occurred there during the 1980s, when we are floating these rivers and walk across the gravel bars and climb up on the tundra bank, if you walk just a little ways along that bank, and you will see a straight line going off as far into the horizon as you can see. And that was from 2-D exploration, which was basically setting these grids up every mile or so.</p>	<p>This issue is addressed in the Recreation Section of the EIS (Section 3.4.6). 30.	Renae	Smith	Counsel for Environmental Protection	74336	23	Economy	Coastal Plain will displace jobs in oil production elsewhere in the United States.135 Instead, the DEIS estimates that during the production phase, the proposed Leasing Program would generate an average of 730 direct jobs and over 3,000 indirect jobs. Given BLM's assumption that 96 percent of Coastal Plain production will replace other U.S. production, it follows that the vast majority of jobs created through the proposed Leasing Program would replace other oil production jobs within the United States. Yet, BLM does not consider or even acknowledge this possibility. BLM cannot rationally rely on a "perfect replacement theory" to downplay greenhouse gas emissions and climate change impacts but ignore this theory when calculating the number of jobs the project will create.136	The EIS focuses on economic impacts at the local, regional, and statewide level; a cost-benefit analysis is outside the scope of analysis of the EIS.
31.	Renae	Smith	Counsel for Environmental Protection	74336	23	Economy	Further, the DEIS's use of a perfect replacement theory for oil production contradicts BLM's analysis of the proposed Leasing Program's economic impacts. In calculating the direct and indirect impacts to the job market, the DEIS does not consider whether the jobs created in the	The EIS focuses on economic impacts at the local, regional, and statewide level; a cost-benefit analysis is outside the scope of analysis of the EIS.
32.	Withheld	Withheld	—	82285	3	Economy	Oil from the Arctic Refuge would have little or no impact on oil prices. According to the Environmental Protection Agency, increasing vehicle fuel efficiency would save more oil per day than the Refuge would provide in one year of peak production. We simply cannot drill our way to lower prices or energy independence and it would be incredibly short-sighted and unnecessary to sacrifice one of the last remaining unspoiled places on earth for a small amount of oil. The Arctic Refuge is part of our national heritage and is the only conservation unit that protects, undisturbed, a complete spectrum of the arctic ecosystems in North America.	Acknowledged. There is no statement in the EIS that suggests that oil production from the Coastal Plain region would lower global oil prices.

33.	Renae	Smith	Counsel for Environmental Protection	74336	22	Economy	This perfect replacement theory, i.e. the concept that 96 percent of Coastal Plain oil production will replace other production, is completely unsupported in this DEIS. BLM provides no meaningful evidence to support its assumption that the vast majority of oil produced in the Coastal Plain will displace other likely cheaper oil production in the United States, let alone global supplies. Nor does BLM explain how it anticipates that Coastal Plain production will interact with other United States, again likely cheaper, production or global production. By assuming that nearly all of the oil generated from the proposed Leasing Program will replace other production, the DEIS may be significantly underestimating the true potential impact of the proposed Leasing Program on greenhouse gas emissions and associated climate change, running afoul of recent judicial rejections of reliance in perfect replacement theory. 134 In effect, BLM has wrongly cited certain economic assumptions to avoid taking a hard look at the extent to which Coastal Plain oil production will impact production and associated climate impacts. This NEPA does not permit.	The EIS focuses on economic impacts; a cost-benefit analysis is outside the scope of analysis of the EIS.

34.	Brook	Brisson	Trustees for Alaska	81368	3	Economy	Also lacking are the data BLM used to forecast jobs and income: the annual number of wells developed, the number of wells producing each year, and production per well per year. These data are used in the DEIS' calculation of employment and income effects, and tax revenues (p. 3-234). Although assumptions for the total number of wells (per production pad, p. B-7) and annual operating costs (dollars per well and per barrel of oil, p. 3-233) are given, by not providing the annual figures that these costs are multiplied by in the calculation of annual totals, the public cannot evaluate the economic impact analysis results (pages B-23 to B-25).	<p>The assumptions used in quantifying the potential economic impacts of post-lease development activities are presented in Section B.6, Method and Assumptions for Hypothetical Development Scenario Projections of the EIS, and also on page 3-233 of the Economy section. Additional detail regarding the assumptions has also been added to the EIS.</p> <p>The EIS has been revised to provide additional detail regarding the number of wells and production. This additional information is presented in Appendix B of the EIS.</p>
35.	Renaë	Smith	Counsel for Environmental Protection	74336	11	Economy	As discussed supra in Section II A., BLM's unreasonably narrow purpose and need statement forecloses evaluation of the potential for the alternatives considered in the DEIS to accomplish Congress's intended purpose: to generate revenue to offset tax revenue losses from the Tax Cuts and Jobs Act. A thorough analysis that accounts for projected market conditions, the high cost of development in the Coastal Plain, and the convergence of multiple factors that will likely depress U.S. oil demand and price demonstrates, as discussed below, that lease sales very likely will generate less revenue than projected, and that leased areas may never become economically viable and generate royalty payments.70	The Tax Act does not direct the Secretary to generate any particular amount of revenue from oil and gas leasing in the Coastal Plain.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
36.	Renae	Smith	Counsel for Environmental Protection	74336	13	Economy	Recent analyses estimate that the price of oil must reach between \$78 and \$90 per barrel for drilling on the Coastal Plain to become economically viable. ⁷⁹ But global oil prices for the past few years have ranged between \$55 and \$60 per barrel, ⁸⁰ and crude oil futures are trading at \$70 per barrel or lower-a far cry from the estimated \$78 to \$90 per barrel breakeven price needed to make Coastal Plain drilling projects viable. ⁸¹	The economic viability of development in the Coastal Plain was not evaluated; an EIS only addresses the potential environmental consequences of a proposed action. The potential leaseholders will make that evaluation prior to bidding on leases. The development scenarios used to evaluate the economic impacts considered the economic costs of development and potential production from fields of assumed sizes.
37.	Renae	Smith	Counsel for Environmental Protection	74336	14	Economy	analysts estimate that lease sales in the Coastal Plain would likely generate a total of anywhere from \$37.5 million to \$76 million. ⁸⁵ But leases sale prices in the Coastal Plain would be lower than some high volume areas of the NPRA. Even with higher price expectations, Coastal Plain lease sale prices would most likely average roughly \$25 to \$30 per acre. ⁸⁶ In this price range, successful leasing of the of the Coastal Plain would likely yield total lease revenues ranging from about \$25 million for an auction offering the minimum or low-end lease sale acreage to \$40 million at the high end of offered acreage. ⁸⁷	There were no estimates of lease sales and payments provided in the EIS. It is unclear at this point what the terms of the lease sales will be. As stated on page 3-231 of the Draft EIS, "direct impacts from issuing oil and gas leases under the directives of Section 20001(c)(1) of PL 115-97 would include the federal government receiving bonus bids and rental payments from leasing; however, these payments cannot be quantified because there is not enough specificity at this time regarding the lease terms."

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
38.	Renae	Smith	Counsel for Environmental Protection	74336	14	Economy	Uncertainty about future oil prices and, thus, about the economic viability of Coastal Plain oil production would be reflected in the bonus bid and lease price bidders may be willing to pay. 82 The CBO in its \$2.2 billion (\$1.1 billion federal) revenue generation estimate acknowledges the uncertainty in its bonus bid and lease sale estimates, noting that “[p]otential bidders might make assumptions that are different from CBO’s, including assumptions about long-term oil prices, production costs, the amount of oil and gas resources in ANWR, and alternative investment opportunities.”83 Recent lease sales in the nearby National Petroleum Reserve in Alaska (NPRA)- where substantial deposit volumes of technically available oil have been confirmed-have ranged from roughly \$5 to \$18 per acre, with a weighted average of \$8.81 per acre.84	The Draft EIS did not provide estimates of bonus bids and rental payments. As stated on page 3-231 of the Draft EIS, “direct impacts from issuing oil and gas leases under the directives of Section 20001(c)(1) of PL 115-97 would include the federal government receiving bonus bids and rental payments from leasing; however, these payments cannot be quantified because there is not enough specificity at this time regarding the lease terms.”
39.	Renae	Smith	Counsel for Environmental Protection	74336	15	Economy	Beyond lease sale revenue, if oil prices fail to raise above the breakeven point over the next 20 years, as some current projections indicate, any Coastal Plain lease sale would not result in actual oil development and would thus provide no royalty payments to offset federal revenue losses from the Tax Cuts and Jobs Act. 88 Even if development does become economically viable with oil prices rising over \$100 per barrel, as U.S. EIA’s analysis assumes, potential royalty payments would not begin until 2031, and, together with lease sales and bonus bid revenue and rent payments, total revenue generation may still be well under the total intended \$2.2 billion, with \$1.1 billion for federal deposit. 89	There is considerable uncertainty regarding oil prices and potential lease revenues. The EIA’s assumptions and scenarios reflect one possibility of future conditions, and the assumptions/scenarios used in the Draft EIS reflect another possibility. A discussion of this uncertainty is provided in the hypothetical development scenario section.

40.	Renae	Smith	Counsel for Environmental Protection	74336	20	Economy	All told, the global demand for oil will likely soon begin to decline significantly.118 As discussed in Section II. C. 2, infra, BLM's DEIS rests on the flawed assumption that oil demand will increase over the next 70 years. That is unlikely and would be inconsistent with current trends that are poised to greatly reduce demand. 119 In sum, there is no need for any oil or gas produced by the proposed Leasing Program, and all of the alternatives considered in the DEIS are unlikely to generate revenue at a level approaching the CBO's projections to offset the cost of the Tax Cuts and Jobs Act. By failing to include in its alternatives analysis any assessment of potential revenue generation, including full and robust evaluation of all the relevant factors discussed above, BLM's alternatives analysis does not satisfy NEPA because it utterly fails to illuminate the real and significant tradeoff between the Leasing Program's illusory benefits and its substantial, long-lasting and irreversible environmental harms.	The Tax Act does not direct the Secretary to generate any particular amount of revenue from oil and gas leasing in the Coastal Plain.

48.	Megan	Williams	o.b.o. Trustees for Alaska	81368	9	Economy	The DEIS states that delays "would therefore also delay potential employment and income effects, as well as revenues that could accrue to the local, State, and federal governments" (p. 3-238). Yet the document does not provide an alternative timeline allowing for these potential events. An alternative development timeline that incorporates these likely sources of delay would provide a more realistic scenario.	The timing of lease sales is set by statute, but the timing of subsequent development on leased lands is uncertain. This Draft EIS considers just one potential hypothetical future development scenario in the area.
49.	Steven	Amstrup	Polar Bears International	81368	10	Economy	The DEIS should have provided all the information used to develop the economic impact analysis to allow the public to critically assess the results. The economic impact estimates (jobs and labor income) rely on the assumed timeline (number of years of exploration, development, and production), number of wells developed and producing per year, production per well per year, and related annual costs. Assumed values for these inputs are not provided in the DEIS and thus there is insufficient information provided to support the economic impacts presented in the DEIS (sections B.10 and 3.4.10).	The EIS has been revised to provide additional detail regarding the number of wells and production. This additional information is presented in Appendix B of the EIS.
50.	Carolyn	Alkire	Key-Log Economics o.b.o. The Wilderness Society	81368	12	Economy	In terms of the economic impacts associated with development expenses, it is not clear if the economic impact analysis distinguished between development expenditures incurred within vs. outside Alaska; annual values for these inputs are not provided.	The estimates of indirect effects (multiplier effects) considered the existing capacity of Alaska industries to meet the estimated increase in demand for goods and services as a result of the development and production activities assumed in the analysis. The amount of local/in-state purchases varies by economic sector and is based on the regional purchase coefficients that are embedded in the IMPLAN model.

55.	Brook	Brisson	Trustees for Alaska	81368	25	Economy	The description of the regional economy (defined as the North Slope Borough, or NSB) should have considered all sectors of the region's economy and the potential effects of proposed development on each. The DEIS mentions only the oil and gas industry and includes nonresidents in the region's workforce: "Oil and gas exploration and development is the primary industry in the NSB and the largest employer of the region's industrial workforce, including nonresidents" (p. 3-229). However, "a large portion of the earnings are not spent in the local and regional economy, as most workers reside permanently outside the NSB" (p. 3-229). Although the DEIS mentions the local government as a "major" employer, it ignores other sectors. According to the U.S. Census Bureau, accommodation and food services, administrative and related services, wholesale trade, health care, and transportation and	The EIS has been revised to provide additional detail regarding employment and wages in other sectors of the regional economy.
56.	Brook	Brisson	Trustees for Alaska	81368	25	Economy	warehousing sectors accounted for 48% of North Slope Borough employees and 40% of annual payroll in 2016. ²⁴ In contrast, less than 0.5% of the oil and gas jobs are held by residents of the North Slope Borough (p. 3-197 and p. 3-229). The DEIS should include a complete overview of the region's businesses, employment, and wages as well as an adequate discussion of the potential effects of oil and gas development on these sectors of the economy.	Additional detail regarding employment and wages in other sectors of the regional economy has been added to Appendix O.

Row #	First Name	Last Name	Organization Name	Letter #	Comment #	Comment Code Name	Comment Text	Response
57.	Steven	Amstrup	Polar Bears International	81368	28	Economy	An analysis of the substantial non-market and non-use values of the Coastal Plain should have been included in the DEIS. The document recognizes the existence of biological and ecological resources and values associated with the Arctic National Wildlife Refuge. But, despite recognizing the potential for economic losses resulting from damage to these resources and ecosystem services, without justification the DEIS dismisses these costs by stating "quantifying nonmarket values associated with the Arctic Refuge is not part of this analysis" (p. 3-231; the text references the Affected Environment section but there is no mention of nonmarket values therein.) The DEIS also acknowledges oil and gas development would negatively affect nonuse values, yet does not identify what the effects might be or why they are not quantified: "non-use and passive use values of the Coastal Plain and its other ecosystem service values (although not quantified in this analysis) would be diminished from their current value by oil and gas leasing development" (p. 3-239).	The EIS has been revised to provide a qualitative description of nonuse/passive use/existence values (nonmarket values) and other ecosystem service values associated with the Coastal Plain (see Section 3.4.10, Economy, Affected Environment). However, a primary study to quantify the nonuse values of the Coastal Plain is outside the scope of this EIS; instead, other relevant studies from the literature on nonuse values are summarized in the EIS. The Economy section focuses on evaluating potential impacts on the local, regional, and statewide economy with respect to jobs, income, and revenues. The evaluation of potential impacts on the physical environment, biological resources, and other social systems, such as cultural resources, subsistence, recreation, visual resources, and public health, are provided in other sections of the EIS.
58.	Withheld	Withheld	Arctic Slope Regional Corporation	83317	3	Economy	ASRC and KIC are entitled to develop our lands and natural resources under ANCSA, ANILCA, and the 2017 Tax Act. Resource development in the Program Area will indirectly spur development on Native owned land and these benefits should be captured in BLM's analysis.	Additional discussion on potential benefits to Kaktovik and KIC has been added in the environmental consequences section under economic sectors. The Draft EIS already has some discussion regarding potential employment opportunities for residents of Kaktovik; under Local Public Infrastructure and Local Businesses, the EIS states that "local businesses, including KIC and its subsidiaries, could receive greater revenues during the exploration, development and production of petroleum resources in the program area."

68.	Jason	Schwartz	Institute for Policy Integrity	94627	22	Economy	<p>it would seem that for the purposes of calculating royalties, BLM is using the region's total production figures, is not applying substitution analysis, and is not assuming that increased production from the Coastal Plains at least partly if not largely offsets other sources of energy. Yet according to the substitution analysis that BLM applies to estimate downstream emissions, every barrel leased from the Coastal Plains will come partly at the expense of, for example, production of oil and gas on other federally leased lands. Production from such other substitute sources would have also generated royalty and tax revenues. But while BLM uses assumption about substitute energy sources to offset its estimates of downstream emissions, the agency does not offset its estimate of government revenue expected from this leasing action by the revenue that substitute energy sources would have provided. The result is an inconsistent methodological approach to the leasing action's alleged monetized economic benefits versus the action's unmonetized climate costs, which may have the effect of overestimating benefits while underestimating costs.</p>	<p>The EIS focuses on economic impacts; a cost-benefit analysis is outside the scope of analysis of the EIS.</p>
